Package ‘CDMConnector’

June 12, 2023

**Title**  Connect to an OMOP Common Data Model

**Version**  1.0.0

**Description**  Provides tools for working with observational health data in the Observational Medical Outcomes Partnership (OMOP) Common Data Model format with a pipe friendly syntax. Common data model database table references are stored in a single compound object along with metadata.

**License**  Apache License (>= 2)

**Encoding**  UTF-8

**RoxygenNote**  7.2.3

**Depends**  R (>= 4.0)

**Imports**  dplyr, DBI (>= 0.3.0), checkmate, magrittr, dbplyr, pillar, cli, purrr, rlang, tidyselect, readr, glue, waldo, methods, withr, lifecycle, jsonlite, stringr, fs, generics, tidy

**Suggests**  arrow, SqlRender, rJava, covr, knitr, rmarkdown, duckdb, RSQLite, RPostgres, odbc, ggplot2, bigquery, testthat (>= 3.0.0), DatabaseConnector, lubridate, tibble, zeallot

**Enhances**  CirceR

**Config/testthat/edition**  3

**VignetteBuilder**  knitr

**Additional_repositories**  https://OHDSI.github.io/drat

**NeedsCompilation**  no

**Author**  Adam Black [aut, cre] (https://orcid.org/0000-0001-5576-8701), Artem Gorbachev [aut], Edward Burn [aut], Marti Catala Sabate [aut]

**Maintainer**  Adam Black <black@ohdsi.org>

**Repository**  CRAN

**Date/Publication**  2023-06-12 12:30:11 UTC

appendPermanent

Index

appendPermanent Run a dplyr query and add the result set to an existing

Description
Run a dplyr query and add the result set to an existing

Usage
appendPermanent(x, name, schema = NULL)
append_permanent(x, name, schema = NULL)

Arguments

x A dplyr query
name Name of the table to be appended. If it does not already exist it will be created.
schema Schema where the table exists. Can be a length 1 or 2 vector. (e.g. schema = "my_schema", schema = c("my_schema", "dbo")

Value
A dplyr reference to the newly created table

Examples
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = CDMConnector::eunomia_dir())
concept <- dplyr::tbl(con, "concept")

# create a table
rxnorm_count <- concept %>%
dplyr::filter(domain_id == "Drug") %>%
dplyr::mutate(isRxnorm = (vocabulary_id == "RxNorm")) %>%
dplyr::count(domain_id, isRxnorm) %>%
computeQu("rxnorm_count")

# append to an existing table
rxnorm_count <- concept %>%
dplyr::filter(domain_id == "Procedure") %>%
dplyr::mutate(isRxnorm = (vocabulary_id == "RxNorm")) %>%
dplyr::count(domain_id, isRxnorm) %>%
appendPermanent("rxnorm_count")

DBI::dbDisconnect(con, shutdown = TRUE)
asDate

as.Date dbplyr translation wrapper

Description

This is a workaround for using as.Date inside dplyr verbs against a database backend. This function should only be used inside dplyr verbs where the first argument is a database table reference. `asDate` must be unquoted with `!!` inside dplyr verbs (see example).

Usage

```r
asDate(x)
```

```r
as_date(x)
```

Arguments

- `x` an R expression

Examples

```r
## Not run:
con <- DBI::dbConnect(odbc::odbc(), "Oracle")
date_tbl <- dplyr::copy_to(con,
    data.frame(y = 2000L, m = 10L, d = 10L),
    name = "tmp",
    temporary = TRUE)

df <- date_tbl %>%
dplyr::mutate(date_from_parts = !!asDate(paste0(
    .data$y, "/",
    .data$m, "/",
    .data$d
))) %>%
collect()

## End(Not run)
```
assert_tables

---

### Description

A cdm object is a list of references to a subset of tables in the OMOP Common Data Model. If you write a function that accepts a cdm object as a parameter, `assert_tables`/`assertTables` will help you check that the tables you need are in the cdm object, have the correct columns/fields, and (optionally) are not empty.

### Usage

```r
assert_tables(cdm, tables, empty.ok = FALSE, add = NULL)
assertTables(cdm, tables, empty.ok = FALSE, add = NULL)
```

### Arguments

- **cdm**: A cdm object
- **tables**: A character vector of table names to check.
- **empty.ok**: Should an empty table (0 rows) be considered an error? TRUE or FALSE (default)
- **add**: An optional `AssertCollection` created by `checkmate::makeAssertCollection()` that errors should be added to.

### Value

Invisibly returns the cdm object

### Examples

```r
## Not run:
# Use assertTables inside a function to check that tables exist
countDrugsByGender <- function(cdm) {
  assertTables(cdm, tables = c("person", "drug_era"), empty.ok = FALSE)

  cdm$person %>%
    dplyr::inner_join(cdm$drug_era, by = "person_id") %>%
    dplyr::count(.data$gender_concept_id, .data$drug_concept_id) %>%
    dplyr::collect()
}

library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
cdm <- cdm_from_con(con)
countDrugsByGender(cdm)
```
assert_write_schema  

**Description**

A cdm object can optionally contain a single schema in a database with write access. `assert_write_schema` checks that the cdm contains the "write_schema" attribute and tests that local dataframes can be written to tables in this schema.

**Usage**

```r
assert_write_schema(cdm, add = NULL)
assertWriteSchema(cdm, add = NULL)
```

**Arguments**

- `cdm` A cdm object
- `add` An optional AssertCollection created by checkmate::makeAssertCollection() that errors should be added to.

**Value**

Invisibly returns the cdm object

---

**cdmDisconnect**  

**Description**

Disconnect the connection of the cdm object

**Usage**

```r
cdmDisconnect(cdm)
cdm_disconnect(cdm)
```

**Arguments**

- `cdm` cdm reference
**cdmFlatten**

Flatten a cdm into a single observation table

**Description**

This experimental function transforms the OMOP CDM into a single observation table. This is only recommended for use with a filtered CDM or a cdm that is small in size.

**Usage**

```r
cdmFlatten(
  cdm,
  domain = c("condition", "drug", "procedure"),
  includeConceptName = TRUE
)

cdm_flatten(
  cdm,
  domain = c("condition", "drug", "procedure"),
  include_concept_name = TRUE
)
```

**Arguments**

- `cdm`: A cdm_reference object
- `domain`: Domains to include. Must be a subset of "condition", "drug", "procedure", "measurement", "visit", "death", "observation".
- `include_concept_name`, `includeConceptName`: Should concept_name and type_concept_name be include in the output table? TRUE (default) or FALSE

**Details**

[Experimental]

**Value**

A lazy query that when evaluated will result in a single cdm table

**Examples**

```r
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main")
```
```r
all_observations <- cdmSubset(cdm, personId = c(2, 18, 42)) %>%
cdmFlatten() %>%
collect()

all_observations
```

```r
#> # A tibble: 213 × 8
#> person_id observation_. start_date end_date type_. domain obser. type_.
#> <dbl> <dbl> <date> <date> <dbl> <chr> <chr> <chr>

#> # ... with 203 more rows, and abbreviated variable names observation_concept_id,  
#> # type_concept_id, observation_concept_name, type_concept_name

DBI::dbDisconnect(con, shutdown = TRUE)

### End(Not run)
```

---

**cdmName**

*Get the CDM name*

**Description**

Extract the CDM name attribute from a cdm_reference object

**Usage**

```r
cdmName(cdm)
cdm_name(cdm)
```

**Arguments**

- `cdm` A cdm object

**Value**

The name of the CDM as a character string
## Examples

```r
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, "main")
cdmName(cdm)
#> [1] "Synthea synthetic health database"

cdm <- cdm_from_con(con, "main", cdm_name = "Example CDM")
cdmName(cdm)
#> [1] "Example CDM"

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

---

### cdmSample

**Subset a cdm object to a random sample of individuals**

**Description**

cdmSample takes a cdm object and returns a new cdm that includes only a random sample of persons in the cdm. Only person_ids in both the person table and observation_period table will be considered.

**Usage**

```r
cdmSample(cdm, n = 1000)
cdm_sample(cdm, n = 1000)
```

**Arguments**

- **cdm**: A cdm_reference object
- **n**: Number of persons to include in the cdm

**Details**

*Experimental*

**Value**

A modified cdm_reference object where all clinical tables are lazy queries pointing to subset
cdmSubset

Subset a cdm object to a set of persons

description
cdmSubset takes a cdm object and a list of person IDs as input. It returns a new cdm that includes data only for persons matching the provided person IDs. Generated cohorts in the cdm will also be subset to the IDs provided.

Usage

```r
cdmSubset(cdm, personId)
cdm_subset(cdm, person_id)
```

Arguments

- `cdm` A cdm_reference object
- `person_id`, `personId` A numeric vector of person IDs to include in the cdm

details

[Experimental]
Value

A modified cdm_reference object where all clinical tables are lazy queries pointing to subset

Examples

```r
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main")

cdm2 <- cdmSubset(cdm, personId = c(2, 18, 42))

cdm2$person %>%
  select(1:3)
#> # Source: SQL [3 x 3]
#> # Database: DuckDB 0.6.1
#> # person_id gender_concept_id year_of_birth
#> # <dbl> <dbl> <dbl>
#> 1 2 8532 1920
#> 2 18 8532 1965
#> 3 42 8532 1909

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

Description

cdmSubset will return a new cdm object that contains lazy queries pointing to each of the cdm tables but subset to individuals in a generated cohort. Since the cdm tables are lazy queries, the subset operation will only be done when the tables are used. computeQuery can be used to run the SQL used to subset a cdm table and store it as a new table in the database.

Usage

cdmSubsetCohort(cdm, cohortTable = "cohort", cohortId = NULL, verbose = FALSE)

cdm_subset_cohort(
  cdm,
  cohort_table = "cohort",
  cohort_id = NULL,
  verbose = FALSE
)
Arguments

cdm
A cdm_reference object

cohortTable, cohort_table
The name of a cohort table in the cdm reference

cohortId, cohort_id
IDs of the cohorts that we want to subset from the cohort table. If NULL (default) all cohorts in cohort table are considered.

verbose
Should subset messages be printed? TRUE or FALSE (default)

Details

[Experimental]

Value

A modified cdm_reference with all clinical tables subset to just the persons in the selected cohorts.

Examples

```r
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main", write_schema = "main")

# generate a cohort
path <- system.file("cohorts2", mustWork = TRUE, package = "CDMConnector")

cohortSet <- readCohortSet(path) %>%
  filter(cohort_name == "GIBleed_male")

# subset cdm to persons in the generated cohort
cdm <- generateCohortSet(cdm, cohortSet = cohortSet, name = "gibleed")

cdmGibleed <- cdmSubsetCohort(cdm, cohortTable = "gibleed")

cdmgibleed$person %>%
  tally()
```

## Source: SQL [1 x 1]
## Database: DuckDB 0.6.1

```
#> n
#> 1 237
```

```r
cdm$person %>%
  tally()
```

## Source: SQL [1 x 1]
## Database: DuckDB 0.6.1

```
#> n
```
## cdm_from_con

Create a CDM reference object from a database connection

### Description

Create a CDM reference object from a database connection

### Usage

```r
cdm_from_con(
  con, 
  cdm_schema = NULL, 
  write_schema = NULL, 
  cohort_tables = NULL, 
  cdm_version = "5.3", 
  cdm_name = NULL
)

cdmFromCon(
  con, 
  cdmSchema = NULL, 
  writeSchema = NULL, 
  cohortTables = NULL, 
  cdmVersion = "5.3", 
  cdmName = NULL
)
```

### Arguments

- **con** A DBI database connection to a database where an OMOP CDM v5.4 or v5.3 instance is located.
- **cdm_schema, cdmSchema** The schema where the OMOP CDM tables are located. Defaults to NULL.
- **write_schema, writeSchema** An optional schema in the CDM database that the user has write access to.
- **cohort_tables, cohortTables** A character vector listing the cohort table names to be included in the CDM object.
cdm_from_files

**cdm_version, cdmVersion**

The version of the OMOP CDM: "5.3" (default), "5.4", "auto". "auto" attempts to automatically determine the cdm version using heuristics. Cohort tables must be in the write_schema.

**cdm_name, cdmName**

The name of the CDM. If NULL (default) the cdm_source_name . field in the CDM_SOURCE table will be used.

**Value**

A list of dplyr database table references pointing to CDM tables

---

**cdm_from_files**

Create a CDM reference from a folder containing parquet, csv, or feather files

**Description**

Create a CDM reference from a folder containing parquet, csv, or feather files

**Usage**

```r
cdm_from_files(path, format = "auto", as_data_frame = TRUE)
cdmFromFiles(path, format = "auto", asDataFrame = TRUE)
```

**Arguments**

- **path**
  A folder where an OMOP CDM v5.4 instance is located.

- **format**
  What is the file format to be read in? Must be "auto" (default), "parquet", "csv", "feather".

- **as_data_frame, asDataFrame**
  TRUE (default) will read files into R as dataframes. FALSE will read files into R as Arrow Datasets.

**Value**

A list of dplyr database table references pointing to CDM tables
**cdm_select_tbl**

Select a subset of tables in a cdm reference object

**Description**

This function uses syntax similar to `dplyr::select` and can be used to subset a cdm reference object to a specific tables.

**Usage**

```r
cdm_select_tbl(cdm, ...)
```

**Arguments**

- `cdm`: A cdm reference object created by `cdm_from_con`
- `...`: One or more table names of the tables of the cdm object. `tidyselect` is supported, see `dplyr::select()` for details on the semantics.

**Value**

A cdm reference object containing the selected tables

**Examples**

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())

cdm <- cdm_from_con(con, "main")

cdm_select_tbl(cdm, person)
cdm_select_tbl(cdm, person, observation_period)
cdm_select_tbl(cdm, tbl_group("vocab"))
cdm_select_tbl(cdm, "person")

DBI::dbDisconnect(con)

## End(Not run)
```

---

**cohortAttrition**

Get attrition table from a GeneratedCohortSet object

**Description**

Get attrition table from a GeneratedCohortSet object
Usage

cohortAttrition(x)

cohort_attrition(x)

Arguments

x A generatedCohortSet object

Description
Get cohort attrition counts from a GeneratedCohortSet object

Usage

cohortAttrition(x)

cohort_attrition(x)

Arguments

x A generatedCohortSet object

Description
Get cohort settings from a GeneratedCohortSet object

Usage

cohortSet(x)

cohort_set(x)

Arguments

x A generatedCohortSet object
**collect.cdm_reference**  
*Bring a remote CDM reference into R*

### Description

This function calls collect on a list of lazy queries and returns the result as a list of dataframes.

### Usage

```r
## S3 method for class 'cdm_reference'
collect(x, ...)  
```

### Arguments

- **x**  
  A `cdm_reference` object.

- **...**  
  Not used. Included for compatibility.

### Value

A `cdm_reference` object that is a list of R dataframes.

### Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
vocab <- cdm_from_con(con, "main") %>%
  cdm_select_tbl("concept", "concept_ancestor")
local_vocab <- collect(vocab)
DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)
```

---

**computePermanent**  
*Run a dplyr query and store the result in a permanent table*

### Description

This function has been superceded by `computeQuery` which should be used instead of `computePermanent`.

### Usage

```r
computePermanent(x, name, schema = NULL, overwrite = FALSE)  
compute_permanent(x, name, schema = NULL, overwrite = FALSE)
```
computeQuery

Arguments

- **x**  
  A dplyr query

- **name**  
  Name of the table to be created

- **schema**  
  Schema to create the new table in. Can be a length 1 or 2 vector. (e.g. `schema = "my_schema", schema = c("my_schema", "dbo")`)

- **overwrite**  
  If the table already exists in the remote database should it be overwritten? (TRUE or FALSE)

Details

[Deprecated]

Value

A dplyr reference to the newly created table

---

**computeQuery**  
*Execute dplyr query and save result in remote database*

Description

This function is a wrapper around `dplyr::compute` that is tested on several database systems. It is needed to handle edge cases where `dplyr::compute` does not produce correct SQL.

Usage

```r
computeQuery(
  x,
  name = uniqueTableName(),
  temporary = TRUE,
  schema = NULL,
  overwrite = FALSE,
  ...
)
```

```r
compute_query(
  x,
  name = uniqueTableName(),
  temporary = TRUE,
  schema = NULL,
  overwrite = FALSE,
  ...
)
```
Arguments

- **x**: A dplyr query
- **name**: The name of the table to create.
- **temporary**: Should the table be temporary: TRUE (default) or FALSE
- **schema**: The schema where the table should be created. Ignored if temporary = TRUE.
- **overwrite**: Should the table be overwritten if it already exists: TRUE or FALSE (default) Ignored if temporary = TRUE.
- ... Further arguments passed on the dplyr::compute

Value

A dplyr::tbl() reference to the newly created table.

Examples

```r
## Not run:
library(CDMConnector)

con <- DBI::dbConnect(duckdb::duckdb(), dbdir = CDMConnector::eunomia_dir())
cdm <- cdm_from_con(con, "main")

# create a temporary table in the remote database from a dplyr query
drugCount <- cdm$concept %>%
  dplyr::count(domain_id == "Drug") %>%
  computeQuery()

# create a permanent table in the remote database from a dplyr query
drugCount <- cdm$concept %>%
  dplyr::count(domain_id == "Drug") %>%
  computeQuery("tmp_table", temporary = FALSE, schema = "main")

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

---

dateadd  

*Add days or years to a date in a dplyr query*

Description

This function must be "unquoted" using the "bang bang" operator (!!). See example.

Usage

```r
dateadd(date, number, interval = "day")
```
datediff

Arguments

date The name of a date column in the database table as a character string
number The number of units to add. Can be a positive or negative whole number.
interval The units to add. Must be either "day" (default) or "year"

Value

Platform specific SQL that can be used in a dplyr query.

Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb())
date_tbl <- dplyr::copy_to(con, data.frame(date1 = as.Date("1999-01-01")),
                           name = "tmpdate", overwrite = TRUE, temporary = TRUE)

df <- date_tbl %>%
     dplyr::mutate(date2 = !!dateadd("date1", 1, interval = "year")) %>%
     dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)
```

---

datediff Compute the difference between two days

Description

This function must be "unquoted" using the "bang bang" operator (!!). See example.

Usage

datediff(start, end, interval = "day")

Arguments

start The name of the start date column in the database as a string.
end The name of the end date column in the database as a string.
interval The units to use for difference calculation. Must be either "day" (default) or "year".

Value

Platform specific SQL that can be used in a dplyr query.
Examples

```r
## Not run:
library(SqlUtilities)
con <- DBI::dbConnect(duckdb::duckdb())
date_tbl <- dplyr::copy_to(con, data.frame(date1 = as.Date("1999-01-01")),
                          name = "tmpdate", overwrite = TRUE, temporary = TRUE)

df <- date_tbl %>%
  dplyr::mutate(date2 = !!dateadd("date1", 1, interval = "year")) %>%
  dplyr::mutate(dif_years = !!datediff("date1", "date2", interval = "year")) %>%
  dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)
```

datepart

Extract the day, month or year of a date in a dplyr pipeline

Description

Extract the day, month or year of a date in a dplyr pipeline

Usage

datepart(date, interval = "year", dbms = NULL)

Arguments

date Character string that represents a date column.
interval Interval to extract from a date. Valid options are "year", "month", or "day".
dbms Database system, if NULL it is auto detected.

Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), ":memory:"
date_tbl <- dplyr::copy_to(con,
                          data.frame(birth_date = as.Date("1993-04-19")),
                          name = "tmp",
                          temporary = TRUE)

df <- date_tbl %>%
  dplyr::mutate(year = !!datepart("birth_date", "year")) %>%
  dplyr::mutate(month = !!datepart("birth_date", "month")) %>%
  dplyr::mutate(day = !!datepart("birth_date", "day")) %>%
  dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)
```
**dbms**

*Get the database management system (dbms) from a cdm_reference or DBI connection*

**Description**

Get the database management system (dbms) from a cdm_reference or DBI connection

**Usage**

`dbms(con)`

**Arguments**

- `con` A DBI connection or cdm_reference

**Value**

A character string representing the dbms that can be used with SqlRender

**Examples**

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
cdm <- cdm_from_con(con)
dbms(cdm)
dbms(con)
## End(Not run)
```

---

**downloadEunomiaData**

*Download Eunomia data files*

**Description**

Download the Eunomia data files from https://github.com/darwin-eu/EunomiaDatasets

**Usage**

```r
downloadEunomiaData(
    datasetName = "GiBleed",
    cdmVersion = "5.3",
    pathToData = Sys.getenv("EUNOMIA_DATA_FOLDER"),
    overwrite = FALSE
)
```
download_eunomia_data(
    dataset_name = "GiBleed",
    cdm_version = "5.3",
    path_to_data = Sys.getenv("EUNOMIA_DATA_FOLDER"),
    overwrite = FALSE
)

Arguments

overwrite Control whether the existing archive file will be overwritten should it already exist.
dataset_name, datasetName The data set name as found on https://github.com/darwin-eu/EunomiaDatasets. The data set name corresponds to the folder with the data set ZIP files
cdm_version, cdmVersion The OMOP CDM version. This version will appear in the suffix of the data file, for example: datasetName_cdmVersion.zip. Default: '5.3'
path_to_data, pathToData The path where the Eunomia data is stored on the file system. By default the value of the environment variable "EUNOMIA_DATA_FOLDER" is used.

Value

Invisibly returns the destination if the download was successful.

Examples

## Not run:
downloadEunomiaData("GiBleed")
## End(Not run)

---

**dropTable**

*Drop tables from write_schema of a cdm object*

**Description**

cdm objects can have zero or more cohort tables stored in a special schema where the user has write access. This function removes tables from a cdm’s write_schema

**Usage**

dropTable(cdm, name, verbose = FALSE)

drop_table(cdm, name, verbose = FALSE)
dropTable

Arguments

- **cdm**: A cdm reference
- **name**: A character vector of tables in the cdm's write_schema or a tidyselect specification of tables to drop. (e.g. `starts_with("temp"), matches("study01"), etc.)
- **verbose**: Print a message when dropping a table? TRUE or FALSE (default)

Value

Returns the cdm object with selected tables removed

Examples

```r
## Not run:
library(CDMConnector)

con <- DBI::dbConnect(duckdb::duckdb(), dbdir = CDMConnector::eunomia_dir())
cdm <- cdm_from_con(con, cdm_schema = "main", write_schema = "main")

# create two temporary tables in the remote database from a query with a common prefix
cdm$tmp_table <- cdm$concept %>%
dplyr::count(domain_id == "Drug") %>%
computeQuery("tmp_table", temporary = FALSE, schema = "main")

cdm$tmp_table2 <- cdm$concept %>%
dplyr::count(domain_id == "Condition") %>%
computeQuery("tmp_table2", temporary = FALSE, schema = "main")

stringr::str_subset(DBI::dbListTables(con), "tmp")
#> [1] "tmp_table" "tmp_table2"

stringr::str_subset(names(cdm), "tmp")
#> [1] "tmp_table" "tmp_table2"

# drop tables with a common prefix

cdm <- dropTable(cdm, name = dplyr::starts_with("temp"))

stringr::str_subset(DBI::dbListTables(con), "tmp")
# character(0)

stringr::str_subset(names(cdm), "tmp")
# character(0)

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```
eunomiaDir

Create a copy of a Eunomia dataset

Description

Creates a copy of a Eunomia database, and returns the path to the new database file. If the dataset does not yet exist on the user’s computer it will attempt to download the source data to the the path defined by the EUNOMIA_DATA_FOLDER environment variable.

Usage

eunomiaDir(
  datasetName = "GiBleed",
  cdmVersion = "5.3",
  pathToData = Sys.getenv("EUNOMIA_DATA_FOLDER"),
  dbms = "duckdb",
  databaseFile = tempfile(fileext = paste0(".", dbms))
)

Arguments

datasetName The data set name as found on https://github.com/darwin-eu/EunomiaDatasets. The data set name corresponds to the folder with the data set ZIP files

cdmVersion The OMOP CDM version. This version will appear in the suffix of the data file, for example: datasetName_cdmVersion.zip. Default: '5.3'

pathToData The path where the Eunomia data is stored on the file system., By default the value of the environment variable "EUNOMIA_DATA_FOLDER" is used.

dbms The database system to use. "sqlite" or "duckdb" (default)

databaseFile The path where the database file will be copied to. By default, the database will be copied to a temporary folder, and will be deleted at the end of the R session.

Value

The file path to the new Eunomia dataset copy

Examples

```r
## Not run:
conn <- DBI::dbConnect(RSQLite::SQLite(), eunomiaDir("GiBleed"))
DBI::dbDisconnect(conn)

conn <- DBI::dbConnect(duckdb::duckdb(), eunomiaDir("GiBleed", dbms = "duckdb"))
DBI::dbDisconnect(conn, shutdown = TRUE)

conn <- DatabaseConnector::connect(dbms = "sqlite", server = eunomiaDir("GiBleed"))
DatabaseConnector::disconnect(conn)
```
eunomia_dir

Create a new Eunomia CDM

Description

Create a copy of the duckdb Eunomia CDM and return the file path

Usage

eunomia_dir(exdir = NULL)

Arguments

exdir

Enclosing directory where the Eunomia CDM should be created. If NULL (default) then a temp folder is created.

Value

The full path to the new Eunomia CDM that can be passed to dbConnect()

Examples

## Not run:
library(DBI)
library(CDMConnector)
con <- dbConnect(duckdb::duckdb(), dbdir = getEunomiaPath())
dbListTables(con)
dbDisconnect(con)

## End(Not run)

eunomia_is_available

Has the Eunomia dataset been cached?

Description

Has the Eunomia dataset been cached?

Usage

eunomia_is_available(dataset_name = "GiBleed", cdm_version = "5.3")
eunomiaIsAvailable(datasetName = "GiBleed", cdmVersion = "5.3")
**generateCohortSet**

**Arguments**

- `dataset_name, datasetName`
  Name of the Eunomia dataset to check. Defaults to "GiBleed".
- `cdm_version, cdmVersion`
  Version of the Eunomia dataset to check. Must be "5.3" or "5.4".

**Value**

TRUE if the eunomia example dataset is available and FALSE otherwise.

---

**generateCohortSet**  
*Generate a cohort set on a cdm object*

**Description**

A "GeneratedCohortSet" object consists of four components:

- A remote table reference to an OHDSI cohort table with at least the columns: `cohort_definition_id`, `subject_id`, `cohort_start_date`, `cohort_end_date`. Additional columns are optional and some analytic packages define additional columns specific to certain analytic cohorts.
- A **settings attribute** which points to a remote table containing cohort settings including the names of the cohorts.
- An **attrition attribute** which points to a remote table with attrition information recorded during generation. This attribute is optional. Since calculating attrition takes additional compute it can be skipped resulting in a NULL attrition attribute.
- A **cohortCounts attribute** which points to a remote table containing cohort counts

Each of the three attributes are tidy tables. The implementation of this object is experimental and user feedback is welcome.

**[Experimental]**

One key design principle is that GeneratedCohortSet objects are created once and can persist across analysis execution but should not be modified after creation. While it is possible to modify a GeneratedCohortSet object doing so will invalidate it and its attributes may no longer be accurate.

**Usage**

```r
generateCohortSet(  
  cdm,  
  cohortSet,  
  name = "cohort",  
  computeAttrition = TRUE,  
  overwrite = FALSE  
)
```

```r
generate_cohort_set(  
  cdm,  
  cohortSet,  
  name = "cohort",  
  computeAttrition = TRUE,  
  overwrite = FALSE  
)```
cohort_set,  
name = "cohort",  
compute_attrition = FALSE,  
overwrite = FALSE  
)  

Arguments  

- **cdm**: A cdm reference created by CDMConnector. write_schema must be specified.  
- **name**: Name of the cohort table to be created. This will also be used as a prefix for the cohort attribute tables.  
- **overwrite**: Should the cohort table be overwritten if it already exists? TRUE or FALSE (default)  
- **cohort_set, cohortSet**: Either a cohortSet object created with readCohortSet() or a named list of Capr cohort definitions.  
- **compute_attrition, computeAttrition**: Should attrition be computed? TRUE (default) or FALSE  

Examples  

```r  
## Not run:  
library(CDMConnector)  
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())  
cdm <- cdm_from_con(con,  
  cdm_schema = "main",  
  write_schema = "main")  
cohortSet <- readCohortSet(system.file("cohorts2", package = "CDMConnector"))  
cdm <- generateCohortSet(cdm, cohortSet, name = "cohort")  
print(cdm$cohort)  
attrition(cdm$cohort)  
settings(cdm$cohort)  
cohortCounts(cdm$cohort)  
## End(Not run)  
```

---

### inSchema  
*Helper for working with compound schemas*

**Description**  

This is similar to dbplyr::in_schema but has been tested across multiple database platforms. It only exists to work around some of the limitations of dbplyr::in_schema.
**intersect_cohorts**

**Usage**

```r
inSchema(schema, table, dbms = NULL)

in_schema(schema, table, dbms = NULL)
```

**Arguments**

- `schema`: A schema name as a character string
- `table`: A table name as character string
- `dbms`: The name of the database management system as returned by `dbms(connection)`

**Value**

A DBI::Id that represents a qualified table and schema

---

**intersect_cohorts**

*Intersect all cohorts in a single cohort table*

**Description**

Intersect all cohorts in a single cohort table

**Usage**

```r
intersect_cohorts(x, cohort_definition_id = 1L)

intersectCohorts(x, cohort_definition_id = 1L)
```

**Arguments**

- `x`: A tbl reference to a cohort table
- `cohort_definition_id`: A number to use for the new `cohort_definition_id` [Experimental]

**Value**

A lazy query that when executed will resolve to a new cohort table with one `cohort_definition_id` resulting from the intersection of all cohorts in the original cohort table
### list_tables

*List tables in a schema*

**Description**

DBI::dbListTables can be used to get all tables in a database but not always in a specific schema. listTables will list tables in a schema.

**Usage**

```r
list_tables(con, schema = NULL)
listTables(con, schema = NULL)
```

**Arguments**

- `con` A DBI connection to a database
- `schema` The name of a schema in a database. If NULL, returns DBI::dbListTables(con).

**Value**

A character vector of table names

**Examples**

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
listTables(con, schema = "main")

## End(Not run)
```

### new_generated_cohort_set

*Low level constructor for GeneratedCohortSet objects for package developers*

**Description**

This constructor function is to be used by analytic package developers to create generatedCohortSet objects. Users should never need to call this function. The use of this function ensures that all generatedCohortSet have a valid structure.
Usage

```r
new_generated_cohort_set(
  cohort_ref,
  cohort_set_ref = NULL,
  cohort_attrition_ref = NULL,
  cohort_count_ref = NULL
)
```

```r
newGeneratedCohortSet(
  cohortRef,
  cohortSetRef = NULL,
  cohortAttritionRef = NULL,
  cohortCountRef = NULL
)
```

Arguments

- **cohort_ref**, **cohortRef**
  A `tbl_sql` object that points to a remote cohort table with the following first four columns: `cohort_definition_id`, `subject_id`, `cohort_start_date`, `cohort_end_date`. Additional columns are optional.

- **cohort_set_ref**, **cohortSetRef**
  A `tbl_sql` object that points to a remote table with the following first two columns: `cohort_definition_id`, `cohort_name`. Additional columns are optional. `cohort_definition_id` should be a primary key on this table and uniquely identify rows.

- **cohort_attrition_ref**, **cohortAttritionRef**
  A `tbl_sql` object that points to an attrition table in a remote database with the first column being `cohort_definition_id`.

- **cohort_count_ref**, **cohortCountRef**
  A `tbl_sql` object that points to a cohort_count table in a remote database with columns `cohort_definition_id`, `cohort_entries`, `cohort_subjects`.

Details

A `generatedCohort` is a set of person-time from an OMOP CDM database. A `generatedCohort` can be represented by a table with three columns: `subject_id`, `cohort_start_date`, `cohort_end_date`. `Subject_id` is the same as `person_id` in the OMOP CDM. A `generatedCohortSet` is a collection of one or more `generatedCohorts` and can be represented as a table with four columns: `cohort_definition_id`, `subject_id`, `cohort_start_date`, `cohort_end_date`.

This constructor function defines the `generatedCohortSet` object in R.

The object is an extension of a `tbl_sql` object defined in `dplyr`. This is a lazy database query that points to a cohort table in the database with at least the columns `cohort_definition_id`, `subject_id`, `cohort_start_date`, `cohort_end_date`. The table could optionally have more columns as well.

In addition the `generatedCohortSet` object has three optional attributes. These are: `cohort_set`, `cohort_attrition`, `cohort_count`. Each of these attributes is also a lazy SQL query (`tbl_sql`) that points to a table in a database and is described below.
cohort_set:
cohort_set is a table with one row per cohort_definition_id. The first two columns of the cohort_set table are: cohort_definition_id, and cohort_name. Additional columns can be added. The cohort_set table is meant to store metadata about the cohort definition. Since this table is required it will be created if it is not supplied.

cohort_attrition:
cohort_attrition is an optional table that stores attrition information recorded during the cohort generation process such as how many persons were dropped at each step of inclusion rule application. The first column of this table should be cohort_definition_id but all other columns currently have no constraints.

cohort_count:
cohort_count is a option attribute table that records the number of records and the number of unique persons in each cohort in a generatedCohortSet. It is derived metadata that can be re-derived as long as cohort_set, the complete list of cohorts in the set, is available. Column names of cohort_count are: cohort_definition_id, number_records, number_subjects. This table is required for generatedCohortSet objects and will be created if not supplied.

Value

A generatedCohortSet object that is a tbl_sql reference to a cohort table in the write_schema of an OMOP CDM

Examples

```r
## Not run:
# This function is for developers who are creating generatedCohortSet
# objects in their packages. The function should accept a cdm_reference
# object as the first argument and return a cdm_reference object with the
# cohort table added. The second argument should be 'name' which will be
# the prefix for the database tables, the name of the cohort table in the
# database and the name of the cohort table in the cdm object.
# Other optional arguments can be added after the first two.

generateCustomCohort <- function(cdm, name, ...) {

  # accept a cdm_reference object as input
  checkmate::assertClass(cdm, "cdm_reference")
  con <- attr(cdm, "dbcon")

  # Create the tables in the database however you like
  # All the tables should be prefixed with 'name'
  # The cohort table should be called 'name' in the database

  # Create the dplyr table references
  cohort_ref <- dplyr::tbl(con, name)
  cohort_set <- dplyr::tbl(con, paste0(name, "_set"))
  cohort_attrition_ref <- dplyr::tbl(con, paste0(name, "_attrition"))
  cohort_count_ref <- dplyr::tbl(con, paste0(name, "_count"))

  # Your code to create the required tables goes here
}
```

# create the generated cohort set object using the constructor
generatedCohortSet <- new_generated_cohort_set(
  cohort_ref,
  cohort_set_ref = cohort_set_ref,
  cohort_attrition_ref = cohort_attrition_ref,
  cohort_count_ref = cohort_count_ref)

# Add the generatedCohortSet to the cdm and return the cdm
cdm[[name]] <- generatedCohortSet
return(cdm)

## End(Not run)

---

**print.cdm_reference**  
Print a CDM reference object

**Description**
Print a CDM reference object

**Usage**

```r
## S3 method for class 'cdm_reference'
print(x, ...)
```

**Arguments**

- `x` A cdm_reference object
- `...` Included for compatibility with generic. Not used.

**Value**

Invisibly returns the input

---

**read_cohort_set**  
Read a set of cohort definitions into R

**Description**

A "cohort set" is a collection of cohort definitions. In R this is stored in a dataframe with cohort_definition_id, cohort_name, and cohort columns. On disk this is stored as a folder with a CohortsToCreate.csv file and one or more json files. If the CohortsToCreate.csv file is missing then all of the json files in the folder will be used, cohort_definition_id will be automatically assigned in alphabetical order, and cohort_name will match the file names.
Usage

read_cohort_set(path)

readCohortSet(path)

Arguments

path  The path to a folder containing Circe cohort definition json files and optionally
      a csv file named CohortsToCreate.csv with columns cohortId, cohortName, and
      jsonPath.

Usage

snapshot(cdm)

Arguments

cdm  A cdm object

Value

A named list of attributes about the cdm including selected fields from the cdm_source table and
record counts from the person and observation_period tables

Examples

## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, "main")
snapshot(cdm)

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
**stow**

Collect a list of lazy queries and save the results as files

**Description**

Collect a list of lazy queries and save the results as files

**Usage**

```r
stow(cdm, path, format = "parquet")
```

**Arguments**

- **cdm**: A cdm object
- **path**: A folder to save the cdm object to
- **format**: The file format to use: "parquet" (default), "csv", "feather" or "duckdb".

**Value**

Invisibly returns the cdm input

**Examples**

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
vocab <- cdm_from_con(con, "main") %>%
  cdm_select_tbl("concept", "concept_ancestor")
stow(vocab, here::here("vocab_tables"))
DBI::dbDisconnect(con, shutdown = TRUE)
```

**summarise_quantile**

Quantile calculation using dbplyr

**Description**

This function provides DBMS independent syntax for quantiles estimation. Can be used by itself or in combination with `mutate()` when calculating other aggregate metrics (min, max, mean).

`summarise_quantile()`, `summarize_quantile()`, `summariseQuantile()` and `summarizeQuantile()` are synonyms.
summarise_quantile

Usage

summarise_quantile(.data, x = NULL, probs, name_suffix = "value")
summarize_quantile(.data, x = NULL, probs, name_suffix = "value")
summariseQuantile(.data, x = NULL, probs, nameSuffix = "value")
summarizeQuantile(.data, x = NULL, probs, nameSuffix = "value")

Arguments

.data lazy data frame backed by a database query.
x column name whose sample quantiles are wanted.
probs numeric vector of probabilities with values in [0,1].
name_suffix, nameSuffix character; is appended to numerical quantile value as a column name part.

Details

Implemented quantiles estimation algorithm returns values analogous to quantile{stats} with argument type = 1. See discussion in Hyndman and Fan (1996). Results differ from PERCENTILE_CONT natively implemented in various DBMS, where returned values are equal to quantile{stats} with default argument type = 7

Value

An object of the same type as '.data'

Examples

## Not run:
con <- DBI::dbConnect(duckdb::duckdb())
mtcars_tbl <- dplyr::copy_to(con, mtcars, name = "tmp", overwrite = TRUE, temporary = TRUE)
df <- mtcars_tbl %>%
dplyr::group_by(cyl) %>%
dplyr::mutate(mean = mean(mpg, na.rm = TRUE)) %>%
summarise_quantile(mpg, probs = c(0, 0.2, 0.4, 0.6, 0.8, 1),
    name_suffix = "quant") %>%
dplyr::collect()
DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
**tbl_group**

*CDM table selection helper*

**Description**

The OMOP CDM tables are grouped together and the `tbl_group` function allows users to easily create a CDM reference including one or more table groups.

**Usage**

```r
tbl_group(group)
tblGroup(group)
```

**Arguments**

- `group`:
  
  A character vector of CDM table groups: "vocab", "clinical", "all", "default", "derived".

**Details**

The "default" table group is meant to capture the most commonly used set of CDM tables. Currently the "default" group is: person, observation_period, visit_occurrence, visit_detail, condition_occurrence, drug_exposure, procedure_occurrence, device_exposure, measurement, observation, death, note, note_nlp, specimen, fact_relationship, location, care_site, provider, payer_plan_period, cost, drug_era, dose_era, condition_era, concept, vocabulary, concept_relationship, concept_ancestor, concept_synonym, drug_strength

**Value**

A character vector of CDM tables names in the groups

**Examples**

```r
## Not run:
con <- DBI::dbConnect(RPostgres::Postgres(),
    dbname = "cdm",
    host = "localhost",
    user = "postgres",
    password = Sys.getenv("PASSWORD"))

cdm <- cdm_from_con(con) %>%
cdm_select_tbl(tbl_group("vocab"))
## End(Not run)
```
union_cohorts

Description
Union all cohorts in a single cohort table

Usage

union_cohorts(x, cohort_definition_id = 1L)

Arguments

x
A tbl reference to a cohort table

cohort_definition_id
A number to use for the new cohort_definition_id

[Experimental]

Value
A lazy query that when executed will resolve to a new cohort table with one cohort_definition_id resulting from the union of all cohorts in the original cohort table

uniqueTableName

Description
Create a unique table name for temp tables

Usage

uniqueTableName()

unique_table_name()

Value
A string that can be used as a dbplyr temp table name
**validate_cdm**

**Validation report for a CDM**

**Description**

Print a short validation report for a cdm object. The validation includes checking that column names are correct and that no tables are empty. A short report is printed to the console. This function is meant for interactive use.

**Usage**

```r
validate_cdm(cdm)
validateCdm(cdm)
```

**Arguments**

- **cdm**
  
  A cdm reference object.

**Value**

Invisibly returns the cdm input

**Examples**

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, cdm_schema = "main")
validate_cdm(cdm)
DBI::dbDisconnect(con)

## End(Not run)
```

---

**version**

**Get the CDM version**

**Description**

Extract the CDM version attribute from a cdm_reference object

**Usage**

```r
version(cdm)
```

**Arguments**

- **cdm**

  A cdm object
Value

"5.3" or "5.4"

Examples

```r
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, "main")
version(cdm)

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

Description

Subset a cdm reference object

Usage

```r
## S3 method for class 'cdm_reference'

x[i]
```

Arguments

- `x`: A cdm reference
- `i`: The name or index of the table to extract from the cdm object

Value

A single cdm table reference
Description

Subset a cdm reference object

Usage

## S3 method for class 'cdm_reference'
x[[i]]

Arguments

x  A cdm reference
i  The name or index of the table to extract from the cdm object

Value

A single cdm table reference

Description

Subset a cdm reference object

Usage

## S3 method for class 'cdm_reference'
x$name

Arguments

x  A cdm reference
name  The name of the table to extract from the cdm object

Value

A single cdm table reference
