Package ‘ChemoSpec’

October 22, 2022

Type Package

Title Exploratory Chemometrics for Spectroscopy

Version 6.1.4

Date 2022-10-21

Description A collection of functions for top-down exploratory data analysis of spectral data including nuclear magnetic resonance (NMR), infrared (IR), Raman, X-ray fluorescence (XRF) and other similar types of spectroscopy. Includes functions for plotting and inspecting spectra, peak alignment, hierarchical cluster analysis (HCA), principal components analysis (PCA) and model-based clustering. Robust methods appropriate for this type of high-dimensional data are available. ChemoSpec is designed for structured experiments, such as metabolomics investigations, where the samples fall into treatment and control groups. Graphical output is formatted consistently for publication quality plots. ChemoSpec is intended to be very user friendly and to help you get usable results quickly. A vignette covering typical operations is available.

License GPL-3

Depends R (>= 3.5), ChemoSpecUtils (>= 1.0)

Imports plyr, stats, utils, grDevices, reshape2, readJDX (>= 0.6), patchwork, ggplot2, plotly, magrittr

Suggests IDPmisc, knitr, js, NbClust, lattice, baseline, mclust, pls, clusterCrit, R.utils, RColorBrewer, seriation, MASS, grid, pcaPP, jsonlite, signal, speaq, tinytest, elasticnet, irlba, rmarkdown, bookdown, chemometrics, hyperSpec, amap, robustbase, gsubfn

ChemoSpec-package

Description

A collection of functions for top-down exploratory data analysis of spectral data obtained via nuclear magnetic resonance (NMR), infrared (IR) or Raman spectroscopy. Includes functions for plotting and inspecting spectra, peak alignment, hierarchical cluster analysis (HCA), principal components analysis (PCA) and model-based clustering. Robust methods appropriate for this type of high-dimensional data are available. ChemoSpec is designed with metabolomics data sets in mind, where the samples fall into groups such as treatment and control. Graphical output is formatted consistently for publication quality plots. ChemoSpec is intended to be very user friendly and help you get usable results quickly. A vignette covering typical operations is available.

# Internal Functions
aovPCAloadings  

Plot aovPCA scores Loadings of a Spectra Object

Description
Uses the results from aovPCA scores to plot the corresponding loadings.

Usage
aovPCAloadings(spectra, PCA, submat = 1, loads = 1, ref = 1, ...)

Arguments
spectra An object of S3 class Spectra.
PCA List of pca results created by aov_pcaSpectra.
submat Integer. Selects list element submat from PCA which is a list of PCA results, each corresponding to the computation in aov_pcaSpectra.
loads An integer vector giving the loadings to plot.
ref An integer specifying the reference spectrum to plot, which appears at the bottom of the plot.
... Parameters to be passed to the plotting routines. Applies to base graphics only.

Value
The returned value depends on the graphics option selected (see GraphicsOptions).

base: None. Side effect is a plot.
ggplot2: The plot is displayed, and a ggplot2 plot object is returned if the value is assigned. The plot can be modified in the usual ggplot2 manner.

Author(s)
Bryan A. Hanson (DePauw University), Matthew J. Keinsley.

References

See Also
An example using this function can be seen in aov_pcaSpectra. See also plotLoadings. Additional documentation at https://bryanhanson.github.io/ChemoSpec/
Uses the results from `aov_pcaSpectra` to plot the scores. Argument `submat` is used to select PCA results from among those stored in argument `PCA`.

**Usage**

```r
aovPCAscores(
  spectra,
  so,
  submat = 1,
  ellipse = "none",
  tol = "none",
  use.sym = FALSE,
  leg.loc = "topright",
  ...
)
```

**Arguments**

- `spectra`: An object of S3 class `Spectra`.
- `so`: List of pca results created by `aov_pcaSpectra`.
- `submat`: Integer. Selects list element `submat` from `PCA` which is a list of PCA results, each corresponding to the computation in `aov_pcaSpectra`.
- `ellipse`: A character vector specifying the type of ellipses to be plotted. One of `c("both", "none", "cls", "rob")`. `cls` specifies classical confidence ellipses, `rob` specifies robust confidence ellipses. An ellipse is drawn for each group unless there are three or fewer samples in the group.
- `tol`: A number describing the fraction of points to be labeled. `tol = 1.0` labels all the points; `tol = 0.05` labels approximately the most extreme 5 percent. Set to "none" to completely suppress labels. Note that a simple approach based upon quantiles is used, assumes that both x and y are each normally distributed, and treats x and y separately. Thus, this is not a formal treatment of outliers, just a means of labeling points. Groups are lumped together.
- `use.sym`: A logical; if TRUE, the color scheme is set to black and the points plotted with symbols. Applies only to `Spectra` objects.
- `leg.loc`: Character; if "none" no legend will be drawn. Otherwise, any string acceptable to `legend`.
- `...`: Additional parameters to be passed to `plotScores`. For example, you can plot confidence ellipses this way. Note that ellipses are drawn based on the groups in `spectra$groups`, but the separation done by `aov_pcaSpectra` is based on argument `fac`. These may not correspond, but you can edit `spectra$groups` to match if necessary.
Value

The returned value depends on the graphics option selected (see GraphicsOptions).

**base:** A data frame or list containing the data plotted. Assign the value and run `str()` or `names()` on it to see what it contains. Side effect is a plot.

**ggplot2:** The plot is displayed, and a ggplot2 plot object is returned if the value is assigned. The plot can be modified in the usual ggplot2 manner. If you want the plotted values, you can access them via the base graphics mode.

---

**aov_pcaSpectra**  
ANOVA-PCA Analysis of Spectra Data

**Description**

ANOVA-PCA is a combination of both methods developed by Harrington. The data is partitioned into submatrices corresponding to each experimental factor, which are then subjected to PCA separately after adding the residual error back. If the effect of a factor is large compared to the residual error, separation along the 1st PC in the score plot should be evident. With this method, the significance of a factor can be visually determined (ANOVA-PCA is not blind to group membership). ANOVA-PCA with only one factor is the same as standard PCA and gives no additional separation.

**Usage**

```r
aov_pcaSpectra(spectra, fac, type = "class", choice = NULL, showNames = TRUE)
```
Arguments

- `spectra`: An object of S3 class `Spectra`.
- `fac`: A vector of character strings giving the factors to be used in the analysis. These should be elements of `Spectra`. Note that there should be 2 or more factors, because ANOVA-PCA on one factor is the same as standard PCA. See the example.
- `type`: Either classical ("cls") or robust ("rob"): Results in either `c_pcaSpectra` or `r_pcaSpectra` being called on the `Spectra` object.
- `choice`: The type of scaling to be performed. See `c_pcaSpectra` and `r_pcaSpectra` for details.
- `showNames`: Logical. Show the names of the submatrices in the console.

Value

A list of PCA results, one for each computed submatrix.

Author(s)

Bryan A. Hanson (DePauw University), Matthew J. Keinsley.

The output of this function is used in functions `aovPCAscores` and `aovPCAloadings`. Additional documentation at [https://bryanhanson.github.io/ChemoSpec/](https://bryanhanson.github.io/ChemoSpec/)

Examples

```r
## Not run:
# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")
data(metMUD2)

# Original factor encoding:
levels(metMUD2$groups)

# Split those original levels into 2 new ones (re-code them)
new.grps <- list(geneBb = c("B", "b"), geneCc = c("C", "c"))
mM3 <- splitSpectraGroups(metMUD2, new.grps)

# run aov_pcaSpectra
PCAs <- aov_pcaSpectra(mM3, fac = c("geneBb", "geneCc"))
```
averageReplicates

**Average Replicates in a Spectra Object**

**Description**

Average the replicates in a **Spectra** object and return a new Spectra object with fewer samples. One should probably not do this until each individual sample has been visualized for quality control, in case it is a potential outlier.

**Usage**

`averageReplicates(spectra, uniq)`

**Arguments**

- **spectra**: An object of S3 class **Spectra** to be processed.
- **uniq**: Character. A character vector containing strings representing unique sample identifiers. The sample names will be searched for these strings, and all samples matching a given string will be averaged and put into a new Spectra object. For example, consider the case where samples are named `S_1_01, S_1_02, ...; S_2_01, S_2_02, ...` where `_01` and so forth signifies replicates of a particular sample. With `uniq = c("S_1", "S_2")` all `S_1` replicates will be averaged and all `S_2` replicates will be averaged. N.B. the strings will be used as regex pattern and grepped.

**Value**

An object of S3 class **Spectra**.
baselineSpectra

Author(s)

Bryan A. Hanson (DePauw University)

Examples

data(SrE.IR)
averaged <- averageReplicates(SrE.IR, uniq = c("EPO", "00", "adSrE", "pSrE"))
sumSpectra(SrE.IR)
sumSpectra(averaged)

baselineSpectra  
Baseline Correction of a Spectra Object

Description

This function mostly wraps functions in package baseline which carries out a variety of baseline correction routines. A simple linear correction method is also available.

Usage

baselineSpectra(spectra, int = TRUE, retC = FALSE, show = 1, ...)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spectra</td>
<td>An object of S3 class Spectra.</td>
</tr>
<tr>
<td>int</td>
<td>Logical; if TRUE, do the correction interactively using widgets. No results are saved. Use this for inspection and exploration only.</td>
</tr>
<tr>
<td>retC</td>
<td>Logical: shall the baseline-corrected spectra be returned in the Spectra object?</td>
</tr>
<tr>
<td>show</td>
<td>Integer. A vector giving the sample numbers for which you wish to see the results of the baseline correction. By &quot;sample numbers&quot; we mean the rows in the spectra$data matrix. To find a specific sample type spectra$names to see which row contains that sample. To see all samples, use show = 1:nrow(spectra$data) where spectra is the name of your particular Spectra object.</td>
</tr>
<tr>
<td>...</td>
<td>Other arguments passed downstream. The relevant ones can be found in baseline. Be sure to pay attention to argument method as you will probably want to use it. You can also use method = &quot;linear&quot; for a simple linear fit, see Details.</td>
</tr>
</tbody>
</table>

Details

In plots using methods from the baseline package, the x axis ticks give the data point index, not the original values from your data. Note that you cannot zoom the non-interactive display of corrected spectra because the underlying function hardwires the display. Try the interactive version instead (int = TRUE), or use plotSpectra on the corrected data. In addition to the methods provided by baseline, you can also use method = "linear". This correction is handled locally, and is very simple: a line is drawn from the first data point to the last, and this becomes the new baseline. This is most suitable for cases in which the baseline rises or falls steadily, as is often seen in chromatograms.
Value

If `int = TRUE`, an interactive plot is created. If `int = FALSE` and `retC = FALSE`, an object of class `baseline` is returned (see `baseline-class`). If `int = FALSE` and `retC = TRUE`, a `Spectra` object containing the corrected spectra is returned. In these latter two cases plots are also drawn.

Author(s)

Bryan A. Hanson (DePauw University)

See Also

Additional documentation at https://bryanhanson.github.io/ChemoSpec/

Examples

```r
data(SrE.IR)
temp <- baselineSpectra(SrE.IR, int = FALSE, method = "modpolyfit")
```

---

**binSpectra**  
*Bin or Bucket a Spectra Object*

Description

This function will bin a `Spectra` object by averaging every `bin.ratio` frequency values, and summing the corresponding intensity values. The net effect is a smoothed and smaller data set. If there are gaps in the frequency axis, each data chunk is processed separately. Note: some folks refer to binning as bucketing.

Usage

```r
binSpectra(spectra, bin.ratio)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spectra</code></td>
<td>An object of S3 class <code>Spectra</code> to be binned.</td>
</tr>
<tr>
<td><code>bin.ratio</code></td>
<td>An integer giving the binning ratio, that is, the number of points to be grouped together into one subset of data.</td>
</tr>
</tbody>
</table>

Details

If the frequency range is not divisible by `bin.ratio` to give a whole number, data points are removed from the beginning of the frequency data until it is, and the number of data points removed is reported at the console. If there are gaps in the data where frequencies have been removed, each continuous piece is sent out and binned separately (by `binSpectra`).
check4Gaps

Value

An object of S3 class Spectra.

Author(s)

Bryan A. Hanson (DePauw University)

See Also

Additional documentation at https://bryanhanson.github.io/ChemoSpec/

Examples

data(metMUD1)
sumSpectra(metMUD1)
res <- binSpectra(metMUD1, bin.ratio = 4)
sumSpectra(res)

check4Gaps

Check for Discontinuities (Gaps) in a Vector & Optionally Make a Plot

Description

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via check4Gaps.

chkGraphicsOpt

Check the Graphics Output Option/Mode

Description

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via chkGraphicsOpt.

chkSpectra

Verify the Integrity of a Spectra or Spectra2D Object

Description

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via chkSpectra.
clupaSpectra

Hierarchical Cluster-Based Peak Alignment on a Spectra Object

Description

This function is a wrapper to several functions in the speaq package. It implements the CluPA algorithm described in the reference.

Usage

clupaSpectra(spectra, bT = NULL, ...)

Arguments

- **spectra**: An object of S3 class Spectra.
- **bT**: Numeric. The baseline threshold. Defaults to five percent of the range of the data, in spectra$data. Passed to detectSpecPeaks.
- **...**: Other arguments to be passed to the underlying functions.

Value

A modified Spectra object.

Author(s)

Bryan A. Hanson (DePauw University)

Examples

# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")
data(alignMUD)

p1 <- plotSpectra(alignMUD, which = 1:20, lab.pos = 4.5, offset = 0.1,
yrange = c(0, 5000), amp = 500)
p1 <- p1 + ggtitle("Misaligned NMR Spectra") +
    coord_cartesian(xlim = c(1.5, 1.8), ylim = c(0, 1900))
p1

aMUD <- clupaSpectra(alignMUD)

p2 <- plotSpectra(aMUD, which = 1:20, lab.pos = 4.5, offset = 0.1,
yrange = c(0, 5000), amp = 500)
p2 <- p2 + ggtitle("Aligned NMR Spectra") +
    coord_cartesian(xlim = c(1.5, 1.8), ylim = c(0, 1900))
p2

colorSymbol  

---

**Color and Symbols in ChemoSpec and ChemoSpec2D**

**Description**

This help page serves both ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via `colorSymbol`.

---

**conColScheme**  

---

**Change the Color Scheme of a Spectra or Spectra2D Object**

**Description**

This help page serves both ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via `conColScheme`.

---

**cv_pcaSpectra**  

---

**Cross-Validation of Classical PCA Results for a Spectra Object**

**Description**

This function carries out classical PCA on the data in a `Spectra` object using a cross-validation method. A simple re-write of Peter Filzmoser’s `pcaCV` method with some small plotting changes.

**Usage**

```r
    cv_pcaSpectra(
      spectra,
      pcs,
      choice = "noscale",
      repl = 50,
      segments = 4,
      segment.type = c("random", "consecutive", "interleaved"),
      length.seg,
      trace = FALSE,
      ...
    )
```
cv_pcaSpectra

Arguments

- **spectra**: An object of S3 class `Spectra`.
- **pcs**: As per `pcaCV` where it is called amax; an integer giving the number of PC scores to include.
- **choice**: A character string indicating the choice of scaling. One of c("noscale", "autoscale", "Pareto").
- **repl**: As per `pcaCV`; the number of replicates to perform.
- **segments**: As per `pcaCV`.
- **segment.type**: As per `pcaCV`.
- **length.seg**: As per `pcaCV`.
- **trace**: As per `pcaCV`.
- **...**: Parameters to be passed to the plotting routines.

Value

Invisibly, a list as described in `pcaCV`. Side effect is a plot.

Author(s)

Bryan A. Hanson, DePauw University. Derived from `pcaCV`.

References

See Also

- `pcaCV` for the underlying function. Additional documentation at https://bryanhanson.github.io/ChemoSpec/

Examples

```r
data(SrE.IR)
pca <- cv_pcaSpectra(SrE.IR, pcs = 5)
```
**c_pcaSpectra**

*Classical PCA of Spectra Objects*

**Description**

A wrapper which carries out classical PCA analysis on a Spectra object. The user can select various options for scaling. There is no normalization by rows - do this manually using normSpectra. There is an option to control centering, but this is mainly for compatibility with the aov_pcaSpectra series of functions. Centering the data should always be done in PCA and it is the default here.

**Usage**

c_pcaSpectra(spectra, choice = "noscale", cent = TRUE)

**Arguments**

- **spectra**: An object of S3 class Spectra.
- **choice**: A character string indicating the choice of scaling. One of c("noscale", "autoscale", "Pareto"). "autoscale" is called "standard normal variate" or "correlation matrix PCA" in some literature.
- **cent**: Logical: whether or not to center the data. Always center the data unless you know it to be already centered.

**Details**

The scale choice autoscale scales the columns by their standard deviation. Pareto scales by the square root of the standard deviation.

**Value**

An object of class prcomp, modified to include a list element called $method, a character string describing the pre-processing carried out and the type of PCA performed (used to annotate plots).

**Author(s)**

Bryan A. Hanson (DePauw University)

**References**

**See Also**

prcomp for the underlying function, s_pcaSpectra for sparse PCA calculations, r_pcaSpectra for robust PCA calculations, irlba_pcaSpectra for PCA via the IRLBA algorithm. Additional documentation at https://bryanhanson.github.io/ChemoSpec/
Examples

## Not run:
# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")
data(metMUD1)
pca <- c_pcaSpectra(metMUD1)

p1 <- plotScree(pca)
p1

p2 <- plotScores(metMUD1, pca, pcs = c(1, 2), ellipse = "cls", tol = 0.05)
p2 <- p2 + ggtitle("Scores: metMUD1 NMR Data")
p2

p3 <- plotLoadings(metMUD1, pca, loads = 1:2, ref = 1)
p3 <- p3 + ggtitle("Loadings: metMUD1 NMR Data")
p3

## End(Not run)

evalClusters

**Evaluate or Compare the Quality of Clusters Quantitatively**

description

This function is a wrapper to two functions: intCriteria function in package clusterCrit, and NbClust in package NbClust. It can be used to quantitatively compare different clustering options.

Usage

evalClusters(
  spectra,
  pkg = "NbClust",
  hclst = NULL,
  k = NULL,
  h = NULL,
  crit = "Dunn",
  ...
)

Arguments

- spectra: An object of S3 class Spectra.
- pkg: Character. One of c("NbClust", "clusterCrit"). The package to use for comparing clusters.
- hclst: An object of S3 class hclust. Only applies to pkg = "clusterCrit".

### evalClusters

- **k**
  - Integer. The number of groups in which to cut the tree (hclust). Only applies to pkg = "clusterCrit".

- **h**
  - Numeric. The height at which to cut the tree. Either k or h must be given, with k taking precedence. See cutree. Only applies to pkg = "clusterCrit".

- **crit**
  - String. A string giving the criteria to be used in evaluating the quality of the cluster. See liintCriteria. Only applies to pkg = "clusterCrit".

- **...**
  - Other parameters to be passed to the functions. In particular, the default NbClust package will need some parameters. See the example.

### Details

Both of the packages used here compute very similar quantities. For details, see the publication and respective vignettes. Package **clusterCrit** takes the approach in which you cluster in a separate step using whatever parameters you like, then the tree is cut either at a given height or in such a way as to produce a fixed number of groups. One or more indices are then computed. Then, you repeat this process with different clustering criteria, and compare. Package **NbClust** allows one to specify a range of possible number of clusters and a few other parameters and will return indices corresponding to each set options, which is somewhat more automated.

### Value

A list giving the results, as described in intCriteria or NbClust.

### Author(s)

Bryan A. Hanson (DePauw University)

### References

### See Also

- hclust for the underlying base function.  
- hcaSpectra for HCA analysis of a Spectra object.  
- hcaScores for HCA analysis of PCA scores from a Spectra object.  

Additional documentation at https://bryanhanson.github.io/ChemoSpec/

### Examples

```r
## Not run:
data(metMUD2)

# Using clusterCrit
res1 <- hcaSpectra(metMUD2) # default clustering and distance methods
res2 <- hcaSpectra(metMUD2, d.method = "cosine")
# The return value from hcaSpectra is a list with hclust as the first element.
crit1 <- evalClusters(metMUD2, pkg = "clusterCrit", hclst = res1[[1]], k = 2)
crit2 <- evalClusters(metMUD2, pkg = "clusterCrit", hclst = res2[[1]], k = 2)
```
# crit1 and crit2 can now be compared.

# Using NbClust
res3 <- evalClusters(metMUD2, min.nc = 2, max.nc = 5, method = "average", index = "kl")

## End(Not run)

---

files2SpectraObject  
**Import Data into a Spectra Object**

**Description**

These functions import data into a Spectra object. For "csv-like" files they use `read.table`, so they are very flexible in regard to file formatting. **Be sure to see the …argument below for important details you need to provide.** files2SpectraObject can also read JCAMP-DX files and will do so if `fileExt` is any of "dx", "DX", "jdx" or "JDX".

**Usage**

```r
files2SpectraObject(
  gr.crit = NULL,
  gr.cols = "auto",
  freq.unit = "no frequency unit provided",
  int.unit = "no intensity unit provided",
  descrip = "no description provided",
  fileExt = "\.(csv|CSV)$",
  out.file = "mydata",
  debug = FALSE,
  ...
)
```

```r
matrix2SpectraObject(
  gr.crit = NULL,
  gr.cols = c("auto"),
  freq.unit = "no frequency unit provided",
  int.unit = "no intensity unit provided",
  descrip = "no description provided",
  in.file = NULL,
  out.file = "mydata",
  chk = TRUE,
  ...
)
```

**Arguments**

- `gr.crit`  
  Group Criteria. A vector of character strings which will be searched for among the file/sample names in order to assign an individual spectrum to group membership. This is done using grep, so characters like "." (period/dot) do not have
files2SpectraObject

their literal meaning (see below). Warnings are issued if there are file/sample names that don’t match entries in gr.crit or there are entries in gr.crit that don’t match any file names.

**gr.cols** Group Colors. See colorSymbol for some options. One of the following:

- Legacy behavior and the default: The word "auto", in which case up to 8 colors will be automatically assigned from package RColorBrewer Set1.
- "Col7". A unique set of up to 7 colorblind-friendly colors is used.
- "Col8". A unique set of up to 8 colors is used.
- "Col12". A mostly paired set of up to 12 colors is used.
- A vector of acceptable color designations with the same length as gr.crit. Colors will be assigned one for one, so the first element of gr.crit is assigned the first element of gr.col and so forth. For Col12 you should pay careful attention to the order of gr.crit in order to match up colors.

**freq.unit** A character string giving the units of the x-axis (frequency or wavelength).

**int.unit** A character string giving the units of the y-axis (some sort of intensity).

**descrip** A character string describing the data set that will be stored. This string is used in some plots so it is recommended that its length be less than about 40 characters.

**fileExt** A character string giving the extension of the files to be processed. regex strings can be used. For instance, the default finds files with either ".csv" or ".CSV" as the extension. Matching is done via a grep process, which is greedy. See also the "Advanced Tricks" section.

**out.file** A file name. The completed object of S3 class Spectra will be written to this file.

**debug** Logical. Applies to files2SpectraObject only. Set to TRUE for troubleshooting when an error is thrown during import. In addition, values of 1-5 will work when importing a JCAMP-DX file via fileExt = ".jdx" etc. These will be passed through to the readJDX function. See there for much more info on importing JCAMP-DX files.

... Arguments to be passed to read.table, list.files or readJDX; see the "Advanced Tricks" section. For read.table, **You MUST supply values for sep, dec and header consistent with your file structure, unless they are the same as the defaults for read.table.**

**in.file** Character. Applies to matrix2SpectraObject only. Input file name, including extension. Can be a vector of file names.

**chk** Logical. Applies to matrix2SpectraObject only. Should the Spectra object be checked for integrity? If you are having trouble importing your data, set this to FALSE and do str(your object) to troubleshoot.

**Value**

A object of class Spectra. An unnamed object of S3 class Spectra is also written to out.file. To read it back into the workspace, use new.name <- loadObject(out.file) (loadObject is package R.utils).
Functions

- files2SpectraObject(): Import data from separate csv files
- matrix2SpectraObject(): Import a matrix of data

files2SpectraObject

files2SpectraObject acts on all files in the current working directory with the specified fileExt so there should be no extra files of that type hanging around (except see next paragraph). The first column should contain the frequency values and the second column the intensity values. The files may have a header or not (supply header = TRUE/FALSE as necessary). The frequency column is assumed to be the same in all files.

If fileExt contains any of "dx", "DX", "jdx" or "JDX", then the files will be processed by readJDX. Consider setting debug = TRUE, or debug = 1 etc for this format, as there are many options for JCAMP, and many are untested. See readJDX for options and known limitations.

matrix2SpectraObject

This function takes one or more csv-like files, containing frequencies in the first column, and samples in additional columns, and processes it into a Spectra object. The file MUST have a header row which includes the sample names. There need not be a header for the first (frequency) column. If more than one file given, they must all have the same frequency entries.

gr.crit and Sample Name Gotchas

The matching of gr.crit against the sample file names (in files2SpectraObject) or column headers/sample names (in codematrix2SpectraObject) is done one at a time, in order, using grep. While powerful, this has the potential to lead to some "gotchas" in certain cases, noted below.

Your file system may allow file/sample names which R will not like, and will cause confusing behavior. File/sample names become variables in ChemoSpec, and R does not like things like "." (minus sign or hyphen) in file/sample names. A hyphen is converted to a period ("."), if found, which is fine for a variable name. However, a period in gr.crit is interpreted from the grep point of view, namely a period matches any single character. At this point, things may behave very differently than one might hope. See make.names for allowed characters in R variables and make sure your file/sample names comply.

The entries in gr.crit must be mutually exclusive. For example, if you have files with names like "Control_1" and "Sample_1" and use gr.crit = c("Control", "Sample") groups will be assigned as you would expect. But, if you have file names like "Control_1_Shade" and "Sample_1_Sun" you can't use gr.crit = c("Control", "Sample", "Sun", "Shade") because each criteria isgrepped in order, and the "Sun/Shade" phrases, being last, will form the basis for your groups. Because this is a grep process, you can get around this by using regular expressions in your gr.crit argument to specify the desired groups in a mutually exclusive manner. In this second example, you could use gr.crit = c("Control(.*)Sun", "Control(.*)Shade", "Sample(.*)Sun", "Sample(.*)Shade") to have your groups assigned based upon both phrases in the file names.

To summarize, gr.crit is used as a grep pattern, and the file/sample names are the target. Make sure your file/sample names comply with make.names.

Finally, samples whose names are not matched using gr.crit are still incorporated into the Spectra object, but they are not assigned a group or color. Therefore they don’t plot, but they do take up
files2SpectraObject

space in a plot! A warning is issued in these cases, since one wouldn’t normally want a spectrum to be orphaned this way.

All these problems can generally be identified by running `sumSpectra` once the data is imported.

### Advanced Tricks

The `...` argument can be used to pass any argument to `read.table` or `list.files`. This includes the possibility of passing arguments that will cause trouble later, for instance `na.strings` in `read.table`. While one might successfully read in data with NA, it will eventually cause problems. The intent of this feature is to allow one to recurse a directory tree containing the data, and/or to specify a starting point other than the current working directory. So for instance if the current working directory is not the directory containing the data files, you can use `path = "my_path"` to point to the desired top-level directory, and `recursive = TRUE` to work your way through a set of subdirectories. In addition, if you are reading in JCAMP-DX files, you can pass arguments to `readJDX` via `...`, e.g. `SOFC = FALSE`. Finally, while argument `fileExt` appears to be a file extension (from its name and the description elsewhere), it’s actually just a grep pattern that you can apply to any part of the file name if you know how to construct the proper pattern.

### Examples

```r
## Not run:
# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")

wd <- getwd() # save current location
setwd(tempdir())
# Grab an included file & move to a temporary directory
tf <- system.file("extdata/PCRF.jdx", package = "ChemoSpec")
chk <- file.copy(from = tf, to = basename(tf))
# Now read in the file, summarize and plot
spec <- files2SpectraObject(  
gr.crit = "PCRF", freq.unit = "ppm", int.unit = "intensity",  
  descrip = "test import", fileExt = "\.jdx")
sumSpectra(spec)
p <- plotSpectra(spec, lab.pos = 3.5, main = "Reduced Fat Potato Chip")
p <- p + ggtitle("Reduced Fat Potato Chip")
p
setwd(wd) # restore working directory

## End(Not run)
```
hcaScores  

_HCA on PCA/MIA/PARAFAC scores from a Spectra or Spectra2D Object_

**Description**

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via hcaScores.

hcaSpectra  

_Plot HCA Results of a Spectra Object_

**Description**

A wrapper which carries out HCA and plots a dendrogram colored by the information in a Spectra object. Many methods for computing the clusters and distances are available.

**Usage**

```r
hcaSpectra(
  spectra,  
  c.method = "complete",  
  d.method = "euclidean",  
  use.sym = FALSE,  
  leg.loc = "topright",  
  ...  
)
```

**Arguments**

- **spectra** An object of S3 class Spectra.
- **c.method** A character string describing the clustering method; must be acceptable to hclust.
- **d.method** A character string describing the distance calculation method; must be acceptable as a method in rowDist.
- **use.sym** A logical; if true, use no color and use lower-case letters to indicate group membership.
- **leg.loc** Character; if "none" no legend will be drawn. Otherwise, any string acceptable to legend.
- **...** Other parameters to be passed to the plotting functions.
**hmapSpectra**

**Value**

A list, containing an object of class `hclust` and an object of class `dendrogram`. The side effect is a plot.

**Author(s)**

Bryan A. Hanson (DePauw University)

**See Also**

* `hclust` for the underlying function. `hcaScores` for similar analysis of PCA scores from a `Spectra` object. Additional documentation at https://bryanhanson.github.io/ChemoSpec/

**Examples**

```r
data(SrE.IR)
myt <- expression(bolditalic(Serenoa) ~ bolditalic(repens) ~ bold(IR ~ Spectra))
res <- hcaSpectra(SrE.IR, main = myt)
```

**Description**

Creates a heat map with marginal dendrograms using seriation procedures. Hierarchical cluster analysis is followed by re-ordering the clusters in a coordinated way across each dimension (controlled by argument `method`, see `hmap`). The vignette for package `seriation` has more details.

**Usage**

```r
hmapSpectra(spectra, ...)
```

**Arguments**

- `spectra` An object of S3 class `Spectra`.
- `...` Additional arguments to be passed downstream. A great deal of control is available - check `hmap` for details. Most of the control actually derives from the `heatmap` function in package `stats`. See the examples.

**Value**

A list as described in `hmap`. Side effect is a plot.
Note

The underlying stats::heatmap function does certain things automatically for the user. For instance, if you pass a vector of names to argument row_labels it is automatically reordered using the rowInd vector that is computed. The user does not need to do the reordering. Another example is the labeling of the columns. The labels are automatically turned 90 degrees, and not every column is labeled to keep things readable.

Interpretation

Looking at the 2nd hmapSpectra example, and keeping in mind the nature of the sample (see SrE.IR), the most similar samples based on the ester peaks (~1740), are in the lower right corner of the heatmap. These are the two outlier samples, composed of triglycerides which contain the ester functional group (and no detectable carboxylic acid). The most similar samples based on the carboxylic acid peaks (~1710) are in the upper left corner. These samples are mostly from the "pure" extract group, according to the manufacturer's label. These samples have a modest to low amount of the ester functional group, which indicates dilution (or adulteration if you like). In fact, the first two samples (NP_adSrE and NR_pSrE) are the two samples with the smallest ester peaks (see first plot in the examples). This suggests that NP_adSrE was diluted only a little with added olive oil.

hmap which will get you to the package (there is no package index page); the vignette is a good place to begin (browseVignettes("seriation")). Additional documentation at https://bryanhanson.github.io/ChemoSpec/

Examples

data(SrE.IR)

# Let's look just at the carbonyl region
IR <- removeFreq(SrE.IR, rem.freq = SrE.IR$freq > 1775 | SrE.IR$freq < 1660)
p <- plotSpectra(IR, which = 1:16, lab.pos = 1800)

# Defaults, except for color scheme:
res <- hmapSpectra(IR, col = heat.colors(5))

# Label samples and frequencies by passing arguments to stats:heatmap
# Also make a few other nice plot adjustments
res <- hmapSpectra(IR,
col = heat.colors(5),
row_labels = IR$names, col_labels = as.character(round(IR$freq)),
margins = c(4, 6))
hypTestScores

Conduct MANOVA using PCA Scores and Factors in a Spectra Object

Description

This function provides a convenient interface for carrying out manova using the scores from PCA and the factors (groups) stored in a Spectra object. The function will do anova as well, if you only provide one vector of scores, though this is probably of limited use. A Spectra object contains group information stored in its spectra$groups element, but you can also use splitSpectraGroups to generate additional groups/factors that might be more useful than the original.

Usage

hypTestScores(spectra, pca, pcs = 1:3, fac = NULL, ...)

Arguments

- **spectra**: An object of S3 class Spectra.
- **pca**: An object of class prcomp.
- **pcs**: An integer vector giving the PCA scores to use as the response in the manova analysis.
- **fac**: A character vector giving the factors to be used in the manova. They will be searched for within the Spectra object.
- **...**: Additional arguments to be passed downstream, in this case to aov. Untested.

Details

This function is an extraordinarily thin wrapper which helps the user to avoid writing a very tedious formula specification.

Value

The results of the analysis print to the console unless assigned. If assigned, the object class is one of several described in aov depending upon the data passed to it.

Author(s)

Bryan A. Hanson (DePauw University)

See Also

- splitSpectraGroups which can be used to create additional factor elements in the Spectra object, which can then be used with this function. Additional documentation at https://bryanhanson.github.io/ChemoSpec/
Examples

```r
data(metMUD2)

# Original factor encoding:
levels(metMUD2$groups)

# Split those original levels into 2 new ones (re-code them)
new.grps <- list(geneBb = c("B", "b"), geneCc = c("C", "c"))
mM3 <- splitSpectraGroups(metMUD2, new.grps)

# Now do the PCA and anova, with 3 ways to see the results
pca <- c_pcaSpectra(mM3)
res <- hypTestScores(mM3, pca, fac = c("geneBb", "geneCc"))
res
summary(res)
summary.aov(res)

# You can also call this function on the existing groups:
res <- hypTestScores(metMUD2, pca, fac = "groups")
```

---

**irlba_pcaSpectra**  
**IRLBA PCA of Spectra Objects**

**Description**

A wrapper which carries out IRLBA PCA analysis on a Spectra object. The user can select various options for scaling. There is no normalization by rows - do this manually using `normSpectra`. The data can be supplied already centered if desired.

**Usage**

```r
irlba_pcaSpectra(spectra, choice = "noscale", n = 3, center = TRUE, ...)
```

**Arguments**

- **spectra**: An object of S3 class `Spectra`.
- **choice**: A character string indicating the choice of scaling. One of c("noscale", "autoscale", "Pareto"). "autoscale" is called "standard normal variate" or "correlation matrix PCA" in some literature.
- **n**: Integer. The number of components desired.
- **center**: Logical. Should the data be centered? Data must be centered for PCA, either before arriving here or via this argument.
- **...**: Other parameters to be passed to `irlba`. 
### Details

The scale choice autoscale scales the columns by their standard deviation. Pareto scales by the square root of the standard deviation.

### Value

A modified object of class `prcomp` and computed via `irlba`, which includes a list element called `$method`, a character string describing the pre-processing carried out and the type of PCA performed (used to annotate plots).

## Not run:
# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")
data(SrE.NMR)
pca <- irlba_pcaSpectra(SrE.NMR)

p1 <- plotScree(pca)
p1

p2 <- plotScores(SrE.NMR, pca, pcs = c(1, 2), ellipse = "cls", tol = 0.05)
p2 <- p2 + ggtitle("Scores: SrE NMR Data")
p2

p3 <- plotLoadings(SrE.NMR, pca, loads = 1:2, ref = 1)
p3 <- p3 + ggtitle("Loadings: SrE NMR Data")
p3

## End(Not run)
```
mclust3dSpectra  mclust Analysis of a Spectra Object in 3D

Description

This function conducts an mclust analysis of the PCA results of a Spectra object and displays the results in 3D. Classical or robust confidence ellipses can be added if desired. Improperly classified data points can be marked. The interactive plot is made via plotly and appears in a browser window. Note that the confidence ellipses computed here are generated independently of the Mclust results - they do not correspond to the ellipses seen in 2D plots from Mclust.

Usage

mclust3dSpectra(
  spectra,
  pca,
  pcs = 1:3,
  ellipse = TRUE,
  rob = FALSE,
  cl = 0.95,
  frac.pts.used = 0.8,
  truth = NULL,
  ...
)

Arguments

spectra  An object of S3 class Spectra.
pca  An object of class prcomp.
pcs  An integer vector describing which PCs to use.
ellipse  Logical indicating if confidence ellipses should be drawn.
rob  Logical; if ellipse = TRUE, indicates that robust confidence ellipses should be drawn. If FALSE, classical confidence ellipses are drawn.
cl  A number indicating the confidence interval for the ellipse.
frac.pts.used  If ellipse = TRUE and rob = TRUE, a number indicating the fraction of the data points to be considered "good" and thus used to compute the robust confidence ellipse.
truth  A character vector indicating the known group membership for each row of the PC scores. Generally this would be spectra$groups.
...  Arguments to be passed to mclust.

Value

The mclust model is returned invisibly, and a plot is produced.
mclustSpectra

Examples

## Not run:
require(mclust)
data(metMUD1)
pca <- c_pcaSpectra(metMUD1)
mclust3dSpectra(metMUD1, pca)

# show mis-classified points
mclust3dSpectra(metMUD1, pca, truth = metMUD1$groups)

## End(Not run)

mclustSpectra(mclust Analysis of a Spectra Object PCA Results

Description

This function is a wrapper for the Mclust function and associated plotting functions.

Usage

mclustSpectra(
spectra,
pca,
pcs = c(1:3),
dims = c(1, 2),
plot = c("BIC", "proj", "errors"),
use.sym = FALSE,
...)

Arguments

spectra An object of S3 class Spectra.
pca An object of class prcomp.
pcs An integer vector describing which PCs to use.
metMUD1

Made Up NMR Data Sets

Description

These data sets are simulated 300 MHz NMR spectra. They are designed mainly to illustrate certain chemometric methods and are small enough that they process quickly.

Format

The data is stored as a Spectra object.
**Details**

alignMUD is a series of mis-aligned spectra of a single small organic molecule.

metMUD1 is composed of 20 samples, each a mixture of four typical small organic compounds (we'll leave it to the reader as an exercise to deduce the spin systems!). These compounds are present in varying random amounts. Ten of the samples are control samples, and ten are treatment samples. Thus you can run PCA and other methods on this data set, and expect to see a separation. This data set is normalized.

metMUD2 also consists of 20 samples of mixtures of the same four compounds. However, the concentrations of some of the compounds are correlated with other compounds, both positively and negatively, and some concentrations are random. metMUD2 is divided into different sample groups which correspond conceptually to two genes, each active or knocked out. This data set is designed to be similar to a metabolomics data set in which the concentrations of some compounds co-vary, and others are independent. This data set is normalized.

```

---

**normSpectra**

Normalize a Spectra Object

**Description**

This function carries out normalization of the spectra in a Spectra object. There are currently four options:

- "PQN" carries out "Probabalistic Quotient Normalization" as described in the reference. This is probably the best option for many data sets. However, please be careful if your sample has protein in it, PQN is potentially biased. See the references.
normSpectra

• "TotInt" normalizes by total intensity. In this case, the y-data of a Spectra object is normalized by dividing each y-value by the sum of the y-values in a given spectrum. Thus each spectrum sums to 1. This method assumes that the total concentration of all substances giving peaks does not vary across samples which may not be true.

• "Range" allows one to do something similar to "TotInt" but rather than using the sum of the entire spectrum as the denominator, only the sum of the given range is used. This would be appropriate if there was an internal standard in the spectrum which was free of interference, and one wanted to normalize relative to it.

• "zero2one" scales each spectrum separately to a [0 ... 1] scale. This is sometimes useful for visual comparison of chromatograms but is inappropriate for spectral data sets.

Usage

normSpectra(spectra, method = "PQN", RangeExpress = NULL)

Arguments

- spectra: An object of S3 class Spectra to be normalized.
- method: One of c("PQN", "TotInt", "Range", "zero2one") giving the method for normalization.
- RangeExpress: A vector of logicals (must be of length(Spectra$freq)). This vector should be TRUE for the frequency range you want to serve as the basis for norming, and FALSE otherwise. The entire spectrum will be divided by the sum of the TRUE range. See the examples.

Value

An object of S3 class Spectra.

Examples

# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")
data(SrE.IR)

# Reference spectrum before normalization
p1 <- plotSpectra(SrE.IR) + ggtitle("Original Spectrum")
p1

# Default PQN normalization
res1 <- normSpectra(SrE.IR)
p2 <- plotSpectra(res1) + ggtitle("PQN Normalization")
p2

# Norm over carbonyl region
RE <- SrE.IR$freq > 1650 & SrE.IR$freq < 1800
res2 <- normSpectra(SrE.IR, method = "Range", RangeExpress = RE)
p3 <- plotSpectra(res2) + ggtitle("Normalized to Carbonyl Peaks")
p3

# Check numerically
rowSums(res2$data[, RE]) # compare to rowSums(SrE.IR$data[,RE])

pcaDiag

Outlier Diagnostic Plots for PCA of a Spectra Object

Description

A function to carry diagnostics on the PCA results for a Spectra object. Basically a wrapper to Filzmoser’s pcaDiagplot which colors everything according to the scheme stored in the Spectra object. Works with PCA results of either class prcomp or class princomp. Works with either classical or robust PCA results.

Usage

pcaDiag(
  spectra,  # Spectra object
  pca,      # PrComp or Princomp object
  pcs = 3,  # Number of components
  quantile = 0.975,  # Quantile for outlier detection
  plot = c("OD", "SD"),  # Plot types
  use.sym = FALSE,    # Use symbols
  ...)

Arguments

spectra An object of S3 class Spectra.
pca An object of class prcomp modified to include a character string (method) describing the pre-processing carried out and the type of PCA performed.
pcs As per pcaDiagplot. The number of principal components to include.
quantile As per pcaDiagplot. The significance criteria to use as a cutoff.
plot A character string, indicating whether to plot the score distances or orthogonal distances, or both. Options are c("OD", "SD").
use.sym logical; if true, the color scheme is change to black and symbols are used for plotting.
... Parameters to be passed to the plotting routines. Applies to base graphics only.

Details

If both plots are desired, the output should be directed to a file rather than the screen. Otherwise, the 2nd plot overwrites the 1st in the active graphics window. Alternatively, just call the function twice, once specifying OD and once specifying SD.

Value

The returned value depends on the graphics option selected (see GraphicsOptions).

base: A data frame or list containing the data plotted. Assign the value and run str() or names() on it to see what it contains. Side effect is a plot.
ggplot2: The plot is displayed, and a ggpplot2 plot object is returned if the value is assigned. The plot can be modified in the usual ggpplot2 manner. If you want the plotted values, you can access them via the base graphics mode.

data(SrE.IR)
pca <- c_pcaSpectra(SrE.IR, choice = "noscale")
p1 <- pcaDiag(SrE.IR, pca, pcs = 2, plot = "OD") + ggtitle("OD Plot")
p1
p2 <- pcaDiag(SrE.IR, pca, pcs = 2, plot = "SD") + ggtitle("SD Plot")
p2
```

plot2Loadings `Plot PCA Loadings from a Spectra Object Against Each Other`

Description

Plots two PCA loadings specified by the user, and labels selected (extreme) points. Typically used to determine which variables (frequencies) are co-varying, although in spectroscopy most peaks are represented by several variables and hence there is a lot of co-varying going on. Also useful to determine which variables are contributing the most to the clustering on a score plot.

Usage

```r
plot2Loadings(spectra, pca, loads = c(1, 2), tol = 0.05, ...)
```

Arguments

- **spectra**: An object of S3 class `Spectra`.
- **pca**: An object of class `prcomp`, modified to include a list element called `$method`, a character string describing the pre-processing carried out and the type of PCA performed (it appears on the plot). This is automatically provided if ChemoSpec functions `c_pcaSpectra` or `r_pcaSpectra` were used to create `pca`.
- **loads**: A vector of two integers specifying which loading vectors to plot.
- **tol**: A number describing the fraction of points to be labeled. `tol = 1.0` labels all the points; `tol = 0.05` labels approximately the most extreme 5 percent. Set to "none" to completely suppress labels. Note that a simple approach based upon quantiles is used, assumes that both x and y are each normally distributed, and treats x and y separately. Thus, this is not a formal treatment of outliers, just a means of labeling points. Groups are lumped together.
- **...**: Parameters to be passed to the plotting routines. Applies to base graphics only.

Value

The returned value depends on the graphics option selected (see `GraphicsOptions`).

- **base**: None. Side effect is a plot.
- **ggplot2**: The plot is displayed, and a ggplot2 plot object is returned if the value is assigned. The plot can be modified in the usual ggplot2 manner.
plot3dScores

3D PCA Score Plot for a Spectra Object

Description

Creates an interactive 3D plot of PCA scores from the analysis of a Spectra object, color coded according the to scheme stored in the object. The plot is created by plotly and appears in a browser window.

Usage

plot3dScores(
  spectra,
  pca,
  pcs = c(1:3),
  ellipse = TRUE,
  rob = FALSE,
  cl = 0.95,
  frac.pts.used = 0.8
)

Arguments

spectra An object of S3 class Spectra.
pca An object of class prcomp.
pcs A vector of three integers specifying the PCA scores to plot.
plotLoadings

Description

Creates a multi-panel plot of loadings along with a reference spectrum.

Usage

plotLoadings(spectra, pca, loads = c(1), ref = 1, ...)

Value

None. Side effect is a plot in a browser window.

Author(s)

Bryan A. Hanson (DePauw University)

Examples

```r
if (interactive()) {
  data(metMUD1)
  pca <- c_pcaSpectra(metMUD1, choice = "noscale")
  p <- plot3dScores(metMUD1, pca)
  p
}
```
**plotScree**

**Description**

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via `plotScree`.

**Arguments**

- **spectra**: An object of S3 class `Spectra`
- **pca**: An object of class `prcomp`, modified to include a list element called `$method`, a character string describing the pre-processing carried out and the type of PCA performed (it appears on the plot). This is automatically provided if ChemoSpec functions `c_pcaSpectra` or `r_pcaSpectra` were used to create `pca`.
- **loads**: An integer vector giving the loadings to plot. More than 3 loadings creates a useless plot using the default graphics window.
- **ref**: An integer specifying the reference spectrum to plot, which appears at the bottom of the plot.
- **...**: Parameters to be passed to the plotting routines. *Applies to base graphics only.*

**Value**

The returned value depends on the graphics option selected (see `GraphicsOptions`).

- **base**: None. Side effect is a plot.
- **ggplot2**: The plot is displayed, and a `ggplot2` plot object is returned if the value is assigned. The plot can be modified in the usual `ggplot2` manner.

**Author(s)**

Bryan A. Hanson (DePauw University), Tejasvi Gupta.

*Scree Plots from PCA or MIA Analysis of a Spectra or Spectra2D Object*

**Description**

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via `plotScree`. 
plotSpectra

Plot Spectra Object

Description

Plots the spectra stored in a Spectra object. Spectra may be plotted offset or stacked. The vertical scale is controlled by a combination of several parameters.

Usage

plotSpectra(
  spectra,
  which = c(1),
  yrange = range(spectra$data),
  offset = 0,
  amplify = 1,
  lab.pos = mean(spectra$freq),
  showGrid = TRUE,
  leg.loc = "none",
...
)

Arguments

  spectra: An object of S3 class Spectra.
  which: An integer vector specifying which spectra to plot, and the order.
  yrange: A vector giving the limits of the y axis desired, for instance c(0, 15). This parameter depends upon the range of values in the stored spectra and defaults to the height of the largest peak in the data set. Interacts with the next two arguments, as well as the number of spectra to be plotted as given in which. Trial and error is used to adjust all these arguments to produce the desired plot.
  offset: A number specifying the vertical offset between spectra if more than one is plotted. Set to 0.0 to overlay the spectra.
  amplify: A number specifying an amplification factor to be applied to all spectra. Useful for magnifying spectra so small features show up (though large peaks will then be clipped, unless you zoom on the x axis).
  lab.pos: A number (in frequency units) giving the location of a label for each spectrum. Generally, pick an area that is clear in all spectra plotted. If no label is desired, set lab.pos = "none".
  showGrid: Logical. Places light gray vertical lines at each tick mark if TRUE.
  leg.loc: Either a list with elements x and y, or a string like "topright". Values in a list should be on [0, 1], i.e. the lower left of the plot area is 0,0 and the upper right is 1,1. String values are those described in legend under "Details". A value of "none" is acceptable as well.

... Parameters to be passed to the plotting routines. Applies to base graphics only.
Value

The returned value depends on the graphics option selected (see GraphicsOptions).

base: None. Side effect is a plot.

ggplot2: The plot is displayed, and a ggplot2 plot object is returned if the value is assigned. The plot can be modified in the usual ggplot2 manner.

Examples

```r
# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")
data(metMUD1)
p1 <- plotSpectra(metMUD1, which = c(10, 11), yrange = c(0, 1.5),
                 offset = 0.06, amplify = 10, lab.pos = 0.5)
p1 <- p1 + ggtitle("metMUD1 NMR Data")
p1

# Add a legend at x, y coords
p2 <- plotSpectra(metMUD1, which = c(10, 11), yrange = c(0, 1.5),
                 offset = 0.06, amplify = 10, lab.pos = 0.5, leg.loc = list(x = 0.8, y = 0.8))
p2 <- p2 + ggtitle("metMUD1 NMR Data")
p2
```

plotSpectraDist  
Plot the Distance Between Spectra and a Reference Spectrum in a Spectra Object

Description

This function plots the distance between a reference spectrum and all other spectra in a Spectra object. Distance can be defined in a number of ways (see Arguments).

Usage

```r
plotSpectraDist(spectra, method = "pearson", ref = 1, labels = TRUE, ...)
```
Arguments

- **spectra**: An object of S3 class `Spectra`.
- **method**: Character. Any method acceptable to `rowDist`.
- **ref**: Integer. The spectrum to be used as a reference.
- **labels**: Logical. Shall the points be labeled?
- ... Parameters to be passed to the plotting routines. Applies to base graphics only.

Value

The returned value depends on the graphics option selected (see `GraphicsOptions`).

- **base**: A data frame or list containing the data plotted. Assign the value and run `str()` or `names()` on it to see what it contains. Side effect is a plot.
- **ggplot2**: The plot is displayed, and a `ggplot2` plot object is returned if the value is assigned. The plot can be modified in the usual `ggplot2` manner. If you want the plotted values, you can access them via the base graphics mode.

Author(s)

Bryan A. Hanson (DePauw University), Tejasvi Gupta.

See Also

To compare all spectra simultaneously in a heatmap, see `sampleDist`. Additional documentation at https://bryanhanson.github.io/ChemoSpec/

Examples

```r
# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")
data(SrE.NMR)
txt1 <- paste("Distance from", SrE.NMR$names[1])
txt2 <- paste("Rank Distance from", SrE.NMR$names[1])
p <- plotSpectraDist(SrE.NMR)
p <- p + labs(title = txt1, xlab = txt2, ylab = txt2) +
  coord_cartesian(ylim = c(0, 1.1), xlim = c(0, 16))
p
```
plotSpectraJS

Plot a Spectra Object Interactively

Description
This function uses the d3.js JavaScript library by Mike Bostock to plot a Spectra object interactively. This is most useful for data exploration. For high quality plots, consider plotSpectra.

Usage
plotSpectraJS(spectra, which = NULL, browser = NULL, minify = TRUE)

Arguments
spectra
An object of S3 class Spectra to be checked.

which
Integer. If not NULL, specifies by number which spectra to plot. If greater control is needed, use removeSample which is more flexible before calling this function.

browser
Character. Something that will make sense to your OS. Only necessary if you want to override your system specified browser as understood by R. See below for further details.

minify
Logical. Shall the JavaScript be minified? This improves performance. However, it requires package js which in turn requires package V8. The latter is not available on all platforms. Details may be available at https://github.com/jeroen/V8

Details
The spectral data are incorporated into the web page. Keep in mind that very large data sets, like NMR spectra with 32K points, will bog down the browser. In these cases, you may need to limit the number of samples in passed to this function. See removeSample or use argument which.

Value
None; side effect is an interactive web page. The temporary directory containing the files that drive the web page is written to the console in case you wish to use those files. This directory is deleted when you quit R. If you wish to read the file, don’t minify the code, it will be unreadable.

Browser Choice
The browser is called by browseURL, which in turn uses options("browser"). Exactly how this is handled is OS dependent.

RStudio Viewer
If browser is NULL, you are using RStudio, and a viewer is specified, this will be called. You can stop this by with options(viewer = NULL).
Browser Choice (Mac)

On a Mac, the default browser is called by /bin/sh/open which in turn looks at which browser you have set in the system settings. You can override your default with browser = "/usr/bin/open -a 'Google Chrome'" for example.

Browser Choice & Performance

You can check the performance of your browser at peacekeeper.futuremark.com The most relevant score is the rendering category.

**removeFreq**

*Remove Frequencies from a Spectra or Spectra2D Object*

**Description**

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via `removeFreq`.

---

**removeGroup**

*Remove Groups from a Spectra or Spectra2D Object*

**Description**

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via `removeGroup`.
removeSample  
Remove Samples from a Spectra or Spectra2D Object

Description
This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via removeSample.

reviewAllSpectra  
Review All the Spectra in a Spectra Object

Description
Utility to review all spectra in a Spectra object. Output depends upon the graphics output choice.

- **base**: Plots each spectrum one at a time, and waits for a return in the console before plotting the next spectrum. Use ESC to get out of the loop.
- **ggplot2**: All the spectra are plotted in a single column.

Usage

```
reviewAllSpectra(spectra, ...)
```

Arguments

- **spectra**: An object of S3 class Spectra.
- **...**: Parameters to be passed to the plotting routines. Applies to base graphics only.

Value
The returned value depends on the graphics option selected (see GraphicsOptions).

- **base**: None. Side effect is a plot.
- **ggplot2**: The plot is displayed, and a ggplot2 plot object is returned if the value is assigned. The plot can be modified in the usual ggplot2 manner.

Author(s)
Bryan A. Hanson (DePauw University), Tejasvi Gupta.

rowDist

*Compute Distance Between Rows of a Matrix*

**Description**

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via `rowDist`.

---

r_pcaSpectra

*Robust PCA of a Spectra Object*

**Description**

A wrapper which carries out robust PCA analysis on a `Spectra` object. The data are row- and column-centered, and the user can select various options for scaling.

**Usage**

```r
r_pcaSpectra(spectra, choice = "noscale")
```

**Arguments**

- `spectra` An object of S3 class `Spectra`.
- `choice` A character vector describing the type of scaling to be carried out. One of c("noscale", "mad").

**Value**

An object of classes `converted_from_princomp` and `prcomp`. It includes a list element called `$method`, a character string describing the pre-processing carried out and the type of PCA performed (used to annotate plots).
**sampleDist**

Compute the Distances Between Samples in a Spectra or Spectra2D Object

**Description**

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via `sampleDist`.

**Author(s)**

Bryan A. Hanson (DePauw University)

**Examples**

```r
## Not run:
# This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
library("ggplot2")
data(metMUD1)
pca <- r_pcaSpectra(metMUD1)

p1 <- plotScree(pca)
p1

p2 <- plotScores(metMUD1, pca, pcs = c(1, 2), ellipse = "cls", tol = 0.05)
p2 <- p2 + ggtitle("Scores: metMUD1 NMR Data")
p2

p3 <- plotLoadings(metMUD1, pca, loads = 1:2, ref = 1)
p3 <- p3 + ggtitle("Loadings: metMUD1 NMR Data")
p3

## End(Not run)
```
sgfSpectra

### Description

This function is a simple wrapper around the function `sgolayfilt`. It allows one to apply Savitzky-Golay filters to a `Spectra` object in a convenient way.

### Usage

```r
sgfSpectra(spectra, m = 0, ...)
```

### Arguments

- `spectra`: An object of S3 class `Spectra` to be checked.
- `m`: The desired m-th derivative. `m = 0` smooths the data (i.e., a rolling average), `m = 1` gives the first derivative etc.
- `...`: Other parameters to be passed to `sgolayfilt`.

### Value

A object of class `Spectra`.

### Author(s)

Spectra                      Spectra Objects

Description

In ChemoSpec, spectral data sets are stored in an S3 class called Spectra, which contains a variety of information in addition to the spectra themselves. Spectra objects are created by `files2SpectraObject` or `matrix2SpectraObject`.

Structure

The structure of a Spectra object is a list of 9 elements and an attribute as follows:

<table>
<thead>
<tr>
<th>element</th>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$freq</td>
<td>num</td>
<td>A common frequency (or wavelength) axis for all the spectra.</td>
</tr>
<tr>
<td>$data</td>
<td>num</td>
<td>The intensities for the spectra. A matrix of dimension no. samples x no. frequency points.</td>
</tr>
<tr>
<td>$names</td>
<td>chr</td>
<td>The sample names for the spectra; length must be no. samples.</td>
</tr>
<tr>
<td>$groups</td>
<td>Factor</td>
<td>The group classification of the samples; length must be no. samples.</td>
</tr>
<tr>
<td>$colors</td>
<td>chr</td>
<td>The colors for each sample; length must be no. samples.</td>
</tr>
<tr>
<td>$sym</td>
<td>integer</td>
<td>As for colors, but symbols for plotting (if b/w is desired).</td>
</tr>
<tr>
<td>$alt.sym</td>
<td>chr</td>
<td>Lower-case letters as alternate symbols for plotting.</td>
</tr>
<tr>
<td>$unit</td>
<td>chr</td>
<td>Two entries, the first giving the x axis unit, the second the y axis unit.</td>
</tr>
<tr>
<td>$desc</td>
<td>chr</td>
<td>A character string describing the data set. This appears on plots and therefore should probably be kept to 40 characters or less.</td>
</tr>
<tr>
<td>- attr</td>
<td>chr</td>
<td>&quot;Spectra&quot;</td>
</tr>
</tbody>
</table>

splitSpectraGroups  

Create New Groups from an Existing Spectra Object

Description

This function takes an existing Spectra object and uses your instructions to split the existing spectra$groups into new groups. The new groups are added to the existing Spectra object (a list) as new elements. This allows one to use different combinations of factors than were originally encoded in the Spectra object. The option also exists to replace the color scheme with one which corresponds to the new factors.

Usage

splitSpectraGroups(spectra, inst = NULL, rep.cols = NULL, ...)

Arguments

spectra  
An object of S3 class Spectra.

inst  
A list giving the name of the new element to be created from a set of target strings given in a character vector. See the example for the syntax.

rep.cols  
Optional. A vector giving new colors which correspond to the levels of inst. Only possible if inst has only one element, as the possible combinations of levels and colors may get complicated.

...  
Additional arguments to be passed downstream. Currently not used.

Details

The items in the character vector are grepped among the existing spectra$groups entries; when found, they are placed in a new element of Spectra. In the example, all spectra$groups entries containing "G" are coded as "G" in a new element called spectra$env, and any entries containing "T" are handled likewise. This amounts to a sort of recoding of factors (the example demonstrates this). Every entry in spectra$groups should be matched by one of the entries in the character vector. If not, you will get <NA> entries. Also, if the targets in the character vector are not unique, your results will reflect the order of the levels. Since this is a grep process, you can pass any valid grep string as the target.

If rep.cols is provided, these colors are mapped one for one onto the levels of the first element of inst. This provides a different means of changing the sample color encoding than conColScheme.

Value

An object of S3 class Spectra, modified to have additional elements as specified by inst.

Author(s)

Bryan A. Hanson (DePauw University)
sPlotSpectra

s-Plot of Spectra Data (Post PCA)

Description

 Produces a scatter plot of the correlation of the variables against their covariance for a chosen principal component. It allows visual identification of variables driving the separation and thus is a useful adjunct to traditional loading plots.

Usage

 sPlotSpectra(spectra, pca, pc = 1, tol = 0.05, ...)

Arguments

 spectra An object of S3 class Spectra.
 pca The result of a pca calculation on Spectra (i.e. the output from c_pcaSpectra or r_pcaSpectra).
 pc An integer specifying the desired pc plot.
 tol A number describing the fraction of points to be labeled. tol = 1.0 labels all the points; tol = 0.05 labels approximately the most extreme 5 percent. Set to "none" to completely suppress labels. Note that a simple approach based upon quantiles is used, assumes that both x and y are each normally distributed, and treats x and y separately. Thus, this is not a formal treatment of outliers, just a means of labeling points. Groups are lumped together.

... Parameters to be passed to the plotting routines. Applies to base graphics only.

See Also

 conColScheme Additional documentation at https://bryanhanson.github.io/ChemoSpec/
Value

The returned value depends on the graphics option selected (see GraphicsOptions).

base: None. Side effect is a plot.

ggplot2: The plot is displayed, and a ggplot2 plot object is returned if the value is assigned. The plot can be modified in the usual ggplot2 manner.

| SrE.IR | IR and NMR Spectra of Serenoa repens (Saw Palmetto) Oil Extracts and Reference Oils |

Description

A collection of 14 IR and NMR spectra of essential oil extracted from the palm Serenoa repens or Saw Palmetto, which is commonly used to treat BPH in men. The 14 spectra are of different retail samples, and are divided into two categories based upon the label description: adSrE, adulterated extract, and pSrE, pure extract. The adulterated samples typically have olive oil added to them, which is inactive towards BPH. There are two additional spectra included as references/outliers: evening primrose oil, labeled EPO in the data set, and olive oil, labeled OO. These latter two oils are mixtures of triglycerides for the most part, while the SrE samples are largely fatty acids. As a result, the spectra of these two groups are subtly different.
sumSpectra

Format

The data are stored as a Spectra object.

Source

IR data collected in the author’s laboratory. NMR data collected at Purdue University with the generosity and assistance of Prof. Dan Raftery and Mr. Tao Ye.

sumGroups

Summarize the Group Membership of a Spectra or Spectra2D Object

Description

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via sumGroups.

sumSpectra

Summarize a Spectra or Spectra2D Object

Description

This function is used by ChemoSpec and ChemoSpec2D, but is formally part of ChemoSpecUtils. You can access full documentation via sumSpectra.
surveySpectra

Plot Measures of Central Tendency and Spread for a Spectra Object

Description

Compute and plot various measures of central tendency and spread for a Spectra object. Several different measures/spreads are available. These are useful as an overview of where a data set varies the most.

Usage

surveySpectra(
spectra,
method = c("sd", "sem", "sem95", "mad", "iqr"),
by.gr = TRUE,
...
)

surveySpectra2(
spectra,
method = c("sd", "sem", "sem95", "mad", "iqr"),
lab.pos = 0.9 * max(spectra$freq),
...
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spectra</td>
<td>An object of S3 class Spectra to be analyzed.</td>
</tr>
<tr>
<td>method</td>
<td>Character. One of c(&quot;sd&quot;, &quot;sem&quot;, &quot;sem95&quot;, &quot;mad&quot;, &quot;iqr&quot;).</td>
</tr>
<tr>
<td>by.gr</td>
<td>Logical, indicating if the analysis is to be done by group or not. Applies to surveySpectra only.</td>
</tr>
<tr>
<td>...</td>
<td>Parameters to be passed to the plotting routines. Applies to base graphics only.</td>
</tr>
<tr>
<td>lab.pos</td>
<td>Numeric, giving the frequency where the label should be drawn. Applies to surveySpectra2 only.</td>
</tr>
</tbody>
</table>

Details

For surveySpectra the method choice works as follows: sd plots the mean spectrum +/- the standard deviation, sem plots the mean spectrum +/- the standard error of the mean, sem95 plots the mean spectrum +/- the standard error at the 95 percent confidence interval, mad plots the median spectrum +/- the median absolute deviation, and finally, iqr plots the median spectrum + the upper hinge and - the lower hinge.

For surveySpectra2, the spectra are mean centered and plotted. Below that, the relative summary statistic is plotted, offset, but on the same scale.
Value

The returned value depends on the graphics option selected (see GraphicsOptions).

- **base**: None. Side effect is a plot.
- **ggplot2**: The plot is displayed, and a ggplot2 plot object is returned if the value is assigned. The plot can be modified in the usual ggplot2 manner.

Functions

- `surveySpectra()`: Spectral survey emphasizing mean or median spectrum, optionally by group.
- `surveySpectra2()`: Spectral survey emphasizing variation among spectra.

**s_pcaSpectra**

_Sparse PCA of Spectra Objects_

Description

A wrapper which carries out sparse PCA analysis on a `Spectra` object. The user can select various options for scaling. There is no normalization by rows - do this manually using `normSpectra`. The data will be centered, as is required by PCA.
s_pcaSpectra

Usage

s_pcaSpectra(spectra, choice = "noscale", K = 3, para = rep(0.5, K), ...)

Arguments

- **spectra**: An object of S3 class `Spectra`
- **choice**: A character string indicating the choice of scaling. One of c("noscale", "autoscale", "Pareto"). "autoscale" is called "standard normal variate" or "correlation matrix PCA" in some literature.
- **K**: Integer. The number of components desired.
- **para**: A vector of length(K) giving the tuning parameters.
- **...**: Other parameters to be passed to `arrayspc`.

Details

The scale choice `autoscale` scales the columns by their standard deviation. `Pareto` scales by the square root of the standard deviation.

Value

An object of class `prcomp` and `converted_from_arrayspc`, which includes a list element called `$method`, a character string describing the pre-processing carried out and the type of PCA performed (used to annotate plots). A check is carried out to see if the computation was successful and a warning issued if it failed.
