Functions Supporting Packages ChemoSpec and ChemoSpec2D

Description

Functions supporting the packages ChemoSpec and ChemoSpec2D.

Author(s)

Bryan A. Hanson (DePauw University), Tejasvi Gupta.

Maintainer: Bryan A. Hanson <hanson@depauw.edu>

See Also

check4Gaps

Check for Discontinuities (Gaps) in a Vector & Optionally Make a Plot

Description

The basic procedure is to compare \( x[n + 1] - x[n] \) for successive values of \( n \). When this value jumps, there is a gap which is flagged. \( \text{beg.indx} \) and \( \text{end.indx} \) will always be contiguous as indices must be; it is the \( x \) values that jump or have the gap. The indices are provided as they are more convenient in some programming contexts. If not assigned, the result appears at the console.

Usage

```r
check4Gaps(x, y = NULL, silent = FALSE, tol = NULL, ...)
```

Arguments

- **x**
  A numeric vector to be checked for gaps.

- **y**
  An optional vector of \( y \)-values which correspond to the \( x \) values. Only used in ChemoSpec. If provided, a plot will be made in the style of a Spectra object showing the gap(s).

- **silent**
  Logical indicating a "no gap" message should not be reported to the console. Important because check4Gaps is called iteratively by other functions.

- **tol**
  A number indicating the tolerance for checking to see if the step between successive \( x \) values are the same. Depending upon how the \( x \) values are stored and rounded, you may need to change the value of \( \text{tol} \) to avoid flagging trivial "gaps". If \( \text{NULL} \), a value is chosen which is just above the median difference between \( x \) values.

- **...**
  Other parameters to be passed to the plot routines if \( y \) is provided, e.g. \( \text{xlim} \).

Value

A data frame giving the data chunks found, with one chunk per row. Also a plot if \( y \) is provided. In the event there are no gaps found, a data frame with one row is returned. The data frame has columns as follows:

- **beg.freq**
  The first frequency value in a given data chunk.

- **end.freq**
  The last frequency value in a given data chunk.

- **size**
  The length (in frequency units) of the data chunk.

- **beg.indx**
  The index of the first frequency value in the data chunk.

- **end.indx**
  The index of the last frequency value in the data chunk.

Author(s)

Bryan A. Hanson (DePauw University).
checkForPackageWithVersion

Description

Utility function for making sure a package is available with a particular version or newer.

Usage

checkForPackageWithVersion(pkg, vers)

Arguments

pkg Character. The name of the package to check.

vers Character. The minimum acceptable version of the package. Will only be checked to the major.minor level.

Value

If the package with the required version or higher is available, TRUE is returned invisibly. Otherwise FALSE is returned.

Author(s)

Bryan A. Hanson (DePauw University).
chkGraphicsOpt

**Description**

This function should be used to check the current graphics mode. It simply reports the current setting unless it is invalid in which case the mode is set to base.

**Usage**

```r
chkGraphicsOpt(silent = TRUE)
```

**Arguments**

- `silent` Logical. Silences most messages if TRUE.

**Value**

Character. The value of the current graphics output option/mode.

**Author(s)**

Bryan A. Hanson (DePauw University), Tejasvi Gupta.

**See Also**

See GraphicsOptions for more information about the graphics options.

chkSpectra

**Verify the Integrity of a Spectra or Spectra2D Object**

**Description**

Utility function to verify that the structure of a Spectra or Spectra2D object is internally consistent. This function should be used after manual editing of these objects. However, in most cases rather than directly editing these objects, one should modify them via:

- `removeFreq`
- `removeSample`
- `removeGroup`

**Usage**

```r
chkSpectra(spectra, confirm = FALSE)
```
Arguments

spectra An object of S3 class ChemoSpec::Spectra() or ChemoSpec2D::Spectra2D().
confirm Logical indicating whether or not to write the results to the console, as would be desirable for interactive use.

Value

None. When used at the console, and the object is OK, no message is written unless confirm = TRUE. At the console, if there is a problem, messages are issued regardless of the value of confirm.

Author(s)

Bryan A. Hanson (DePauw University).

Examples

if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  data(SrE.IR)
  chkSpectra(SrE.IR)
}

if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
  library("ChemoSpec2D")
  data(MUD1)
  chkSpectra(MUD1)
}

---

colorSymbol

Description

In ChemoSpec and ChemoSpec2D, the user may use any color name/format known to R. The current color scheme of a Spectra or Spectra2D object may be determined using sumGroups or sumSpectra. The colors can also be queried and changed using conColScheme.

Format

Colors are stored as character vectors and symbols as numeric vectors.

Details

An important fact to keep in mind is that most people with normal vision cannot distinguish more than about 8-12 colors, and doing so depends upon the viewing circumstances: if on paper, printer, ink and paper type all matter, and if on a screen, the background color makes a big difference. Further, color-blind individuals have additional challenges. A great discussion of color issues can
be found in the colorspace package. The Polychrome package has further discussion and utilities for choosing qualitative colorschemes, including those for color-blind individuals.

ChemoSpec, but not ChemoSpec2D, can also create plots using the built-in symbols and lower case letters. This is useful for color-blind individuals, plots in rgl which can’t plot regular symbols, and plots for where there are more groups than could be reasonably coded in color. A good discussion of which symbols are most readily distinguished can be found in Robinson: "Good Plot Symbols by Default" Journal of Computational and Graphical Statistics DOI: 10.1080/10618600.2019.1637746

ChemoSpecUtils supplies four color/symbol schemes for your consideration. If the particular order of colors in any of these does not suit your needs, you can always choose the ones you want, and/or rearrange the order, or simply provide your own.

• The colors and symbols produced by \texttt{gr.cols = "auto"} in the import functions.
• \texttt{Col8} provides eight unique colors. These are more saturated than the automatic colors.
• \texttt{Col12} provides a mostly paired set of 12 unique colors suitable for groups that come in pairs.
• \texttt{Col7} provides seven color-blind friendly colors. These can be visualized at https://projects.susielu.com/viz-palette by using the hex codes obtained by typing \texttt{data(Col7); Col7} in the R console.

\textbf{Author(s)}

Bryan A. Hanson (DePauw University).

\textbf{Examples}

```
# Make a plot showing all the built-in color options
data(Col7)
data(Col12)
data(Sym12)
data(Co18)
data(Sym8)
# You need to install package "RColorBrewer" to display the default color scheme
if (requireNamespace("RColorBrewer", quietly = TRUE)) {
  auto <- RColorBrewer::brewer.pal(8, "Set1")
}
sp <- 0.75 # space between major plot elements
tsp <- 0.15 # additional space between points and color swatches/descriptive text
h <- 0.25 # height of the swatch
y <- 0.0 # bottom of the plot, the reference point

# empty plot
plot(1:12, rep(0.0, 12),
     type = "n", yaxt = "n", xaxt = "n", bty = "n",
     xlab = "", ylab = "", ylim = c(0, 3.5))

text(6.5, y + h + tsp * 4 + sp * 3.5,
     labels = "Automatic Color & Symbol Options", cex = 1.25, font = 2)
```
# Col12
for (i in 1:12) {
  rect(i - 0.5, y, i + 0.5, y + h, border = NA, col = Col12[i])
}
points(1:12, rep(y + h + tsp, 12), pch = Sym12)
text(0.6, y + h + tsp * 2, adj = 0,
  labels = "gr.cols = 'Col12' 12 mostly paired distinct colors/symbols"
)

# Col8
for (i in 1:8) {
  rect(i - 0.5, y + sp, i + 0.5, y + sp + h, border = NA, col = Col8[i])
}
points(1:8, rep(y + h + tsp + sp, 8), pch = Sym8)
text(0.6, y + h + tsp * 2 + sp, adj = 0,
  labels = "gr.cols = 'Col8' 8 distinct colors/symbols"
)

# auto (default)
if (requireNamespace("RColorBrewer", quietly = TRUE)) {
  for (i in 1:8) {
    rect(i - 0.5, y + sp * 2, i + 0.5, y + sp * 2 + h, border = NA, col = auto[i])
  }
  points(1:8, rep(y + h + tsp + sp * 2, 8), pch = Sym8)
text(0.6, y + h + tsp * 2 + sp * 2, adj = 0,
  labels = "gr.cols = 'auto' 8 distinct colors/symbols"
  )
}

# colorblind-friendly
for (i in 1:7) {
  rect(i - 0.5, y + sp * 3, i + 0.5, y + sp * 3 + h, border = NA, col = Col7[i])
}
points(1:7, rep(y + h + tsp + sp * 3, 7), pch = Sym8[1:7])
text(0.6, y + h + tsp * 2 + sp * 3, adj = 0,
  labels = "gr.cols = 'Col7' 7 colorblind-friendly colors"
)

---

**conColScheme**

Change the Color Scheme of a Spectra or Spectra2D Object

**Description**

This function permits you to change the color scheme of an existing Spectra or Spectra2D object.

**Usage**

```r
conColScheme(spectra, new.cols = NULL, silent = FALSE)
```
Arguments

spectra  An object of S3 class `ChemoSpec::Spectra()` or `ChemoSpec2D::Spectra2D()`.

new.cols  A character vector giving the new color values, of length(unique(spectra$colors)). If not provided, the function will print the old values for reference.

silent  Logical. If TRUE, suppresses all reporting.

Value

spectra  An object of S3 class `ChemoSpec::Spectra()` or `ChemoSpec2D::Spectra2D()`.

Author(s)

Bryan A. Hanson (DePauw University).

See Also

For a discussion of general issues of color, see `colorSymbol`.

Examples

```r
if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  data(metMUD1)

  sumSpectra(metMUD1)
  newSpec <- conColScheme(metMUD1) # reports old colors
  newSpec <- conColScheme(metMUD1, new = c("pink", "violet"))
}

if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
  library("ChemoSpec2D")
  data(MUD1)

  sumSpectra(MUD1)
  newSpec <- conColScheme(MUD1) # reports old colors
  newSpec <- conColScheme(MUD1, new = c("pink", "violet"))
}
```

Description

In ChemoSpec and ChemoSpec2D, the user may choose from the following graphics output options:

- base graphics (also the only style from the early days of ChemoSpec through version 5).
- ggplot2 graphics, the default.
- plotly graphics.
Details

Here’s how it works:

- Upon starting ChemoSpec or ChemoSpec2D the graphics output mode is set to ggplot2.
- To see the current value, do chkGraphicsOpt. If by some chance the value is corrupted it will be set to base.
- To change the graphics output mode, do options(ChemoSpecGraphics = 'option'), where 'option' is one of the options listed above.
- ggplot2 graphics are not available for all plots. If ggplot2 graphics are not available, base graphics will be automatically used, regardless of the setting in options(ChemoSpecGraphics).

What you can do with your plots:

- Base graphics are the original graphics option in R. They cannot be modified.
- For ggplot2 graphics, ChemoSpec and ChemoSpec2D employ theme_bw with only a very few modifications. You can add things to your plot, or override the theme used here via the usual ggplot2 methods. A few simple examples are given below but this is not the place for a ggplot2 tutorial. See https://ggplot2.tidyverse.org/ for all things ggplot2.
- plotly graphics is an interactive graphics option where the user can use the tools provided by plotly package and interact with the plot.

Author(s)

Bryan A. Hanson (DePauw University), Tejasvi Gupta.

Examples

```r
if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  library("ggplot2")
  data(metMUD1)

  # Using the default ggplot2 graphics
  p1 <- plotSpectra(metMUD1,
                   which = c(10, 11), yrange = c(0, 1.5),
                   offset = 0.06, amplify = 10, lab.pos = 0.5)
  p1

  # Modifying ggplot2 graphics
  # Add a title
  p2 <- p1 + ggtitle("metMUD1 NMR Data")
  p2

  # Zoom the axes
  p3 <- p1 + coord_cartesian(xlim = c(1.5, 2.0))
  p3

  # Change the ggplot2 theme
  p4 <- p1 + theme_gray() + theme(legend.position = "none")
  p4
}
# plotLoadings uses patchwork, whose plots are modified differently
if (requireNamespace("patchwork", quietly = TRUE)) {
  pca <- c_pcaSpectra(metMUD1)
  p5 <- plotLoadings(metMUD1, pca, loads = c(1, 2))
  p5
  p6 <- p5 + patchwork::plot_annotation(title = "metMUD1 NMR Data")
  p6
  # but to change the theme on each subplot, use the & operator
  p7 <- p6 & theme_gray()  # compare to p6 + theme_gray()
  p7
}

---

**hcaScores**

### Description

A wrapper which performs HCA on the scores from a PCA of a **Spectra** object or POP/MIA/PARAFAC of a **Spectra2D** object. Many methods for computing the clusters and distances are available.

### Usage

```r
hcaScores(
  spectra,
  so,
  scores = c(1:5),
  c.method = "complete",
  d.method = "euclidean",
  use.sym = FALSE,
  leg.loc = "topright",
  ...
)
```

### Arguments

- **spectra** An object of S3 class **ChemoSpec::Spectra()** or **ChemoSpec2D::Spectra2D()**.
- **so** "Score Object" One of the following:
  - An object of class **prcomp**, created by ChemoSpec functions **c_pcaSpectra, r_pcaSpectra, irlba_pcaSpectra** or **s_pcaSpectra**.
  - An object of class **mia** produced by function **miaSpectra2D**.
  - An object of class **parafac** produced by function **pfacSpectra2D**.
  - An object of class **pop** produced by function **popSpectra2D**.
Any of the above score objects will have been modified to include a list element called `$method`, a character string describing the pre-processing carried out and the type of PCA performed (used to annotate the plot).

- **scores**
  A vector of integers specifying the components (scores) to plot.

- **c.method**
  A character string describing the clustering method; must be acceptable to `hclust`.

- **d.method**
  A character string describing the distance calculation method; must be acceptable as a method in `rowDist`.

- **use.sym**
  A logical; if true, use no color and use lower-case letters to indicate group membership. Applies only to Spectra objects.

- **leg.loc**
  Character; if "none" no legend will be drawn. Otherwise, any string acceptable to `legend`.

- **...**
  Parameters to be passed to the plotting routines. Applies to base graphics only.

**Value**

A list, containing an object of class `hclust` and an object of class `dendrogram`. The side effect is a plot.

**Author(s)**

Bryan A. Hanson (DePauw University).

**See Also**

- `hclust` for the underlying function. See `hcaSpectra` for HCA of the entire data set stored in the `Spectra` object.

**Examples**

```r
if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  data(metMUD1)

  pca <- c_pcaSpectra(metMUD1)
  hca <- hcaScores(metMUD1, pca, main = "metMUD1 NMR Data PCA Scores")
}

if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
  library("ChemoSpec2D")
  data(MUD1)

  mia <- miaSpectra2D(MUD1)
  hca <- hcaScores(MUD1, mia, scores = 1:2, main = "MUD1 MIA Scores")
  set.seed(123)
  pfac <- pfacSpectra2D(MUD1, parallel = FALSE, nfac = 2)
  hca <- hcaScores(MUD1, pfac, scores = 1:2, main = "MUD1 PARAFAC Scores")
}
```
plotScores

Description

Plots the requested scores using the color scheme derived from the Spectra or Spectra2D object. Options are provided to add confidence ellipses for each group in the object. The ellipses may be robust or classical. Option to label the extreme points provided.

Usage

plotScores(
    spectra,  
    so,       
    pcs = c(1, 2), 
    ellipse = "none", 
    tol = "none", 
    use.sym = FALSE, 
    leg.loc = "topright", 
    ... 
)

Arguments

spectra  An object of S3 class ChemoSpec::Spectra() or ChemoSpec2D::Spectra2D().
so        "Score Object" One of the following:
• An object of class prcomp, created by ChemoSpec functions c_pcaSpectra, 
  r_pcaSpectra, irlba_pcaSpectra or s_pcaSpectra.
• An object of class mia produced by function miaSpectra2D.
• An object of class parafac produced by function pfacSpectra2D.
• An object of class pop produced by function popSpectra2D.

Any of the above score objects will have been modified to include a list element called $method, a character string describing the pre-processing carried out and the type of PCA performed (used to annotate the plot).

pcs A vector of two integers specifying the components (scores) to plot.

ellipse A character vector specifying the type of ellipses to be plotted. One of c("both", "none", "cls", "rob"). cls specifies classical confidence ellipses, rob specifies robust confidence ellipses. An ellipse is drawn for each group unless there are three or fewer samples in the group.

tol A number describing the fraction of points to be labeled. tol = 1.0 labels all the points; tol = 0.05 labels approximately the most extreme 5 percent. Set to 'none' to completely suppress labels. Note that a simple approach based upon quantiles is used, assumes that both x and y are each normally distributed, and treats x and y separately. Thus, this is not a formal treatment of outliers, just a means of labeling points. Groups are lumped together for the computation.
plotScores

use.sym A logical; if TRUE, the color scheme is set to black and the points plotted with symbols. Applies only to Spectra objects.

leg.loc Either a list with elements x and y, or a string like 'topright'. Values in a list should be on \([0,1]\), i.e. the lower left of the plot area is \(0,0\) and the upper right is \(1,1\). Allowed string values are those described in \texttt{graphics::legend()} under 'Details'. A value of 'none' is acceptable as well.

... Parameters to be passed to the plotting routines. Applies to base graphics only.

Value

The returned value depends on the graphics option selected (see \texttt{GraphicsOptions()}).

- **base**: None. Side effect is a plot.
- **ggplot2**: The plot is displayed, and a \texttt{ggplot2} object is returned if the value is assigned. The plot can be modified in the usual \texttt{ggplot2} manner.

Author(s)

Bryan A. Hanson (DePauw University), Tejasvi Gupta.

Examples

```r
if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  library("ggplot2")
  # This example assumes the graphics output is set to ggplot2 (see ?GraphicsOptions).
  data(metMUD1)

  pca <- c_pcaSpectra(metMUD1)
  p <- plotScores(metMUD1, pca, pcs = c(1, 2), ellipse = "cls", tol = 0.05)
  p <- p + ggtitle("metMUD1 NMR Data")
  p
}

if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
  library("ChemoSpec2D")
  library("ggplot2")
  data(MUD1)

  mia <- miaSpectra2D(MUD1)
  p1 <- plotScores(MUD1, mia, tol = 0.1, ellipse = "cls")
  p1 <- p1 + ggtitle("MIA Scores")
  p1

  set.seed(123)
  pfac <- pfacSpectra2D(MUD1, parallel = FALSE, nfac = 2)
  p2 <- plotScores(MUD1, pfac, tol = 0.1, leg.loc = "bottomright")
  p2 <- p2 + ggtitle("PARAFAC Score Plot")
  p2
}
```
plotScree

Scree Plots from PCA or MIA Analysis of a Spectra or Spectra2D Object

Description

Functions that draw a traditional scree plot, or an alternative style that is perhaps more informative. These plots illustrate the variance explained by each component in a PCA or MIA analysis.

Usage

plotScree(pca, style = "alt", ...)

Arguments

pca
Either:

• An object of class `prcomp`, modified to include a list element called `$method`, a character string describing the pre-processing carried out and the type of PCA performed (it appears on the plot). This is automatically provided if ChemoSpec functions `c_pcaSpectra` or `r_pcaSpectra` were used to create pca.

• An object of class `mia` produced by function `miaSpectra2D`.

style
Character. One of c("trad", "alt") giving the style of plot desired (traditional or alternative). "trad" is not supported for `mia` objects.

...
Parameters to be passed to the plotting routines. Applies to base graphics only.

Value

The returned value depends on the graphics option selected (see `GraphicsOptions()`).

• base: None. Side effect is a plot.

• ggplot2: The plot is displayed, and a ggplot2 object is returned if the value is assigned. The plot can be modified in the usual ggplot2 manner.

Author(s)

Bryan A. Hanson (DePauw University), Tejasvi Gupta.

References

The idea for the alternative style plot came from the NIR-Quimiometria blog by jrcuesta, at https://nir-quimiometria.blogspot.com/2012/02/pca-for-nir-spectrapart-004-projections.html
removeFreq

Remove Frequencies from a Spectra or Spectra2D Object

Description

This function removes specified frequencies from a Spectra or Spectra2D object. For instance, one might want to remove regions lacking any useful information (to reduce the data size), remove regions with large interfering peaks (e.g. the water peak in 1H NMR) or simply focus on a region of interest.

Usage

removeFreq(spectra, rem.freq = NULL, remF2 = NULL, remF1 = NULL)

Arguments

- `spectra` An object of S3 class ChemoSpec::Spectra() or ChemoSpec2D::Spectra2D().
- `rem.freq` For a Spectra object, a vector of logicals. rem.freq can be any valid R statement that leads to a vector of logicals (must be of length(Spectra$freq)). This vector should be TRUE for frequencies you want to be removed and FALSE for those frequencies which will be kept. In the examples, the | and & operators may seem backward in a sense, but R evaluates them one at a time and then combines them to give the desired result. You may wish to look at Comparison and Logic. See the examples. In addition, since January 2020 rem.freq may be a formula as described below.
- `remF2` Applies to Spectra2D objects. A formula giving the range of frequencies to be extracted. May include "low" or "high" representing the extremes of the spectra. Values outside the range of F2 are tolerated without notice and are handled as min or max. See the examples.
As for remF2.

Value

An object of S3 class `ChemoSpec::Spectra()` or `ChemoSpec2D::Spectra2D()`.

Modifying Spectra2D Objects

Regarding Spectra2D objects, one cannot remove frequencies from the interior of a 2D NMR data set and expect to get a meaningful contour plot, because doing so puts unrelated peaks adjacent in the data set. This would lead to contours being drawn that don’t exist in the original data set. However, one can remove data from the interior and run a PARAFAC analysis on the result, using the spectrum as an abstract object (that is, the spectrum may not plottable, but the resulting scores are still meaningful).

Author(s)

Bryan A. Hanson (DePauw University).

See Also

`removeFreq` for another way to remove data.

Examples

```r
if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  data(SrE.IR)
  sumSpectra(SrE.IR)

  # Examples where rem.freq is a logical vector

  # Remove frequencies from one end:
  newIR <- removeFreq(SrE.IR, rem.freq = SrE.IR$freq > 3500)

  # Remove frequencies from both ends at once:
  newIR <- removeFreq(SrE.IR, rem.freq = SrE.IR$freq > 3500 |
                      SrE.IR$freq < 800)

  # Remove frequencies from the middle:
  newIR <- removeFreq(SrE.IR, rem.freq = SrE.IR$freq > 800
                       & SrE.IR$freq < 1000)

  # The logic of this last one is as follows. Any values
  # that are TRUE will be removed.
  values <- 1:7
  values > 2
  values < 6
  values > 2 & values < 6

  # Examples where rem.freq is a formula
```
# Remove frequencies from one end:
newIR <- removeFreq(SrE.IR, rem.freq = 3500 ~ high)

# Remove frequencies from both ends is a two step process with formulas:
newIR <- removeFreq(SrE.IR, rem.freq = 3500 ~ high)

}

---

**removeGroup**

*Remove a Group from a Spectra or Spectra2D Object*

**Description**

Removes specified groups from a Spectra or Spectra2D object.
removeGroup

Usage

removeGroup(spectra, rem.group)

Arguments

spectra An object of S3 class `ChemoSpec::Spectra()` or `ChemoSpec2D::Spectra2D()`.
rem.group A character vector (handled as a regex) giving the groups to be removed.

Details

This function will report if extra data elements are found. These will probably need to be edited manually. The indices reported to the console can be helpful in this regard.

If rem.group is a character vector, the sample names are grepped for the corresponding values. Remember that the grepping process is greedy, i.e. grepping for "XY" find not only "XY" but also "XYZ".

Unused levels in $groups are dropped.

Value

An object of S3 class `ChemoSpec::Spectra()` or `ChemoSpec2D::Spectra2D()`.

Author(s)

Bryan A. Hanson (DePauw University).

Examples

```r
if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  data(SrE.IR)

  sumGroups(SrE.IR)
  SrE.IRa <- removeGroup(SrE.IR, rem.group = "pSrE")
  sumGroups(SrE.IRa)
}

if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
  library("ChemoSpec2D")
  data(MUD1)

  sumGroups(MUD1)
  MUD1a <- removeGroup(MUD1, rem.group = "Ether")
  sumGroups(MUD1a)
}
```
removeSample

Remove Samples from a Spectra or Spectra2D Object

Description

Removes specified samples from a Spectra or Spectra2D object.

Usage

removeSample(spectra, rem.sam)

Arguments

spectra  
An object of S3 class ChemoSpec::Spectra() or ChemoSpec2D::Spectra2D().

rem.sam  
Either an integer vector specifying the samples to be removed, or a character vector (handled as a regex) giving the sample names to be removed.

Details

This function will report if extra data elements are found. These will probably need to be edited manually. The indices reported to the console can be helpful in this regard.

If rem.sam is a character vector, the sample names are grepped for the corresponding values. Remember that the grepping process is greedy, i.e. grepping for "XY" find not only "XY" but also "XYZ".

Value

An object of S3 class ChemoSpec::Spectra() or ChemoSpec2D::Spectra2D().

Author(s)

Bryan A. Hanson (DePauw University).

Examples

if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  data(SrE.IR)

  # Remove the 9th spectrum/sample:
  SrE.IR$names
  SrE.IRa <- removeSample(SrE.IR, rem.sam = 9)
  SrE.IRa$names

  # Removes a spectrum/sample with this exact name:
  SrE.IRb <- removeSample(SrE.IR, rem.sam = "NW_adSrE")
  SrE.IRb$names
}
if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
    library("ChemoSpec2D")
data(MUD1)

    # Removes the 5th spectrum:
    MUD1$names
    MUD1a <- removeSample(MUD1, rem.sam = 5)
    MUD1a$names

    # Removes a spectrum/sample with this exact name:
    MUD1$names
    MUD1b <- removeSample(MUD1, rem.sam = "Ether_3")
    MUD1b$names
}

---

### rowDist

**Compute Distance Between Rows of a Matrix**

**Description**

This function computes the distance between rows of a matrix using a number of methods. It is primarily a wrapper for `Dist` which provides many options. However, cosine distance is calculated locally. See the reference for an excellent summary of distances and similarities. Keep in mind that distances are always positive by definition. Further, in the literature one can find the same distance defined different ways. For instance, the definition of the "pearson" and "correlation" distances differs slightly between the reference below and `Dist`. So please study the definitions carefully to get the one you want. The example illustrates the behavior of some common distance definitions. Notice that "pearson" and "cosine" are mathematically identical for the particular definition of "pearson" used by `Dist`.

**Usage**

```r
rowDist(x, method)
```

**Arguments**

- `x`: A matrix whose rows will be used for the distance calculation.
- `method`: Character; one of "cosine", "euclidean", "maximum", "manhattan", "canberra", "binary", "pearson", "correlation", "spearman", "kendall", "abspearson", "abscorrelation".

**Value**

An object of class `dist`.

**Author(s)**

Bryan A. Hanson (DePauw University).

      method = "cosine",
      main = "SrE.IR Cosine Distance Between Samples"
    )
    SrE.dmatrix <- sampleDist(SrE.IR, # abspearson distance bounded on [0...1]
      method = "abspearson",
      main = "SrE.IR Absolute Pearson Distance Between Samples"
    )
    SrE.dmatrix <- sampleDist(SrE.IR, # euclidean distance unbounded
      method = "euclidean",
      main = "SrE.IR Euclidean Distance Between Samples"
    )
  }
  if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
    library("ChemoSpec2D")
    library("lattice")
    data(MUD1)
    MUD1.dmatrix <- sampleDist(MUD1,
      method = "cosine",
      main = "MUD1 Cosine Distance Between Samples"
    )
  }
}
sumGroups

Summarize the Group Membership of a Spectra or Spectra2D Object

Description
This function summarizes the group membership of a Spectra or Spectra2D object.

Usage
sumGroups(spectra)

Arguments
spectra An object of S3 class ChemoSpec::Spectra() or ChemoSpec2D::Spectra2D().

Value
A data frame as follows. Note that if there are groups with no members these are dropped.

group The name of the group.
no. The number in the group.
color The color assigned to the group.
symbol The symbol assigned to the group. Spectra objects only.
alt.symbol The alternative symbol assigned to the group. Spectra objects only.

Author(s)
Bryan A. Hanson (DePauw University).

See Also
To summarize the entire object, sumSpectra.

Examples
if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
data(SrE.IR)
  sumGroups(SrE.IR)
}

if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
  library("ChemoSpec2D")
data(MUD1)
  sumGroups(MUD1)
}
sumSpectra  

*Summarize a Spectra or Spectra2D Object*

**Description**

Provides a summary of a `Spectra` or `Spectra2D` object, essentially a more spectroscopist-friendly version of `str()`.

**Usage**

```r
sumSpectra(spectra, ...)
```

**Arguments**

- `spectra`  
  An object of S3 class `ChemoSpec::Spectra()` or `ChemoSpec2D::Spectra2D()`.

- `...`  
  Arguments to be passed downstream. Main use is to pass a value for `tol` to function `check4Gaps` when using ChemoSpec. Not used in ChemoSpec2D.

**Details**

Prior to summarizing, `chkSpectra` is run with `confirm = FALSE`. If there are problems, warnings are issued to the console and the summary is not done. The `Spectra` or `Spectra2D` object is checked to see if it contains data elements beyond what is required. If so, these extra elements are reported to the console.

**Value**

None. Results printed at console.

**Author(s)**

Bryan A. Hanson (DePauw University).

**Examples**

```r
if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  data(SrE.IR)
  sumSpectra(SrE.IR)
}

if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
  library("ChemoSpec2D")
  data(MUD1)
  sumSpectra(MUD1)
}
```
updateGroups  Update Group Names in a Spectra or Spectra2D Object

Description

A convenience function that can be used to update (change) group names. The default group names come from the gr.crit argument in the import functions files2SpectraObject, matrix2SpectraObject or files2Spectra2DObject. In some cases gr.crit may have complex regex patterns, and this function makes updating them to more appropriate/more readable strings easier.

Usage

updateGroups(spectra, new.grps = NULL, silent = FALSE)

Arguments

spectra An object of S3 class ChemoSpec::Spectra() or ChemoSpec2D::Spectra2D().
new.grps A vector of character values giving the new group names. The new values must correspond to the order of the old values. This vector should give the unique values only (so, it should have length(unique(spectra$groups))). If not provided, the function will print the old values for reference.
silent Logical. If TRUE, suppresses all reporting.

Value

spectra An object of S3 class ChemoSpec::Spectra() or ChemoSpec2D::Spectra2D().

Author(s)

Bryan A. Hanson (DePauw University).

Examples

if (checkForPackageWithVersion("ChemoSpec", 6.0)) {
  library("ChemoSpec")
  data(metMUD1)
  metMUD1a <- updateGroups(metMUD1) # reports old groups
  metMUD1a <- updateGroups(metMUD1, new.grps = c("C", "T"))
}

if (checkForPackageWithVersion("ChemoSpec2D", 0.5)) {
  library("ChemoSpec2D")
  data(MUD1)
  MUD1a <- updateGroups(MUD1, new.grps = c("control", "treatment"))
}
