Package ‘DTAT’

October 12, 2022

Type Package

Title Dose Titration Algorithm Tuning

Version 0.3-4

Date 2020-06-07

Maintainer David C. Norris <david@precisionmethods.guru>

Depends R (>= 3.4.0), survival

Imports km.ci, pomp, Hmisc, data.table, dplyr, r2d3, shiny, jsonlite, methods

Suggests knitr, rmarkdown, lattice, latticeExtra, widgetframe, tidyrr, RColorBrewer

Description Dose Titration Algorithm Tuning (DTAT) is a methodologic framework allowing dose individualization to be conceived as a continuous learning process that begins in early-phase clinical trials and continues throughout drug development, on into clinical practice. This package includes code that researchers may use to reproduce or extend key results of the DTAT research programme, plus tools for trialists to design and simulate a ‘3+3/PC’ dose-finding study. Please see Norris (2017) <doi:10.12688/f1000research.10624.3> and Norris (2017) <doi:10.1101/240846>.

Dose Titration Algorithm Tuning: a Framework for Dose Individualization in Drug Development

Description

Dose Titration Algorithm Tuning (DTAT) is a methodologic framework allowing dose individualization to be conceived as a continuous learning process that begins in early-phase clinical trials and continues throughout drug development, on into clinical practice. This package includes code that researchers may use to reproduce or extend key results of the DTAT research programme, plus tools for trialists to design and simulate a '3+3/PC' dose-finding study. Please see Norris (2017) doi: 10.12688/f1000research.10624.3 and Norris (2017) doi: 10.1101/240846.

Author(s)

**as_d3_data,DE-method**  
*Convert a DE object to JSON*

**Description**

Convert a DE object to JSON

**Usage**

```r
## S4 method for signature 'DE'
as_d3_data(x, ...)
```

**Arguments**

- `x`  
  An object of class DE

- `...`  
  Unused.

**DE-class**  
*An S4 class for simulating dose-titration study designs*

**Description**

An S4 class for simulating dose-titration study designs

**Slots**

doses  
A numeric vector of prospectively-determined discrete doses to trial.

units  
A string indicating dose units, e.g. "mg/kg".

MTDi  
A numeric vector of optimal doses for simulated study participants. Optionally a call to an `r<distribution>(...)` function which may be parsed to calculate the mtd_quantiles slot.

mtd_quantiles  
A numeric vector of quantiles of the distribution from which the MTDi slot was simulated. Intended mainly to support visualization of this distribution, e.g. as an transparent overlay on the dose-survival plot. NULL in case MTDi is provided verbatim.

fractol  
A numeric vector of probabilities for the simulated MTDi slot. Intended mainly to support visualization, e.g. plotting of 'MTD pointers' on the interactive dose-survival plot.
data A data.frame with columns:
- **id** Participant identifier
- **period** DLT assessment period, numbered consecutively from 1
- **dose** Dose level, numbered consecutively starting from 1
- **dlt** A logical indicator: did this this participant experience a DLT during this period?

**stop_esc** integer Period in which ‘stop rule’ was triggered

**ds_conf_level** numeric Confidence level for confidence band around Kaplan-Meier estimate of the dose-survival curve.

**dose_drop_threshold** numeric Threshold for triggering the ‘bypass rule’.

**stop_esc_under** numeric Threshold for triggering the ‘stop rule’.

**undo_esc_under** numeric Threshold for triggering the ‘rollback rule’.

---

**de.bioRxiv.240846**

Simulated ‘3+3/PC’ dose-titration study from bioRxiv paper no.

240846

---

**Description**

This is a length-10 list of data frames, summarizing the simulated trial from this paper, at the end of periods 1, 2, ..., 10. This structure reflects an awkward S3 implementation that package DTAT v0.3 reimplemented using S4. This data set is retained to support regression tests.

**Format**

A length-10 list of data frames, each with the following columns:

- **id** Participant identifier
- **period** DLT assessment period, numbered consecutively from 1
- **dose** Dose level, numbered consecutively starting from 1
- **dlt** A logical indicator: did this this participant experience a DLT during this period?

**Details**

A **stop.esc** attribute is attached to data frames in this list, indicating when escalation stopped during the simulated trial.

**References**

Examples

```r
data(de.bioRxiv.240846)
# Demonstrate that the new S4 3+3/PC implementation reproduces the
# simulated trial from the paper:
set.seed(2017)
CV <- 0.7; mean_mtd <- 1.0
shape <- CV^-2; scale <- mean_mtd/shape
trial <- new("DE", doses=0.25 * 1.4^(0:6),
             MTDi=rgamma(24, shape=shape, scale=scale),
             units="mg")
trial <- titration(trial, periods=10)
stopifnot(all(trial@data == de.bioRxiv.240846[[10]]))
stopifnot(trial@stop_esc == attr(de.bioRxiv.240846[[10]],'stop.esc'))
```

dose.survfit

Calculate a dose-survival curve from a dose titration study, adding a confidence band

Description

The 'dose-survival curve' is nothing other than an empirical cumulative distribution for MTDi in the sampled population. The term 'survival' is suggested in part by our application of the Kaplan-Meier estimator to interval-censored toxicity information.

Usage

dose.survfit(de, method = "rothman", avoid.degeneracy = TRUE, conf.level = 0.8)

Arguments

- `de`: A dose titration experiment like the data slot of class \texttt{DE}
- `method`: The method to be used by \texttt{km.ci} when calculating CI
- `avoid.degeneracy`: When TRUE, this parameter directs the function to introduce artificial events into the dose titration experiment, to avoid degeneracies at the lower and upper ends of the dose-survival curve.
- `conf.level`: Confidence level for KM confidence band.

Details

TODO: Describe details of degeneracy avoidance, once these have stabilized.

Value

An object of class \texttt{survfit}.

Examples

CV <- 0.7; mean_mtd <- 1.0
shape <- CV^-2; scale <- mean_mtd/shape
trial <- new("DE", doses=0.25 * 1.4^(0:6),
  MTDi=rgamma(24, shape=shape, scale=scale),
  units="mg")
trial <- titration(trial, periods=10)
sf <- dose.survfit(trial@data)
summary(sf)

---

dose.survival Extract interval-censored dose tolerance data from a dose titration study

Description

Constructs a Surv object from a dose-escalation experiment, using interval-censoring constructs of type='interval2'.

Usage

dose.survival(de)

Arguments

de A data frame describing a dose-titration study

Value

A Surv object of type='interval2'

Author(s)

David C. Norris

See Also

dose.survfit
Examples

CV <- 0.7; mean_mtd <- 1.0
shape <- CV^-2; scale <- mean_mtd/shape
trial <- new("DE", doses=0.25 * 1.4^(0:6),
    MTDi=rgamma(24, shape=shape, scale=scale),
    units="mg")
trial <- titration(trial, periods=10)
dose.survival(trial@data)

d.s.curvetrace

Description

This utility function simply makes the results of dose.survfit available in the convenient form of a list.

Usage

ds.curve(de, ...)

Arguments

de A data frame describing a dose-titration study.
...
    Passed through to function dose.survfit

Value

A list with components surv, upper and lower, each containing a vector that can be indexed by dose level.

Author(s)

David C. Norris

dose.survfit
Examples

CV <- 0.7; mean_mtd <- 1.0
shape <- CV^-2; scale <- mean_mtd/shape
trial <- new("DE", doses=0.25 * 1.4^(0:6),
          MTDi=rgamma(24, shape=shape, scale=scale),
          units="mg")
trial <- titration(trial, periods=10)
ds.curve(trial@data)

dtat1000

Precomputed neutrophil-guided chemotherapy dose titration for 1000 simulated subjects.

Description

This dataset is provided to support fast reproduction of a forthcoming pharmacoeconomic paper that includes examination of the empirical distribution of MTDi in N=1000 simulated subjects.

Format

A data frame showing end-of-cycle state of neutrophil-guided dose titration for 1000 simulated subjects, across 10 cycles of chemotherapy.

cycle  Cycle number 1..10
id     Subject identifiers; an ordered factor with levels id1 < ... < id1000
Cc     Central-compartment drug concentration
Cp     Peripheral-compartment drug concentration
Prol   Progenitor cells in proliferating compartment of Friberg et al. (2002) model
Tx.1   Transit compartment 1
Tx.2   Transit compartment 1
Tx.3   Transit compartment 1
Circ   Concentration (cells/mm^3) of circulating neutrophils
dose   Dose of 1-hour infusion administered this cycle
CircMin Neutrophil nadir (cells/mm^3)
tNadir  Time (days) of neutrophil nadir
scaled.dose Fourth root of dose
time   Time (weeks) of dose administration

Details

Running the examples interactively, you can verify the reproducibility of this dataset. (That demo is included in a donttest block to spare the CRAN servers.)

# 1. Extract the N final doses, assuming convergence by the tenth course
MTD_i <- with(dtat1000, dose[time==27])
MTD_i <- MTD_i[MTD_i < 5000] # Exclude few outliers
# 2. Do a kernel density plot
library(Hmisc)
hist <- histogram(~MTD_i, breaks=c(0,100,200,300,400,600,900,1500,2500,4000,5000)
, xlab=expression(MTD[i]))
approx <- data.frame(mtd_i=seq(0, 5000, 10))
approx <- upData(approx,
  gamma = dgamma(mtd_i, shape=1.75, scale=200))
dist <- xyplot(gamma ~ mtd_i, data=approx, type='l', col='black', lwd=2)
library(grid)
hist + dist
grid.text(expression(MTD[i] %~% paste("Gamma(" , alpha==1.75,",", beta==1/200,")))
  , x=unit(0.5,"npc")
  , y=unit(0.75,"npc")
)

## A very long repro

# Demonstrate close reproduction of original titration (the titration takes many minutes!)
set.seed(2016)
library(pomp)
Onoue.Friberg(N=1000)
# This titration may take an hour to run...
chemo <- titrate(doserange = c(50, 3000),
  dta=newton.raphson(dose1 = 100,
    omega = 0.75,
    slope1 = -2.0,
    slopeU = -0.2)
)

dtat1k <- upData(chemo$course
  , time = 3*(cycle-1)
  , labels = c(time="Time")
  , units = c(time="weeks")
  , print = FALSE)
c10dose1k <- subset(dtat1k, cycle==10)$scaled.dose
c10dose1000 <- subset(dtat1000, cycle==10)$scaled.dose
newton.raphson

Description

This higher-order ('factory') function produces a simple dose titration algorithm for neutrophil-guided chemotherapy dosing.

Usage

newton.raphson(dose1, omega, slope1, slopeU)

Arguments

dose1 The starting dose for titration
omega A relaxation parameter used to moderate dose increments
slope1 Dose-response slope assumed prior to 2nd measured neutrophil nadir
slopeU Upper bound imposed on slope estimates

Details

This function manifests the core concept of Dose Titration Algorithm Tuning by delivering an objectively realized 'DTA'. It therefore enables a variety of DTAs to be implemented and compared.

Value

A dose titration function that advises dose for next cycle of chemotherapy.

Author(s)

David C. Norris

See Also

titrte
Onoue.Friberg

Description

This function produces a POMP model combining docetaxel pharmacokinetics (PK) drawn from Table 2 of Onoue et al (2016) with myelosuppression dynamics drawn from Friberg et al (2002). This model enables simulation of neutrophil-guided dose titration of docetaxel, as done in Norris (2017).

Usage

```r
Onoue.Friberg(
  N,
  cycle.length.days = 21,
  data = data.frame(time = c(seq(0, 1.95, 0.05), seq(2, cycle.length.days * 24, 1)), y = NA),
  delta.t = 0.1
)
```

Arguments

- **N**: Size of simulated population.
- **cycle.length.days**: Duration (in days) of chemotherapy cycle to be simulated.
- **data**: Passed through as the data argument of the pomp constructor.
- **delta.t**: Time-step (in hours) of pomp’s euler plug-in.

Value

No value is returned; rather, the function sets global variables in package environment DTAT::sim.

Author(s)

David C. Norris

References

See Also

pomp, sim

Examples

```r
# Reproduce the sim$pkpd model and sim$pop population from reference #3:
library(pomp)
Onoue.Friberg(N=25)
sim$pop # NB: this differs from pop of original paper...

# Whereas the present version of Onoue.Friberg() draws simulated populations
# using pomp::rprior(), to reproduce the original F1000Research paper [3] we
# re-draw sim$pop as originally & prosaically done (see https://osf.io/vwnqz/):
set.seed(2016)
N <- 25
dtx.mm <- 0.808 # molar mass (mg/μM) of docetaxel
sim$pop$Circ0 <- rlnorm(N, meanlog=log(5050), sdlog=0.42) # units=cells/mm^3
sim$pop$MTT <- rlnorm(N, meanlog=log(89.3), sdlog=0.16) # mean transit time
sim$pop$gamma <- rlnorm(N, meanlog=log(0.163), sdlog=0.039) # feedback factor
sim$pop$Emax <- rlnorm(N, meanlog=log(83.9), sdlog=0.33)
sim$pop$EC50 <- rlnorm(N, meanlog=log(7.17*dtx.mm), sdlog=0.50)
# PK params from 2-compartment docetaxel model of Onoue et al (2016)
sim$pop$CL <- rlnorm(N, meanlog=log(32.6), sdlog=0.295)
sim$pop$Q <- rlnorm(N, meanlog=log(5.34), sdlog=0.551)
sim$pop$Vc <- rlnorm(N, meanlog=log(5.77), sdlog=0.1) # Onoue gives no CV% for V1
sim$pop$Vp <- rlnorm(N, meanlog=log(11.0), sdlog=0.598) # Called 'V2' in Onoue
sim$pop$kTR=4/sim$pop$MTT

# Now we run the sim$pkpd model, separately for each of N simulated individuals:
allout <- data.frame() # accumulator for N individual ODE solutions
for (id in 1:sim$N) {
  out <- trajectory(sim$pkpd,
                   params=c(sim$pop[sim$pop$id==id, -which(names(sim$pop) %in% c('id','MTT'))]
                     , sigma=0.05, dose=100, duration=1),
                   format="data.frame")
  # drop 'traj' and shift 'time' to first column
  out <- out[,c('time',setdiff(colnames(out),c('time','traj')))]
  out$id <- paste("id",id,sep="")
  allout <- rbind(allout, out)
}
library(Hmisc)
allout <- upData(allout
```

library(tidyrr)
cout <- gather(allout, key="Series", value="Concentration"
  , Cc, Cp
  , factor_key = TRUE)
label(cout$Concentration) <- "Drug Concentration"

# Figure 1 from reference [3]:
library(RColorBrewer)
xYplot(Concentration ~ time | id, group=Series
  , data=cout, subset=time<6
  , layout=c(5,NA)
  , type='l', as.table=TRUE
  , label.curves=FALSE
  , par.settings=list(superpose.line=list(lwd=2,col=brewer.pal(4,"PRGn")[c(1,4)])
  , scales=list(y=list(log=TRUE, lim=c(10^-3,10^1)))
  , auto.key=list(points=FALSE, lines=TRUE, columns=2))

mout <- gather(allout, key="Series", value="ANC"
  , Prol, Tx.1, Tx.2, Tx.3, Circ
  , factor_key = TRUE)
mout <- upData(mout
  , time = time/24
  , units = c(time="days")
  , print = FALSE)

# Figure 3 from citation [3]:
xYplot(ANC ~ time | id, group=Series
  , data=mout
  , layout=c(5,5)
  , type='l', as.table=TRUE
  , label.curves=FALSE
  , par.settings=list(superpose.line=list(lwd=2,col=brewer.pal(11,"RdYlBu")[c(1,3,4,8,10)])
  , scales=list(y=list(log=TRUE, lim=c(100,15000), at=c(200, 500, 1000, 2000, 5000, 10000)))
  , auto.key=list(points=FALSE, lines=TRUE, columns=5))

---

**plot.DE.missing-method**

Plot a DE object as an interactive htmlwidget

**Description**

Plot a DE object as an interactive htmlwidget
Usage

```r
## S4 method for signature 'DE,missing'
plot(x, y, ..., devtree = FALSE)
```

Arguments

- `x`: An object of class `DE`
- `y`: Unused; included for S4 generic consistency
- `...`: Passed to `r2d3`, enabling caller to (e.g.) override the default `viewer = "internal"`.
- `devtree`: Logical indicator used to select local package dir

**runDTATapp**

*Run Shiny apps included in package DTAT*

Description

Run Shiny apps included in package DTAT

Usage

```r
runDTATapp(app)
```

Arguments

- `app`: Character vector of length 1. Name of app to run.

Value

Invoked for side effect. Runs the named Shiny app.

Examples

```r
if(interactive()){
  runDTATapp("Sim33PC")
  runDTATapp("TheCost")
}
```
Power-law scaling for doses

Description
Implement an inverse power-law scaling for drug dose.

Usage
scaled(dose, a = 4)

Arguments
dose  A numeric vector of doses
a     A numeric exponent for power-law rescaling

Value
A rescaled vector of doses

Author(s)
David C. Norris

seq.function
A seq method supporting custom-scaled plot axes.

Description
This provides a seq method for class function, supporting a natural axis scaling idiom.

Usage
## S3 method for class 'function'
seq(scalefun, from, to, length.out, digits = NULL, ...)

Arguments
scalefun A numeric function that will be invoked componentwise, and so need not be vectorized
from, to The starting and ending values of the sequence returned
length.out Desired length of the sequence
digits   If non-NULL, returned value is rounded accordingly
...      Unused; included for S3 generic/method consistency.
**Value**

A numeric vector that (not considering the effect of any rounding applied), becomes an arithmetic sequence after application of `scalefun` to it. The initial and final elements of that vector are from and to.

**Author(s)**

David C. Norris

**Examples**

```r
# Provide evenly-spaced length-6 sequence from 100 to 1000,
# evenly spaced on a fourth-root scale:
seq(function(dose, a=4.0) dose^(1/a), from=100, to=1000, length.out=6, digits=0)
```

---

**Environment for simulation global variables.**

---

**Description**

To simplify the code of package DTAT, as well as client tasks, this exported environment contains a handful of global variables useful for the simulations.

**Details**

Global variables maintained within environment `sim` are:

1. `pkpd`: The population PK/PD model to be simulated.
2. `pop`: A sample drawn from the population model.
3. `N`: Restricts simulation to first N subjects in pop.
4. `params.default`: Default parameters.

**Examples**

```r
# Even when nrow(pop) is large, one may easily restrict
table simulations to pop[1:N], as follows:
sim$N <- 25
# Now perform simulation work
## Not run:
titrate(...)  ## End(Not run)
```
titrate

Perform neutrophil-guided dose titration of a chemotherapy drug.

Description

This is included in package DTAT mainly for archival purposes, with the aim to document a reproduction of Figure 5 from the 2017 *F1000Research* paper (referenced below), using a clearer and more general software design than is found in the online code supplement available at https://osf.io/vwnqz/.

Usage

```r
titrate(draw.days = NULL, Ncycles = 10, doserange = c(50, 500), dta = NULL)
```

Arguments

- **draw.days**: Integer days on which ANC is to be measured
- **Ncycles**: Number of chemo cycles through which to simulate titration
- **doserange**: Range of doses to consider
- **dta**: A Dose Titration Algorithm (DTA) to drive the titration

Value

A list with 2 components:

- **course**: A data frame containing cycle-wise measures of each id’s titration course
- **anc.ts**: A data frame detailing high-frequency ANC measures for each id

Author(s)

David C. Norris

References

Examples

```r
if(interactive()){  
  # Reproduce Figure 5 from the F1000Research paper (run time > 10 s).  
  # 1. Set up sim$pop & sim$pkpd by running the repro for Figures 1 & 3:  
  example(topic="Onoue.Friberg", package="DTAT", ask=FALSE)  
  # 2. Do the neutrophil-nadir-guided dose titration:  
  chemo <- titrate(draw.days = c(50, 3000),  
              Ncycles = 10,  
              doserange = c(50, 3000),  
              dta=newton.raphson(dose1 = 50,  
                                 omega = 0.75,  
                                 slope1 = -2.0,  
                                 minimizer = "newton",  
                                 tolerance = 0.0001),  
              dta = NULL)
```
titration

Simulate a '3+3/PC' dose-titration trial

description

Simulate a '3+3/PC' dose-titration trial

usage

```r
titration(x, periods, ...)
```
Arguments

x An object of S4 class \texttt{DE}

periods The number of DLT assessment periods to titrate over. Should be a positive integer.

... May be used to pass \texttt{verbatim = 'TRUE'} to internal \texttt{step_time} method.
