

Package ‘CDMConnector’

March 23, 2023

Title Connect to an OMOP Common Data Model

Version 0.5.1

Description Provides tools for working with observational health data in the Observational Medical Outcomes Partnership (OMOP) Common Data Model format with a pipe friendly syntax.
Common data model database table references are stored in a single compound object along with metadata.

License Apache License (≥ 2)

Encoding UTF-8

RoxygenNote 7.2.3

Depends R (≥ 4.0)

Imports dplyr, DBI ($\geq 0.3.0$), checkmate, magrittr, dbplyr, pillar, cli, purrr, rlang, tidyselect, readr, glue, waldo, methods, withr, lifecycle, jsonlite, stringr, fs

Suggests arrow, SqlRender, rJava, covr, knitr, rmarkdown, duckdb, RSQLite, RPostgres, odbc, ggplot2, testthat ($\geq 3.0.0$), DatabaseConnector, lubridate

Enhances CirceR

Config/testthat/edition 3

VignetteBuilder knitr

appendPermanent	<i>Run a dplyr query and add the result set to an existing</i>
-----------------	--

Description

Run a dplyr query and add the result set to an existing

Usage

```
appendPermanent(x, name, schema = NULL)
```

```
append_permanent(x, name, schema = NULL)
```

Arguments

x	A dplyr query
name	Name of the table to be appended. If it does not already exist it will be created.
schema	Schema where the table exists. Can be a length 1 or 2 vector. (e.g. schema = "my_schema", schema = c("my_schema", "dbo"))

Value

A dplyr reference to the newly created table

Examples

```
## Not run:
library(CDMConnector)

con <- DBI::dbConnect(duckdb::duckdb(), dbdir = CDMConnector::eunomia_dir())
concept <- dplyr::tbl(con, "concept")

# create a table
rxnorm_count <- concept %>%
  dplyr::filter(domain_id == "Drug") %>%
  dplyr::mutate(isRxnorm = (vocabulary_id == "RxNorm")) %>%
  dplyr::count(domain_id, isRxnorm) %>%
  computeQu("rxnorm_count")

# append to an existing table
rxnorm_count <- concept %>%
  dplyr::filter(domain_id == "Procedure") %>%
  dplyr::mutate(isRxnorm = (vocabulary_id == "RxNorm")) %>%
  dplyr::count(domain_id, isRxnorm) %>%
  appendPermanent("rxnorm_count")

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

asDate	<i>as.Date dbplyr translation wrapper</i>
--------	---

Description

This is a workaround for using `as.Date` inside `dplyr` verbs against a database backend. This function should only be used inside `dplyr` verbs where the first argument is a database table reference. `asDate` must be unquoted with `!!` inside `dplyr` verbs (see example).

Usage

```
asDate(x)
```

```
as_date(x)
```

Arguments

`x` an R expression

Examples

```
## Not run:
con <- DBI::dbConnect(odbc::odbc(), "Oracle")
date_tbl <- dplyr::copy_to(con,
  data.frame(y = 2000L, m = 10L, d = 10L),
  name = "tmp",
  temporary = TRUE)

df <- date_tbl %>%
  dplyr::mutate(date_from_parts = !!asDate(paste0(
    .data$y, "/",
    .data$m, "/",
    .data$d
  ))) %>%
  collect()

## End(Not run)
```

assert_tables	<i>Assert that tables exist in a cdm object</i>
---------------	---

Description

A `cdm` object is a list of references to a subset of tables in the OMOP Common Data Model. If you write a function that accepts a `cdm` object as a parameter `assert_tables/assertTables` will help you check that the tables you need are in the `cdm` object, have the correct columns/fields, and (optionally) are not empty.

Usage

```
assert_tables(cdm, tables, empty.ok = FALSE, add = NULL)
```

```
assertTables(cdm, tables, empty.ok = FALSE, add = NULL)
```

Arguments

cdm	A cdm object
tables	A character vector of table names to check.
empty.ok	Should an empty table (0 rows) be considered an error? TRUE or FALSE (default)
add	An optional AssertCollection created by <code>checkmate::makeAssertCollection()</code> that errors should be added to.

Value

Invisibly returns the cdm object

Examples

```
## Not run:
# Use assertTables inside a function to check that tables exist
countDrugsByGender <- function(cdm) {
  assertTables(cdm, tables = c("person", "drug_era"), empty.ok = FALSE)

  cdm$person %>%
    dplyr::inner_join(cdm$drug_era, by = "person_id") %>%
    dplyr::count(.data$gender_concept_id, .data$drug_concept_id) %>%
    dplyr::collect()
}

library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
cdm <- cdm_from_con(con)

countDrugsByGender(cdm)

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

Description

A cdm object can optionally contain a single schema in a database with write access. `assert_write_schema` checks that the cdm contains the "write_schema" attribute and tests that local dataframes can be written to tables in this schema.

Usage

```
assert_write_schema(cdm, add = NULL)
```

```
assertWriteSchema(cdm, add = NULL)
```

Arguments

cdm	A cdm object
add	An optional AssertCollection created by <code>checkmate::makeAssertCollection()</code> that errors should be added to.

Value

Invisibly returns the cdm object

cdmFlatten	<i>Flatten a cdm into a single observation table</i>
------------	--

Description

This experimental function transforms the OMOP CDM into a single observation table. This is only recommended for use with a filtered CDM or a cdm that is small in size.

Usage

```
cdmFlatten(
  cdm,
  domain = c("condition", "drug", "procedure"),
  includeConceptName = TRUE
)
```

```
cdm_flatten(
  cdm,
  domain = c("condition", "drug", "procedure"),
  include_concept_name = TRUE
)
```

Arguments

cdm A cdm_reference object

domain Domains to include. Must be a subset of "condition", "drug", "procedure", "measurement", "visit", "death", "observation".

include_concept_name, includeConceptName
Should concept_name and type_concept_name be include in the output table?
TRUE (default) or FALSE

Details**[Experimental]****Value**

A lazy query that when evaluated will result in a single cdm table

Examples

```
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main")

all_observations <- cdmSubset(cdm, personId = c(2, 18, 42)) %>%
  cdmFlatten() %>%
  collect()

all_observations
#> # A tibble: 213 × 8
#>   person_id observation_ start_date end_date type_ domain obser. type_
#>   <dbl>          <dbl> <date>   <date>   <dbl> <chr> <chr> <chr>

#> # ... with 203 more rows, and abbreviated variable names observation_concept_id,
#> #   type_concept_id, observation_concept_name, type_concept_name

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

cdmName *Get the CDM name*

Description

Extract the CDM name attribute from a cdm_reference object

Usage

```
cdmName(cdm)
```

```
cdm_name(cdm)
```

Arguments

cdm A cdm object

Value

The name of the CDM as a character string

Examples

```
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, "main")
cdmName(cdm)
#> [1] "Synthea synthetic health database"

cdm <- cdm_from_con(con, "main", cdm_name = "Example CDM")
cdmName(cdm)
#> [1] "Example CDM"

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

cdmSample *Subset a cdm object to a random sample of individuals*

Description

cdmSample takes a cdm object and returns a new cdm that includes only a random sample of persons in the cdm. Only person_ids in both the person table and observation_period table will be considered.

Usage

```
cdmSample(cdm, n = 1000)
```

```
cdm_sample(cdm, n = 1000)
```

Arguments

cdm	A cdm_reference object
n	Number of persons to include in the cdm

Details

[Experimental]

Value

A modified cdm_reference object where all clinical tables are lazy queries pointing to subset

Examples

```
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main")

cdmSampled <- cdmSample(cdm, n = 2)

cdmSampled$person %>%
  select(person_id)
#> # Source:   SQL [2 x 1]
#> # Database: DuckDB 0.6.1
#>   person_id
#>   <dbl>
#> 1      155
#> 2     3422

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

cdmSubset	<i>Subset a cdm object to a set of persons</i>
-----------	--

Description

cdmSubset takes a cdm object and a list of person IDs as input. It returns a new cdm that includes data only for persons matching the provided person IDs. Generated cohorts in the cdm will also be subset to the IDs provided.

Usage

```
cdmSubset(cdm, personId)

cdm_subset(cdm, person_id)
```

Arguments

cdm	A cdm_reference object
person_id, personId	A numeric vector of person IDs to include in the cdm

Details

[Experimental]

Value

A modified cdm_reference object where all clinical tables are lazy queries pointing to subset

Examples

```
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main")

cdm2 <- cdmSubset(cdm, personId = c(2, 18, 42))

cdm2$person %>%
  select(1:3)
#> # Source:   SQL [3 x 3]
#> # Database: DuckDB 0.6.1
#>   person_id gender_concept_id year_of_birth
#>   <dbl>         <dbl>         <dbl>
#> 1         2             8532         1920
#> 2        18             8532         1965
```

```
#> 3      42      8532      1909
DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)
```

cdmSubsetCohort	<i>Subset a cdm to the individuals in one or more cohorts</i>
-----------------	---

Description

cdmSubset will return a new cdm object that contains lazy queries pointing to each of the cdm tables but subset to individuals in a generated cohort. Since the cdm tables are lazy queries, the subset operation will only be done when the tables are used. computeQuery can be used to run the SQL used to subset a cdm table and store it as a new table in the database.

Usage

```
cdmSubsetCohort(cdm, cohortTable = "cohort", cohortId = NULL, verbose = FALSE)
```

```
cdm_subset_cohort(
  cdm,
  cohort_table = "cohort",
  cohort_id = NULL,
  verbose = FALSE
)
```

Arguments

cdm	A cdm_reference object
cohortTable, cohort_table	The name of a cohort table in the cdm reference
cohortId, cohort_id	IDs of the cohorts that we want to subset from the cohort table. If NULL (default) all cohorts in cohort table are considered.
verbose	Should subset messages be printed? TRUE or FALSE (default)

Details

[Experimental]

Value

A modified cdm_reference with all clinical tables subset to just the persons in the selected cohorts.

Examples

```

## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main", write_schema = "main")

# generate a cohort
path <- system.file("cohorts2", mustWork = TRUE, package = "CDMConnector")

cohortSet <- readCohortSet(path) %>%
  filter(cohort_name == "GIBlead_male")

# subset cdm to persons in the generated cohort
cdm <- generateCohortSet(cdm, cohortSet = cohortSet, name = "gibleed")

cdmGiBlead <- cdmSubsetCohort(cdm, cohortTable = "gibleed")

cdmGiBlead$person %>%
  tally()
#> # Source:   SQL [1 x 1]
#> # Database: DuckDB 0.6.1
#>       n
#>   <dbl>
#> 1   237

cdm$person %>%
  tally()
#> # Source:   SQL [1 x 1]
#> # Database: DuckDB 0.6.1
#>       n
#>   <dbl>
#> 1  2694

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)

```

cdm_from_con

Create a CDM reference object from a database connection

Description

Create a CDM reference object from a database connection

Usage

```

cdm_from_con(
  con,
  cdm_schema = NULL,
  cdm_tables = tbl_group("default"),
  write_schema = NULL,
  cohort_tables = NULL,
  cdm_version = "5.3",
  cdm_name = NULL
)

```

```

cdmFromCon(
  con,
  cdmSchema = NULL,
  cdmTables = tbl_group("default"),
  writeSchema = NULL,
  cohortTables = NULL,
  cdmVersion = "5.3",
  cdmName = NULL
)

```

Arguments

- con** A DBI database connection to a database where an OMOP CDM v5.4 or v5.3 instance is located.
- cdm_schema, cdmSchema** The schema where the OMOP CDM tables are located. Defaults to NULL.
- cdm_tables, cdmTables** Which tables should be included? Supports a character vector, tidyselect selection helpers, or table groups.
- `tbl_group("all")` all CDM tables
 - `tbl_group("vocab")` the CDM vocabulary tables
 - `tbl_group("clinical")` the clinical CDM tables
- write_schema, writeSchema** An optional schema in the CDM database that the user has write access to.
- cohort_tables, cohortTables** A character vector listing the cohort table names to be included in the CDM object.
- cdm_version, cdmVersion** The version of the OMOP CDM: "5.3" (default), "5.4", "auto". "auto" attempts to automatically determine the cdm version using heuristics. Cohort tables must be in the `write_schema`.
- cdm_name, cdmName** The name of the CDM. If NULL (default) the `cdm_source_name` field in the `CDM_SOURCE` table will be used.

Value

A list of dplyr database table references pointing to CDM tables

cdm_from_files	<i>Create a CDM reference from a folder containing parquet, csv, or feather files</i>
----------------	---

Description

Create a CDM reference from a folder containing parquet, csv, or feather files

Usage

```
cdm_from_files(path, format = "auto", as_data_frame = TRUE)
```

```
cdmFromFiles(path, format = "auto", asDataFrame = TRUE)
```

Arguments

path	A folder where an OMOP CDM v5.4 instance is located.
format	What is the file format to be read in? Must be "auto" (default), "parquet", "csv", "feather".
as_data_frame, asDataFrame	TRUE (default) will read files into R as dataframes. FALSE will read files into R as Arrow Datasets.

Value

A list of dplyr database table references pointing to CDM tables

cohortAttrition	<i>Get attrition table from a GeneratedCohortSet object</i>
-----------------	---

Description

Get attrition table from a GeneratedCohortSet object

Usage

```
cohortAttrition(x)
```

```
cohort_attrition(x)
```

Arguments

x	A generatedCohortSet object
---	-----------------------------

cohortCount	<i>Get cohort counts from a GeneratedCohortSet object</i>
-------------	---

Description

Get cohort counts from a GeneratedCohortSet object

Usage

cohortCount(x)

cohort_count(x)

Arguments

x A generatedCohortSet object

cohortSet	<i>Get cohort settings from a GeneratedCohortSet object</i>
-----------	---

Description

Get cohort settings from a GeneratedCohortSet object

Usage

cohortSet(x)

cohort_set(x)

Arguments

x A generatedCohortSet object

`collect.cdm_reference` *Bring a remote CDM reference into R*

Description

This function calls `collect` on a list of lazy queries and returns the result as a list of dataframes.

Usage

```
## S3 method for class 'cdm_reference'  
collect(x, ...)
```

Arguments

`x` A `cdm_reference` object.
`...` Not used. Included for compatibility.

Value

A `cdm_reference` object that is a list of R dataframes.

Examples

```
## Not run:  
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())  
vocab <- cdm_from_con(con, cdm_tables = c("concept", "concept_ancestor"))  
local_vocab <- collect(vocab)  
DBI::dbDisconnect(con, shutdown = TRUE)  
  
## End(Not run)
```

`computePermanent` *Run a dplyr query and store the result in a permanent table*

Description

This function has been superseded by `computeQuery` which should be used instead of `computePermanent`.

Usage

```
computePermanent(x, name, schema = NULL, overwrite = FALSE)  
  
compute_permanent(x, name, schema = NULL, overwrite = FALSE)
```

Arguments

x	A dplyr query
name	Name of the table to be created
schema	Schema to create the new table in Can be a length 1 or 2 vector. (e.g. schema = "my_schema", schema = c("my_schema", "dbo"))
overwrite	If the table already exists in the remote database should it be overwritten? (TRUE or FALSE)

Details**[Deprecated]****Value**

A dplyr reference to the newly created table

computeQuery	<i>Execute dplyr query and save result in remote database</i>
--------------	---

Description

This function is a wrapper around `dplyr::compute` that is tested on several database systems. It is needed to handle edge cases where `dplyr::compute` does not produce correct SQL.

Usage

```
computeQuery(
  x,
  name = uniqueTableName(),
  temporary = TRUE,
  schema = NULL,
  overwrite = FALSE,
  ...
)

compute_query(
  x,
  name = uniqueTableName(),
  temporary = TRUE,
  schema = NULL,
  overwrite = FALSE,
  ...
)
```

Arguments

x	A dplyr query
name	The name of the table to create.
temporary	Should the table be temporary: TRUE (default) or FALSE
schema	The schema where the table should be created. Ignored if temporary = TRUE.
overwrite	Should the table be overwritten if it already exists: TRUE or FALSE (default) Ignored if temporary = TRUE.
...	Further arguments passed on the <code>dplyr::compute</code>

Value

A `dplyr::tbl()` reference to the newly created table.

Examples

```
## Not run:
library(CDMConnector)

con <- DBI::dbConnect(duckdb::duckdb(), dbdir = CDMConnector::eunomia_dir())
cdm <- cdm_from_con(con, "main")

# create a temporary table in the remote database from a dplyr query
drugCount <- cdm$concept %>%
  dplyr::count(domain_id == "Drug") %>%
  computeQuery()

# create a permanent table in the remote database from a dplyr query
drugCount <- cdm$concept %>%
  dplyr::count(domain_id == "Drug") %>%
  computeQuery("tmp_table", temporary = FALSE, schema = "main")

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

dateadd

Add days or years to a date in a dplyr query

Description

This function must be "unquoted" using the "bang bang" operator (!!). See example.

Usage

```
dateadd(date, number, interval = "day")
```

Arguments

date	The name of a date column in the database table as a character string
number	The number of units to add. Can be a positive or negative whole number.
interval	The units to add. Must be either "day" (default) or "year"

Value

Platform specific SQL that can be used in a dplyr query.

Examples

```
## Not run:
con <- DBI::dbConnect(duckdb::duckdb())
date_tbl <- dplyr::copy_to(con, data.frame(date1 = as.Date("1999-01-01")),
                           name = "tmpdate", overwrite = TRUE, temporary = TRUE)

df <- date_tbl %>%
  dplyr::mutate(date2 = !!dateadd("date1", 1, interval = "year")) %>%
  dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

datediff	<i>Compute the difference between two days</i>
----------	--

Description

This function must be "unquoted" using the "bang bang" operator (!!). See example.

Usage

```
datediff(start, end, interval = "day")
```

Arguments

start	The name of the start date column in the database as a string.
end	The name of the end date column in the database as a string.
interval	The units to use for difference calculation. Must be either "day" (default) or "year".

Value

Platform specific SQL that can be used in a dplyr query.

Examples

```
## Not run:
library(SqlUtilities)
con <- DBI::dbConnect(duckdb::duckdb())
date_tbl <- dplyr::copy_to(con, data.frame(date1 = as.Date("1999-01-01")),
                             name = "tmpdate", overwrite = TRUE, temporary = TRUE)

df <- date_tbl %>%
  dplyr::mutate(date2 = !!dateadd("date1", 1, interval = "year")) %>%
  dplyr::mutate(dif_years = !!datediff("date1", "date2", interval = "year")) %>%
  dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

dbms	<i>Get the database management system (dbms) from a cdm_reference or DBI connection</i>
------	---

Description

Get the database management system (dbms) from a cdm_reference or DBI connection

Usage

```
dbms(con)
```

Arguments

con A DBI connection or cdm_reference

Value

A character string representing the dbms that can be used with SqlRender

Examples

```
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
cdm <- cdm_from_con(con)
dbms(cdm)
dbms(con)

## End(Not run)
```

downloadEunomiaData *Download Eunomia data files*

Description

Download the Eunomia data files from <https://github.com/darwin-eu/EunomiaDatasets>

Usage

```
downloadEunomiaData(  
  datasetName = "GiBleed",  
  cdmVersion = "5.3",  
  pathToData = Sys.getenv("EUNOMIA_DATA_FOLDER"),  
  overwrite = FALSE  
)  
  
download_eunomia_data(  
  dataset_name = "GiBleed",  
  cdm_version = "5.3",  
  path_to_data = Sys.getenv("EUNOMIA_DATA_FOLDER"),  
  overwrite = FALSE  
)
```

Arguments

`overwrite` Control whether the existing archive file will be overwritten should it already exist.

`dataset_name`, `datasetName` The data set name as found on <https://github.com/darwin-eu/EunomiaDatasets>. The data set name corresponds to the folder with the data set ZIP files

`cdm_version`, `cdmVersion` The OMOP CDM version. This version will appear in the suffix of the data file, for example: `datasetName_cdmVersion.zip`. Default: '5.3'

`path_to_data`, `pathToData` The path where the Eunomia data is stored on the file system., By default the value of the environment variable "EUNOMIA_DATA_FOLDER" is used.

Value

Invisibly returns the destination if the download was successful.

Examples

```
## Not run:  
downloadEunomiaData("GiBleed")  
  
## End(Not run)
```

dropTable	<i>Drop tables from write_schema of a cdm object</i>
-----------	--

Description

cdm objects can have zero or more cohort tables stored in a special schema where the user has write access. This function removes tables from a cdm's write_schema

Usage

```
dropTable(cdm, name, verbose = FALSE)
```

```
drop_table(cdm, name, verbose = FALSE)
```

Arguments

cdm	A cdm reference
name	A character vector of tables in the cdm's write_schema or a tidyselect specification of tables to drop. (e.g. starts_with("temp"), matches("study01"), etc.)
verbose	Print a message when dropping a table? TRUE or FALSE (default)

Value

Returns the cdm object with selected tables removed

Examples

```
## Not run:
library(CDMConnector)

con <- DBI::dbConnect(duckdb::duckdb(), dbdir = CDMConnector::eunomia_dir())
cdm <- cdm_from_con(con, cdm_schema = "main", write_schema = "main")

# create two temporary tables in the remote database from a query with a common prefix
cdm$tmp_table <- cdm$concept %>%
  dplyr::count(domain_id == "Drug") %>%
  computeQuery("tmp_table", temporary = FALSE, schema = "main")

cdm$tmp_table2 <- cdm$concept %>%
  dplyr::count(domain_id == "Condition") %>%
  computeQuery("tmp_table2", temporary = FALSE, schema = "main")

stringr::str_subset(DBI::dbListTables(con), "tmp")
#> [1] "tmp_table" "tmp_table2"
stringr::str_subset(names(cdm), "tmp")
#> [1] "tmp_table" "tmp_table2"
```

```

# drop tables with a common prefix
cdm <- dropTable(cdm, name = dplyr::starts_with("tmp"))

stringr::str_subset(DBI::dbListTables(con), "tmp")
#> character(0)
stringr::str_subset(names(cdm), "tmp")
#> character(0)

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)

```

eunomiaDir

Create a copy of a Eunomia dataset

Description

Creates a copy of a Eunomia database, and returns the path to the new database file. If the dataset does not yet exist on the user's computer it will attempt to download the source data to the the path defined by the EUNOMIA_DATA_FOLDER environment variable.

Usage

```

eunomiaDir(
  datasetName = "GiBleed",
  cdmVersion = "5.3",
  pathToData = Sys.getenv("EUNOMIA_DATA_FOLDER"),
  dbms = "duckdb",
  databaseFile = tempfile(fileext = paste0(".", dbms))
)

```

Arguments

datasetName	The data set name as found on https://github.com/darwin-eu/EunomiaDatasets . The data set name corresponds to the folder with the data set ZIP files
cdmVersion	The OMOP CDM version. This version will appear in the suffix of the data file, for example: datasetName_cdmVersion.zip. Default: '5.3'
pathToData	The path where the Eunomia data is stored on the file system., By default the value of the environment variable "EUNOMIA_DATA_FOLDER" is used.
dbms	The database system to use. "sqlite" or "duckdb" (default)
databaseFile	The path where the database file will be copied to. By default, the database will be copied to a temporary folder, and will be deleted at the end of the R session.

Value

The file path to the new Eunomia dataset copy

Examples

```
## Not run:
conn <- DBI::dbConnect(RSQLite::SQLite(), eunomiaDir("GiBleed"))
DBI::dbDisconnect(conn)

conn <- DBI::dbConnect(duckdb::duckdb(), eunomiaDir("GiBleed", dbms = "duckdb"))
DBI::dbDisconnect(conn, shutdown = TRUE)

conn <- DatabaseConnector::connect(dbms = "sqlite", server = eunomiaDir("GiBleed"))
DatabaseConnector::disconnect(conn)

## End(Not run)
```

eunomia_dir

Create a new Eunomia CDM

Description

Create a copy of the duckdb Eunomia CDM and return the file path

Usage

```
eunomia_dir(exdir = NULL)
```

Arguments

exdir Enclosing directory where the Eunomia CDM should be created. If NULL (default) then a temp folder is created.

Value

The full path to the new Eunomia CDM that can be passed to `dbConnect()`

Examples

```
## Not run:
library(DBI)
library(CDMConnector)
con <- dbConnect(duckdb::duckdb(), dbdir = getEunomiaPath())
dbListTables(con)
dbDisconnect(con)

## End(Not run)
```

eunomia_is_available *Has the Eunomia dataset been cached?*

Description

Has the Eunomia dataset been cached?

Usage

```
eunomia_is_available(dataset_name = "GiBleed", cdm_version = "5.3")
```

```
eunomiaIsAvailable(datasetName = "GiBleed", cdmVersion = "5.3")
```

Arguments

dataset_name, datasetName

Name of the Eunomia dataset to check. Defaults to "GiBleed".

cdm_version, cdmVersion

Version of the Eunomia dataset to check. Must be "5.3" or "5.4".

Value

TRUE if the eunomia example dataset is available and FALSE otherwise

generateCohortSet *Generate a cohort set on a cdm object*

Description

A "GeneratedCohortSet" object consists of several components

- A remote table reference to an OHDSI cohort table with at least the columns: cohort_definition_id, subject_id, cohort_start_date, cohort_end_date. Additional columns are optional and some analytic packages define additional columns specific to certain analytic cohorts.
- A **settings attribute** which points to a remote table containing cohort settings including the names of the cohorts.
- An **attrition attribute** which points to a remote table with attrition information recorded during generation. This attribute is optional. Since calculating attrition takes additional compute it can be skipped resulting in a NULL attrition attribute.
- A **cohortCounts attribute** which points to a remote table containing cohort counts

Each of the three attributes are tidy tables. The implementation of this object is experimental and user feedback is welcome.

[Experimental]

One key design principle is that GeneratedCohortSet objects are created once and can persist across analysis execution but should not be modified after creation. While it is possible to modify a GeneratedCohortSet object doing so will invalidate it and it's attributes may no longer be accurate.

Usage

```
generateCohortSet(
  cdm,
  cohortSet,
  name = "cohort",
  computeAttrition = FALSE,
  overwrite = FALSE
)
```

```
generate_cohort_set(
  cdm,
  cohort_set,
  name = "cohort",
  compute_attrition = FALSE,
  overwrite = FALSE
)
```

Arguments

cdm	A cdm reference created by CDMConnector. write_schema must be specified.
name	Name of the cohort table to be created. This will also be used as a prefix for the cohort attribute tables.
overwrite	Should the cohort table be overwritten if it already exists? TRUE or FALSE (default)
cohort_set, cohortSet	A cohortSet object created with readCohortSet().
compute_attrition, computeAttrition	Should attrition be computed? TRUE or FALSE (default)

Examples

```
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con,
  cdm_schema = "main",
  cdm_tables = c(tbl_group("default")),
  write_schema = "main")

cohortSet <- readCohortSet(system.file("cohorts2", package = "CDMConnector"))
cdm <- generateCohortSet(cdm, cohortSet, name = "cohort")

print(cdm$cohort)

attrition(cdm$cohort)
settings(cdm$cohort)
cohortCounts(cdm$cohort)

## End(Not run)
```

list_tables	<i>List tables in a schema</i>
-------------	--------------------------------

Description

DBI::dbListTables can be used to get all tables in a database but not always in a specific schema. listTables will list tables in a schema.

Usage

```
list_tables(con, schema = NULL)
```

```
listTables(con, schema = NULL)
```

Arguments

con	A DBI connection to a database
schema	The name of a schema in a database. If NULL, returns DBI::dbListTables(con).

Value

A character vector of table names

Examples

```
## Not run:  
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())  
listTables(con, schema = "main")  
  
## End(Not run)
```

new_generated_cohort_set	<i>Low level constructor for GeneratedCohortSet objects for package developers</i>
--------------------------	--

Description

This constructor function is to be used by analytic package developers to create generatedCohortSet objects. Users should never need to call this function. The use of this function ensures that all generatedCohortSet have a valid structure.

Usage

```
new_generated_cohort_set(
  cohort_ref,
  cohort_set_ref = NULL,
  cohort_attrition_ref = NULL,
  cohort_count_ref = NULL
)
```

```
newGeneratedCohortSet(
  cohortRef,
  cohortSetRef = NULL,
  cohortAttritionRef = NULL,
  cohortCountRef = NULL
)
```

Arguments

- `cohort_ref`, `cohortRef`
A `tbl_sql` object that points to a remote cohort table with the following first four columns: `cohort_definition_id`, `subject_id`, `cohort_start_date`, `cohort_end_date`. Additional columns are optional.
- `cohort_set_ref`, `cohortSetRef`
A `tbl_sql` object that points to a remote table with the following first two columns: `cohort_definition_id`, `cohort_name`. Additional columns are optional. `cohort_definition_id` should be a primary key on this table and uniquely identify rows.
- `cohort_attrition_ref`, `cohortAttritionRef`
A `tbl_sql` object that points to an attrition table in a remote database with the first column being `cohort_definition_id`.
- `cohort_count_ref`, `cohortCountRef`
A `tbl_sql` object that points to a `cohort_count` table in a remote database with columns `cohort_definition_id`, `cohort_entries`, `cohort_subjects`.

Details

A `generatedCohort` is a set of person-time from an OMOP CDM database. A `generatedCohort` can be represented by a table with three columns: `subject_id`, `cohort_start_date`, `cohort_end_date`. `Subject_id` is the same as `person_id` in the OMOP CDM. A `generatedCohortSet` is a collection of one or more `generatedCohorts` and can be represented as a table with four columns: `cohort_definition_id`, `subject_id`, `cohort_start_date`, `cohort_end_date`.

This constructor function defines the `generatedCohortSet` object in R.

The object is an extension of a `tbl_sql` object defined in `dplyr`. This is a lazy database query that points to a cohort table in the database with at least the columns `cohort_definition_id`, `subject_id`, `cohort_start_date`, `cohort_end_date`. The table could optionally have more columns as well.

In addition the `generatedCohortSet` object has three optional attributes. These are: `cohort_set`, `cohort_attrition`, `cohort_count`. Each of these attributes is also a lazy SQL query (`tbl_sql`) that points to a table in a database and is described below.

cohort_set:

cohort_set is a table with one row per cohort_definition_id. The first two columns of the cohort_set table are: cohort_definition_id, and cohort_name. Additional columns can be added. The cohort_set table is meant to store metadata about the cohort definition.

cohort_attrition:

cohort_attrition is an optional table that stores attrition information recorded during the cohort generation process such as how many persons were dropped at each step of inclusion rule application. The first column of this table should be cohort_definition_id but all other columns currently have no constraints.

cohort_count:

cohort_count is a option attribute table that records the number of records and the number of unique persons in each cohort in a generatedCohortSet. It is derived metadata that can be re-derived as long as cohort_set, the complete list of cohorts in the set, is available. Column names of cohort_count are: cohort_definition_id, number_records, number_subjects.

Value

A generatedCohortSet object that is a tbl_sql reference to a cohort table in the write_schema of an OMOP CDM

Examples

```
## Not run:
# This function is for developers who are creating generatedCohortSet
# objects in their packages. The function should accept a cdm_reference
# object as the first argument and return a cdm_reference object with the
# cohort table added. The second argument should be `name` which will be
# the prefix for the database tables, the name of the cohort table in the
# database and the name of the cohort table in the cdm object.
# Other optional arguments can be added after the first two.

generateCustomCohort <- function(cdm, name, ...) {

  # accept a cdm_reference object as input
  checkmate::assertClass(cdm, "cdm_reference")
  con <- attr(cdm, "dbcon")

  # Create the tables in the database however you like
  # All the tables should be prefixed with `name`
  # The cohort table should be called `name` in the database

  # Create the dplyr table references
  cohort_ref <- dplyr::tbl(con, name)
  cohort_set <- dplyr::tbl(con, paste0(name, "_set"))
  cohort_attrition_ref <- dplyr::tbl(con, paste0(name, "_attrition"))
  cohort_count_ref <- dplyr::tbl(con, paste0(name, "_count"))

  # create the generated cohort set object using the constructor
  generatedCohortSet <- new_generated_cohort_set(
```

```

    cohort_ref,
    cohort_set_ref = cohort_set_ref,
    cohort_attrition_ref = cohort_attrition_ref,
    cohort_count_ref = cohort_count_ref)

. # Add the generatedCohortSet to the cdm and return the cdm
  cdm[[name]] <- generatedCohortSet
  return(cdm)
}

## End(Not run)

```

```
print.cdm_reference Print a CDM reference object
```

Description

Print a CDM reference object

Usage

```
## S3 method for class 'cdm_reference'
print(x, ...)
```

Arguments

x A cdm_reference object
 ... Included for compatibility with generic. Not used.

Value

Invisibly returns the input

```
read_cohort_set Read a set of cohort definitions into R
```

Description

A "cohort set" is a collection of cohort definitions. In R this is stored in a dataframe with cohort_definition_id, cohort_name, and cohort columns. On disk this is stored as a folder with a CohortsToCreate.csv file and one or more json files. If the CohortsToCreate.csv file is missing then all of the json files in the folder will be used, cohort_definition_id will be automatically assigned in alphabetical order, and cohort_name will match the file names.

Usage

```
read_cohort_set(path)
```

```
readCohortSet(path)
```

Arguments

path	The path to a folder containing Circe cohort definition json files and optionally a csv file named CohortsToCreate.csv with columns cohortId, cohortName, and jsonPath.
------	---

snapshot	<i>Extract CDM metadata</i>
----------	-----------------------------

Description

Extract the name, version, and selected record counts from a cdm.

Usage

```
snapshot(cdm)
```

Arguments

cdm	A cdm object
-----	--------------

Value

A named list of attributes about the cdm including selected fields from the cdm_source table and record counts from the person and observation_period tables

Examples

```
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, cdm_tables = c(tbl_group("default"), "cdm_source"))
snapshot(cdm)

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

stow	<i>Collect a list of lazy queries and save the results as files</i>
------	---

Description

Collect a list of lazy queries and save the results as files

Usage

```
stow(cdm, path, format = "parquet")
```

Arguments

cdm	A cdm object
path	A folder to save the cdm object to
format	The file format to use: "parquet", "csv", "feather".

Value

Invisibly returns the cdm input

Examples

```
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
vocab <- cdm_from_con(con, cdm_tables = c("concept", "concept_ancestor"))
stow(vocab, here::here("vocab_tables"))
DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

summarise_quantile	<i>Quantile calculation using dbplyr</i>
--------------------	--

Description

This function provides DBMS independent syntax for quantiles estimation. Can be used by itself or in combination with `mutate()` when calculating other aggregate metrics (min, max, mean).

`summarise_quantile()`, `summarize_quantile()`, `summariseQuantile()` and `summarizeQuantile()` are synonyms.

Usage

```

summarise_quantile(.data, x = NULL, probs, name_suffix = "value")
summarize_quantile(.data, x = NULL, probs, name_suffix = "value")
summariseQuantile(.data, x = NULL, probs, nameSuffix = "value")
summarizeQuantile(.data, x = NULL, probs, nameSuffix = "value")

```

Arguments

<code>.data</code>	lazy data frame backed by a database query.
<code>x</code>	column name whose sample quantiles are wanted.
<code>probs</code>	numeric vector of probabilities with values in [0,1].
<code>name_suffix</code> , <code>nameSuffix</code>	character; is appended to numerical quantile value as a column name part.

Details

Implemented quantiles estimation algorithm returns values analogous to `quantile{stats}` with argument `type = 1`. See discussion in Hyndman and Fan (1996). Results differ from `PERCENTILE_CONT` natively implemented in various DBMS, where returned values are equal to `quantile{stats}` with default argument `type = 7`

Value

An object of the same type as `'data'`

Examples

```

## Not run:
con <- DBI::dbConnect(duckdb::duckdb())
mtcars_tbl <- dplyr::copy_to(con, mtcars, name = "tmp", overwrite = TRUE, temporary = TRUE)

df <- mtcars_tbl %>%
  dplyr::group_by(cyl) %>%
  dplyr::mutate(mean = mean(mpg, na.rm = TRUE)) %>%
  summarise_quantile(mpg, probs = c(0, 0.2, 0.4, 0.6, 0.8, 1),
                    name_suffix = "quant") %>%
  dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)

```

`tbl_group`*CDM table selection helper*

Description

The OMOP CDM tables are grouped together and the `tbl_group` function allows users to easily create a CDM reference including one or more table groups.

Usage

```
tbl_group(group)
```

```
tblGroup(group)
```

Arguments

`group` A character vector of CDM table groups: "vocab", "clinical", "all", "default", "derived".

Details

" alt" alt

The "default" table group is meant to capture the most commonly used set of CDM tables. Currently the "default" group is: person, observation_period, visit_occurrence, visit_detail, condition_occurrence, drug_exposure, procedure_occurrence, device_exposure, measurement, observation, death, note, note_nlp, specimen, fact_relationship, location, care_site, provider, payer_plan_period, cost, drug_era, dose_era, condition_era, concept, vocabulary, concept_relationship, concept_ancestor, concept_synonym, drug_strength

Value

A character vector of CDM tables names in the groups

Examples

```
## Not run:
con <- DBI::dbConnect(RPostgres::Postgres(),
  dbname = "cdm",
  host = "localhost",
  user = "postgres",
  password = Sys.getenv("PASSWORD"))

cdm <- cdm_from_con(con, cdm_tables = tbl_group("vocab"))

## End(Not run)
```

validate_cdm	<i>Validation report for a CDM</i>
--------------	------------------------------------

Description

Print a short validation report for a cdm object. The validation includes checking that column names are correct and that no tables are empty. A short report is printed to the console. This function is meant for interactive use.

Usage

```
validate_cdm(cdm)
```

```
validateCdm(cdm)
```

Arguments

cdm A cdm reference object.

Value

Invisibly returns the cdm input

Examples

```
## Not run:  
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())  
cdm <- cdm_from_con(con, cdm_tables = c("person", "observation_period"))  
validate_cdm(cdm)  
DBI::dbDisconnect(con)  
  
## End(Not run)
```

version	<i>Get the CDM version</i>
---------	----------------------------

Description

Extract the CDM version attribute from a cdm_reference object

Usage

```
version(cdm)
```

Arguments

cdm A cdm object

Value

"5.3" or "5.4"

Examples

```
## Not run:  
library(CDMConnector)  
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())  
cdm <- cdm_from_con(con, cdm_tables = c(tbl_group("default"), "cdm_source"))  
version(cdm)  
  
DBI::dbDisconnect(con, shutdown = TRUE)  
  
## End(Not run)
```
