Package ‘DDPNA’

May 17, 2022

Type Package

Title Disease-Driven Differential Proteins Co-Expression Network Analysis

Version 0.3.1

Date 2022-5-16

Author Kefu Liu [aut, cre]

Maintainer Kefu Liu <liukefu19@163.com>

URL https://github.com/liukf10/DDPNA

BugReports https://github.com/liukf10/DDPNA/issues

Description Functions designed to connect disease-related differential proteins and co-expression network. It provides the basic statistics analysis included t test, ANOVA analysis. The network construction is not offered by the package, you can used ‘WGCNA’ package which you can learn in Peter et al. (2008) <doi:10.1186/1471-2105-9-559>. It also provides module analysis included PCA analysis, two enrichment analysis, Planner maximally filtered graph extraction and hub analysis.

Imports stats, ggplot2, ggalt, MEGENA, igraph, Hmisc, utils, grDevices, plyr, scales, grid, VennDiagram

Suggests WGCNA, Biostrings, impute, ggfortify

License GPL-2

Encoding UTF-8

Depends R (>= 3.5)

DDPNA-package Disease-driven Differential Proteins And Proteomic Co-expression Network Associated Analysis

Description

disease driven proteins associated network in different species crosstalk. The package is used to analysis differential proteomics consensus network in two or more datasets. The function Data_impute need impute package from Bioconductor, the function ID_match and the function MaxQdataconvert need Biostrings package from Bioconductor.
Details

Package: DDPNA
Type: Package
Version: 0.3.1
Create Date: 2019-03-18
Date: 2022-05-16
License: GPL (>= 2)

~ An overview of how to use the package, including the most important functions ~

Author(s)
Kefu Liu
Maintainer: Kefu Liu <lkf1013@gmail.com>

Description
anova analysis in proteomic data.

Usage
anova_p(data, group)

Arguments
data protein quantification data. column is sample. row is protein ID.
group sample group information

Author(s)
Kefu Liu

Examples
data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
group <- gsub("[0-9]+", "", colnames(logD))
anova_P <- anova_p(logD[1:100,], group)
Description

extract significant differential protein

Usage

changedID(relative_value, group, vs.set2, vs.set1 = "WT",
rank = "none", anova = TRUE, anova.cutoff = 0.05,
T.cutoff = 0.05, Padj = "fdr",
cutoff = 1.5, datatype = c("none","log2"), fctype = "all", ...)

Arguments

relative_value  protein quantification data
group           sample group information
vs.set2         compared group 2 name
vs.set1         compared group 1 name
rank            order by which type. This must be (an abbreviation of) one of the strings
"none","foldchange","anova","t"
anova           a logical value indicating whether do anova analysis.
anova.cutoff    a numeric value indicated that anova test p value upper limit.
T.cutoff        a numeric value indicated that t.test p value upper limit.
Padj            p adjust methods of multiple comparisons. it can seen in p.adjust.methods.
cutoff          a numeric value indicated that foldchange lower limit.
datatype        The quantification data is normal data or log2 data.
fctype          foldchange is ordered by up-regulated or down-regulated or changed
...             Other arguments.

Details

extract significant differential protein ID based on foldchange, t.test p value, anova p value.

Value

a vector of protein ID information.

Author(s)

Kefu Liu
Examples

data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
group <- gsub("[0-9]+", ",", colnames(logD))
up <- changedID(logD[201:260,], group, vs.set2 = "ad", vs.set1 = "ctl",
    rank = "foldchange", anova = FALSE, Padj = "none", cutoff = 1,
    datatype = "log2", fctype = "up")

Description

summarize the statistics information of data

Usage

dataStatInf(prodata, group, intensity = "intensity",
    Egrp = NULL, Cgrp = "ctl",
    meanmethod = "mean", datatype = c("none", "log2"),
    anova = TRUE, T.test = c("pairwise", "student", "none"),
    Aadj = "none", Tadj = "none", cutoff = FALSE, ...)
cutoff

- a logical value or a numeric value. The default value is FALSE, which means do not remove any P value. If the value is TRUE, P value > 0.05 will remove and showed as NA in result. If the value is numeric, P value > the number will remove and showed as NA in result.

Value

- a data.frame of protein ID and Statistics information.

Author(s)

- Kefu Liu

Examples

```r
data(imputedData)
group <- gsub("[0-9]+", ",", colnames(imputedData$intensity))
data <- imputedData
data$info <- data$info[1:100,]
data$intensity <- data$intensity[1:100,]
stat <- dataStatInf(data, group, meanmethod = "median",
                    T.test = "pairwise", Aadj = "fdr",
                    Tadj = "fdr", cutoff = FALSE)
```

Description

- data clean process: detect and remove outlier sample and impute missing value. The process is following: 1. Remove some genes which the number of missing value larger than maxNAratio. 2. Outlier sample detect and remove these sample. 3. Repeat Steps 1-2 until meet the iteration times or no outlier sample can be detected. 4. impute the missing value. The function also can only do gene filter or remove outlier or impute missing value.

Usage

```r
Data_impute(data, inf = "inf", intensity = "LFQ", miss.value = NA,
             splINExt = TRUE, maxNAratio = 0.5,
             removeOutlier = TRUE,
             outlierdata = "intensity", iteration = NA, sdout = 2,
             distmethod = "manhattan", A.IAC = FALSE,
             dohclust = FALSE, treelabels = NA,
             plot = TRUE, filename = NULL,
             text.cex = 0.7, text.col = "red", text.pos = 1,
             text.labels = NA, abline.col = "red", abline.lwd = 2,
             impute = TRUE, verbose = 1, ...)
```
Arguments

data MaxQconvert data or a list Vector which contain two data.frame: ID information and quantification data
inf the data.frame name contain protein ID information
intensity the data.frame name only contain quantification data
miss.value the type of miss.value showed in quantification data. The default value is NA. The miss.value usually can be NA or 0.
splNExt a logical value whether extract sample name.(suited for MaxQuant quantification data)
maxNAratio The maximum percent missing data allowed in any row (default 50%). For any rows with more than maxNAratio% missing will deleted.
removeOutlier a logical value indicated whether remove outlier sample.
outlierdata The value is deprecated. which data will be used to analysis outlier sample detect. This must be (an abbreviation of) one of the strings "intensity","relative_value","log2_value".
iteration a numeric value indicating how many times it go through the outlier sample detect and remove loop. NA means do loops until no outlier sample.
sdout a numeric value indicating the threshold to judge the outlier sample. The default 2 means 0.95 confidence intervals
distmethod The distance measure to be used. This must be (an abbreviation of) one of the strings "manhattan","euclidean","canberra","correlation"
A.IAC a logical value indicated whether decreasing correlation variance.
dohclust a logical value indicated whether doing hierarchical clustering and plot dendrograms.
treelabels labels of dendrograms
plot a logical value indicated whether plot numbersd scatter diagrams.
filename the filename of plot. The number and plot type information will added automatically. The default value is NULL which means no file saving. all the plot will be saved to "plot" folder and saved in pdf format.
text.cex outlier sample annotation text size(scatter diagrams parameters)
text.col outlier sample annotation color(scatter diagrams parameters)
text.pos outlier sample annotation position(scatter diagrams parameters)
text.labels outlier sample annotation (scatter diagrams parameters)
abline.col the threshold line color (scatter diagrams parameters)
abline.lwd the threshold line width (scatter diagrams parameters)
impute a logical value indicated whether do knn imputation.
verbose integer level of verbosity. Zero means silent, 1 means have some Diagnostic Messages.

Details
detect and remove outlier sample and impute missing value.
Value

a list of proteomic data.

inf          Portein information included protein IDs and other information.
intensity    Quantification information.
relative_value intensity divided by geometric mean
log2_value   log2 of relative_value

Author(s)

Kefu Liu

Examples

data(Dforimpute)
data <- Data_impute(Dforimpute,distmethod="manhattan")

DEPsets  

Description

eextract two or more ID sets intersection set and complementary set and define the colors.

Usage

DEPsets(datalist, colors = c("red", "green", "blue"))

Arguments

datalist      a list contains more than two ID sets.
colors        define each ID sets color.

Value

a list contains intersection set and complementary set information and colors.
gene.set      a list of each set ID information.
color.code    the colors of each set

Author(s)

Kefu Liu
Examples

data(net)
data(imputedData)
Module <- Module_inf(net, imputedData$inf)
group <- gsub("[0-9]+", ",", colnames(imputedData$intensity))
data <- imputedData
data$inf <- data$inf[1:100,]
data$intensity <- data$intensity[1:100,]
stat <- dataStatInf(data, group, meanmethod = "median",
  T.test = "pairwise", Aadj = "fdr",
  Tadj = "fdr", cutoff = FALSE)
stat <- rename_dupnewID(stat, Module, DEPfromMod = TRUE)
stat1 <- stat$new.ID[stat$ad > 1]
stat2 <- stat$new.ID[stat$asym > 1]
datalist <- list(stat1 = stat1, stat2 = stat2)
sets <- DEPsets(datalist)

Description

get the DEP enrich fold in Module and plot a HeatMap

Usage

DEP_Mod_HeatMap(DEP_Mod, xlab = "DEP", filter = c("p","p.adj"),
cutoff = 0.05, filename = NULL, ...)

Arguments

DEP_Mod a list of DEP_Mod enrichment information. data.frame in list is get from Module_Enrich function.
xlab it indicate x value in heatmap. it must be a value between "DEP" and "MOD".
filter p value or p.adjust value used to filter the enrich significant module.
cutoff a numeric value is the cutoff of p value. Larger than the value will remove to show in plot.
filename plot filename. If filename is null, it will print the plot.
... other argument.

Value

a list of enrich fold heatmap information.
enrichFold enrichFold of DEP in Modules.
textMatrix significant enrichment module information.
Author(s)
Kefu Liu

Examples

data(net)
data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
group <- gsub("\[0-9]+\", "", colnames(logD))
Module <- Module_inf(net, data$inf)
# define 2 DEP ID data: a and b
a <- Module$ori.ID[1:100]
b <- Module$ori.ID[50:100]
a <- Module_Enrich(Module, a, coln="ori.ID", enrichtype = "ORA")
b <- Module_Enrich(Module, b, coln="ori.ID", enrichtype = "ORA")
rownames <- a$module.name;
a <- data.frame(Counts = a$Counts, module.size = a$module.size,
precent = a$precent, p = a$p, p.adj = a$p.adj,
Z.score = a$Z.score, stringsAsFactors = FALSE)
rownames(a) <- rownames;
rownames <- b$module.name;
b <- data.frame(Counts = b$Counts, module.size = b$module.size,
precent = b$precent, p = b$p, p.adj = b$p.adj,
Z.score = b$Z.score, stringsAsFactors = FALSE)
rownames(b) <- rownames;
DEP_Mod <- list(a = a, b = b)
heatMapInf <- DEP_Mod_HeatMap(DEP_Mod)

Description
remove hubs which is not in the IDsets and replot the PFG network

Usage

DEP_Mod_net_plot(ModNet, IDsets = NULL, data = NULL, module = NULL,
plot = TRUE, filename = NULL, filetype = "pdf",
OnlyPlotLast = TRUE, BranchCut = TRUE,
reconstructNet = TRUE, iteration = Inf, label.hubs.only = TRUE,
node.default.color = "grey",
hubLabel.col = "black", ...)
Arguments

ModNet data contains network information which get from getmoduleHub
IDsets ID sets information which get from DEPsets
data the value should be defined only when reconstructNet is TRUE. The value is proteomic quantification data, which is same as the input in getmoduleHub.
module the value should be defined only when reconstructNet is TRUE. The value is module information which is same as the input in getmoduleHub.
plot a logical value whether plot a picture.
filename the filename of plot. The default value is NULL which means no file saving. The function is use ggsave to achieve.
filetype the file type of plot. the type should be one of "eps", "ps", "tex" (pictex), "pdf", "jpeg", "tiff", "png", "bmp", "svg" or "wmf" (windows only).
OnlyPlotLast a logical value whether plot the final network.
BranchCut a logical value whether remove unhub proteins which have no connection to DEPs.
reconstructNet a logical value whether reconstruct network.
itration iteration times when reconstruct network.
label.hubs.only a logical value whether show labels for hubs only.
node.default.color Default node colors for those that do not intersect with signatures in gene.set.
hubLabel.col Label color for hubs.
...

Value

a list contains network information

netgene all IDs in network.
hub hub IDs
PMFG PMFG graph data frame information

Author(s)

Kefu Liu

Examples

data(net)
data(imputedData)
Module <- Module_inf(net, imputedData$inf)
module <- gsub("[0-9]+","", colnames(imputedData$intensity))
data <- imputedData
data$inf <- data$inf[1:100,]
data$intensity <- data$intensity[1:100,]
stat <- dataStatInf(data, group, meanmethod = "median",
    T.test = "pairwise", Aadj = "fdr",
    Tadj = "fdr", cutoff = FALSE)
stat1 <- stat$ori.ID[stat$ad > 1]
stat2 <- stat$ori.ID[stat$asym > 1]
datalist <- list(stat1 = stat1, stat2 = stat2)
sets <- DEPsets(datalist)

logD <- imputedData$log2_value
rownames(logD) <- imputedData$inf$ori.ID
Mod3 <- getmoduleHub(logD, Module, 3, coln = "ori.ID", adjustp = FALSE)

newnet <- DEP_Mod_net_plot(Mod3, sets,
    data = logD, module = Module,
    plot = FALSE, filename = NULL, filetype = "pdf",
    OnlyPlotLast = FALSE, reconstructNet = FALSE)

fc.pos

description

Pick up proteins based on foldchange and return proteins position in data.

Usage

fc.pos(fc, vs.set2, vs.set1 = "WT",
cutoff = 1, datatype = c("none", "log2"),
fctype = "all", order = TRUE)

Arguments

fc proteomic data of mean value in groups.
vs.set2 compared group 2 name
vs.set1 compared group 1 name
cutoff a numeric value indicated foldchange threshold.
datatype The quantification data is normal data or log2 data. This must be (an abbrevia-
tion of) one of the strings "none", "log2".
fctype foldchange is ordered by up-regulated or down-regulated or changed
order a logical value indicated that whether ordered by foldchange.

Author(s)

Kefu Liu
Examples

data(imputedData)
data <- imputedData
relative <- data$relative_value
rownames(relative) <- data$inf$ori.ID
group <- gsub("[0-9]+", "", colnames(relative))
datamean <- groupmean(relative, group, name = FALSE)
fc_1vs2 <- fc.pos(datamean, vs.set2 = "ad", vs.set1 = "ctl",
cutoff = 1, datatype = "none",
fctype = "up", order = TRUE)
f_ID <- rownames(relative)[fc_1vs2]

FCSenrichplot

Description

plot of FCS enrichment analysis

Usage

FCSenrichplot(FCSenrich, count = 1, p = 0.05, filter = "p",
plot = TRUE, filename = NULL, filetype = "pdf", ...)

Arguments

FCSenrich FCS enrichment information which is getted in module_enrich function.
count a numeric value. Module will choosed when countnumber is larger than count value.
p a numeric value. Module will choosed when any Fisher's extract test p value is less than count value.
filter filter methods. This must be (an abbreviation of) one of the strings "p", "p.adj", "none".
plot a logical value indicating whether draw enrichment variation trend plot.
filename the filename of plot. The default value is NULL which means no file saving. The plot will be saved to "plot" folder.
filetype the file type of plot. the type should be one of "eps", "ps", "tex" (ptex), "pdf", "jpeg", "tiff", "png", "bmp", "svg" or "wmf" (windows only).

Author(s)

Kefu Liu
getmoduleHub

Examples

```r
data(imputedData)
data(net)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
group <- gsub("[0-9]\+","", colnames(logD))
Module <- Module_inf(net, data$inf)
pos <- which(Module$moduleNum %in% c(11:13))
up <- changedID(logD[pos,], group, vs.set2 = "ad", vs.set1 = "ctl",
    rank = "foldchange", anova = FALSE, Padj = "none", cutoff = 1,
    datatype = "log2", fctype = "up")
FCSenrich <- Module_Enrich(Module[pos,], up, coln="ori.ID")
FCSenrich <- FCSenrichplot(FCSenrich)
```

getmoduleHub

Description

extract PMFG information and get Module hub proteins.

Usage

```r
getmoduleHub(data, module, mod_num, coln = "new.ID",
    cor.sig = 0.05, cor.r = 0, cor.adj="none",
    adjustp = TRUE, hub.p = 0.05)
```

Arguments

data proteomic quantification data.
module module information which is getted in Module_inf function.
mod_num the module name which module will be calculate.
coln column name of module contains protein IDs. it could be matched with "classifiedID"
cor.sig a numeric value indicated that correlation p value less than cor.sig will be picked.
cor.r a numeric value indicated that correlation r value larger than cor.r will be picked.
cor.adj P value correction method. method information can see in p.adjust.method
adjustp a logical value indicating whether pick hub protein by FDR methods.
hub.p a numeric value indicated that hub proteins are p value less than hub.p.
Value

A list contains PMFG network information. `list(hub = hubgene, degreeStat = Stat, graph = g, PMFG = gg)

hub

Hub information.

degreeStat

Degree statistics information

graph

The original graph data frame

PMFG

PMFG graph data frame

Author(s)

Kefu Liu

Examples

data(net)
data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
group <- gsub("[0-9]+\.", ", colnames(logD))
Module <- Module_inf(net, data$inf)
Mod10 <- getmoduleHub(logD, Module, 10, coln = "ori.ID", adjustp = FALSE)
if (requireNamespace("MEGENA", quietly = TRUE)) {
  library(MEGENA)
  plot_subgraph(module = Mod10$degreeStat$gene,
               hub = Mod10$hub, PFN = Mod10$PMFG,
               node.default.color = "black",
               gene.set = NULL, color.code = c("grey"), show.legend = TRUE,
               label.hubs.only = TRUE, hubLabel.col = "red", hubLabel.sizeProp = 0.5,
               show.topn.hubs = 10, node.sizeProp = 13, label.sizeProp = 13,
               label.scaleFactor = 10, layout = "kamada.kawai")
}

Description

Mean of sample group

Usage

groupmean(data, group, method = c("mean", "median"), name = TRUE)
ID_match

Arguments

- **data**: protein quantification data. column is sample, row is protein ID.
- **group**: sample group information
- **method**: Arithmetic mean of sample group or median of sample group. This must be (an abbreviation of) one of the strings "mean","median".
- **name**: a logical value indicated whether add "mean" or "median" in sample group name.

Author(s)

Kefu Liu

Examples

```r
data(imputedData)
data <- imputedData
logD <- data$log2_value
group <- gsub("[0-9]+","", colnames(logD))
datamean <- groupmean(logD, group, name = FALSE)
```

Description

homolog protein Uniprot ID match

Usage

```r
ID_match(data, db1.path = NULL, db2.path = NULL, out.folder = NULL,
blast.path = NULL, evalue = 0.1, verbose = 1)
```

Arguments

- **data**: dataset of protein information. Column Names should contain "ori.ID" and "ENTRY.NAME". "ori.ID" is Uniprot ID
- **db1.path**: fasta file, database of transferred species
- **db2.path**: fasta file, database of original species
- **out.folder**: blast result output folder, the folder path should be the same with db1.path
- **blast.path**: blast+ software install path
- **evalue**: blast threshold, the lower means more rigorous
- **verbose**: integer level of verbosity. Zero means silent, 1 means have Diagnostic Messages.
Details

Homolog protein Uniprot ID match is based on the ENTRY.NAME, gene name and sequence homophylly in two different species or different version of database.

Value

A data.frame included 4 columns: ori.ID, ENTRY.NAME, new.ID, match.type.

Note

This function should install ‘blast+’ software, Version 2.7.1. ‘blast+’ download website: https://ftp.ncbi.nlm.nih.gov/blast/executables/blast+/LATEST/. If unstall ‘blast+’ software, it could use R function replaced, but it will take a lot of time. db1.path, db2.path, out.folder are both need the complete path. Out.folder and db1.path should be in the same folder. Path should have no special character. data should have colname: ori.ID, ENTRY.NAME.

Author(s)

Kefu Liu

Examples

# suggested to install blast+ software
# it will take a long time without blast+ software
data(Sample_ID_data)
if(requireNamespace("Biostrings", quietly = TRUE)){
  out.folder = tempdir();
  write.table(Sample_ID_data$db1, file.path(out.folder,"db1.fasta"),
             quote = FALSE, row.names = FALSE, col.names = FALSE);
  write.table(Sample_ID_data$db2, file.path(out.folder,"db2.fasta"),
             quote = FALSE, row.names = FALSE, col.names = FALSE);
  data <- ID_match(Sample_ID_data$ID_match_data,
                   db1.path = file.path(out.folder,"db1.fasta"),
                   db2.path = file.path(out.folder,"db2.fasta"),
                   out.folder = out.folder,
                   blast.path = NULL,
                   evalue = 0.1, verbose = 1)
  file.remove(file.path(out.folder,"db1.fasta"),
              file.path(out.folder,"db2.fasta"))
}

MaxQdataconvert

One-step to extract ‘Maxquant’ quantification data and convert

Description

‘Maxquant’ quantification data extract and homolog protein Uniprot ID match.
MaxQdataconvert

Usage

MaxQdataconvert(pgfilename, IDname = "Majority.protein.IDs", IDtype = c("MaxQ","none"), CONremove = TRUE, justID = TRUE, status1 = TRUE, ENTRY1 = TRUE, db1.path = NULL, db2.path = NULL, out.folder = NULL, blast.path = NULL, savecsvpath = NULL, csvfilename = NULL, verbose = 1, ...)

Arguments

pgfilename 'Maxquant' quantification file "protein groups.txt"
IDname The column name of uniprot ID. The default value is "Majority.protein.IDs" which is the column name in MaxQuant data.
IDtype "MaxQ" means proteinGroups is 'Maxquant' quantification data, "none" means other type data. This must be (an abbreviation of) one of the strings: "MaxQ","none".
CONremove a logical value indicated whether remove contaminant IDs. When IDtype is "none", it will remove unmatch ID compared with database2.
justID a logical value indicated whether only extract ID when IDtype is "MaxQ".
status1 a logical value indicated whether extract the first ID status when IDtype is "MaxQ".
ENTRY1 a logical value indicated whether extract the first ID ENTRY NAME when IDtype is "MaxQ".

Details

one-step to extract MaxQuant or other quantification data and convert. The function contain ID_match function.
MaxQdataconvert

Value

- **protein_IDs**: Protein IDs which is IDname column information.
- **intensity**: Quantification intensity information. When IDtype is "none", it is the QuanCol columns information.
- **iBAQ**: Quantification iBAQ intensity information. (only for IDtype is "MaxQ")
- **LFQ**: Quantification LFQ intensity information. (only for IDtype is "MaxQ")

Note

db1.path, db2.path, out.folder are both need the complete path. Out.folder and db1.path should be
in the same folder. Path should have no special character.

ID_match

Examples

```r
# suggested to install blast+ software

# it will take a long time without blast+ software
data(Sample_ID_data)
if(requireNamespace("Biostrings", quietly = TRUE)){
  out.folder = tempdir();
  write.table(Sample_ID_data$db1,file.path(out.folder,"db1.fasta"),
              quote = FALSE,row.names = FALSE, col.names = FALSE);
  write.table(Sample_ID_data$db2,file.path(out.folder,"db2.fasta"),
              quote = FALSE,row.names = FALSE, col.names = FALSE);
  write.table(Sample_ID_data$pginf,
              file = file.path(out.folder,"proteingroups.txt"),
              quote = FALSE,
              sep = "\t",dec = ".", row.names = FALSE, col.names = TRUE )
Maxdata <- MaxQdataconvert(file.path(out.folder,"proteingroups.txt"),
                           IDtype = "MaxQ",
                           db1.path = file.path(out.folder,"db1.fasta"),
                           db2.path = file.path(out.folder,"db2.fasta"),
                           out.folder = out.folder,
                           blast.path = NULL)
file.remove(file.path(out.folder,"db1.fasta"),
            file.path(out.folder,"db2.fasta"),
            file.path(out.folder,"proteingroups.txt") )
}
```
MaxQprotein

read proteomic quantification data and separate the protein information and quantification information.

Description

The function will separate data into 4 parts: protein information, intensity, iBAQ and LFQ (iBAQ and LFQ only fit for 'MaxQuant' software result). For MaxQ data, it can remove the contaminant and reverse protein.

Usage

MaxQprotein(proteinGroups, IDname = "Majority.protein.IDs", IDtype = "MaxQ", remove = TRUE, QuanCol = NULL, verbose = 1)

Arguments

proteinGroups the proteomic quantification data
IDname The column name of uniprot ID. The default value is "Majority.protein.IDs" which is the column name in MaxQuant data.
IDtype "MaxQ" means proteinGroups is Maxquant quantification data, "none" means other type data. This must be (an abbreviation of) one of the strings: "MaxQ","none".
remove a logical value indicated whether remove contaminant and reverse ID.
QuanCol The quantification data columns. It’s only needed when IDtype is "none". When IDtype is "none" and QuanCol is not given, the intensity will auto extract all columns except IDname as quantification data. It may have error in next analysis.
verbose integer level of verbosity. Zero means silent, 1 means have Diagnostic Messages.

Value

a list of proteomic information.

protein_IDs Portein IDs which is IDname column information.
intensity Quantification intensity information. When IDtype is "none", it is the QuanCol columns information.
iBAQ Quantification iBAQ intensity information.(only for IDtype is "MaxQ")
LFQ Quantification LFQ intensity information.(only for IDtype is "MaxQ")

Author(s)

Kefu Liu
Examples

data(ProteomicData)
# example for MaxQ Data
MaxQdata <- MaxQprotein(ProteomicData$MaxQ)
# example for other type Data
otherdata <- MaxQprotein(ProteomicData$none, IDname = "Protein",
IDtype = "none", QuanCol = 2:9)

ME_inf

module eigengenes information

Description
put sample names as rownames in WGCNA module eigenvalue data.frame.

Usage
ME_inf(MEs, data, intensity.type = "LFQ", rowname = NULL)

Arguments

MEs module eigenvalue which is calculated in WGCNA package.
data protein quantification data. column is sample. row is protein ID.
intensity.type quantification data type, which can help extract sample name. This must be (an abbreviation of) one of the strings "LFQ", "intensity", "iBAQ", "none".
rowname sample names when "intensity.type" is "none", rowname will be used.

Author(s)
Kefu Liu

Examples

data(net)
data(imputedData)
data <- imputedData
logD2 <- data$log2_value
MEs <- ME_inf(MEs, logD)
modpcomp

Description
extract module pca component

Usage
modpcomp(data, colors, nPC = 2,
          plot = FALSE, filename = NULL, group = NULL)

Arguments
data
    protein quantification data. column is sample. row is protein ID.

colors
    protein and module information. which is calculated in WGCNA package.

nPC
    how many PCA component will saved.

plot
    a logical value indicating whether draw PCA plot. This function need load
    ggfortify first.

filename
    The filename of plot. The default value is NULL which means no file saving. The
    plot will be saved to "plot" folder and saved in pdf format.

group
    sample group information.

Author(s)
Kefu Liu

Examples
data(net)
data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
Module_PCA <- modpcomp(logD, net$colors)

# if plot PCA and plot module 6 PCA

group <- gsub("[0-9]+", ",", colnames(logD))
pos <- which(net$colors == 6)
if (requireNamespace("ggfortify", quietly = TRUE)){
    require("ggfortify")
    Module_PCA <- modpcomp(logD[pos,], net$colors[pos], plot = TRUE, group = group)
}
moduleID (inf, module, num, coln = "new.ID")

Arguments

inf: dataset protein ID information. a vector of protein IDs.
module: module information which is getted in Module_inf function.
um: module number which will extract to compared with dataset ID information.
coln: column names of module protein IDs.

details

column coln information in module when module number is num intersect with inf.

Author(s)

Kefu Liu

Examples

data(net)
data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
group <- gsub("[0-9]+", ",", colnames(logD))
Module <- Module_inf(net, data$inf)
up <- changedID(logD, group, vs.set2 = "ad", vs.set1 = "ctl",
    rank = "foldchange",anova = FALSE, Padj = "none", cutoff = 1,
    datatype = "log2",fctype = "up")
intersection <- moduleID(up, Module, 5, coln = "ori.ID")
Module_Enrich

Description

Enrichment analysis of a sets of proteins in all modules. The function offered two enrichment methods: ORA and FCS.

Usage

Module_Enrich(module, classifiedID, enrichtype = "FCS",
    coln = "new.ID", datainf = NULL, p.adj.method = "BH")

Arguments

module module information which is getted in Module_inf function.
classifiedID a sets of protein IDs which is ordered by change value/ p value and so on.
enrichtype enrichment method. This must be (an abbreviation of) one of the strings "FCS","ORA". "FCS" means analyzes step-by-step a proteins list which is ordered by change ratio/ p value and so on. "ORA" means analyzes a proteins list by Fisher's extract test.
coln column name of module contains protein IDs. it could be matched with "classifiedID"
datainf proteomic data protein ID information. The default value is "NULL". which is means that the "classifiedID" come from proteomic information is the same as the module construction proteomic information. If they are different, proteomic data information should be given.
p.adj.method p adjust methods of multiple comparisons. it can seen in p.adjust.methods.

Value

a list contains classifiedID enrichment information.
Counts the counts of classifiedID in module.
module.size the number of module ID
module.name module name
precent counts divided module.size
p enrichment p value in each module
p.adj enrichment p.adj value in each module
Z.score Z score is -log2 P value.

Author(s)

Kefu Liu
Examples

data(net)
data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
group <- gsub("[0-9]+\"\",\"\", colnames(logD))
Module <- Module_inf(net, data$inf)
up <- changedID(logD, group, vs.set2 = "ad", vs.set1 = "ctl",
rank = "foldchange", anova = FALSE, Padj = "none", cutoff = 1,
datatype = "log2", fctype = "up")
FCSenrich <- Module_Enrich(Module, up, coln="ori.ID")

Description

module and protein information match

Usage

Module_inf(net, inf, inftype = "Convert", IDname = NULL, ...)

Arguments

net module network which is calculated in WGCNA package.
inf proteome quantification data information which contains protein IDs.
inftype data information type. This must be (an abbreviation of) one of the strings "Convert","MaxQ","none". "Convert" means protein ID is converted by MaxquantDataconvert function. "MaxQ" means original Maxquant software quantification data information.
IDname IDname is "inf" column names which will extract.
... other argument.

Author(s)

Kefu Liu

Examples

data(net)
data(imputedData)
data <- imputedData
Module <- Module_inf(net, data$inf)
multi.t.test

Description

multiple comparisons t test and choose significant proteins in proteomic data.

Usage

multi.t.test(data, group,
    sig = 0.05, Adj.sig = TRUE,
    grpAdj = "bonferroni",
    geneAdj = "fdr", ...)

Arguments

data protein quantification data. column is sample. row is protein ID.
group sample group information
sig signficant P value threshold. The default is 0.05.
Adj.sig a logical value indicated that whether adjust P-values for multiple proteins comparisons in each two groups.
grpAdj adjust multiple groups comparisions P-value in each two groups. The default is "bonferroni". it can seen in p.adjust.methods.
geneAdj adjust multiple proteins comparisions P-value in each group. The default is "fdr". it can seen in p.adjust.methods.
...
Other arguments.

Author(s)

Kefu Liu

Examples

data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
group <- gsub("[0-9]+", "", colnames(logD))
Tsig_P <- multi.t.test(logD[1:100,], group, Adj.sig = FALSE, geneAdj = "fdr")
P.G.extract

Protein Groups information extract.

Description

uniprot ID, ENTRYNAME and status information extract. (only fit for `MaxQuant` data.)

Usage

P.G.extract(inf, ncol = 4, justID = FALSE,
  status1 = TRUE, ENTRY1 = TRUE, ID1 = TRUE,
  sp1 = TRUE, onlysp = FALSE, verbose = 0)

Arguments

inf          protein groups IDs information.
ncol         column numbers of output result.
justID       a logical value indicated whether only extract uniprot ID.
status1      a logical value indicated whether extract the first ID status.
ENTRY1       a logical value indicated whether extract the first ID ENTRY NAME.
ID1          a logical value indicated whether extract the first ID UNIPROT ACCESSION.
sp1          a logical value indicated whether extract the first sp ID as the new first ID.
onlysp       a logical value indicated whether only keep sp ID in the second or later ID result.
verbose      integer level of verbosity. Zero means silent, 1 means have Diagnostic Messages.

Author(s)

Kefu Liu

Examples

data(ProteomicData)
MaxQdata <- MaxQprotein(ProteomicData$MaxQ)
inf <- P.G.extract(MaxQdata$protein_IDs, justID = TRUE, status = TRUE, ENTRY = TRUE)
rename_dupnewID

Description

rename the duplicated newID in moduleinf and renew the ID in DEPstat

Usage

rename_dupnewID(DEPstat, moduleinf, DEPfromMod = FALSE)

Arguments

DEPstat            a dataframe contains columns: new.ID and ori.ID. it can get from dataStatInf.
moduleinf         a dataframe contains columns: new.ID and ori.ID. it can get from Module_inf.
DEPfromMod         a logical value indicated that whether DEPstat and moduleinf is getted from the
                    same datasets. The default value is FALSE.

Value

a data.frame contains DEPstat information and renewed the new.ID column.

Author(s)

Kefu Liu

Examples

data(net)
data(imputedData)
Module <- Module_inf(net, imputedData$inf)
group <- gsub("[0-9]","", colnames(imputedData$intensity))
data <- imputedData
data$inf <- data$inf[1:100,]
data$intensity <- data$intensity[1:100,]
stat <- dataStatInf(data, group, meanmethod = "median",
                    T.test = "pairwise", Aadj = "fdr",
                    Tadj = "fdr", cutoff = FALSE)
stat <- rename_dupnewID(stat, Module, DEPfromMod = TRUE)
**Description**

FCS enrichment analysis of a sets of proteins in one module.

**Usage**

```r
single_mod_enrichplot(module, Mod_Nam, classifiedID,
    coln = "new.ID", datainf = NULL,
    plot = TRUE, filename = NULL, ...)
```

**Arguments**

- `module`: module information which is getted in `Module_inf` function.
- `Mod_Nam`: the module name which module will be calculate.
- `classifiedID`: a sets of protein IDs which is ordered by change value/ p value and so on.
- `coln`: column name of module contains protein IDs. it could be matched with "classifiedID"
- `datainf`: proteomic data protein ID information. The default value is "NULL". which is means that the "classifiedID" come from proteomic information is the same as the module construction proteomic information. If they are different, proteomic data information should be given.
- `plot`: a logical value indicating whether draw enrichment variation trend plot.
- `filename`: the filename of plot. The default value is NULL which means no file saving. The plot will be saved to "plot" folder and saved in pdf format.
- `...`: Other arguments.

**Author(s)**

Kefu Liu

**Examples**

```r
data(net)
data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$info$ori.ID
group <- gsub("[0-9]+","", colnames(logD))
Module <- Module_inf(net, data$info)
up <- changedID(logD, group, vs.set2 = "ad", vs.set1 = "ctl",
    rank = "foldchange", anova = FALSE, Padj = "none", cutoff = 1,
    datatype = "log2", fctype = "up")
m5enrich <- single_mod_enrichplot(Module, 5, up, coln="ori.ID")
```
### Description

pick soft thresholding powers for WGCNA analysis and plot

### Usage

```r
SoftThresholdScaleGraph(data,
    xlab = "Soft Threshold (power)",
    ylab = "Scale Free Topology Model Fit, signed R^2",
    main = "Scale independence",
    filename = NULL)
```

### Arguments

- **data**: protein quantification data. row is sample, column is protein ID.
- **xlab**: x axis label
- **ylab**: y axis label
- **main**: plot title
- **filename**: the filename of plot. The default value is NULL which means no file saving. The plot will be saved to "plot" folder and saved in pdf format.

### Details

pick soft thresholding powers for WGCNA analysis and plot. The function is also can replaced by "pickSoftThreshold" function in WGCNA package.

### Value

A list with the following components:

- **powerEstimate**: the lowest power fit for scale free topology.
- **fitIndices**: a data frame containing the fit indices for scale free topology.

### Author(s)

Kefu Liu

### See Also

pickSoftThreshold in WGCNA package.
Examples

# it will take some times
data(imputedData)
data <- imputedData
logD <- data$log2_value
rownames(logD) <- data$inf$ori.ID
if (requireNamespace("WGCNA", quietly = TRUE))
  sft <- SoftThresholdScaleGraph(t(logD))

Description

The major parameter optimization in function blockwiseModules in WGCNA package. The function will do a series of network construction by change various parameter in blockwiseModules and record the result. (it will take a long time)

Usage

wgcnatest(data, power = NULL, maxBlockSize = 5000,
corType = "pearson", networkType = "unsigned",
TOMType = "unsigned", detectCutHeight = NULL,
deepSplit = TRUE, minModSize = TRUE,
minKMEtoStay = TRUE, minCoreKME = FALSE,
reassignThreshold = FALSE, mergeCutHeight = FALSE,
pamRespectsDendro = FALSE,
maxModNum = 30, minModNum = 8, MaxMod0ratio = 0.3,
...)

Arguments

data protein quantification data used in network construction. Row is sample. Column is protein ID. More information can get from blockwiseModules in WGCNA package.

power Soft-thresholding power for network construction. The default value is NULL. it will run pickSoftThreshold function in WGCNA package to pick the lowest appropriate power. More information can get from blockwiseModules in WGCNA package.

maxBlockSize integer giving maximum block size for module detection. More information can get from blockwiseModules in WGCNA package.

corType one of "pearson" and "bicor". More information can get from blockwiseModules in WGCNA package.
networkType

One of "signed hybrid", "unsigned", "signed". More information can get from `blockwiseModules` in WGCNA package.

TOMType

One of "none", "unsigned", "signed", "signed Nowick", "unsigned 2", "signed 2" and "signed Nowick 2". More information can get from `blockwiseModules` in WGCNA package.

detectCutHeight

dendrogram cut height for module detection. The default value is NULL, which means it will calculate the cutheight through correlation r when p value is 0.05. When the value is larger than 0.995, it will set to detectCutHeight or 0.995. More information can get from `blockwiseModules` in WGCNA package.

deepSplit

The default value is TRUE, which means the function will test deepSplit from 0 to 4. If the value is FALSE, deepSplit is 2. You also can setting integer value between 0 and 4 by yourself. integer value between 0 and 4. More information can get from `blockwiseModules` in WGCNA package.

minModSize

Minimum module size for module detection. The default value is TRUE, which means the function will test 15, 20, 30, 50. If the value is FALSE, minModSize is 20. You also can setting integer value by yourself. More information can get from `blockwiseModules` in WGCNA package.

minKMEtoStay

The default value is TRUE, which means the function will test 0.1, 0.2, 0.3. If the value is FALSE, minKMEtoStay is 0.3. You also can setting value by yourself. Value between 0 to 1. More information can get from `blockwiseModules` in WGCNA package.

minCoreKME

The default value is FALSE, minCoreKME is 0.5. If the value is TRUE, which means the function will test 0.4 and 0.5. You also can setting value by yourself. Value between 0 to 1. More information can get from `blockwiseModules` in WGCNA package.

reassignThreshold

P-value ratio threshold for reassigning genes between modules. The default value is FALSE, reassignThreshold is 1e-6. If the value is TRUE, which means the function will test 0.01 and 0.05. You also can setting value by yourself. More information can get from `blockwiseModules` in WGCNA package.

mergeCutHeight

dendrogram cut height for module merging. The default value is FALSE, mergeCutHeight is 0.15. If the value is TRUE, which means the function will test 0.15, 0.3 and 0.45. You also can setting value by yourself. More information can get from `blockwiseModules` in WGCNA package.

pamRespectsDendro

A logical value indicated that whether do pamStage or not. More information can get from `blockwiseModules` in WGCNA package.

maxModNum

The maximum module number. If network construction make more than maxModNum of modules. The result will not record.

minModNum

The minimum module number. If network construction make less than minModNum of modules. The result will not record.

MaxMod0ratio

The maximum Mod0 protein numbers ratio in total proteins. If network construction make more than MaxMod0ratio in module 0. The result will not record.

... Other arguments from `blockwiseModules` in WGCNA package.
Details

More information can get from `blockwiseModules` in WGCNA package.

Value

a data.frame contains protein number in each module and the parameter information.
