Package ‘CDMConnector’

August 23, 2023

Title Connect to an OMOP Common Data Model

Version 1.1.2

Description Provides tools for working with observational health data in the Observational Medical Outcomes Partnership (OMOP) Common Data Model format with a pipe friendly syntax. Common data model database table references are stored in a single compound object along with metadata.

License Apache License (>= 2)

BugReports https://github.com/darwin-eu/CDMConnector/issues

Encoding UTF-8

RoxygenNote 7.2.3

Depends R (>= 4.0)

Imports dplyr, DBI (>= 0.3.0), checkmate, dbplyr, cli, purrr, rlang, tidyselect, readr, glue, waldo, methods, withr, lifecycle, jsonlite, stringr, stringi, fs, generics, tidyr, pool

Suggests arrow, SqlRender, rJava, covr, knitr, rmarkdown, duckdb, RSQLite, RPostgres, odbc, ggplot2, bigrquery, testthat (>= 3.0.0), DatabaseConnector, lubridate, tibble, zeallot

Enhances CirceR, Capr

Config/testthat/edition 3

Run a dplyr query and add the result set to an existing

### appendPermanent

**Description**

Run a dplyr query and add the result set to an existing

**Usage**

```r
appendPermanent(x, name, schema = NULL)
append_permanent(x, name, schema = NULL)
```

**Arguments**

- **x**  
  A dplyr query

- **name**  
  Name of the table to be appended. If it does not already exist it will be created.

- **schema**  
  Schema where the table exists. Can be a length 1 or 2 vector. (e.g. schema = "my_schema", schema = c("my_schema", "dbo"))

**Value**

A dplyr reference to the newly created table

**Examples**

```r
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
concept <- dplyr::tbl(con, "concept")

# create a table
rxnorm_count <- concept %>%
dplyr::filter(domain_id == "Drug") %>%
dplyr::mutate(isRxnorm = (vocabulary_id == "RxNorm")) %>%
dplyr::count(domain_id, isRxnorm) %>%
computeQuery("rxnorm_count")
```
# append to an existing table
rxnorm_count <- concept %>%
  dplyr::filter(domain_id == "Procedure") %>%
  dplyr::mutate(isRxnorm = (vocabulary_id == "RxNorm")) %>%
  dplyr::count(domain_id, isRxnorm) %>%
  appendPermanent("rxnorm_count")

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)

---

**asDate**

**as.Date dplyr translation wrapper**

---

**Description**

This is a workaround for using `as.Date` inside dplyr verbs against a database backend. This function should only be used inside dplyr verbs where the first argument is a database table reference. `asDate` must be unquoted with `!!` inside dplyr verbs (see example).

**Usage**

```r
asDate(x)

as_date(x)
```

**Arguments**

- `x`: an R expression

**Examples**

```r
## Not run:
con <- DBI::dbConnect(odbc::odbc(), "Oracle")
date_tbl <- dplyr::copy_to(con,
  data.frame(y = 2000L, m = 10L, d = 10L),
  name = "tmp",
  temporary = TRUE)

df <- date_tbl %>%
  dplyr::mutate(date_from_parts = !!asDate(paste0(
    .data$y, "/",
    .data$m, "/",
    .data$d
  ))) %>%
  collect()

## End(Not run)
```
assert_tables

Assert that tables exist in a cdm object

Description

A cdm object is a list of references to a subset of tables in the OMOP Common Data Model. If you write a function that accepts a cdm object as a parameter assert_tables/assertTables will help you check that the tables you need are in the cdm object, have the correct columns/fields, and (optionally) are not empty.

Usage

assert_tables(cdm, tables, empty.ok = FALSE, add = NULL)
assertTables(cdm, tables, empty.ok = FALSE, add = NULL)

Arguments

cdm  A cdm object
tables A character vector of table names to check.
empty.ok Should an empty table (0 rows) be considered an error? TRUE or FALSE (default)
add An optional AssertCollection created by checkmate::makeAssertCollection() that errors should be added to.

Value

Invisibly returns the cdm object

Examples

## Not run:
# Use assertTables inside a function to check that tables exist
countDrugsByGender <- function(cdm) {
  assertTables(cdm, tables = c("person", "drug_era"), empty.ok = FALSE)
  cdm$person %>%
    dplyr::inner_join(cdm$drug_era, by = "person_id") %>%
    dplyr::count(.data$gender_concept_id, .data$drug_concept_id) %>%
    dplyr::collect()
}

library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
cdm <- cdm_from_con(con)
countDrugsByGender(cdm)
assert_write_schema  Assert that cdm has a writable schema

Description
A cdm object can optionally contain a single schema in a database with write access. `assert_write_schema` checks that the cdm contains the "write_schema" attribute and tests that local dataframes can be written to tables in this schema.

Usage
`assert_write_schema(cdm, add = NULL)`

Arguments
- `cdm` A cdm object
- `add` An optional AssertCollection created by `checkmate::makeAssertCollection()` that errors should be added to.

Value
Invisibly returns the cdm object

cdmDisconnect  Disconnect the connection of the cdm object

Description
Disconnect the connection of the cdm object

Usage
`cdmDisconnect(cdm)`

Arguments
- `cdm` cdm reference
cdmFlatten

Flatten a cdm into a single observation table

Description

This experimental function transforms the OMOP CDM into a single observation table. This is only recommended for use with a filtered CDM or a cdm that is small in size.

Usage

```r
cdmFlatten(
  cdm,
  domain = c("condition", "drug", "procedure"),
  includeConceptName = TRUE
)
```

```r
cdm_flatten(
  cdm,
  domain = c("condition", "drug", "procedure"),
  include_concept_name = TRUE
)
```

Arguments

- `cdm` A cdm_reference object
- `domain` Domains to include. Must be a subset of "condition", "drug", "procedure", "measurement", "visit", "death", "observation".
- `include_concept_name, includeConceptName` Should concept_name and type_concept_name be include in the output table? TRUE (default) or FALSE

Details

[Experimental]

Value

A lazy query that when evaluated will result in a single cdm table

Examples

```r
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main")
```
all_observations <- cdmSubset(cdm, personId = c(2, 18, 42)) %>%
cdmFlatten() %>%
collect()

all_observations

#> # A tibble: 213 × 8
#>  person_id observation_. start_date end_date type_. domain obser. type_.
#>   <dbl> <dbl> <date> <date> <dbl> <chr> <chr> <chr>

#> # ... with 203 more rows, and abbreviated variable names observation_concept_id,
#> # type_concept_id, observation_concept_name, type_concept_name

DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)

cdmName

### Get the CDM name

**Description**

Extract the CDM name attribute from a cdm_reference object

**Usage**

```r
cdmName(cdm)
cdm_name(cdm)
```

**Arguments**

- `cdm` A cdm object

**Value**

The name of the CDM as a character string
Examples

```r
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, "main")
cdmName(cdm)
#> [1] "Synthea synthetic health database"

cdm <- cdm_from_con(con, "main", cdm_name = "Example CDM")
cdmName(cdm)
#> [1] "Example CDM"

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

---

### cdmSample

**Subset a cdm object to a random sample of individuals**

**Description**

cdmSample takes a cdm object and returns a new cdm that includes only a random sample of persons in the cdm. Only person_ids in both the person table and observation_period table will be considered.

**Usage**

```r
cdmSample(cdm, n)
cdm_sample(cdm, n)
```

**Arguments**

- `cdm` A cdm_reference object
- `n` Number of persons to include in the cdm

**Details**

[Experimental]

**Value**

A modified cdm_reference object where all clinical tables are lazy queries pointing to subset
## Not run:

```r
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main")

cdmSampled <- cdmSample(cdm, n = 2)

cdmSampled$person %>%
  select(person_id)

#> # Source: SQL [2 x 1]
#> # Database: DuckDB 0.6.1
#> # person_id
#> <dbl>
#> 1 155
#> 2 3422

DBI::dbDisconnect(con, shutdown = TRUE)
```

## End(Not run)

---

### cdmSubset

**Subset a cdm object to a set of persons**

**Description**

cdmSubset takes a cdm object and a list of person IDs as input. It returns a new cdm that includes data only for persons matching the provided person IDs. Generated cohorts in the cdm will also be subset to the IDs provided.

**Usage**

```r
cdmSubset(cdm, personId)

cdm_subset(cdm, person_id)
```

**Arguments**

- **cdm** A cdm_reference object
- **person_id, personId** A numeric vector of person IDs to include in the cdm

**Details**

[Experimental]
cdmSubsetCohort

Value
A modified cdm_reference object where all clinical tables are lazy queries pointing to subset

Examples

```r
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

cdm <- cdm_from_con(con, cdm_schema = "main")

cdm2 <- cdmSubset(cdm, personId = c(2, 18, 42))

cdm2$person %>%
  select(1:3)
```

```r
#> # Source: SQL [3 x 3]
#> # Database: DuckDB 0.6.1
#> # person_id gender_concept_id year_of_birth
#> # <dbl> <dbl> <dbl>
#> 1 2 8532 1920
#> 2 18 8532 1965
#> 3 42 8532 1909
```

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

Description

`cdmSubsetCohort` will return a new cdm object that contains lazy queries pointing to each of the cdm tables but subset to individuals in a generated cohort. Since the cdm tables are lazy queries, the subset operation will only be done when the tables are used. `computeQuery` can be used to run the SQL used to subset a cdm table and store it as a new table in the database.

Usage

```r
cdmSubsetCohort(cdm, cohortTable = "cohort", cohortId = NULL, verbose = FALSE)
```

```r
cdm_subset_cohort(
  cdm,
  cohort_table = "cohort",
  cohort_id = NULL,
  verbose = FALSE
)
```
cdmSubsetCohort

Arguments

- **cdm**
  - A cdm_reference object
- **cohortTable**, **cohort_table**
  - The name of a cohort table in the cdm reference
- **cohortId**, **cohort_id**
  - IDs of the cohorts that we want to subset from the cohort table. If NULL (default) all cohorts in cohort table are considered.
- **verbose**
  - Should subset messages be printed? TRUE or FALSE (default)

Details

[Experimental]

Value

A modified cdm_reference with all clinical tables subset to just the persons in the selected cohorts.

Examples

```r
## Not run:
library(CDMConnector)
library(dplyr, warn.conflicts = FALSE)

con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())

# generate a cohort
path <- system.file("cohorts2", mustWork = TRUE, package = "CDMConnector")

cohortSet <- readCohortSet(path) %>%
  filter(cohort_name == "GIBleed_male")

# subset cdm to persons in the generated cohort
cdm <- generateCohortSet(cdm, cohortSet = cohortSet, name = "gibleed")

cdmGibled <- cdmSubsetCohort(cdm, cohortTable = "gibleed")

cdmGibled$person %>%
  tally()
#> # Source: SQL [1 x 1]
#> # Database: DuckDB 0.6.1
#>   n
#> <dbl>
#> 1 237

cdm$person %>%
  tally()
#> # Source: SQL [1 x 1]
#> # Database: DuckDB 0.6.1
#> n
```
cdm_from_con

```r
#> <dbl>
#> 1 2694
```

```r
DBI::dbDisconnect(con, shutdown = TRUE)
```

```r
## End(Not run)
```

**cdm_from_con**

Create a CDM reference object from a database connection

## Description

Create a CDM reference object from a database connection

## Usage

```r
cdm_from_con(
  con,
  cdm_schema = NULL,
  write_schema = NULL,
  cohort_tables = NULL,
  cdm_version = "5.3",
  cdm_name = NULL
)
cdmFromCon(
  con,
  cdmSchema = NULL,
  writeSchema = NULL,
  cohortTables = NULL,
  cdmVersion = "5.3",
  cdmName = NULL
)
```

## Arguments

- **con**: A DBI database connection to a database where an OMOP CDM v5.4 or v5.3 instance is located.
- **cdm_schema, cdmSchema**: The schema where the OMOP CDM tables are located. Defaults to NULL.
- **write_schema, writeSchema**: An optional schema in the CDM database that the user has write access to.
- **cohort_tables, cohortTables**: A character vector listing the cohort table names to be included in the CDM object.
cdm_from_files

**cdm_version, cdmVersion**

The version of the OMOP CDM: "5.3" (default), "5.4", "auto". "auto" attempts to automatically determine the cdm version using heuristics. Cohort tables must be in the write_schema.

**cdm_name, cdmName**

The name of the CDM. If NULL (default) the cdm_source_name . field in the CDM_SOURCE table will be used.

**Value**

A list of dplyr database table references pointing to CDM tables

---

### cdm_from_files

Create a CDM reference from a folder containing parquet, csv, or feather files

**Description**

Create a CDM reference from a folder containing parquet, csv, or feather files

**Usage**

```r
cdm_from_files(
  path,
  format = "auto",
  cdm_version = "5.3",
  cdm_name = NULL,
  as_data_frame = TRUE
)

cdmFromFiles(
  path,
  format = "auto",
  cdmVersion = "5.3",
  cdmName = NULL,
  asDataFrame = TRUE
)
```

**Arguments**

- **path**
  
  A folder where an OMOP CDM v5.4 instance is located.

- **format**
  
  What is the file format to be read in? Must be "auto" (default), "parquet", "csv", "feather".

- **cdm_version, cdmVersion**
  
  The version of the cdm (5.3 or 5.4)

- **cdm_name, cdmName**
  
  A name to use for the cdm.
as_data_frame, asDataFrame
TRUE (default) will read files into R as dataframes. FALSE will read files into R as Arrow Datasets.

Value

A list of dplyr database table references pointing to CDM tables

cdm_select_tbl

Select a subset of tables in a cdm reference object

Description

This function uses syntax similar to dplyr::select and can be used to subset a cdm reference object to a specific tables

Usage

cdm_select_tbl(cdm, ...)

Arguments

cdm A cdm reference object created by cdm_from_con
...
One or more table names of the tables of the cdm object. tidyselect is supported, see dplyr::select() for details on the semantics.

Value

A cdm reference object containing the selected tables

Examples

## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())

cdm <- cdm_from_con(con, "main")

cdm_select_tbl(cdm, person)
cdm_select_tbl(cdm, person, observation_period)
cdm_select_tbl(cdm, tbl_group("vocab"))
cdm_select_tbl(cdm, "person")

DBI::dbDisconnect(con)

## End(Not run)
cohortAttrition

*Get attrition table from a GeneratedCohortSet object*

**Description**

Get attrition table from a GeneratedCohortSet object

**Usage**

`cohortAttrition(x)`

`cohort_attrition(x)`

**Arguments**

`x`  
A generatedCohortSet object

---

cohortCount

*Get cohort counts from a GeneratedCohortSet object*

**Description**

Get cohort counts from a GeneratedCohortSet object

**Usage**

`cohortCount(x)`

`cohort_count(x)`

**Arguments**

`x`  
A generatedCohortSet object
**cohortSet**

Get cohort settings from a GeneratedCohortSet object

**Description**

Get cohort settings from a GeneratedCohortSet object

**Usage**

cohortSet(x)

cohort_set(x)

**Arguments**

x A generatedCohortSet object

**cohort_erafy**

Collapse cohort records within a certain number of days

**Description**

Collapse cohort records within a certain number of days

**Usage**

cohort_erafy(x, gap)

cohortErafy(x, gap)

**Arguments**

x A generated cohort set

gap When two cohort records are gap days apart or less the periods will be collapsed into a single record

**Value**

A lazy query on a generated cohort set
cohort_union  Union all cohorts in a cohort set with cohorts in a second cohort set

Description
Union all cohorts in a cohort set with cohorts in a second cohort set

Usage
cohort_union(x, y)
cohortUnion(x, y)

Arguments
- x  A tbl reference to a cohort table with one or more generated cohorts
- y  A tbl reference to a cohort table with one generated cohort

Value
A lazy query that when executed will resolve to a new cohort table with one the same cohort_definitions_ids in x resulting from the union of all cohorts in x with the single cohort in y cohort table

collect.cdm_reference  Bring a remote CDM reference into R

Description
This function calls collect on a list of lazy queries and returns the result as a list of dataframes.

Usage
## S3 method for class 'cdm_reference'
collect(x, ...)

Arguments
- x  A cdm_reference object.
- ...  Not used. Included for compatibility.

Value
A cdm_reference object that is a list of R dataframes.
Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
vocab <- cdm_from_con(con, "main") %>%
  cdm_select_tbl("concept", "concept_ancestor")
local_vocab <- collect(vocab)
DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

**computeQuery**

*Execute dplyr query and save result in remote database*

**Description**

This function is a wrapper around `dplyr::compute` that is tested on several database systems. It is needed to handle edge cases where `dplyr::compute` does not produce correct SQL.

**Usage**

```r
computeQuery(
  x,
  name = uniqueTableName(),
  temporary = TRUE,
  schema = NULL,
  overwrite = FALSE,
  ...
)
```

**Arguments**

- `x` A dplyr query
- `name` The name of the table to create.
- `temporary` Should the table be temporary: TRUE (default) or FALSE
- `schema` The schema where the table should be created. Ignored if temporary = TRUE.
- `overwrite` Should the table be overwritten if it already exists: TRUE or FALSE (default) Ignored if temporary = TRUE.
- `...` Further arguments passed on the dplyr::compute
copy_cdm_to

Copy a cdm object from one database to another

Description

It may be helpful to be able to easily copy a small test cdm from a local database to a remote for testing. copy_cdm_to takes a cdm object and a connection. It copies the cdm to the remote database connection. CDM tables can be prefixed in the new database allowing for multiple cdms in a single shared database schema.

Usage

copy_cdm_to(con, cdm, schema, overwrite = FALSE)

copyCdmTo(con, cdm, schema, overwrite = FALSE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>con</td>
<td>A DBI database connection created by DBI::dbConnect</td>
</tr>
<tr>
<td>cdm</td>
<td>A cdm reference object created by CDMConnector::cdmFromCon or CDMConnector::cdm_from_con</td>
</tr>
<tr>
<td>schema</td>
<td>schema name in the remote database where the user has write permission</td>
</tr>
<tr>
<td>overwrite</td>
<td>Should the cohort table be overwritten if it already exists? TRUE or FALSE (default)</td>
</tr>
</tbody>
</table>
**dateadd**

### Details

[Experimental]

### Value

A cdm reference object pointing to the newly created cdm in the remote database

---

**dateadd** | *Add days or years to a date in a dplyr query*

---

### Description

This function must be "unquoted" using the "bang bang" operator (!!). See example.

### Usage

```r
dateadd(date, number, interval = "day")
```

### Arguments

- **date**: The name of a date column in the database table as a character string
- **number**: The number of units to add. Can be a positive or negative whole number.
- **interval**: The units to add. Must be either "day" (default) or "year"

### Value

Platform specific SQL that can be used in a dplyr query.

### Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb())
date_tbl <- dplyr::copy_to(con, data.frame(date1 = as.Date("1999-01-01")),
                          name = "tmpdate", overwrite = TRUE, temporary = TRUE)
df <- date_tbl %>%
    dplyr::mutate(date2 = !!dateadd("date1", 1, interval = "year")) %>%
    dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```
datediff

Compute the difference between two days

Description

This function must be "unquoted" using the "bang bang" operator (!!!). See example.

Usage

datediff(start, end, interval = "day")

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>The name of the start date column in the database as a string.</td>
</tr>
<tr>
<td>end</td>
<td>The name of the end date column in the database as a string.</td>
</tr>
<tr>
<td>interval</td>
<td>The units to use for difference calculation. Must be either &quot;day&quot; (default) or &quot;year&quot;.</td>
</tr>
</tbody>
</table>

Value

Platform specific SQL that can be used in a dplyr query.

Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb())
date_tbl <- dplyr::copy_to(con, data.frame(date1 = as.Date("1999-01-01")),
                           name = "tmpdate", overwrite = TRUE, temporary = TRUE)

df <- date_tbl %>%
    dplyr::mutate(date2 = !!dateadd("date1", 1, interval = "year")) %>%
    dplyr::mutate(dif_years = !!datediff("date1", "date2", interval = "year")) %>%
    dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

datepart

Extract the day, month or year of a date in a dplyr pipeline

Description

Extract the day, month or year of a date in a dplyr pipeline
Usage

```r
datepart(date, interval = "year", dbms = NULL)
```

Arguments

- **date**: Character string that represents a date column.
- **interval**: Interval to extract from a date. Valid options are "year", "month", or "day".
- **dbms**: Database system, if NULL it is auto detected.

Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), ":memory:"
date_tbl <- dplyr::copy_to(con,
  data.frame(birth_date = as.Date("1993-04-19")),
  name = "tmp",
  temporary = TRUE)
df <- date_tbl %>%
dplyr::mutate(year = !!datepart("birth_date", "year")) %>%
dplyr::mutate(month = !!datepart("birth_date", "month")) %>%
dplyr::mutate(day = !!datepart("birth_date", "day")) %>%
dplyr::collect()
DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)
```

---

**dbms**

*Get the database management system (dbms) from a cdm_reference or DBI connection*

Description

Get the database management system (dbms) from a cdm_reference or DBI connection

Usage

```r
dbms(con)
```

Arguments

- **con**: A DBI connection or cdm_reference

Value

A character string representing the dbms that can be used with SqlRender
Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
cdm <- cdm_from_con(con)
dbms(cdm)
dbms(con)

## End(Not run)
```

downloadEunomiaData  Download Eunomia data files

Description

Download the Eunomia data files from https://github.com/darwin-eu/EunomiaDatasets

Usage

```r
downloadEunomiaData(
  datasetName = "GiBleed",
  cdmVersion = "5.3",
  pathToData = Sys.getenv("EUNOMIA_DATA_FOLDER"),
  overwrite = FALSE
)
```

```r
download_eunomia_data(
  dataset_name = "GiBleed",
  cdm_version = "5.3",
  path_to_data = Sys.getenv("EUNOMIA_DATA_FOLDER"),
  overwrite = FALSE
)
```

Arguments

- **overwrite** Control whether the existing archive file will be overwritten should it already exist.
- **dataset_name, datasetName** The data set name as found on https://github.com/darwin-eu/EunomiaDatasets. The data set name corresponds to the folder with the data set ZIP files.
- **cdm_version, cdmVersion** The OMOP CDM version. This version will appear in the suffix of the data file, for example: `datasetName_cdmVersion.zip`. Default: '5.3'
- **path_to_data, pathToData** The path where the Eunomia data is stored on the file system. By default the value of the environment variable "EUNOMIA_DATA_FOLDER" is used.
**dropTable**

*Drop tables from write_schema of a cdm object*

**Description**

`cdm` objects can have zero or more cohort tables stored in a special schema where the user has write access. This function removes tables from a `cdm`'s `write_schema`.

**Usage**

```r
dropTable(cdm, name, verbose = FALSE)
drop_table(cdm, name, verbose = FALSE)
```

**Arguments**

- `cdm`: A `cdm` reference
- `name`: A character vector of tables in the `cdm`'s `write_schema` or a `tidyselect` specification of tables to drop. (e.g. `starts_with("temp")`, `matches("study01")`, etc.)
- `verbose`: Print a message when dropping a table? TRUE or FALSE (default)

**Value**

Returns the `cdm` object with selected tables removed

**Examples**

```r
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
cdm <- cdm_from_con(con, cdm_schema = "main", write_schema = "main")

# create two temporary tables in the remote database from a query with a common prefix
cdm$concept <- cdm$concept %>%
dplyr::count(domain_id == "Drug") %>%
computeQuery("tmp_table", temporary = FALSE, schema = "main")
```
function (datasetName, dataset_name) {
  eunomiaDir(  # function call
    datasetName = "GiBleed",  # default name
    cdmVersion = "5.3",  # specific version
    databaseFile = tempfile(fileext = ".duckdb")  # temporary file
  )
}

eunomia_dir(  # function call
  dataset_name = "GiBleed",  # default name
  cdm_version = "5.3",  # specific version
  database_file = tempfile(fileext = ".duckdb")  # temporary file
  )

Arguments

datasetName, dataset_name
  One of "GiBleed" (default), "synthea-allergies-10k", "synthea-anemia-10k", "synthea-breast_cancer-10k", "synthea-contraceptives-10k", "synthea-covid19-10k", "synthea-
eunomia_is_available

Has the Eunomia dataset been cached?

Description

Has the Eunomia dataset been cached?

Usage

eunomia_is_available(dataset_name = "GiBleed", cdm_version = "5.3")
eunomiaIsAvailable(datasetName = "GiBleed", cdmVersion = "5.3")

Arguments

dataset_name, datasetName

Name of the Eunomia dataset to check. Defaults to "GiBleed".

cdm_version, cdmVersion

Version of the Eunomia dataset to check. Must be "5.3" or "5.4".

Value

TRUE if the eunomia example dataset is available and FALSE otherwise
exampleDatasets  
List the available example CDM datasets

Description

List the available example CDM datasets

Usage

exampleDatasets()

example_datasets()

Value

A character vector with example CDM dataset identifiers

Examples

## Not run:
library(CDMConnector)
exampleDatasets()[1]
#> [1] "GiBleed"

con <- DBI::dbConnect(duckdb::duckdb(), eunomiaDir("GiBleed"))
cdm <- cdm_from_con(con)

## End(Not run)

generateCohortSet  
Generate a cohort set on a cdm object

Description

A "GeneratedCohortSet" object consists of four components

- A remote table reference to an OHDSI cohort table with at least the columns: cohort_definition_id, subject_id, cohort_start_date, cohort_end_date. Additional columns are optional and some analytic packages define additional columns specific to certain analytic cohorts.
- A settings attribute which points to a remote table containing cohort settings including the names of the cohorts.
- An attrition attribute which points to a remote table with attrition information recorded during generation. This attribute is optional. Since calculating attrition takes additional compute it can be skipped resulting in a NULL attrition attribute.
- A cohortCounts attribute which points to a remote table containing cohort counts
Each of the three attributes are tidy tables. The implementation of this object is experimental and user feedback is welcome.

[Experimental]

One key design principle is that GeneratedCohortSet objects are created once and can persist across analysis execution but should not be modified after creation. While it is possible to modify a GeneratedCohortSet object doing so will invalidate it and its attributes may no longer be accurate.

Usage

```r
generateCohortSet(
  cdm,            
  cohortSet,      
  name = "cohort", 
  computeAttrition = TRUE, 
  overwrite = FALSE
)
```

```r
generate_cohort_set(
  cdm,            
  cohort_set,     
  name = "cohort", 
  compute_attrition = TRUE, 
  overwrite = FALSE
)
```

Arguments

- `cdm`: A cdm reference created by CDMConnector. write_schema must be specified.
- `name`: Name of the cohort table to be created. This will also be used as a prefix for the cohort attribute tables.
- `overwrite`: Should the cohort table be overwritten if it already exists? TRUE (default) or FALSE (default)
- `cohort_set, cohortSet`: Can be a cohortSet object created with readCohortSet(), a single Capr cohort definition, or a named list of Capr cohort definitions.
- `compute_attrition, computeAttrition`: Should attrition be computed? TRUE (default) or FALSE

Examples

```r
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, 
  cdm_schema = "main", 
  write_schema = "main")

cohortSet <- readCohortSet(system.file("cohorts2", package = "CDMConnector"))
```
generateConceptCohortSet

Create a new generated cohort set from a list of concept sets

Description

Generate a new cohort set from one or more concept sets. Each concept set will result in one cohort and represent the time during which the concept was observed for each subject/person. Concept sets can be passed to this function as:

- A named list of numeric vectors, one vector per concept set
- A named list of Capr concept sets

Clinical observation records will be looked up in the respective domain tables using the vocabulary in the CDM. If a required domain table does not exist in the cdm object a warning will be given. Concepts that are not in the vocabulary or in the data will be silently ignored. If end dates are missing or do not exist, as in the case of the procedure and observation domains, the the start date will be used as the end date.

Usage

generateConceptCohortSet(
  cdm,
  conceptSet = NULL,
  name = "cohort",
  limit = "first",
  requiredObservation = c(0, 0),
  end = "observation_period_end_date",
  overwrite = FALSE
)

generate_concept_cohort_set(
  cdm,
  concept_set = NULL,
  name = "cohort",
  limit = "first",
  required_observation = c(0, 0),
  end = "observation_period_end_date",
  overwrite = FALSE
)
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdm</td>
<td>A cdm reference object created by CDMConnector::cdmFromCon or CDMConnector::cdm_from_con</td>
</tr>
<tr>
<td>conceptSet, concept_set</td>
<td>A named list of numeric vectors or Capr concept sets</td>
</tr>
<tr>
<td>name</td>
<td>The name of the new generated cohort table as a character string</td>
</tr>
<tr>
<td>limit</td>
<td>Include &quot;first&quot; (default) or &quot;all&quot; occurrences of events in the cohort</td>
</tr>
<tr>
<td></td>
<td>• &quot;first&quot; will include only the first occurrence of any event in the concept set in the cohort.</td>
</tr>
<tr>
<td></td>
<td>• &quot;all&quot; will include all occurrences of the events defined by the concept set in the cohort.</td>
</tr>
<tr>
<td>requiredObservation, required_observation</td>
<td>A numeric vector of length 2 that specifies the number of days of required observation time prior to index and post index for an event to be included in the cohort.</td>
</tr>
<tr>
<td>end</td>
<td>How should the cohort_end_date be defined?</td>
</tr>
<tr>
<td></td>
<td>• &quot;observation_period_end_date&quot; (default): The earliest observation_period_end_date after the event start date</td>
</tr>
<tr>
<td></td>
<td>• numeric scalar: A fixed number of days from the event start date</td>
</tr>
<tr>
<td></td>
<td>• &quot;event_end_date&quot;: The event end date. If the event end date is not populated then the event start date will be used</td>
</tr>
<tr>
<td>overwrite</td>
<td>Should the cohort table be overwritten if it already exists? TRUE or FALSE (default)</td>
</tr>
</tbody>
</table>

Value

A cdm reference object with the new generated cohort set table added

inSchema

Helper for working with compound schemas

Description

This is similar to dbplyr::in_schema but has been tested across multiple database platforms. It only exists to work around some of the limitations of dbplyr::in_schema.

Usage

inSchema(schema, table, dbms = NULL)

in_schema(schema, table, dbms = NULL)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>A schema name as a character string</td>
</tr>
<tr>
<td>table</td>
<td>A table name as character string</td>
</tr>
<tr>
<td>dbms</td>
<td>The name of the database management system as returned by dbms(connection)</td>
</tr>
</tbody>
</table>
### intersect_cohorts

Intersect all cohorts in a single cohort table

**Description**

Intersect all cohorts in a single cohort table

**Usage**

```r
intersect_cohorts(x, cohort_definition_id = 1L)
```

**Arguments**

- `x` A tbl reference to a cohort table
- `cohort_definition_id` A number to use for the new cohort_definition_id
  - [Superseded]

**Value**

A lazy query that when executed will resolve to a new cohort table with one cohort_definition_id resulting from the intersection of all cohorts in the original cohort table

### list_tables

List tables in a schema

**Description**

DBI::dbListTables can be used to get all tables in a database but not always in a specific schema.

**Usage**

```r
list_tables(con, schema = NULL)
```

**Arguments**

- `con` A DBI connection to a database
- `schema` The name of a schema in a database. If NULL, returns DBI::dbListTables(con).
**new_generated_cohort_set**

**Value**

A character vector of table names

**Examples**

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
listTables(con, schema = "main")
## End(Not run)
```

---

**new_generated_cohort_set**

*Constructor for GeneratedCohortSet objects*

**Description**

This constructor function is to be used by analytic package developers to create generatedCohortSet objects.

**Usage**

```r
new_generated_cohort_set(
  cohort_ref,
  cohort_set_ref = NULL,
  cohort_attrition_ref = NULL,
  cohort_count_ref = NULL,
  overwrite = FALSE
)
```

```r
newGeneratedCohortSet(
  cohortRef,
  cohortSetRef = NULL,
  cohortAttritionRef = NULL,
  cohortCountRef = NULL,
  overwrite = FALSE
)
```

**Arguments**

- `cohort_ref`, `cohortRef`
  
  A `tbl_sql` object that points to a remote cohort table with the following first four columns: cohort_definition_id, subject_id, cohort_start_date, cohort_end_date. Additional columns are optional.
cohort_set_ref, cohortSetRef
A tbl_sql object that points to a remote table with the following first two columns: cohort_definition_id, cohort_name. Additional columns are optional. cohort_definition_id should be a primary key on this table and uniquely identify rows.

cohort_attrition_ref, cohortAttritionRef
A tbl_sql object that points to an attrition table in a remote database with the first column being cohort_definition_id.

cohort_count_ref, cohortCountRef
A tbl_sql object that points to a cohort_count table in a remote database with columns cohort_definition_id, cohort_entries, cohort_subjects.

overwrite
Should tables be overwritten if they already exist? TRUE or FALSE (default)

Details
A generatedCohort is a set of person-time from an OMOP CDM database. A generatedCohort can be represented by a table with three columns: subject_id, cohort_start_date, cohort_end_date. Subject_id is the same as person_id in the OMOP CDM. A generatedCohortSet is a collection of one or more generatedCohorts and can be represented as a table with four columns: cohort_definition_id, subject_id, cohort_start_date, cohort_end_date.

This constructor function defines the generatedCohortSet object in R.

The object is an extension of a tbl_sql object defined in dplyr. This is a lazy database query that points to a cohort table in the database with at least the columns cohort_definition_id, subject_id, cohort_start_date, cohort_end_date. The table could optionally have more columns as well.

In addition the generatedCohortSet object has three optional attributes. These are: cohort_set, cohort_attrition, cohort_count. Each of these attributes is also a lazy SQL query (tbl_sql) that points to a table in a database and is described below.

cohort_set:
cohort_set is a table with one row per cohort_definition_id. The first two columns of the cohort_set table are: cohort_definition_id, and cohort_name. Additional columns can be added. The cohort_set table is meant to store metadata about the cohort definition. Since this table is required it will be created if it is not supplied.

cohort_attrition:
cohort_attrition is an optional table that stores attrition information recorded during the cohort generation process such as how many persons were dropped at each step of inclusion rule application. The first column of this table should be cohort_definition_id but all other columns currently have no constraints.

cohort_count:
cohort_count is a option attribute table that records the number of records and the number of unique persons in each cohort in a generatedCohortSet. It is derived metadata that can be re-derived as long as cohort_set, the complete list of cohorts in the set, is available. Column names of cohort_count are: cohort_definition_id, number_records, number_subjects. This table is required for generatedCohortSet objects and will be created if not supplied.
Value

A generatedCohortSet object that is a tbl_sql reference to a cohort table in the write_schema of an OMOP CDM

Examples

```r
## Not run:
# This function is for developers who are creating generatedCohortSet
# objects in their packages. The function should accept a cdm_reference
# object as the first argument and return a cdm_reference object with the
# cohort table added. The second argument should be `name` which will be
# the prefix for the database tables, the name of the cohort table in the
# database and the name of the cohort table in the cdm object.
# Other optional arguments can be added after the first two.

generateCustomCohort <- function(cdm, name, ...) {
  # accept a cdm_reference object as input
  checkmate::assertClass(cdm, "cdm_reference")
  con <- attr(cdm, "dbcon")

  # Create the tables in the database however you like
  # All the tables should be prefixed with `name`
  # The cohort table should be called `name` in the database

  # Create the dplyr table references
  cohort_ref <- dplyr::tbl(con, name)
  cohort_set <- dplyr::tbl(con, paste0(name, ".set"))
  cohort_attrition_ref <- dplyr::tbl(con, paste0(name, ".attrition"))
  cohort_count_ref <- dplyr::tbl(con, paste0(name, ".count"))

  # add to the cdm
  cdm[[name]] <- cohort_ref

  # create the generated cohort set object using the constructor
  cdm[[name]] <- new_generated_cohort_set(
    cdm[[name]],
    cohort_set_ref = cohort_set_ref,
    cohort_attrition_ref = cohort_attrition_ref,
    cohort_count_ref = cohort_count_ref
  )

  return(cdm)
}

## End(Not run)
```

print.cdm_reference

Print a CDM reference object
Description

Print a CDM reference object

Usage

```r
## S3 method for class 'cdm_reference'
print(x, ...)
```

Arguments

- `x`: A `cdm_reference` object
- `...`: Included for compatibility with generic. Not used.

Value

Invisibly returns the input

---

**read_cohort_set**

*Read a set of cohort definitions into R*

Description

A "cohort set" is a collection of cohort definitions. In R this is stored in a dataframe with cohort_definition_id, cohort_name, and cohort columns. On disk this is stored as a folder with a CohortsToCreate.csv file and one or more json files. If the CohortsToCreate.csv file is missing then all of the json files in the folder will be used, cohort_definition_id will be automatically assigned in alphabetical order, and cohort_name will match the file names.

Usage

```r
read_cohort_set(path)
readCohortSet(path)
```

Arguments

- `path`: The path to a folder containing Circe cohort definition json files and optionally a csv file named CohortsToCreate.csv with columns cohortId, cohortName, and jsonPath.
recordCohortAttrition  Add attrition reason to a GeneratedCohortSet object

Description
Update the cohort attrition table with new counts and a reason for attrition.

Usage
recordCohortAttrition(cohort, reason, cohortId = NULL)

record_cohort_attrition(cohort, reason, cohortId = NULL)

Arguments
- cohort: A generated cohort set
- reason: The reason for attrition as a character string
- cohortId: Cohort definition id of the cohort you want to update the attrition

Value
The cohort object with the attributes created or updated.

[Experimental]

Examples
## Not run:
library(CDMConnector)
library(dplyr)

c <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
ccd <- cdm_from_con(con = c, cdm_schema = "main", write_schema = "main")
ccd <- generateConceptCohortSet(
  cdm = cdm, conceptSet = list(pharyngitis = 4112343), name = "new_cohort"
)

cohortSet(cdm$new_cohort)
cohortCount(cdm$new_cohort)
cohortAttrition(cdm$new_cohort)

cdm$new_cohort <- cdm$new_cohort %>%
  filter(cohort_start_date >= as.Date("2010-01-01"))

cdm$new_cohort <- updateCohortAttributes(
  cohort = cdm$new_cohort, reason = "Only events after 2010"
)

cohortSet(cdm$new_cohort)
cohortCount(cdm$new_cohort)
cohortAttrition(cdm$new_cohort)

## End(Not run)

---

**snapshot**

*Extract CDM metadata*

**Description**

Extract the name, version, and selected record counts from a cdm.

**Usage**

```r
snapshot(cdm)
```

**Arguments**

- `cdm`  
  A cdm object

**Value**

A named list of attributes about the cdm including selected fields from the cdm_source table and record counts from the person and observation_period tables

**Examples**

```r
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, "main")
snapshot(cdm)

DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)
```

---

**stow**

*Collect a list of lazy queries and save the results as files*

**Description**

Collect a list of lazy queries and save the results as files

**Usage**

```r
stow(cdm, path, format = "parquet")
```
Arguments

- **cdm**: A cdm object
- **path**: A folder to save the cdm object to
- **format**: The file format to use: "parquet" (default), "csv", "feather" or "duckdb".

Value

Invisibly returns the cdm input

Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), dbdir = eunomia_dir())
vocab <- cdm_from_con(con, "main") %>%
  cdm_select_tbl("concept", "concept_ancestor")
  stow(vocab, here::here("vocab_tables"))
DBI::dbDisconnect(con, shutdown = TRUE)
## End(Not run)
```

summarise_quantile

Quantile calculation using dbplyr

Description

This function provides DBMS independent syntax for quantiles estimation. Can be used by itself or in combination with `mutate()` when calculating other aggregate metrics (min, max, mean).

`summarise_quantile()`, `summarize_quantile()`, `summariseQuantile()` and `summarizeQuantile()` are synonyms.

Usage

```r
summarise_quantile(.data, x = NULL, probs, name_suffix = "value")
summarize_quantile(.data, x = NULL, probs, name_suffix = "value")
summariseQuantile(.data, x = NULL, probs, nameSuffix = "value")
summarizeQuantile(.data, x = NULL, probs, nameSuffix = "value")
```

Arguments

- **.data**: lazy data frame backed by a database query.
- **x**: column name whose sample quantiles are wanted.
- **probs**: numeric vector of probabilities with values in [0,1].
- **name_suffix**, **nameSuffix**: character; is appended to numerical quantile value as a column name part.
Details

Implemented quantiles estimation algorithm returns values analogous to `quantile(stats)` with argument type = 1. See discussion in Hyndman and Fan (1996). Results differ from `PERCENTILE_CONT` natively implemented in various DBMS, where returned values are equal to `quantile(stats)` with default argument type = 7.

Value

An object of the same type as `'.data'`

Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb())
mtcars_tbl <- dplyr::copy_to(con, mtcars, name = "tmp", overwrite = TRUE, temporary = TRUE)

df <- mtcars_tbl %>%
dplyr::group_by(cyl) %>%
dplyr::mutate(mean = mean(mpg, na.rm = TRUE)) %>%
  summarise_quantile(mpg, probs = c(0, 0.2, 0.4, 0.6, 0.8, 1),
                     name_suffix = "quant") %>%
dplyr::collect()

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```

**tbl_group**

*CDM table selection helper*

Description

The OMOP CDM tables are grouped together and the tbl_group function allows users to easily create a CDM reference including one or more table groups.

Usage

```r
tbl_group(group)
tblGroup(group)
```

Arguments

- `group`: A character vector of CDM table groups: "vocab", "clinical", "all", "default", "derived".
Details

The "default" table group is meant to capture the most commonly used set of CDM tables. Currently the "default" group is: person, observation_period, visit_occurrence, visit_detail, condition_occurrence, drug_exposure, procedure_occurrence, device_exposure, measurement, observation, death, note, note_nlp, specimen, fact_relationship, location, care_site, provider, payer_plan_period, cost, drug_era, dose_era, condition_era, concept, vocabulary, concept_relationship, concept_ancestor, concept_synonym, drug_strength

Value

A character vector of CDM tables names in the groups

Examples

```r
## Not run:
con <- DBI::dbConnect(RPostgres::Postgres(),
dbname = "cdm",
host = "localhost",
user = "postgres",
password = Sys.getenv("PASSWORD"))

cdm <- cdm_from_con(con) %>%
  cdm_select_tbl(tbl_group("vocab"))

## End(Not run)
```

union_cohorts

Union all cohorts in a single cohort table

Description

Union all cohorts in a single cohort table

Usage

```r
union_cohorts(x, cohort_definition_id = 1L)

unionCohorts(x, cohort_definition_id = 1L)
```

Arguments

- `x` A tbl reference to a cohort table
- `cohort_definition_id` A number to use for the new cohort_definition_id

[Superseded]
validate_cdm

**Value**
A lazy query that when executed will resolve to a new cohort table with one cohort_definition_id resulting from the union of all cohorts in the original cohort table.

---

uniqueTableName  
Create a unique table name for temp tables

---

**Description**
Create a unique table name for temp tables

**Usage**

```r
uniqueTableName()
unique_table_name()
```

**Value**
A string that can be used as a dbplyr temp table name

---

validate_cdm  
Validation report for a CDM

---

**Description**
Print a short validation report for a cdm object. The validation includes checking that column names are correct and that no tables are empty. A short report is printed to the console. This function is meant for interactive use.

**Usage**

```r
validate_cdm(cdm)
validateCdm(cdm)
```

**Arguments**

cdm  
A cdm reference object.

**Value**
Invisibly returns the cdm input
Examples

```r
## Not run:
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, cdm_schema = "main")
validate_cdm(cdm)
DBI::dbDisconnect(con)

## End(Not run)
```

---

### version

**Get the CDM version**

#### Description

Extract the CDM version attribute from a cdm_reference object

#### Usage

```r
version(cdm)
```

#### Arguments

- `cdm` A cdm object

#### Value

"5.3" or "5.4"

#### Examples

```r
## Not run:
library(CDMConnector)
con <- DBI::dbConnect(duckdb::duckdb(), eunomia_dir())
cdm <- cdm_from_con(con, "main")
version(cdm)

DBI::dbDisconnect(con, shutdown = TRUE)

## End(Not run)
```
Description
Subset a cdm reference object

Usage
```r
## S3 method for class 'cdm_reference'
x[i]
```

Arguments
- `x` A cdm reference
- `i` The name or index of the table to extract from the cdm object

Value
A single cdm table reference
### Description
Subset a cdm reference object

### Usage
```r
## S3 method for class 'cdm_reference'
x$name
```

### Arguments
- **x**: A cdm reference
- **name**: The name of the table to extract from the cdm object

### Value
A single cdm table reference
