

Package ‘REDCapCAST’

January 9, 2024

Title REDCap Castellated Data Handling

Version 24.1.1

Description Originally forked from the R part of 'REDCapRITS' by Paul Egeler.

See <<https://github.com/pegeler/REDCapRITS>>.

Handles castellated datasets from 'REDCap' projects with repeating instruments.

Assists in casting tidy tables from raw 'REDCap' data exports for each repeated instrument. Keeps a focused data export approach, by allowing to only export required data from the database.

'REDCap' (Research Electronic Data Capture) is a secure, web-based software platform designed to support data capture for research studies, providing

1) an intuitive interface for validated data capture; 2) audit trails for tracking data manipulation and export procedures; 3) automated export procedures for seamless data downloads to common statistical packages; and 4) procedures for data integration and interoperability with external sources (Harris et al (2009) <[doi:10.1016/j.jbi.2008.08.010](https://doi.org/10.1016/j.jbi.2008.08.010)>;

Harris et al (2019) <[doi:10.1016/j.jbi.2019.103208](https://doi.org/10.1016/j.jbi.2019.103208)>).

Depends R (>= 3.4.0)

Suggests spelling, httr, jsonlite, testthat, Hmisc, readr, knitr, rmarkdown, gt, usethis, ggplot2

License GPL (>= 3)

Encoding UTF-8

LazyData true

clean_redcap_name	<i>clean_redcap_name</i>
-------------------	--------------------------

Description

Stepwise removal on non-alphanumeric characters, trailing white space, substitutes spaces for underscores and converts to lower case. Trying to make up for different naming conventions.

Usage

```
clean_redcap_name(x)
```

Arguments

x vector or data frame for cleaning

Value

vector or data frame, same format as input

d2w

Convert single digits to words

Description

Convert single digits to words

Usage

```
d2w(x, lang = "en", neutrum = FALSE, everything = FALSE)
```

Arguments

x	data. Handle vectors, data.frames and lists
lang	language. Danish (da) and English (en), Default is "en"
neutrum	for numbers depending on counted word
everything	flag to also split numbers >9 to single digits

Value

returns characters in same format as input

Examples

```
d2w(c(2:8,21))
d2w(data.frame(2:7,3:8,1),lang="da",neutrum=TRUE)

## If everything=T, also larger numbers are reduced.
## Elements in the list are same length as input
d2w(list(2:8,c(2,6,4,23),2), everything=TRUE)
```

ds2dd

*Data set to data dictionary function***Description**

Migrated from stRoke ds2dd(). Fits better with the functionality of 'REDCapCAST'

Usage

```
ds2dd(
  ds,
  record.id = "record_id",
  form.name = "basis",
  field.type = "text",
  field.label = NULL,
  include.column.names = FALSE,
  metadata = names(redcapcast_meta)
)
```

Arguments

ds	data set
record.id	name or column number of id variable, moved to first row of data dictionary, character of integer. Default is "record_id".
form.name	vector of form names, character string, length 1 or length equal to number of variables. Default is "basis".
field.type	vector of field types, character string, length 1 or length equal to number of variables. Default is "text".
field.label	vector of form names, character string, length 1 or length equal to number of variables. Default is NULL and is then identical to field names.
include.column.names	Flag to give detailed output including new column names for original data set for upload.
metadata	Metadata column names. Default is the included REDCapCAST::redcapcast_data.

Value

data.frame or list of data.frame and vector

Examples

```
redcapcast_data$record_id <- seq_len(nrow(redcapcast_data))
ds2dd(redcapcast_data, include.column.names=TRUE)
```

`easy_redcap`*Secure API key storage and data acquisition in one*

Description

Secure API key storage and data acquisition in one

Usage

```
easy_redcap(project.name, widen.data = TRUE, ...)
```

Arguments

<code>project.name</code>	The name of the current project (for key storage with 'keyring::key_set()')
<code>widen.data</code>	argument to widen the exported data
<code>...</code>	arguments passed on to 'REDCapCAST::read_redcap_tables()'

Value

data.frame or list depending on `widen.data`

`focused_metadata`*focused_metadata*

Description

Extracts limited metadata for variables in a dataset

Usage

```
focused_metadata(metadata, vars_in_data)
```

Arguments

<code>metadata</code>	A dataframe containing metadata
<code>vars_in_data</code>	Vector of variable names in the dataset

Value

A dataframe containing metadata for the variables in the dataset

get_api_key	<i>Retrieve project API key if stored, if not, set and retrieve</i>
-------------	---

Description

Retrieve project API key if stored, if not, set and retrieve

Usage

```
get_api_key(key.name)
```

Arguments

key.name	character vector of key name
----------	------------------------------

Value

character vector

match_fields_to_form	<i>Match fields to forms</i>
----------------------	------------------------------

Description

Match fields to forms

Usage

```
match_fields_to_form(metadata, vars_in_data)
```

Arguments

metadata	A data frame containing field names and form names
vars_in_data	A character vector of variable names

Value

A data frame containing field names and form names

read_redcap_tables *Download REDCap data*

Description

Implementation of REDCap_split with a focused data acquisition approach using REDCapR::redcap_read and only downloading specified fields, forms and/or events using the built-in focused_metadata including some clean-up. Works with classical and longitudinal projects with or without repeating instruments.

Usage

```
read_redcap_tables(
  uri,
  token,
  records = NULL,
  fields = NULL,
  events = NULL,
  forms = NULL,
  raw_or_label = "label",
  split_forms = "all",
  generics = c("record_id", "redcap_event_name", "redcap_repeat_instrument",
              "redcap_repeat_instance")
)
```

Arguments

uri	REDCap database uri
token	API token
records	records to download
fields	fields to download
events	events to download
forms	forms to download
raw_or_label	raw or label tags
split_forms	Whether to split "repeating" or "all" forms, default is all.
generics	vector of auto-generated generic variable names to ignore when discarding empty rows

Value

list of instruments

Examples

```
# Examples will be provided later
```

redcapcast_data	<i>Data set for demonstration</i>
-----------------	-----------------------------------

Description

This is a small dataset from a REDCap database for demonstrational purposes. Contains only synthetic data.

Usage

```
data(redcapcast_data)
```

Format

A data frame with 22 variables:

record_id ID, numeric
redcap_event_name Event name, character
redcap_repeat_instrument Repeat instrument, character
redcap_repeat_instance Repeat instance, numeric
cpr CPR number, character
inclusion Inclusion date, date
dob Date of birth, date
age Age decimal, numeric
age_integer Age integer, numeric
sex Legal sex, character
cohabitation Cohabitation status, character
hypertension Hypertension, character
diabetes diabetes, character
region region, character
baseline_data_start_complete Completed, character
mrs_assessed mRS Assessed, character
mrs_date Assesment date, date
mrs_score Score, numeric
mrs_complete Complete, numeric
event_date Event date, date
event_type Event type, character
new_event_complete Completed, character

redcapcast_meta	<i>REDCap metadata from data base</i>
-----------------	---------------------------------------

Description

This metadata dataset from a REDCap database is for demonstrational purposes.

Usage

```
data(redcapcast_meta)
```

Format

A data frame with 22 variables:

field_name field_name, character

form_name form_name, character

section_header section_header, character

field_type field_type, character

field_label field_label, character

select_choices_or_calculations select_choices_or_calculations, character

field_note field_note, character

text_validation_type_or_show_slider_number text_validation_type_or_show_slider_number, character

text_validation_min text_validation_min, character

text_validation_max text_validation_max, character

identifier identifier, character

branching_logic branching_logic, character

required_field required_field, character

custom_alignment custom_alignment, character

question_number question_number, character

matrix_group_name matrix_group_name, character

matrix_ranking matrix_ranking, character

field_annotation field_annotation, character

`REDCap_split`*Split REDCap repeating instruments table into multiple tables*

Description

This will take output from a REDCap export and split it into a base table and child tables for each repeating instrument. Metadata is used to determine which fields should be included in each resultant table.

Usage

```
REDCap_split(  
  records,  
  metadata,  
  primary_table_name = "",  
  forms = c("repeating", "all")  
)
```

Arguments

<code>records</code>	Exported project records. May be a <code>data.frame</code> , response, or character vector containing JSON from an API call.
<code>metadata</code>	Project metadata (the data dictionary). May be a <code>data.frame</code> , response, or character vector containing JSON from an API call.
<code>primary_table_name</code>	Name given to the list element for the primary output table (as described in <i>README.md</i>). Ignored if <code>forms = 'all'</code> .
<code>forms</code>	Indicate whether to create separate tables for repeating instruments only or for all forms.

Value

A list of "data.frame"s. The number of tables will differ depending on the `forms` option selected.

- `'repeating'`: one base table and one or more tables for each repeating instrument.
- `'all'`: a `data.frame` for each instrument, regardless of whether it is a repeating instrument or not.

Author(s)

Paul W. Egeler, M.S., GStat

Examples

```
## Not run:
# Using an API call -----

library(RCurl)

# Get the records
records <- postForm(
  uri = api_url,      # Supply your site-specific URI
  token = api_token, # Supply your own API token
  content = 'record',
  format = 'json',
  returnFormat = 'json'
)

# Get the metadata
metadata <- postForm(
  uri = api_url,      # Supply your site-specific URI
  token = api_token, # Supply your own API token
  content = 'metadata',
  format = 'json'
)

# Convert exported JSON strings into a list of data.frames
REDCapRITS::REDCap_split(records, metadata)

# Using a raw data export -----

# Get the records
records <- read.csv("/path/to/data/ExampleProject_DATA_2018-06-03_1700.csv")

# Get the metadata
metadata <- read.csv(
  "/path/to/data/ExampleProject_DataDictionary_2018-06-03.csv")

# Split the tables
REDCapRITS::REDCap_split(records, metadata)

# In conjunction with the R export script -----

# You must set the working directory first since the REDCap data export
# script contains relative file references.
old <- getwd()
setwd("/path/to/data/")

# Run the data export script supplied by REDCap.
# This will create a data.frame of your records called 'data'
source("ExampleProject_R_2018-06-03_1700.r")

# Get the metadata
metadata <- read.csv("ExampleProject_DataDictionary_2018-06-03.csv")
```

```
# Split the tables
REDCapRITS::REDCap_split(data, metadata)
setwd(old)

## End(Not run)
```

redcap_wider

Redcap Wider

Description

Converts a list of REDCap data frames from long to wide format. Handles longitudinal projects, but not yet repeated instruments.

Usage

```
redcap_wider(  
  list,  
  event.glue = "{.value}_{redcap_event_name}",  
  inst.glue = "{.value}_{redcap_repeat_instance}"  
)
```

Arguments

<code>list</code>	A list of data frames.
<code>event.glue</code>	A dplyr::glue string for repeated events naming
<code>inst.glue</code>	A dplyr::glue string for repeated instruments naming

Value

The list of data frames in wide format.

Examples

```
list <- list(data.frame(record_id = c(1,2,1,2),  
  redcap_event_name = c("baseline", "baseline", "followup", "followup"),  
  age = c(25,26,27,28)),  
  data.frame(record_id = c(1,2),  
  redcap_event_name = c("baseline", "baseline"),  
  gender = c("male", "female")))  
redcap_wider(list)
```

sanitize_split	<i>Sanitize list of data frames</i>
----------------	-------------------------------------

Description

Removing empty rows

Usage

```
sanitize_split(
  l,
  generic.names = c("record_id", "redcap_event_name", "redcap_repeat_instrument",
    "redcap_repeat_instance")
)
```

Arguments

`l` A list of data frames.
`generic.names` A vector of generic names to be excluded.

Value

A list of data frames with generic names excluded.

split_non_repeating_forms	<i>Split a data frame into separate tables for each form</i>
---------------------------	--

Description

Split a data frame into separate tables for each form

Usage

```
split_non_repeating_forms(table, universal_fields, fields)
```

Arguments

`table` A data frame
`universal_fields` A character vector of fields that should be included in every table
`fields` A two-column matrix containing the names of fields that should be included in each form

Value

A list of data frames, one for each non-repeating form

Examples

```
# Create a table
table <- data.frame(
  id = c(1, 2, 3, 4, 5),
  form_a_name = c("John", "Alice", "Bob", "Eve", "Mallory"),
  form_a_age = c(25, 30, 25, 15, 20),
  form_b_name = c("John", "Alice", "Bob", "Eve", "Mallory"),
  form_b_gender = c("M", "F", "M", "F", "F")
)

# Create the universal fields
universal_fields <- c("id")

# Create the fields
fields <- matrix(
  c("form_a_name", "form_a",
    "form_a_age", "form_a",
    "form_b_name", "form_b",
    "form_b_gender", "form_b"),
  ncol = 2, byrow = TRUE
)

# Split the table
split_non_repeating_forms(table, universal_fields, fields)
```

strsplitx

Extended string splitting

Description

Can be used as a substitute of the base function. Main claim to fame is easing the split around the defined delimiter, see example.

Usage

```
strsplitx(x, split, type = "classic", perl = FALSE, ...)
```

Arguments

x	data
split	delimiter
type	Split type. Can be c("classic", "before", "after", "around")
perl	perl param from strsplit()
...	additional parameters are passed to base strsplit handling splits

Value

list

Examples

```
test <- c("12 months follow-up", "3 steps", "mRS 6 weeks", "Counting to 231 now")
strsplitx(test, "[0-9]", type="around")
```
