**Details**

This was adapted from [https://publications.copernicus.org/for\\_authors/manuscript\\_preparation.html](https://publications.copernicus.org/for_authors/manuscript_preparation.html).

An number of required and optional manuscript sections, e.g. `acknowledgements`, `competinginterests`, or `authorcontribution`, must be declared using the respective properties of the R Markdown header - see skeleton file.

**Version:** Based on `copernicus_package.zip` in the version 6.4, 8th August 2021, using `copernicus.cls` in version 9.32, 7 July 2021.

**Copernicus journal abbreviations:** You can use the function `copernicus_journal_abbreviations()` to get the journal abbreviation for all journals supported by the Copernicus article template.

**Important note:** The online guidelines by Copernicus are the official resource. Copernicus is not responsible for the community contributions made to support the template in this package. Copernicus converts all typeset TeX files into XML, the expressions and markups have to be highly standardized. Therefore, please keep the following in mind:

- Please provide only one figure file for figures with several panels, and please do not use `\subfloat` or similar commands.

- Please use only commands in which words, numbers, etc. are within braces (e.g. `\text{TEXT}` instead of `\rm TEXT`).
- For algorithms, please use the syntax given in `template.tex` or provide your algorithm as a figure.
- Please do not define new commands.
- Supported packages (`\usepackage{}`) are already integrated in the `copernicus.cls`. Please do not insert additional ones in your `.tex` file.
- If you opt for syntax highlighting for your preprint or other reasons, please do not forget to use `highlight = NULL` for your final file upload once your manuscript was accepted for publication.
- Spaces in labels (`\label{ }`) are not allowed; please make sure that no label name is assigned more than once.
- Please do not use `\paragraph{ }`; only `\subsubsection{ }` is allowed.
- It is not possible to add tables in colour.

### Value

An R Markdown output format.

### Note

If you use `rmarkdown::pdf_document()`, all internal references (i.e. tables and figures) must use `\ref{ }` whereas with `bookdown::pdf_document2()`, you can additionally use `\@ref()`.

### References

## Details

This file is only a basic article template. For full details of *The R Journal* style and information on how to prepare your article for submission, see the [Instructions for Authors](#)

### About this format and the R Journal requirements:

`rticles::rjournal_article` will help you build the correct files requirements:

- A R file will be generated automatically using `knitR::purl` - see <https://bookdown.org/yihui/rmarkdown-cookbook/purl.html> for more information.
- A tex file will be generated from this Rmd file and correctly included in `RJwrapper.tex` as expected to build `RJwrapper.pdf`.
- All figure files will be kept in the default `rmarkdown*_files` folder. This happens because `keep_tex = TRUE` by default in `rticles::rjournal_article`
- Only the bib filename is to be modified. An example bib file is included in the template (`RJreferences.bib`) and you will have to name your bib file as the tex, R, and pdf files.
