Package ‘EGRET’

February 8, 2019

Type Package

Title Exploration and Graphics for RivEr Trends

Version 3.0.2

License CC0

Depends R (>= 3.0)

Imports dataRetrieval (>= 2.0.1), survival, fields, methods, utils, graphics, stats, grDevices, truncnorm, foreach

Suggests EGRETci, xtable, knitr, rmarkdown, extrafont, testthat, rkt, doParallel, parallel

LazyLoad yes

LazyData yes

EGRET-package

EGRET package includes WRTDS and flowHistory

Description

Package: EGRET
Type: Package
License: Unlimited for this package, dependencies have more restrictive licensing.
Copyright: This software is in the public domain because it contains materials that originally came from the United States Government.
LazyLoad: yes

Details

Collection of functions to do WRTDS and flowHistory analysis, and produce graphs and tables of data and results from these analyses.
Create named list for EGRET analysis

Description

Create a named list with the INFO, Daily, and Sample dataframes, and surface matrix. If any of these are not available, an NA should be

Usage

```
as.egret(INFO, Daily, Sample = NA, surfaces = NA)
```

Arguments

- **INFO**: dataframe containing the INFO dataframe
- **Daily**: dataframe containing the daily data
- **Sample**: dataframe containing the sample data
- **surfaces**: matrix returned from `modelEstimation`. Default is NA.

Value

eList named list with Daily, Sample, and INFO dataframes, along with the surfaces matrix. Any of these values can be NA, not all EGRET functions will work with missing parts of the named list eList.

See Also

`readNWISDaily`, `readNWISSample`

Examples

```
eList <- Choptank_elist
Daily <- getDaily(eList)
INFO <- getInfo(eList)
eList_flowHistory <- as.egret(INFO, Daily)
plotFlowSingle(eList_flowHistory, 1)
Sample <- getSample(eList)
surfaces <- getSurfaces(eList)
eList_full <- as.egret(INFO, Daily, Sample, surfaces)
plotFluxQ(eList_full)
```
**blankTime**

*Deletes the computed values during periods of time when there are no sample data*

**Description**

This function is used when the data analyst believes that a gap in the sample data record is so long that estimates during that period are not reliable. This is only used for periods of several years in duration. For this period, the values of Conc, Flux, FNConc and FNFlux are all converted to NA.

**Usage**

`blankTime(eList, startBlank, endBlank)`

**Arguments**

- `eList`: named list with at least the Daily dataframe
- `startBlank`: character specifying starting date of blank period, input in quotes in yyyy-mm-dd format
- `endBlank`: character specifying the ending date of blank period, input in quotes in yyyy-mm-dd format

**Value**

`eList` named list with modified Daily data frame.

**Examples**

```r
startBlank = "2004-10-01"
endBlank = "2006-09-30"
eList <- Choptank_eList
eList <- blankTime(eList, startBlank, endBlank)
```

---

**boxConcMonth**

*Box plot of the water quality data by month*

**Description**

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata.

Although there are a lot of optional arguments to this function, most are set to a logical default.
Usage

boxConcMonth(eList, printTitle = TRUE, cex = 0.8, cex.axis = 1.1,
cex.main = 1.1, las = 1, logScale = FALSE, tcl = 0.5,
tinyPlot = FALSE, customPar = FALSE, showYLabels = TRUE,
showXLabels = TRUE, showXAxis = TRUE, showYAxis = TRUE, ...)

Arguments

- **eList**: named list with at least the Sample and INFO dataframes
- **printTitle**: logical variable if TRUE title is printed, if FALSE not printed (this is best for a multi-plot figure)
- **cex**: numerical value giving the amount by which plotting symbols should be magnified
- **cex.axis**: magnification to be used for axis annotation relative to the current setting of cex
- **cex.main**: magnification to be used for main titles relative to the current setting of cex
- **las**: numeric in 0,1,2,3; the style of axis labels, see ?par
- **logScale**: logical if TRUE y plotted in log axis
- **tcl**: number defaults to 0.5, specifies length of tick marks as fraction of height of a line of text
- **tinyPlot**: logical variable, if TRUE plot is designed to be plotted small as part of a multi-plot figure, default is FALSE.
- **customPar**: logical defaults to FALSE. If TRUE, par() should be set by user before calling this function
- **showYLabels**: logical defaults to TRUE. If FALSE, the y axis label is not plotted
- **showXLabels**: logical defaults to TRUE. If FALSE, the x axis label is not plotted
- **showXAxis**: logical defaults to TRUE. If FALSE, the x axis is not plotted
- **showYAxis**: logical defaults to TRUE. If FALSE, the y axis is not plotted
- **...**: arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see ?par for options)

See Also

- boxplot

Examples

```r
el <- Choptank_eList
# Water year:
boxConcMonth(el)
# Graphs consisting of Jun-Aug
el <- setPA(elist, paStart=6,paLong=3)
boxConcMonth(el)
```
boxConcThree

Three box plots side-by-side

Description

This function is used to compare the distribution of concentration in the sample and predicted data set. It shows three boxplots. One for the sample, one for the predictions on days with sample values, and one for all days (whether or not they had sample values).

Data come from named list, which contains a Sample dataframe with the sample data, a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Usage

boxConcThree(eList, tinyPlot = FALSE, printTitle = TRUE, moreTitle = "WRTDS", customPar = FALSE, font.main = 2, cex = 0.8, cex.main = 1.1, cex.axis = 1.1, ...)

Arguments

eList named list with at least the Daily, Sample, and INFO dataframes
	tinyPlot logical variable, if TRUE plot is designed to be plotted small as part of a multi-plot figure, default is FALSE.
	printTitle logical variable if TRUE title is printed, if FALSE not printed (this is best for a multi-plot figure)
	moreTitle character specifying some additional information to go in figure title, typically some information about the specific estimation method used, default is no additional information

customPar logical defaults to FALSE. If TRUE, par() should be set by user before calling this function
	font.main font to be used for plot main titles
	cex numerical value giving the amount by which plotting symbols should be magnified
	cex.main magnification to be used for main titles relative to the current setting of cex
	cex.axis magnification to be used for axis annotation relative to the current setting of cex
	... arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see ?par for options)

See Also

boxplot
Examples

```r
eList <- Choptank_elist
# Water year:
boxConcThree(eList)
# Graphs consisting of Jun-Aug
eList <- setPA(eList, paStart=6, paLong=3)
boxConcThree(eList)
```

Description

This function is used to compare the distribution of discharges in the sample data set and the discharges in the full daily data set. Note that discharge is plotted on a logarithmic axis. The boxplot is created using the log values but the scale is presented in the original units. An ideal situation would show the two boxes roughly similar to each other or the sample boxplot having median, upper quartile, and higher values being slightly greater than in the boxplot of all days.

Data come from named list, which contains a Sample dataframe with the sample data, a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Usage

```r
boxQTwice(eList, printTitle = TRUE, qUnit = 2, cex = 0.8,
           cex.main = 1.1, logScale = TRUE, cex.axis = 1.1, tcl = 0.5,
           las = 1, tinyPlot = FALSE, usgsStyle = FALSE, customPar = FALSE,
           ...)```

Arguments

- `eList` named list with at least the Daily, Sample, and INFO dataframes
- `printTitle` logical variable if TRUE title is printed, if FALSE not printed (this is best for a multi-plot figure)
- `qUnit` object of qUnit class `printQUnitCheatsheet`, or numeric represented the short code, or character representing the descriptive name.
- `cex` numerical value giving the amount by which plotting symbols should be magnified
- `cex.main` magnification to be used for main titles relative to the current setting of cex
- `logScale` logical if TRUE y plotted in log axis. Defaults to TRUE.
- `cex.axis` magnification to be used for axis annotation relative to the current setting of cex
- `tcl` number defaults to 0.5, specifies length of tick marks as fraction of height of a line of text
A box plot of WRTDS residuals by month

Description

This function produces a boxplot of the residuals from WRTDS, expressed in natural log concentration units. It provides an alternative for viewing the standardized residuals, where the each residual is divided by its estimated standard error. The monthly boxplot widths are proportional to the square root of the sample size. The residuals for a censored value are determined as the difference between the natural log of the average of the upper and lower bounds on the sample value, minus the log space estimate of concentration.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata

Usage

```r
boxResidMonth(eList, stdResid = FALSE, las = 1, printTitle = TRUE,
    cex = 0.8, cex.axis = 1.1, cex.main = 1.1, font.main = 2,
    tinyPlot = FALSE, customPar = FALSE, randomCensored = FALSE, ...)
```
calculateMonthlyResults

Arguments

- elist: named list with at least the Sample and INFO dataframes
- stdResid: logical variable, if TRUE it uses the standardized residual, if FALSE it uses the actual, default is FALSE
- las: numeric in 0,1,2,3; the style of axis labels
- printTitle: logical variable if TRUE title is printed, if FALSE not printed (this is best for a multi-plot figure)
- cex: numerical value giving the amount by which plotting symbols should be magnified
- cex.axis: magnification to be used for axis annotation relative to the current setting of cex
- cex.main: magnification to be used for main titles relative to the current setting of cex
- font.main: font to be used for plot main titles
- tinyPlot: logical variable, if TRUE plot is designed to be plotted small, as a part of a multipart figure, default is FALSE
- customPar: logical, defaults to FALSE. If TRUE, par() should be set by user before calling this function
- randomCensored: logical. Show censored residuals as randomized. Default = FALSE.
- ...: arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see ?par for options)

See Also

boxplot

Examples

```r
elist <- Choptank_eList
# Water year:
boxResidMonth(elist)
# Graphs consisting of Jun-Aug
elist <- setPA(elist, paStart=6, paLong=3)
boxResidMonth(elist)
```

calculateMonthlyResults

Calculates monthly mean values of Q, Conc, Flux, FNConc, and FN-Flux for the entire record.

Description

Computes the monthly mean values of discharge, concentration, flux, flow-normalized concentration and flow-normalized flux (Q, Conc, Flux, FNConc, and FNFlux) in SI units. Note that the Flux and FNFlux values are average flux values (not totals). For discharge they are in m3/s, concentration is mg/L, and flux is kg/day. It returns a data frame containing month, year, decimal year, and mean values of DecYear, Q, Conc, Flux, FNConc, and FNFlux.
Usage

calculateMonthlyResults(eList)

Arguments

eList named list with at least the Daily dataframes

Value

MonthlyResults data frame of numeric values describing the monthly average values

Examples

eList <- Choptank_eList
monthlyResults <- calculateMonthlyResults(eList)

censoredSegments

Generic plotting function to create censored line segments

Description

Basic plotting framework for EGRET dot plots. Graphical parameters default to values that work well with most plots, but all can be re-assigned. See ?par for complete definitions of most optional input variables.

Usage

censoredSegments(yBottom, yLow, yHigh, x, Uncen, col = "black", lwd = 1)

Arguments

yBottom number specifying minimum flux (required)
yLow vector specifying the x data (required), such as ConcLow
yHigh vector specifying the x data (required), such as ConcHigh
x vector x data (required)
Uncen vector that defines whether the values are censored (0) or not (1)
col color of points on plot, see ?par 'Color Specification'
lwd number line width

See Also

segments
checkStartEndDate

Examples

\begin{verbatim}
  x <- c(1,2,3,4,5,6)
y <- c(1,3,4,3,3,4,7)
xlim <- c(min(x)*.75,max(x)*1.25)
ylim <- c(0,1.25*max(y))
xlab <- "Date"
ylab <- "Concentration"
xTicks <- pretty(xlim)
yTicks <- pretty(ylim)
genericEGRETDotPlot(x=x, y=y,
  xlim=xlim, ylim=ylim,
  xlab=xlab, ylab=ylab,
  xTicks=xTicks, yTicks=yTicks,
  plotTitle="Test"
)
yBottom <- 0
yLow <- c(NA,3,4,3,3,4,7)
yHigh <- c(1,3,4,3,3,5,NA)
Uncen <- c(0,1,1,1,0,0)
censoredSegments(yBottom=yBottom,yLow=yLow,yHigh=yHigh,x=x,Uncen=Uncen)
\end{verbatim}

Description

Checks that the start date is before the end date. If not, it will give the user the opportunity to correct, otherwise will create a warning.

Usage

\begin{verbatim}
  checkStartEndDate(startDate, endDate, interactive = TRUE)
\end{verbatim}

Arguments

  \begin{itemize}
    \item \textbf{startDate} character
    \item \textbf{endDate} character
    \item \textbf{interactive} logical Option for interactive mode. If true, there is user interaction for error handling and data checks.
  \end{itemize}

Value

vector where first value is startDate, second is endDate

Examples

\begin{verbatim}
  startDate <- '1985-01-01'
  endDate <- '1990-01-01'
  checkStartEndDate(startDate, endDate)
\end{verbatim}
checkSurfaceSpan  

Description

checkSurfaceSpan

Usage

checkSurfaceSpan(eList)

Arguments

eList  named list with at least the Daily, Sample, and INFO dataframes

Examples

eList <- Choptank_eList
checkSurfaceSpan(eList)

Example eList

Description

Example data representing data from the Choptank River at Greensboro, MD, USGS data Data is a named list of the Daily, Sample, INFO dataframes, and the surface matrix.

Examples

head(Choptank_eList$Daily)
head(Arkansas_eList$Daily)
compressData

Compress sample data frame

Description
Using raw data that has at least dateTime, value, code, populates the measured data portion of the Sample dataframe used in EGRET. ConcLow = Lower bound for an observed concentration ConcHigh = Upper bound for an observed concentration Uncen = 1 if uncensored, 0 if censored

Usage
compressData(data, verbose = TRUE, interactive = NULL)

Arguments
data dataframe contains at least dateTime, value, code columns
verbose logical specifying whether or not to display progress message
interactive logical deprecated. Use 'verbose' instead

Value
data frame returnDataFrame data frame containing dateTime, ConcHigh, ConcLow, Uncen

Examples

datetime <- c('1985-01-01', '1985-01-02', '1985-01-03')
comment1 <- c('', '', '')
value1 <- c(1, 2, 3)
comment2 <- c('','<','')
value2 <- c(2, 3, 4)
comment3 <- c('','<','')
value3 <- c(3, 4, 5)
dataInput <- data.frame(dateTime, comment1, value1, comment2, value2, comment3, value3, stringsAsFactors=FALSE)
compressData(dataInput)

Constants

Constants included with EGRET

Description
- fluxConstFlux conversion object
- qConstFlow conversion object
- monthInfoMonth object
Examples

fluxConst
fluxConst[['kgDay']]@unitName
fluxConst[['kgDay']]@unitName
qConst
qConst[['cfs']]@qUnitName

---

Data Overview for WRTDS

Description

Gives a summary of data to be used for WRTDS analysis.

Usage

dataOverview(Daily, Sample)

Arguments

Daily dataframe
Sample dataframe

See Also

mergeReport

Examples

eList <- Choptank_elist
exDaily <- getDaily(eList)
exSample <- getSample(eList)
dataOverview(Daily = exDaily, Sample = exSample)

---

Check date format

Description

Checks to see if format is YYYY-MM-DD. Also performs a few other date checks.

Usage

dateFormatCheck(date)
**decimalHighLow**

**Arguments**

- date character

**Value**

- condition logical TRUE or FALSE if checks passed or failed

**Examples**

```r
date <- '1985-01-01'
dateFormatCheck(date)
dateWrong <- '1999/1/7'
dateFormatCheck(dateWrong)
```

---

**decimalHighLow**

**Description**

decimalHighLow

**Usage**

```r
decimalHighLow(df)
```

**Arguments**

- df data.frame with Date, DecYear, and Month columns

**Value**

- list with DecHigh and DecLow (water year high/low decimal values)

**Examples**

```r
eList <- Choptank_eList
highLow <- decimalHighLow(eList$Sample)

DecHigh <- highLow[['DecHigh']]  
DecLow <- highLow[['DecLow']]```
estCrossVal

*Jack-Knife cross validation of the WRTDS (Weighted Regressions on Time, Discharge, and Season)*

**Description**

This function fits the WRTDS model \( n \) times (where \( n \) is the number of observations). For each fit, the data value being estimated is eliminated from the record. This gives predictions that do not depend on knowing the actual result for that day. Thus it provides for a more "honest" estimate of model performance than a traditional error analysis that uses all the data.

**Usage**

```r
estCrossVal(DecLow, DecHigh, Sample, windowY = 7, windowQ = 2,
            windowS = 0.5, minNumObs = 100, minNumUncen = 50,
            edgeAdjust = TRUE, verbose = TRUE)
```

**Arguments**

- **DecLow**: number specifying minimum decimal year
- **DecHigh**: number specifying maximum decimal year
- **Sample**: data frame containing the sample values, default is Sample
- **windowY**: numeric specifying the half-window width in the time dimension, in units of years, default is 7
- **windowQ**: numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2
- **windowS**: numeric specifying the half-window width in the seasonal dimension, in units of years, default is 0.5
- **minNumObs**: numeric specifying the minimum number of observations required to run the weighted regression, default is 100
- **minNumUncen**: numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50
- **edgeAdjust**: logical specifying whether to use the modified method for calculating the windows at the edge of the record. The modified method tends to reduce curvature near the start and end of record. Default is TRUE.
- **verbose**: logical specifying whether or not to display progress message

**Value**

SampleCrossV data frame containing the sample data augmented by the results of the cross-validation exercise
**estDailyFromSurfaces**

**Examples**

```r
elist <- Choptank_elist
Sample <- getSample(elist)
Daily <- getDaily(elist)
umDays <- length(Daily$DecYear)
Declow <- Daily$DecYear[1]
Declow <- Daily$DecYear[numDays]
## Not run:
SampleCrossV <- estCrossVal(numDays,Declow,Declow,Sample)

## End(Not run)
```

**estDailyFromSurfaces**  Estimates all daily values of Concentration, Flux, Flow-Normalized Concentration, and Flow Normalized Flux

**Description**

Uses the surfaces estimated in estSurfaces to estimate these four time series in addition to the time series for standard error and yHat (estimated log concentration). The results are stored in an augmented version of the Daily data frame, which is returned as part of an EGRET object.

Bin the LogQ values by day-of-year.

**Usage**

```r
estDailyFromSurfaces(eList, localsurfaces = NA, localDaily = NA)
getConcFluxFromSurface(eList, allLogQsByDayOfYear, localDaily, localsurfaces = NA)
getSurfaceEstimates(eList, localsurfaces = NA, localDaily = NA)
bin_Qs(localDaily)
```

**Arguments**

- `eList` named list with at least the Daily and INFO dataframes, and the surface matrix
- `localsurfaces` surface over-riding the one stored in eList. Default is NA.
- `localDaily` data frame to override eList$Daily. Default is NA.
- `allLogQsByDayOfYear` list

**Value**

eget object with altered Daily data frame
Daily dataframe with yHat, SE, ConcDay and FluxDay calculated
estSurfaces

**Examples**

```r
eList <- Choptank_elist

# This is usually done in modelEstimation:
Daily <- getDaily(eList)
surfaceIndexParameters <- surfaceIndex(Daily)
INFO <- elist$INFO
INFO$bottomLogQ <- surfaceIndexParameters[['bottomLogQ']]  
INFO$stepLogQ <- surfaceIndexParameters[['stepLogQ']]  
INFO$nVectorLogQ <- surfaceIndexParameters[['nVectorLogQ']]  
INFO$bottomYear <- surfaceIndexParameters[['bottomYear']]  
INFO$stepYear <- surfaceIndexParameters[['stepYear']]  
INFO$nVectorYear <- surfaceIndexParameters[['nVectorYear']]  
eList$INFO <- INFO

## Not run:
Daily <- estDailyFromSurfaces(eList)

## End(Not run)
```

---

**estSurfaces**

*Estimate the three surfaces (for yHat, SE and ConcHat) as a function of DecYear and logQ and store in the three-dimensional object called surfaces*

**Description**

This function uses weighted survival regression to estimate three surfaces that cover the complete range of DecYear and log(Q) values in the Daily data set. These surfaces are: (1) the estimated log concentration (yHat), (2) the estimated standard error (SE), (3) the estimated concentration (ConcHat). They are mapped as an array that covers the complete space of daily discharge and time. The first index is discharge, layed out in 14 equally spaced levels of log(Q). The second index is time, layed out as 16 increments of the calendar year, starting January 1. It returns the 3 dimensional array called surfaces. This array will be used to estimate these 3 quantities for any given day in the daily values record.

**Usage**

```r
estSurfaces(eList, surfaceStart = NA, surfaceEnd = NA,  
localSample = NA, windowY = 7, windowQ = 2, windowS = 0.5,  
minNumObs = 100, minNumUncen = 50, edgeAdjust = TRUE,  
verbose = TRUE, interactive = NULL, run.parallel = FALSE)
```

**Arguments**

- **eList**
  - named list with at least the Sample and Daily dataframes
- **surfaceStart**
  - Date object for start of surface slice (or character starting date for data retrieval in the form YYYY-MM-DD). Default is NA.
### estSurfaces

**surfaceEnd**  
Date object for end of surface slice (or character starting date for data retrieval in the form YYYY-MM-DD). Default is NA.

**localSample**  
data frame to override eList$Sample. Default is NA.

**windowY**  
numeric specifying the half-window width in the time dimension, in units of years, default is 7

**windowQ**  
numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2

**windowS**  
numeric specifying the half-window width in the seasonal dimension, in units of years, default is 0.5

**minNumObs**  
numeric specifying the minimum number of observations required to run the weighted regression, default is 100

**minNumUncen**  
numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50

**edgeAdjust**  
logical specifying whether to use the modified method for calculating the windows at the edge of the record. Default is TRUE.

**verbose**  
logical specifying whether or not to display progress message

**interactive**  
logical deprecated. Use 'verbose' instead

**runParallel**  
logical to run bootstrapping in parallel or not

### Value

surfaces array containing the three surfaces estimated, array is 3 dimensional

### Examples

```r
eList <- Choptank_eList
## Not run:
surfaces <- estSurfaces(eList)

surfaceStart <- "1984-10-01"
surfaceEnd <- "1986-09-30"
surfaces_1 <- estSurfaces(eList, surfaceStart, surfaceEnd)

wall_sample <- head(eList$Sample, n=500)
surface_wall <- estSurfaces(eList, localSample = wall_sample)

## End(Not run)
```
fixSampleFrame  
*Update Sample dataframe*

**Description**

Used for updating the Sample dataframe if ConcLow or ConcHigh is manually adjusted. Adjusts ConcAve and Uncen columns.

**Usage**

```r
fixSampleFrame(eList)
```

**Arguments**

- `eList` named list with at least the Sample dataframes

**Value**

localSample data frame

**Examples**

```r
eList <- Choptank_eList
Sample <- eList$Sample
Sample[,c("ConcLow","ConcHigh")]<-c(NA,0.01)# Adjusted to left-censored
Sample[,c("ConcLow","ConcHigh")]<-c(1.1,1.3)# Adjusted to interval-censored
Sample[,c("ConcLow","ConcHigh")]<-c(1.3,1.3)# Simple adjustment
eList$Sample <- Sample
eList <- fixSampleFrame(eList)
eList$Sample[1:3,]
```

---

**flexFN**  
*Flexible Flow Normalization*

**Description**

This function implements generalized flow normalization. This means that for determining the flow normalized concentration and flow normalized flux for any given year, there is a specified list of years from which to create the discharge record used in the flow-normalization process. That set of years is defined by the `dateInfo` object.

**Usage**

```r
flexFN(eList, dateInfo, localsurfaces = NA, oldSurface = FALSE,
       flowNormStartCol = "flowNormStart", flowNormEndCol = "flowNormEnd",
       flowStartCol = "flowStart", flowEndCol = "flowEnd")
```
**Arguments**

- **eList** named list with at least the Daily, Sample, and INFO dataframes
- **dateInfo** data frame with 4 columns. The column names and descriptions are described below. Default is NA.
- **localsurfaces** surface (3-dimensional matrix) over-riding the one stored in eList Default = NA.
- **oldSurface** logical, if TRUE, use the surface object in eList. Default is FALSE.
- **flowNormStartCol** character, name of the column in dateInfo that starts the segment for the flow normalization
- **flowNormEndCol** character, name of the column in dateInfo that ends the segment for the flow normalization
- **flowStartCol** character, name of the column in dateInfo that starts the segment for the portion of the flow to be populated with flow-normalized values.
- **flowEndCol** character, name of the column in dateInfo that ends the segment for the portion of the flow to be populated with flow-normalized values.

**Value**

named list, eList, containing INFO, Daily, Sample, and surfaces objects

**Examples**

eList <- Choptank_eList
eList <- setUpEstimation(eList)
flowNormStart <- c("1979-10-01", "1990-01-01", "1992-10-10")
flowNormEnd <- c("1995-06-06", "2004-03-03", "2011-09-29")
flowStart <- c("1979-10-01", "1995-06-07", "2004-03-04")
flowEnd <- c("1995-06-06", "2004-03-03", "2011-09-29")
dateInfo <- data.frame(flowNormStart, flowNormEnd, flowStart, flowEnd, stringsAsFactors = FALSE)

## Not run:
newEList <- flexFN(eList, dateInfo)
plotFluxHist(newEList)
flexPlotAddOn(newEList)

wallSurface <- estSurfaces(eList, localSample = eList$Sample[1:500,])
wallEList <- flexFN(eList, dateInfo, localsurface = wallSurface)
plotFluxHist(wallEList)

## End(Not run)
Description

Flexible Flow Normalization Plot Add On

Usage

```
flexPlotAddOn(eList, showArrows = TRUE, showRect = TRUE, 
customPalette = NULL)
```

Arguments

eList named list with at least the Daily, Sample, and INFO dataframes
showArrows logical whether or not to show arrows representing flow segments
showRect logical whether or not to show rectangles representing sample segments
customPalette character vector of colors as a hexadecimal string of the form "#rrggbb". Defaults to NULL, which indicates the use of a default palette (up to 21 segments).

Examples

```
eList <- Choptank_eList
eList <- setUpEstimation(eList)
flowNormStart <- c("1979-10-01","1990-01-01","1992-10-10")
flowNormEnd <- c("1995-06-06","2004-03-03","2011-09-29")
flowStart <- c("1979-10-01","1995-06-07","2004-03-04")
flowEnd <- c("1995-06-06","2004-03-03","2011-09-29")
dateInfo <- data.frame(flowNormStart, 
flowNormEnd, 
flowStart, 
flowEnd, 
stringsAsFactors = FALSE)

## Not run:
newEList <- flexFN(eList, dateInfo)
plotFluxHist(newEList)
flexPlotAddOn(newEList)

plotFluxHist(newEList)
flexPlotAddOn(newEList, customPalette=c("#d5ce48", "#fd300f", "#3e0289"))

## End(Not run)
```
flowDuration

*Computes several values of the flow duration curve for streamflow centered on a specific date of the year*

Description

This function is useful for helping the analyst determine the empirical probability distribution of streamflow for a particular part of the year or for the whole year. This is particularly useful in setting up discharge scales for various other plots in this package.

Usage

```r
flowDuration(eList, centerDate = "09-30", qUnit = 2, span = 365)
```

Arguments

- `eList` named list with at least Daily and INFO dataframes
- `centerDate` character specifying the center date of the part of the year for which the flow duration is to be calculated, it is in the form "mm-dd" (it must be in quotes). Default is "09-30"
- `qUnit` object of qUnit class `printQUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name. Default is qUnit = 2, which corresponds to cubic meters per second.
- `span` number this is the half-width of the window over which the discharge values are to be used in constructing the flow-duration curve. If the full year is desired any value greater than 182 will provide serve. Note that for a window of about 2-months width, a span value should be about 30. Default is 365.

Value

`qDuration` A named vector with flow duration information.

Examples

```r
eList <- Choptank_eList
# for a window of 30 days either side of June 25 expressed in units of cfs:
flowDuration(eList, "06-25", qUnit=1, span=30)
# for a flow-duration curve covering the whole year, expressed in units of csf:
flowDuration(eList, "01-01", qUnit=2)
```
**fluxBiasMulti**  
*Produces 8-panel plot that is useful for determining if there is a flux bias problem*

**Description**

These plots use the jack-knife estimates from WRTDS to investigate the potential flux bias problem. It can also be used for estimates constructed by other methods (such as LOADEST) if the results are stored in a data frame organized like the Sample data frame. It allows additional label information to indicate what method is used. The use of this plot is described in Hirsch, Robert M., 2014. Large Biases in Regression-Based Constituent Flux Estimates: Causes and Diagnostic Tools. Journal of the American Water Resources Association (JAWRA) 1-24. DOI: 10.1111/jawr.12195

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

**Usage**

```r
fluxBiasMulti(eList, qUnit = 2, fluxUnit = 3, moreTitle = "WRTDS",
              cex = 0.7, cex.axis = 1.1, cex.main = 1.1,
              randomCensored = FALSE, col = "black", lwd = 1, ...)
```

**Arguments**

- **eList**  named list with at least Sample, Daily, and INFO dataframes
- **qUnit**  object of qUnit class. `printqUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name.
- **fluxUnit**  object of fluxUnit class. `printFluxUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name.
- **moreTitle**  character specifying some additional information to go in figure title, typically some information about the specific estimation method used, default is no additional information
- **cex**  numerical value giving the amount by which plotting symbols should be magnified
- **cex.axis**  magnification to be used for axis annotation relative to the current setting of cex
- **cex.main**  magnification to be used for main titles relative to the current setting of cex
- **randomCensored**  logical. Show censored residuals as randomized.
- **col**  color of points on plot, see `par 'Color Specification'
- **lwd**  number line width
- **...**  arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see `par for options`)
**Examples**

```r
eList <- Choptank_elist
fluxBiasMulti(eList)
# Water year:
## Not run:
pdf("fluxBiasMulti.pdf", height=9, width=8)
fluxBiasMulti(eList)
dev.off()
# Graphs consisting of Jun-Aug
eList <- setPA(eList,paStart=6,paLong=3)
pdf("fluxBiasMultiSummer.pdf", height=9, width=8)
fluxBiasMulti(eList)
dev.off()
```

```r
## End(Not run)
```

---

**fluxBiasStat**  
Compute the flux bias statistic: \( \frac{\text{mean of estimated flux} - \text{mean of observed flux}}{\text{mean of observed flux}} \)

---

**Description**  
Computes three versions of the flux bias: The first where all censored values are set to their minimum. The second where all censored values are set to their maximum. The third which is the average of the other two. In practice there is rarely a noticeable difference among them.

**Usage**

```r
fluxBiasStat(localSample)
```

**Arguments**

- **localSample**  
  data frame that contains the concentration data, default name is Sample

**Value**

- **fluxBias** a vector of three numerical values, a lower bound, upper bound and an average estimate of the ratio of \( \frac{\text{mean estimated flux} - \text{mean observed flux}}{\text{mean estimated flux}} \). Typically one should use fluxBias[3]

**Examples**

```r
eList <- Choptank_elist
Sample <- getSample(eList)
fluxBias <- fluxBiasStat(Sample)
```
### fluxUnit-class

**Description**

Some details about the fluxUnit class

**Details**

- **shortName** A character specifying the short name.
- **unitFactor** A numeric representing the conversion factor
- **unitName** A character specifying the full name.
- **unitExpress** An expression specifying the full name starting with Observed.
- **unitExpressTiny** An expression specifying the abbreviated name starting with Observed.
- **unitEstimate** An expression specifying the full name starting with Estimated.
- **unitEstimateTiny** An expression specifying the abbreviated name starting with Estimated.
- **unitUSGS** A character specifying flux with full text.
- **shortCode** A number for quick lookup

### formatCheckDate

**Description**

This function was never incorporated into the EGRET workflow and will be removed in future versions.

**Usage**

`formatCheckDate(Date, dateString, interactive = TRUE)`

**Arguments**

- **Date** character
- **dateString** character used in either error message or interactive message. An example would be "startDate"
- **interactive** logical Option for interactive mode. If true, there is user interaction for error handling and data checks.

**Details**

Response to the date format checker. If the date is not formatted correctly, it will give the user the opportunity to correct, otherwise will create a warning.
**Value**

condition logical if TRUE,

---

**formatCheckParameterCd**

**formatCheckParameterCd**

---

**Description**

This function was never incorporated into the EGRET workflow and will be removed in future versions. A similar check exists within the dataRetrieval functions. Checks that the parameter code is 5 digits. If it is less, it will pad the character with zeros. If more, ask the user to re-enter.

**Usage**

formatCheckParameterCd(parameterCd, interactive = TRUE)

**Arguments**

- parameterCd: character to check
- interactive: logical Option for interactive mode. If true, there is user interaction for error handling and data checks.

**Value**

parameterCd character

---

**generalAxis**

Axis generation for log discharge

---

**Description**

Discharge axis tick generation

**Usage**

generalAxis(x, maxVal, minVal, units = NA, logScale = FALSE, tinyPlot = FALSE, padPercent = 5, concentration = TRUE, usgsStyle = FALSE, prettyDate = TRUE)
Arguments

- `x` vector to create scale about
- `maxVal` number maximum value on returned scale
- `minVal` number minimum value on returned scale
- `units` character concentration units. Typically found in INFO$param.units.
- `logScale` logical whether or not to return a log scale
- `tinyPlot` logical
- `padPercent` number used to pad the max and min if not specified
- `concentration` logical if concentration=TRUE, labels returned as concentration units, otherwise flux units.
- `usgsStyle` logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels
- `prettyDate` logical use 'pretty' limits for date axis if TRUE, or force the yearStart/yearEnd as limits if FALSE

Examples

```r
eList <- Choptank_elist
Daily <- getDaily(eList)
INFO <- getInfo(eList)
x <- Daily$Q
max <- max(x)
min <- 0
units <- INFO$param.units
generalAxis(x, max, min, units)
min <- min(x)
generalAxis(x, max, min, units, log=TRUE)
```

genericEGRETDotPlot  Generic EGRET plotting function

Description

Basic plotting framework for EGRET dot plots. Graphical parameters default to values that work well with most plots, but all can be re-assigned. See ?par for complete definitions of most optional input variables.

Usage

```r
genericEGRETDotPlot(x, y, xlim, ylim, xTicks = pretty(xlim),
yTicks = pretty(ylim), printTitle = TRUE, xaxs = "i", xlab = "",
yaxs = "i", ylab = "", plotTitle = "", pch = 20, cex = 0.7,
cex.main = 1.3, font.main = 2, cex.lab = 1.2, tcl = 0.5,
cex.axis = 1, las = 1, xDate = FALSE, tinyPlot = FALSE,
```
Arguments

x vector specifying the x data (required)
y vector specifying the y data (required)
xlim vector specifying the x plotting range (required)
ylim vector specifying the y plotting range (required)
xticks vector specifying x axis tick placement (required)
yticks vector specifying y axis tick placement (required)
printTitle logical defaults to TRUE, plotting parameter to control whether to have title
xaxs character defaults to "i", defines the style of x-axis interval calculation. Possible values are i, r, e, s, d.
xlab character defaults to "", defines the x label
yaxs character defaults to "i", defines the style of y-axis interval calculation. Possible values are i, r, e, s, d.
ylab character defaults to "", defines the y label
plotTitle character defaults to "", defines the plot title
pch number defaults to 20, specifies plot symbol
cex number defaults to 0.7, specifies plotting text magnification
cex.main number defaults to 1.3, specifies title text magnification
font.main number defaults to 2, specifies which font to use for text
cex.lab number defaults to 1.2 specifies label text magnification
tcl number defaults to 0.5, specifies length of tick marks as fraction of height of a line of text.
cex.axis number defaults to 1, specifies axis text magnification
las number represents style of axis labels
xDate logical defaults to FALSE, changes x label to "year-month" format if set to TRUE and total years less than 4.
tinyPlot logical defaults to FALSE, if TRUE, changes defaults to be appropriate for multi-plot
hLine logical defaults to FALSE, inserts horizontal line at zero
oneToOneLine logical defaults to FALSE, inserts 1:1 line
rmSciX logical defaults to FALSE, changes x label from scientific to fixed
rmSciY logical defaults to FALSE, changes y label from scientific to fixed
customPar logical defaults to FALSE. If TRUE, par() should be set by user before calling this function
getDaily

Get Daily dataframe from EGRET object

Description
From a named list or EGRET object, extract the Daily dataframe

Usage
getDaily(x, ...)

## S3 method for class 'egret'
getDaily(x, ...)

## Default S3 method:
getDaily(x, ...)
getInfo

Arguments

x  EGRET object or named list
...  additional parameters

Value

Daily dataframe

See Also

readNWISDaily, readNWISSample

Examples

eList <- Choptank_eList
daily <- getDaily(eList)

getInfo  Get INFO dataframe from EGRET object

Description

From a named list or EGRET object, extract the INFO dataframe

Usage

gINFO(x, ...)

## S3 method for class 'egret'
gINFO(x, ...)

## Default S3 method:
gINFO(x, ...)

Arguments

x  EGRET object or named list
...  additional parameters

Value

INFO dataframe

See Also

readNWISDaily, readNWISSample
getSample

Get Sample dataframe from EGRET object

Description
From a named list or EGRET object, extract the Sample dataframe

Usage
getSample(x, ...)

Arguments
x  EGRET object or named list
... additional parameters

Value
Sample dataframe

See Also
readNWISDaily, readNWISSample

Examples
eList <- Choptank_eList
INFO <- getinfo(eList)

eList <- Choptank_eList
Sample <- getSample(eList)
**getSurfaces**

*Get surfaces matrix from EGRET object*

**Description**

From a named list or EGRET object, extract the surfaces matrix.

**Usage**

```r
getsurfaces(x, ...)  
```

```r  
## S3 method for class 'egret'  
getsurfaces(x, ...)  
```

```r  
## Default S3 method:  
getsurfaces(x, ...)  
```

**Arguments**

- `x` EGRET object or named list
- `...` additional parameters

**Value**

Sample dataframe

**See Also**

`readNWISDaily, readNWISSample`

**Examples**

```r  
eList <- Choptank_elist  
surfaces <- getsurfaces(eList)  
```

---

**INFOdataframe**

*Import metadata to create INFO data frame*

**Description**

Populates INFO data frame from either NWIS (readNWISInfo), Water Quality Portal (readWQPInfo), or user-supplied files (readUserInfo).
Usage

readNWISInfo(siteNumber, parameterCd, interactive = TRUE)

readWQPInfo(siteNumber, parameterCd, interactive = TRUE)

readUserInfo(filePath, fileName, hasHeader = TRUE, separator = ",", interactive = TRUE)

Arguments

- **siteNumber**: character site number. For `readNWISInfo`, this is usually an 8 digit number, for `readWQPInfo`, it is usually a longer code. For instance, a USGS site number in the Water Quality Portal would be in the form ‘USGS-XXXXXXXX’. If the siteNumber is left blank (an empty string), the interactive option allows users to enter required information by hand, otherwise those fields are left blank.

- **parameterCd**: character USGS parameter code (a 5 digit number) or characteristic name (if using `readWQPInfo`). If the parameterCd is left blank (an empty string), the interactive option allows users to enter required information by hand, otherwise those fields are left blank.

- **interactive**: logical Option for interactive mode. If true, there is user interaction for error handling and data checks.

- **filePath**: character specifying the path to the file (used in `readUserInfo`)

- **fileName**: character name of file to open (used in `readUserInfo`)

- **hasHeader**: logical true if the first row of data is the column headers (used in `readUserInfo`)

- **separator**: character that separates data cells (used in `readUserInfo`)

Value

INFO data frame. Any metadata can be stored in INFO. However, there are 8 columns that EGRET uses by name in some functions:

<table>
<thead>
<tr>
<th>Required column</th>
<th>Used in function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>param.units***</td>
<td>All concentration plotting functions</td>
<td>The units as listed in this field are used to create the concentration axis labels</td>
</tr>
<tr>
<td>shortName</td>
<td>All plotting functions</td>
<td>Station short name, used to label plots</td>
</tr>
<tr>
<td>paramShortName</td>
<td>All plotting functions</td>
<td>Parameter short name, used to label plots</td>
</tr>
<tr>
<td>drainSqKm</td>
<td>plotFlowSingle, printSeries</td>
<td>Calculate runoff</td>
</tr>
<tr>
<td>constitAbbrev</td>
<td>saveResults</td>
<td>Parameter abbreviation, used to auto-name workspace</td>
</tr>
<tr>
<td>staAbbrev</td>
<td>saveResults</td>
<td>Station abbreviation, used to auto-name workspace</td>
</tr>
<tr>
<td>paStart</td>
<td>Most EGRET functions</td>
<td>Starting month of period of analysis. Defaults to 10</td>
</tr>
<tr>
<td>paLong</td>
<td>Most EGRET functions</td>
<td>Length in number of months of period of analysis. Defaults to 12</td>
</tr>
</tbody>
</table>

*** Additionally, EGRET assumes that all concentrations are saved in mg/l. If some variation of ‘mg/l’ is not found in INFO$param.units, functions that calculate flux will issue a warning. This is because the conversion from mg/l to the user-specified flux unit (e.g., kg/day) uses hard-coded conversion factors.
is.egret

Check for EGRET object

Description
Checks object to see if it is an EGRET object

Usage
is.egret(x)

Arguments
x  object to check

Value
logical

See Also
readNWISsite, readNWISpCode, whatWQPsites

Examples
# These examples require an internet connection to run
# Automatically gets information about site 05114000 and temperature
INFO <- readNWISInfo('05114000', '00010')

# Not run:
INFO <- readNWISInfo('05114000', '00010')

# These examples require an internet connection to run
# Automatically gets information about site 01594440 and temperature, no interaction with user
nameToUse <- 'Specific conductance'

elist <- Choptank_elist
is.egret(elist)
```

---

**logPretty1**  
*Sets up tick marks for an axis with a log scale, where the graph is small*

---

**Description**

Axis tick marks for a log scale for cases where the data cover many orders of magnitude and the graph is small. These tick marks are designed to progress by factors of 10.

**Usage**

```
logPretty1(xMin, xMax)
```

**Arguments**

- `xMin`  
  A numeric value for the minimum value to be plotted, it must be > 0
- `xMax`  
  A numeric value for the maximum value to be plotted, it must be > xMax

**Value**

`xTicks` A vector representing the values for each of the tick marks

**Examples**

```
xMin <- 0.7
xMax <- 990000
logPretty1(xMin, xMax)
xMin <- 3
xMax <- 15
logPretty1(xMin, xMax)
```

---

**logPretty3**  
*Sets up tick marks for an axis with a log scale*

---

**Description**

Axis tick marks for a log scale. These tick marks are designed to progress with 3 tick marks for every factor of 10. For example: 2,5,10,20,50,100,200,500.

**Usage**

```
logPretty3(xMin, xMax)
```
Arguments

\texttt{xMin} \hspace{1cm} A numeric value for the minimum value to be plotted, it must be >0
\texttt{xMax} \hspace{1cm} A numeric value for the maximum value to be plotted, it must be >xMax

Value

\texttt{xTicks} A vector representing the values for each of the tick marks

Examples

\texttt{logPretty3(0.7, 990000)}
\texttt{logPretty3(3, 15)}

description

Part of the \texttt{flowHistory} system. The data come from \texttt{Daily} and \texttt{INFO} data frames. Note that the function \texttt{setPA} must be run before this to establish the period of analysis (e.g. water year).

Usage

\texttt{makeAnnualSeries(eList, edgeAdjust = TRUE)}

Arguments

\texttt{eList} \hspace{1cm} named list with at least \texttt{Daily} and \texttt{INFO} dataframes
\texttt{edgeAdjust} \hspace{1cm} logical specifying whether to use the modified method for calculating the windows at the edge of the record. The modified method tends to reduce curvature near the start and end of record. Default is \texttt{TRUE}, but a logical in \texttt{INFO$edgeAdjust} will override the default.

Details

\begin{tabular}{ll}
\texttt{istat} & Name \\
1 & minimum 1-day daily mean discharge \\
2 & minimum 7-day mean of the daily mean discharges \\
3 & minimum 30-day mean of the daily mean discharges \\
4 & median of the daily mean discharges \\
5 & mean of the daily mean discharges \\
6 & maximum 30-day mean of the daily mean discharges \\
7 & maximum 7-day mean of the daily mean discharges \\
8 & maximum 1-day daily mean discharge \\
\end{tabular}
Value

annualSeries matrix that contains the annual series of streamflow statistics

Examples

```r
eList <- Choptank_elist
annualSeries <- makeAnnualSeries(eList)
```

Description

This function is used to add two columns to the Sample data frame: rResid and rObserved. rResid is the randomized residual value computed in log concentration units, and rObserved is the randomized 'observed' value of concentration in concentration units. Both of these are computed for all censored samples ("less than values").

Usage

```r
makeAugmentedSample(eList)
```

Arguments

eList named list with at least the Sample dataframe

Value

eList named list with modified Sample dataframe.

Examples

```r
choptankAugmented <- makeAugmentedSample(Choptank_elist)
```
**makeDateInfo**

Description

Create a data frame that organizes date segmentations for runSeries.

Usage

`makeDateInfo(windowSide, surfaceStart, surfaceEnd, firstQDate0, lastQDate0)`

Arguments

- `windowSide`: integer number of automatically generated span sections, default is 7. If NA, code will use
- `surfaceStart`: character (or Date) in YYYY-MM-DD. Date on which we want the analysis to start, it must be at or after the
- `surfaceEnd`: character (or Date) in YYYY-MM-DD. Date on which we want the analysis to end, it must be at or before the end of
- `firstQDate0`: character (or Date) in YYYY-MM-DD. The first day used in flow normalizing distributions, default is the start of eList$Daily
- `lastQDate0`: character (or Date) in YYYY-MM-DD. The last day used in flow normalizing distributions, default is the end of eList$Daily

Examples

```r
windowSide <- 7
surfaceStart <- "1984-01-01"
surfaceEnd <- "2012-12-31"
firstQDate0 <- "1970-01-01"
lastQDate0 <- "2014-06-01"
dateInfo <- makeDateInfo(windowSide,
                          surfaceStart, surfaceEnd,
                          firstQDate0, lastQDate0)
```

**mergeReport**

Description

This function does three things. 1) It transfers the daily discharge value from the Daily data frame to to Sample data frame for those days with samples. 2) It merges the INFO, Daily and Sample data frames to form an eList object, 3) and it prints out a "report" of basic information about the Daily and Sample data frames.
mergeReport

Usage

mergeReport(INFO, Daily, Sample = NA, surfaces = NA, verbose = TRUE,
interactive = NULL)

Arguments

INFO dataframe metadata about the Sample and Daily data frames.
Daily dataframe containing the daily discharge data
Sample dataframe containing the sample data
surfaces matrix returned from modelEstimation. Default is NA.
verbose logical specifying whether or not to display summary information on the Daily
and Sample dataframes.
interactive logical deprecated. Use 'verbose' instead

Details

Note that the Sample dataframe in the global environment does not update with the flow information.

Value
eList named list with Daily, Sample, and INFO dataframes, along with the surfaces matrix. Any of
these values can be NA, not all EGRET functions will work with missing parts of the named list eList.

See Also
 readNWISDaily, readNWISSample

Examples

```r
siteNumber <- '01491000'
pCode <- '00631'
## Not run:
Daily <- readNWISDaily(siteNumber, '00060', '1984-10-01', '')
Sample <- readNWISSample(siteNumber, pCode, '1984-10-01', '')
INFO <- readNWISInfo(siteNumber, pCode, interactive=FALSE)
eList <- mergeReport(INFO, Daily, Sample)
Sample <- eList$Sample
plot(eList)

# Create eList with no water quality data:

eList <- mergeReport(INFO, Daily, Sample = NA)
plotFour(eList)

## End(Not run)```
modelEstimation

Estimation process for the WRTDS (Weighted Regressions on Time, Discharge, and Season)

**Description**

This one function does three things. 1) a jack-knife cross-validation of a WRTDS model in which it augments the Sample data frame in the eList 2) fits the WRTDS model creating the, fits the surfaces matrix and places it in the eList (the surfaces matrix expresses the estimated concentration as a function of discharge and time), 3) estimates the daily values of concentration and flux, and flow normalized concentration and flux and places these in the Daily data frame in the eList values. It returns a named list with the following dataframes: Daily, INFO, Sample, and the matrix: surfaces.

**Usage**

```r
modelEstimation(eList, windowY = 7, windowQ = 2, windowS = 0.5,
                minNumObs = 100, minNumUncen = 50, edgeAdjust = TRUE,
                verbose = TRUE, run.parallel = FALSE)
```

**Arguments**

- **eList**: named list with at least the INFO, Daily, and Sample dataframes
- **windowY**: numeric specifying the half-window width in the time dimension, in units of years, default is 7
- **windowQ**: numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2
- **windowS**: numeric specifying the half-window with in the seasonal dimension, in units of years, default is 0.5
- **minNumObs**: numeric specifying the minimum number of observations required to run the weighted regression, default is 100
- **minNumUncen**: numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50
- **edgeAdjust**: logical specifying whether to use the modified method for calculating the windows at the edge of the record. The edgeAdjust method tends to reduce curvature near the start and end of record. Default is TRUE.
- **verbose**: logical specifying whether or not to display progress message
- **run.parallel**: logical to run WRTDS in parallel or not

**Value**

eList named list with INFO, Daily, and Sample dataframes, along with the surfaces matrix. Any of these values can be NA, not all EGRET functions will work with missing parts of the named list eList.
Examples

eList <- Choptank_eList

## Not run:

# Run an estimation adjusting windowQ from default:
eList <- modelEstimation(eList, windowQ=5)

library(doParallel)
nCores <- parallel::detectCores() - 1
cl <- makePSOCKcluster(nCores)
registerDoParallel(cl)
eList <- modelEstimation(eList, windowQ=5, run.parallel = TRUE)
stopCluster(cl)

## End(Not run)

---

monthLabel-class     monthLabel class

Description

Some details about the monthLabel class

Details

- **monthAbbrev** A character specifying the abbreviated month name.
- **monthFull** A character specifying the full month name
- **monthSingle** A character specifying the single letter of the month.

---

multiPlotDataOverview     Produces a 4 panel plot that gives an overview of the data set prior to any processing

Description

This function produces the 4 plots based only on the data stored in the eList. The four plots are 1) log concentration versus log discharge, 2) log concentration versus time 3) a boxplot of log concentration by month, and 4) a side-by-side boxplot of the sampled discharges and all daily discharges. To save space, the graphic is labeled only at the top of the 4 graph display.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Usage

```r
multiPlotDataOverview(eList, qUnit = 2, cex.main = 1.2,
                       randomCensored = FALSE, logScaleConc = TRUE, logScaleQ = TRUE)
```
Arguments

- **elist** named list with at least Daily, Sample, and INFO dataframes
- **qUnit** object of qUnit class `printQUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name.
- **cex.main** magnification to be used for main titles relative to the current setting of cex
- **randomCensored** logical. Show censored values as randomized. Default is FALSE. If TRUE, `makeAugmentedSample` must be run first.
- **logScaleConc** logical if TRUE y in concentration graphs plotted in log axis. Default is TRUE.
- **logScaleQ** logical if TRUE y in streamflow graphs plotted in log axis. Default is TRUE.

Examples

```r
elist <- Choptank_elist
# Water year:
multiPlotDataOverview(elist, qUnit=1)
# Graphs consisting of Jun-Aug
eList <- setPA(elist, paStart=6, paLong=3)
multiPlotDataOverview(elist, qUnit=1)
```

---

**plot15**

Makes 15 graphs of streamflow statistics on a single page

Description

Part of flowHistory system.

Usage

```r
plot15(eList, yearStart, yearEnd)
```

Arguments

- **eList** named list with at least the Daily and INFO dataframes
- **yearStart** A numeric value for year in which the graph should start, default is NA, which indicates that the graph should start with first annual value
- **yearEnd** A numeric value for year in which the graph should end, default is NA, which indicates that the graph should end with last annual value

See Also

`plot1of15`
Examples

```r
eList <- Choptank_eList
## Not run:
pdf("plot15.pdf", height=10, width=8)
plot15(eList, yearStart=1990, yearEnd=2000)
dev.off()

## End(Not run)
```

---

**plot1of15**

*plots 1 of the 15 graphs of streamflow statistics on a single page*

---

**Description**

Part of the flowHistory system. The 15 graphs include annual and four seasonal graphs for each of 3 flow statistics: 1-day maximum, mean, and 7-day minimum.

**Usage**

```r
plot1of15(eList, yearStart, yearEnd, qf, istat, isBottom = FALSE)
```

**Arguments**

- **eList**: named list with at least the Daily and INFO dataframes
- **yearStart**: A numeric value for the year in which the graph should start
- **yearEnd**: A numeric value for the year in which the graph should end
- **qf**: a scale factor to convert discharge in cubic feet per second to mm/day
- **istat**: A numeric value selecting the flow statistic to be plotted, must be an integer from 1 to 8
- **isBottom**: logical, if TRUE the graph is from the bottom row and thus needs x axis labels, if FALSE it does not need labels

**Examples**

```r
eList <- Choptank_eList
plot1of15(eList, 1990, 2000, 0.2938476, 5)
```
Description

Data come from named list, which contains a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

The annual concentrations are "time-weighted" mean concentrations (as opposed to "flow-weighted"). The annual results reported are for a specified "period of analysis" which can be an entire water year, a calendar, a season or even an individual month. User specifies this period of analysis in the call to setupYears.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Usage

plotConcHist(eList, yearStart = NA, yearEnd = NA, concMax = NA, printTitle = TRUE, tinyPlot = FALSE, usgsStyle = FALSE, plotFlowNorm = TRUE, plotAnnual = TRUE, cex = 0.8, cex.axis = 1.1, cex.main = 1.1, lwd = 2, col = "black", col.pred = "green", customPar = FALSE, ...)

Arguments

eList named list with at least the Daily and INFO dataframes
yearStart numeric is the calendar year containing the first estimated annual value to be plotted, default is NA (which allows it to be set automatically by the data)
yearEnd numeric is the calendar year just after the last estimated annual value to be plotted, default is NA (which allows it to be set automatically by the data)
concMax numeric. Maximum value of concentration to be plotted.
printTitle logical variable if TRUE title is printed, if FALSE title is not printed (this is best for a multi-plot figure)
tinyPlot logical variable, if TRUE plot is designed to be plotted small, as a part of a multipart figure, default is FALSE
usgsStyle logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels
plotFlowNorm logical variable if TRUE flow normalized line is plotted, if FALSE not plotted
plotAnnual logical variable if TRUE annual concentration points are plotted, if FALSE not plotted
cex numerical value giving the amount by which plotting symbols should be magnified
cex.axis magnification to be used for axis annotation relative to the current setting of cex
**plotConcPred**

- `cex.main`: magnification to be used for main titles relative to the current setting of `cex`.
- `lwd`: number magnification of line width.
- `col`: color of points on plot, see `?par` 'Color Specification'.
- `col.predict`: color of flow normalized line on plot, see `?par` 'Color Specification'.
- `customPar`: logical defaults to FALSE. If TRUE, `par()` should be set by user before calling this function (for example, adjusting margins with `par(mar=c(5,5,5,5)))`. If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
- `...`: arbitrary graphical parameters that will be passed to `genericEGRETDotPlot` function (see `?par` for options).

**See Also**

- `setupYears`, `genericEGRETDotPlot`

**Examples**

```R
yearStart <- 2001
yearEnd <- 2010
eList <- Choptank_eList

# Water year:
plotConcHist(eList, yearStart, yearEnd)
# Graphs consisting of Jun-Aug
eList <- setPA(eList, paStart=6, paLong=3)
plotConcHist(eList)
```

**Description**

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata.

Although there are a lot of optional arguments to this function, most are set to a logical default.

**Usage**

```R
plotConcPred(eList, concMax = NA, logScale = FALSE,
             printTitle = TRUE, tinyPlot = FALSE, cex = 0.8, cex.axis = 1.1,
             cex.main = 1.1, customPar = FALSE, col = "black", lwd = 1,
             randomCensored = FALSE, usgsStyle = FALSE, ...)
```
Arguments

elist named list with at least the Sample and INFO dataframes
concMax number specifying the maximum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data)
logScale logical, default TRUE, TRUE indicates y axis is in log scale, "xy" indicates both x and y in log scale, "x" is only x
printTitle logical variable if TRUE title is printed, if FALSE not printed (this is best for a multi-plot figure)
tinyPlot logical variable, if TRUE plot is designed to be plotted small, as a part of a multipart figure, default is FALSE
cex numerical value giving the amount by which plotting symbols should be magnified
cex.axis magnification to be used for axis annotation relative to the current setting of cex
cex.main magnification to be used for main titles relative to the current setting of cex
customPar logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with `par(mar=c(5,5,5,5)))`. If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
col color of points on plot, see `?par 'Color Specification'`
lwd number line width
randomCensored logical. Show censored values as randomized.
usgsStyle logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels
...

arbitrary graphical parameters that will be passed to `genericEGRETDotPlot` function (see `?par for options`)

See Also

`selectDays`, `genericEGRETDotPlot`

Examples

eList &lt;- Choptank_elist
# Water year:
plotConcPred(eList)
plotConcPred(eList, logScale=TRUE)
# Graphs consisting of Jun-Aug
eList &lt;- setPA(eList, paStart=6, paLong=3)
plotConcPred(eList, usgsStyle=TRUE)
Description

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata. Discharge is plotted on a log scale.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Usage

plotConcQ(eList, qUnit = 2, tinyPlot = FALSE, logScale = FALSE, randomCensored = FALSE, concMax = NA, concMin = NA, printTitle = TRUE, cex = 0.8, cex.axis = 1.1, cex.main = 1.1, usgsStyle = FALSE, rmSciX = FALSE, rmSciY = FALSE, customPar = FALSE, col = "black", lwd = 1, ...)

Arguments

eList named list with at least the Sample and INFO dataframes
qUnit object of qUnit class printqUnitCheatSheet, or numeric represented the short code, or character representing the descriptive name.
tinyPlot logical variable, if TRUE plot is designed to be plotted small as part of a multi-part figure, default is FALSE.
logScale logical if TRUE x and y plotted in log axis
randomCensored logical. Show censored values as randomized.
concMax number specifying the maximum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data)
concMin numeric value for lower limit on concentration shown on the vertical log graph, default is NA (which causes the lower limit to be set automatically, based on the data). This value is ignored for linear scales, using 0 as the minimum value for the concentration axis.
printTitle logical variable if TRUE title is printed, if FALSE title is not printed (this is best for a multi-plot figure)
cex numerical value giving the amount by which plotting symbols should be magnified
cex.axis magnification to be used for axis annotation relative to the current setting of cex
cex.main magnification to be used for main titles relative to the current setting of cex
usgsStyle logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.
rmSciX logical defaults to FALSE, changes x label from scientific to fixed
rmSciY logical defaults to FALSE, changes y label from scientific to fixed
customPar  logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.

col  color of points on plot, see ?par 'Color Specification'
lwd  number line width

...  arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see ?par for options)

See Also

selectDays, genericEGRETDotPlot

Examples

eList <- Choptank_elist
# Water year:
plotConcQ(eList)
plotConcQ(eList, logScale=TRUE)
# Graphs consisting of Jun-Aug
eList <- setPA(eList, paStart=6, paLong=3)
plotConcQ(eList, usgsStyle = TRUE)

plotConcQSmooth  Plot up to three curves representing the concentration versus discharge relationship. Each curve is a different point in time.

Description

These plots are like a vertical slice of the estimated concentration surface that is seen in the plot-Contours function. These plots show how the concentration-discharge relationship is changing over time. Typically the time points selected would be in three years at the same time of year spaced out over the period of record. But that is not necessary. Another possibility is to use this to explore seasonal differences. In this case the three dates would be in the same year but different times during the year.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata.

Usage

plotConcQSmooth(eList, date1, date2, date3, qLow, qHigh, qUnit = 2, legendLeft = 0, legendTop = 0, concMax = NA, concMin = NA, bw = FALSE, printTitle = TRUE, printValues = FALSE, minNumObs = 100, minNumUncen = 50, colors = c("black", "red", "green"), printLegend = TRUE, windowY = 7, windowQ = 2, windowS = 0.5, tinyPlot = FALSE, customPar = FALSE, lwd = 2,
cex = 0.8, cex.axis = 1.1, cex.main = 1.1, cex.legend = 1.2,
lineVal = c(1, 1, 1), logScale = FALSE, edgeAdjust = TRUE,
usgsStyle = FALSE, ...

Arguments

eList
  named list with at least the Sample and INFO dataframes

date1
  character specifying the date for the first curve on the graph, it is in the form
  "yyyy-mm-dd" (must be in quotes)

date2
  character specifying the date for the second curve on the graph, it is in the form
  "yyyy-mm-dd" (must be in quotes). If only one curve is wanted this should be
  NA

date3
  character specifying the date for the third curve on the graph, it is in the form
  "yyyy-mm-dd" (must be in quotes). If a third curve is not wanted this should be
  NA

qLow
  numeric value for the lowest discharge to be considered, expressed in the units
  of discharge that are being used (as specified in qUnit)

qHigh
  numeric value for the highest discharge to be considered, expressed in the units
  of discharge that are being used (as specified in qUnit)

qUnit
  object of qUnit class. printqUnitCheatSheet, or numeric represented the short
  code, or character representing the descriptive name.

legendLeft
  numeric which represents the left edge of the legend in the units of the plot.

legendTop
  numeric which represents the top edge of the legend in the units of the plot.

concMax
  numeric value for upper limit on concentration shown on the graph, default = NA
  (which causes the upper limit to be set automatically, based on the data)

concMin
  numeric value for lower limit on concentration shown on the vertical log graph,
  default is NA (which causes the lower limit to be set automatically, based on the
  data). This value is ignored for linear scales, using 0 as the minimum value for
  the concentration axis.

bw
  logical if TRUE graph is produced in black and white, default is FALSE (which
  means it will use color)

printTitle
  logical variable if TRUE title is printed, if FALSE not printed

printValues
  logical variable if TRUE the results shown on the graph are also printed to
  the console and returned in a dataframe (this can be useful for quantifying the
  changes seen visually in the graph), default is FALSE (not printed)

minNumObs
  numeric specifying the minimum number of observations required to run the
  weighted regression, default is 100

minNumUncen
  numeric specifying the minimum number of uncensored observations to run the
  weighted regression, default is 50

colors
  color vector of lines on plot, see ?par 'Color Specification'. Defaults to c("black","red","green")

printLegend
  logical if TRUE, legend is included

windowY
  numeric specifying the half-window width in the time dimension, in units of
  years, default is 7
plotConcQSmooth

numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2

windowS numeric specifying the half-window width in the seasonal dimension, in units of years, default is 0.5

tinyPlot logical variable, if TRUE plot is designed to be plotted small as part of a multipart figure, default is FALSE.
customPar logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
lwd number line width
cex numerical value giving the amount by which plotting symbols should be magnified
cex.axis magnification to be used for axis annotation relative to the current setting of cex
cex.main magnification to be used for main titles relative to the current setting of cex
cex.legend magnification to be used for legend annotation relative to the current setting of cex

lineVal vector of line types. Defaults to c(1,1,1) which is a solid line for each line. Options: 0=blank, 1=solid (default), 2=dashed, 3=dotted, 4=dotdash, 5=longdash, 6=twodash

logScale logical whether or not to use a log scale in the y axis.
edgeAdjust logical specifying whether to use the modified method for calculating the windows at the edge of the record. The modified method tends to reduce curvature near the start and end of record. Default is TRUE.

usgsStyle logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels

... arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see ?par for options)

Examples

date1<"2001-06-01"
date2<"2005-06-01"
date3<"2010-06-01"
qLow<-1
qHigh<-100
eList <- Choptank_elist
plotConcQSmooth(eList, date1, date2, date3, qLow, qHigh)
plotConcQSmooth(eList, date1, date2, date3, qLow, qHigh, logScale=TRUE)
plotConcTime

Plot of Observed Concentration versus Time

Description

This function allows the user to plot all of the data, but also to limit it in two ways. The data can be limited to only those observed concentrations collected in a specified discharge range. The data can also be limited to only those observed in certain months of the year. These two selection criteria can be combined. For example, we may only want to plot data for discharges between 100 and 500 cubic feet per second in the months of March, April and May.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata.

Usage

plotConcTime(eList, qUnit = 2, yearStart = NA, yearEnd = NA,
qlower = NA, qupper = NA, randomCensored = FALSE,
tinyPlot = FALSE, concMax = NA, concMin = NA, printTitle = TRUE,
logScale = FALSE, cex = 0.8, cex.axis = 1.1, cex.main = 1.1,
customPar = FALSE, col = "black", lwd = 1, usgsStyle = FALSE,
...)

Arguments

- **eList**: named list with at least the Sample and INFO dataframes
- **qUnit**: object of qUnit class printqUnitCheatSheet, or numeric represented the short code, or character representing the descriptive name.
- **yearStart**: numeric is the calendar year containing the first estimated annual value to be plotted, default is NA (which allows it to be set automatically by the data)
- **yearEnd**: numeric is the calendar year just after the last estimated annual value to be plotted, default is NA (which allows it to be set automatically by the data)
- **qlower**: numeric the lower bound on values of discharge used to select the data points to be plotted, units are those specified by qUnit, default = NA which is equivalent to a lower bound of zero but if the desired lower bound is zero use qLower = NA
- **qupper**: numeric the upper bound on values of discharge for selection of data points to be plotted, units are those specified by qUnit, default = NA which is equivalent to an upper bound of infinity
- **randomCensored**: logical. Show censored values as randomized.
- **tinyPlot**: logical variable, if TRUE plot is designed to be plotted small as part of a multi-part figure, default is FALSE.
- **concMax**: numeric value for the maximum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data)
### plotConcTimeDaily

- **concMin**: numeric value for lower limit on concentration shown on the vertical log graph, default is NA (which causes the lower limit to be set automatically, based on the data). This value is ignored for linear scales, using 0 as the minimum value for the concentration axis.
- **printTitle**: logical variable if TRUE title is printed, if FALSE title is not printed (this is best for a multi-plot figure).
- **logScale**: logical, default FALSE, FALSE creates a linear scale y-axis, TRUE creates a y-axis is in log scale.
- **cex**: numerical value giving the amount by which plotting symbols should be magnified.
- **cex.axis**: magnification to be used for axis annotation relative to the current setting of cex.
- **cex.main**: magnification to be used for main titles relative to the current setting of cex.
- **customPar**: logical defaults to FALSE. If TRUE, par() should be set by user before calling this function. (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
- **col**: color of points on plot, see ?par 'Color Specification'
- **lwd**: number line width.
- **usgsStyle**: logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.
- **...**: arbitrary functions sent to the generic plotting function. See ?par for details on possible parameters.

```

---

**plotConcTimeDaily**  
Plot of the time series of daily concentration estimates and the sample values for the days that were sampled
Description

This plot is useful for visual examination of the ability of the WRTDS, or other model, to fit the data, seen in a time-series perspective. The graph is most useful when it covers a period of just a few years and not the complete record but a complete record can be done by repeated use over a series of segments.

Although there are a lot of optional arguments to this function, most are set to a logical default. Data come from named list, which contains a Sample dataframe with the sample data, a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Usage

```r
plotConcTimeDaily(eList, yearStart = NA, yearEnd = NA,
                   tinyPlot = FALSE, concMax = NA, printTitle = TRUE, cex = 0.8,
                   cex.axis = 1.1, randomCensored = FALSE, cex.main = 1.1,
                   customPar = FALSE, col = "black", lwd = 1, prettyDate = TRUE,
                   usgsStyle = FALSE, ...)```

Arguments

- `eList` named list with at least the Daily, Sample, and INFO dataframes
- `yearStart` numeric specifying the starting date (expressed as decimal years, for example 1989.0) for the plot
- `yearEnd` numeric specifying the ending date for the plot
- `tinyPlot` logical variable, if TRUE plot is designed to be short and wide, default is FALSE.
- `concMax` number specifying the maximum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data)
- `printTitle` logical variable if TRUE title is printed, if FALSE title is not printed (this is best for a multi-plot figure)
- `cex` numerical value giving the amount by which plotting symbols should be magnified
- `cex.axis` magnification to be used for axis annotation relative to the current setting of cex
- `randomCensored` logical. Show censored values as randomized.
- `cex.main` magnification to be used for main titles relative to the current setting of cex
- `customPar` logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with `par(mar=c(5,5,5,5))`). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
- `col` color of points on plot, see `?par` 'Color Specification'
- `lwd` number line width
- `prettyDate` logical use 'pretty' limits for date axis if TRUE, or force the yearStart/yearEnd as limits if FALSE
- `usgsStyle` logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels
- `...` arbitrary functions sent to the generic plotting function. See `?par` for details on possible parameters
plotConcTimeSmooth

See Also

selectDays, genericEGRETDotPlot

Examples

eList <- Choptank_eList
# Water year:
plotConcTimeDaily(eList)
plotConcTimeDaily(eList, yearStart=1998, yearEnd=2001)
# Graphs consisting of Jun-Aug
eList <- setPA(eList, paStart=6, paLong=3)
plotConcTimeDaily(eList)

Description

These plots show how the concentration-time relationship is changing over flow.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data and an INFO dataframe with metadata.

Usage

plotConcTimeSmooth(eList, q1, q2, q3, centerDate, yearStart, yearEnd,
  qUnit = 2, legendLeft = 0, legendTop = 0, concMax = NA,
  concMin = NA, bw = FALSE, printTitle = TRUE, colors = c("black",
  "red", "green"), printValues = FALSE, tinyPlot = FALSE,
  minNumObs = 100, minNumUncen = 50, windowY = 10, windowQ = 2,
  windowS = 0.5, cex.main = 1.1, lwd = 2, printLegend = TRUE,
  cex.legend = 1.2, cex = 0.8, cex.axis = 1.1, customPar = FALSE,
  lineVal = c(1, 1, 1), logScale = FALSE, edgeAdjust = TRUE,
  usgsStyle = FALSE, ...)

Arguments

eList : named list with at least the Sample and INFO dataframes
q1 : numeric This is the discharge value for the first curve to be shown on the plot. It is expressed in units specified by qUnit.
q2 : numeric This is the discharge value for the second curve to be shown on the plot. It is expressed in units specified by qUnit. If you don’t want a second curve then the argument must be q2=NA
plotConcTimeSmooth

q3 numeric This is the discharge value for the third curve to be shown on the plot. It is expressed in units specified by qUnit. If you don’t want a third curve then the argument must be q3=NA

centerDate character This is the time of year to be used as the center date for the smoothing. It is expressed as a month and day and must be in the form "mm-dd"

yearStart numeric This is the starting year for the graph. The first value plotted for each curve will be at the first instance of centerDate in the year designated by yearStart.

yearEnd numeric This is the end of the sequence of values plotted on the graph. The last value will be the last instance of centerDate prior to the start of yearEnd. (Note, the number of values plotted on each curve will be yearEnd-yearStart.)

qUnit object of qUnit class. printUnitCheatsheet, or numeric represented the short code, or character representing the descriptive name.

legendLeft numeric which represents the left edge of the legend in the units of the plot.

legendTop numeric which represents the top edge of the legend in the units of the plot.

concMax numeric value for upper limit on concentration shown on the graph, default = NA (which causes the upper limit to be set automatically, based on the data)

concMin numeric value for lower limit on concentration shown on the vertical log graph, default is NA (which causes the lower limit to be set automatically, based on the data). This value is ignored for linear scales, using 0 as the minimum value for the concentration axis.

bw logical if TRUE graph is produced in black and white, default is FALSE (which means it will use color)

printTitle logical variable if TRUE title is printed, if FALSE not printed

colors color vector of lines on plot, see ?par 'Color Specification'. Defaults to c("black","red","green")

printValues logical variable if TRUE the results shown on the graph are printed to the console and returned in a dataframe (this can be useful for quantifying the changes seen visually in the graph), default is FALSE (not printed)

tinyPlot logical variable, if TRUE plot is designed to be plotted small, as a part of a multipart figure, default is FALSE

minNumObs numeric specifying the minimum number of observations required to run the weighted regression, default is 100

minNumUncen numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50

windowY numeric specifying the half-window width in the time dimension, in units of years, default is 10

windowQ numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2

windowS numeric specifying the half-window with in the seasonal dimension, in units of years, default is 0.5

cex.main magnification to be used for main titles relative to the current setting of cex

lwd line width, a positive number, defaulting to 1
plotContour

printLegend logical if TRUE, legend is included

cex.legend number magnification of legend

```r
cex
```
numerical value giving the amount by which plotting symbols should be magnified

cex.axis magnification to be used for axis annotation relative to the current setting of cex

customPar logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.

```r
lineVal
```
vector of line types. Defaults to c(1,1,1) which is a solid line for each line. Options: 0=blank, 1=solid (default), 2=dashed, 3=dotted, 4=dotdash, 5=longdash, 6=twodash

logScale logical whether or not to use a log scale in the y axis.

edgeAdjust logical specifying whether to use the modified method for calculating the windows at the edge of the record. The modified method tends to reduce curvature near the start and end of record. Default is TRUE.

usgsStyle logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels

... arbitrary functions sent to the generic plotting function. See ?par for details on possible parameters

genericEGRETDotPlot, runSurvReg

Examples

```r
q <- 10
q2 <- 25
q3 <- 75
centerDate <- "01-01"
yearStart <- 2000
yearEnd <- 2010
eList <- Choptank_elist
plotConcTimeSmooth(eList, q, q2, q3, centerDate, yearStart, yearEnd)
plotConcTimeSmooth(eList, q, q2, q3, centerDate, yearStart, yearEnd, logScale=TRUE)
```

plotContours

Color contour plot of the estimated surfaces as a function of discharge and time (surfaces include log concentration, standard error, and concentration)
**Description**

These plots are normally used for plotting the estimated concentration surface (whatSurface=3) but can be used to explore the estimated surfaces for the log of concentration or for the standard error (in log space) which is what determines the bias correction. The plots are often more interpretable when the time limits are only about 4 years apart. To explore changes over a long time period it is best to do this multiple times, for various time slices of 4 years (for example) or to use the function plotDiffContours.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

**Usage**

```r
plotContours(eList, yearStart, yearEnd, qBottom = NA, qTop = NA,
              whatSurface = 3, qUnit = 2, contourLevels = NA, span = 60,
              pval = 0.05, printTitle = TRUE, vert1 = NA, vert2 = NA,
              horiz = NA, tcl = 0.03, flowDuration = TRUE, customPar = FALSE,
              yTicks = NA, tick.lwd = 1, usgsStyle = FALSE, lwd = 2,
              cex.main = 1, cex.axis = 1,
              color.palette = colorRampPalette(c("white", "gray", "blue", "red")),
              ...)
```

**Arguments**

- `eList` named list with at least the Daily and INFO dataframes, and surfaces matrix
- `yearStart` numeric value for the starting date for the graph, expressed as decimal year (typically whole number such as 1989.0)
- `yearEnd` numeric value for the ending date for the graph, expressed as decimal year, (for example 1993.0)
- `qBottom` numeric value for the bottom edge of the graph, expressed in the units of discharge that are being used (as specified in qUnit). NA will choose a "pretty" lower limit nearest to the 5% of discharge. If yTicks are specified, then the first value of yTicks becomes the lowest discharge shown on the figure.
- `qTop` numeric value for the top edge of the graph, expressed in the units of discharge that are being used (as specified in qUnit). NA will choose a "pretty" upper limit nearest to the 95% of discharge. If yTicks are specified, then the last value of yTicks becomes the highest discharge shown on the figure.
- `whatSurface` numeric value, can only accept 1, 2, or 3; whatSurface=1 is yHat (log concentration), whatSurface=2 is SE (standard error of log concentration), and whatSurface=3 is ConcHat (unbiased estimate of concentration), default = 3.
- `qUnit` object of qUnit class, `printQUnitCheatsheet`, or numeric represented the short code, or character representing the descriptive name.
- `contourLevels` numeric vector containing the contour levels for the contour plot, arranged in ascending order, default is NA (which causes the contour levels to be set automatically, based on the data)
span numeric, it is the half-width (in days) of the smoothing window for computing the flow duration information, default = 60
pval numeric, the probability value for the lower flow frequency line on the graph
printTitle logical variable if TRUE title is printed, if FALSE not printed
vert1 numeric, the location in time for a black vertical line on the figure, yearStart<vert1<yearEnd, default is NA (vertical line is not drawn)
vert2 numeric, the location in time for a black vertical line on the figure, yearStart<vert2<yearEnd, default is NA (vertical line is not drawn)
horiz numeric, the location in discharge for a black horizontal line on the figure, qBottom<vert1<qTop, default is NA (no horizontal line is drawn)
tcl numeric, length of tick marks in inches, default is 0.03
flowDuration logical variable if TRUE plot the flow duration lines (5 and 95 flow percentiles), if FALSE do not plot them, default = TRUE
customPar logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins.
yTicks vector of yTick labels and marks that will be plotted in log space. (for example yTicks = c(3, 5, 10, 20, 50, 100, 200, 400). The first and last values determine the range of the y axis. If NA, the tick marks will be automatically generated.
tick.lwd line width for axis ticks, default is 1
usgsStyle logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.
lwd numeric, line width of flowDuration curve, default is 2
cex.main magnification to be used for main titles relative to the current setting of cex
cex.axis magnification to be used for axis annotation relative to the current setting of cex
color.palette a function that creates a color palette for the contour plot. Default goes from white to gray to blue to red using the function colorRampPalette(c("white","gray","blue","red"))
A few preset options are heat.colors, topo.colors, and terrain.colors.

... arbitrary functions sent to the generic plotting function. See ?par for details on possible parameters

Examples

yearStart <- 2001
yearEnd <- 2010
qBottom <- 0.5
qTop<- 22
clevel <- seq(0,3.5,0.5)
elist <- Choptank_elist
plotContours(elist, yearStart,yearEnd,qBottom,qTop, contourLevels = clevel)
plotContours(elist, yearStart,yearEnd,qBottom=0.1,qTop=NA, contourlevels = clevel)
yTicksModified <- c(.1,1,10,25)
plotContours(elist, yearStart,yearEnd,qBottom,qTop,
contourLevels = clevel,yTicks=yTicksModified,flowDuration=FALSE)
plotDiffContours

Plots the difference between two years from a contour plot created by `plotContours`

Description

These plots are normally used for plotting changes in the estimated concentration surface (whatSurface=3) but can be used to explore the changes in estimated surfaces for the log of concentration or for the standard error (in log space) which is what determines the bias correction.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Usage

```r
plotDiffContours(eList, year0, year1, qBottom = NA, qTop = NA,
  maxDiff = NA, whatSurface = 3, tcl = 0.03, qUnit = 2,
  span = 60, pval = 0.05, printTitle = TRUE, plotPercent = FALSE,
  vert1 = NA, vert2 = NA, horiz = NA, flowDuration = TRUE,
  yTicks = NA, tick.lwd = 1, lwd = 2, cex.main = 0.95,
  cex.axis = 1, customPar = FALSE, usgsStyle = FALSE,
  color.palette = colorRampPalette(c("blue", "white", "red")), ...)
```

Arguments

- **eList**: named list with at least the Daily and INFO dataframes, and surfaces matrix
- **year0**: numeric value for the calendar year that is the first year of the pair of years for the analysis, should be a whole number
- **year1**: numeric value for the calendar year that is the second year of the pair of years for the analysis, should be a whole number
- **qBottom**: numeric value for the bottom edge of the graph, expressed in the units of discharge that are being used (as specified in qUnit). NA will choose a "pretty" lower limit nearest to the 5% of discharge. If `yTicks` are specified, then the first value of `yTicks` becomes the lowest discharge shown on the figure.
**plotDiffContours**

- **qTop**: numeric value for the top edge of the graph, expressed in the units of discharge that are being used (as specified in qUnit). NA will choose a “pretty” upper limit nearest to the 95% of discharge. If yTicks are specified, then the last value of yTicks becomes the highest discharge shown on the figure.

- **maxDiff**: numeric value which is the absolute value of the largest change in concentration that will be shown on the figure. Alternatively, a vector with the minimum and maximum values in the change in concentration scale. If NA, the scale will be set from 5% to 95% of the concentration difference.

- **whatSurface**: numeric value, can only accept 1, 2, or 3: whatSurface=1 is yHat (log concentration), whatSurface=2 is SE (standard error of log concentration), and whatSurface=3 is ConcHat (unbiased estimate of concentration), default = 3

- **tcl**: numeric, length of tick marks in inches, default is 0.1

- **qUnit**: object of qUnit class. `printqUnitCheatsheet`, or numeric represented the short code, or character representing the descriptive name.

- **span**: numeric, it is the half-width (in days) of the smoothing window for computing the flow duration information, default = 60

- **pval**: numeric, the probability value for the lower flow frequency line on the graph

- **printTitle**: logical variable if TRUE title is printed, if FALSE not printed

- **plotPercent**: logical. If TRUE, plots percent difference, if FALSE, plots absolute differences. Defaults to FALSE.

- **vert1**: numeric, the location in time for a black vertical line on the figure, yearStart < vert1 < yearEnd, default is NA (vertical line is not drawn)

- **vert2**: numeric, the location in time for a black vertical line on the figure, yearStart < vert2 < yearEnd, default is NA (vertical line is not drawn)

- **horiz**: numeric, the location in discharge for a black horizontal line on the figure, qBottom<vert1<qTop, default is NA (no horizontal line is drawn)

- **flowDuration**: logical variable if TRUE plot the flow duration lines (5 and 95 flow percentiles), if FALSE do not plot them, default = TRUE

- **yTicks**: vector of yTick labels and marks that will be plotted in log space. (for example yTicks = c(3, 5, 10, 20, 50, 100, 200, 400). The first and last values determine the range of the y axis. If NA, the tick marks will be automatically generated.

- **tick.lwd**: line width for axis ticks, default is 2

- **lwd**: numeric, line width of flowDuration curve, default is 1

- **cex.main**: magnification to be used for main titles relative to the current setting of cex

- **cex.axis**: magnification to be used for axis annotation relative to the current setting of cex

- **customPar**: logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar= c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins.

- **usgsStyle**: logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.
color.palette  a function that creates a color palette for the contour plot. Default goes from blue to white to red using the function colorRampPalette(c("blue","white","red")). A few preset options are heat.colors, topo.colors, and terrain.colors.

... arbitrary functions sent to the generic plotting function. See ?par for details on possible parameters

Examples

```r
year0<-2001
year1<-2009
qBottom<-0.33
qTop<-22
maxDiff<-0.5
eList <- Choptank_eList
plotDiffContours(eList, year0, year1)
plotDiffContours(eList, year0, year1, maxDiff=maxDiff)
plotDiffContours(eList, year0, year1, qBottom, qTop, maxDiff)

yTicksModified <- c(.1,1,10,25)
plotDiffContours(eList, year0, year1, qBottom, qTop, maxDiff,
yTicks=yTicksModified, flowDuration=FALSE)

colors <- colorRampPalette(c("blue","white","red"))
plotDiffContours(eList, year0, year1, qBottom, qTop, maxDiff,
    color.palette=colors, flowDuration=FALSE)

colors2 <- heat.colors # Some other options: topo.colors, terrain.colors, cm.colors
plotDiffContours(eList, year0, year1, qBottom, qTop, maxDiff,
    lwd=2, color.palette=colors2, flowDuration=FALSE)

plotDiffContours(eList, year0, year1, qBottom, qTop, maxDiff, cex.lab=2, flowDuration=FALSE)
par(mar=c(5,8,5,8))
plotDiffContours(eList, year0, year1, qBottom, qTop, maxDiff,
    customPar=TRUE, flowDuration=FALSE)
```

`plotFlowSingle`  Creates a plot of a time series of a particular flow statistic and a lowess smooth of that flow statistic

Description

A part of the flowHistory system. The index of the flow statistics is istat. These statistics are: (1) 1-day minimum, (2) 7-day minimum, (3) 30-day minimum, (4) median (5) mean, (6) 30-day maximum, (7) 7-day maximum, and (8) 1-day maximum

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.
**plotFlowSingle**

**Usage**

```r
plotFlowSingle(eList,  istat, yearStart = NA, yearEnd = NA, qMax = NA,
      printTitle = TRUE, tinyPlot = FALSE, customPar = FALSE,
      runoff = FALSE, qUnit = 1, printStaName = TRUE, printPA = TRUE,
      usgsStyle = FALSE, printIstat = TRUE, cex = 0.8, cex.axis = 1.1,
      cex.main = 1.1, lwd = 2, col = "black", ...)
```

**Arguments**

- **eList**: named list with at least the Daily and INFO dataframes
- **istat**: A numeric value for the flow statistic to be graphed (possible values are 1 through 8)
- **yearStart**: A numeric value for year in which the graph should start, default is NA, which indicates that the graph should start with first annual value
- **yearEnd**: A numeric value for year in which the graph should end, default is NA, which indicates that the graph should end with last annual value
- **qMax**: A numeric value for the maximum value to be used for y-axis of graph, default is NA means that graph is self-scaling
- **printTitle**: logical variable, if TRUE title is printed, if FALSE title is not printed, default is TRUE
- **tinyPlot**: logical variable, if TRUE plot is designed to be plotted small, as a part of a multipart figure, default is FALSE
- **customPar**: logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
- **runoff**: logical variable, if TRUE the streamflow data are converted to runoff values in mm/day
- **qUnit**: object of qUnit class `printqUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name.
- **printStaName**: logical variable, if TRUE station name is printed in title, if FALSE not printed, default is TRUE
- **printPA**: logical variable, if TRUE Period of Analysis information is printed in title, if FALSE not printed, default is TRUE
- **usgsStyle**: logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.
- **printIstat**: logical variable, if TRUE print the statistic name is printed in title, if FALSE not printed, default is TRUE
- **cex**: numerical value giving the amount by which plotting symbols should be magnified
- **cex.axis**: magnification to be used for axis annotation relative to the current setting of cex
- **cex.main**: magnification to be used for main titles relative to the current setting of cex
- **lwd**: number line width
plotFluxHist

Graph of annual flux and flow normalized flux versus year

Description

The annual results reported are for a specified "period of analysis" which can be an entire water year, a calendar, a season or even an individual month. The user specifies this period of analysis in the call to setupYears.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Usage

plotFluxHist(eList, yearStart = NA, yearEnd = NA, fluxUnit = 9, fluxMax = NA, printTitle = TRUE, usgsStyle = FALSE, plotFlowNorm = TRUE, plotAnnual = TRUE, tinyPlot = FALSE, col = "black", col.pred = "green", cex = 0.8, cex.axis = 1.1, cex.main = 1.1, lwd = 2, customPar = FALSE, ...)
plotFluxHist

Arguments

elist, numeric is the calendar year containing the first estimated annual value to be plotted, default is NA (which allows it to be set automatically by the data)

yearStart, numeric is the calendar year just after the last estimated annual value to be plotted, default is NA (which allows it to be set automatically by the data)

yearEnd, number representing entry in pre-defined fluxUnit class array. printFluxUnitCheatSheet

fluxMax, number specifying the maximum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data)

printTitle, logical variable if TRUE title is printed, if FALSE title is not printed (this is best for a multi-plot figure)

usgsStyle, logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.

plotFlowNorm, logical variable if TRUE the flow normalized line is plotted, if FALSE not plotted

plotAnnual, logical variable if TRUE annual flux points are plotted, if FALSE not plotted

tinyPlot, logical variable, if TRUE plot is designed to be plotted small, as a part of a multipart figure, default is FALSE

col, color of points on plot, see ?par 'Color Specification'

col.pred, color of flow normalized line on plot, see ?par 'Color Specification'

cex, numerical value giving the amount by which plotting symbols should be magnified

cex.axis, magnification to be used for axis annotation relative to the current setting of cex

cex.main, magnification to be used for main titles relative to the current setting of cex

lwd, number line width

customPar, logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.

... arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see ?par for options)

setupYears

Examples

yearStart <- 2001
yearEnd <- 2010
eList <- Choptank_elist
# Water year:
## Not run:
plotFluxHist(eList)
plotFluxPred(eList, yearStart, yearEnd, fluxUnit = 1)
plotFluxPred(eList, yearStart, yearEnd, fluxUnit = 'kgDay')

# Graphs consisting of Jun-Aug
eList <- setPA(eList, paStart=6,paLong=3)
plotFluxHist(eList)

## End(Not run)

---

**plotFluxPred**

*Graph of observed versus estimated flux*

**Description**

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata.

Although there are a lot of optional arguments to this function, most are set to a logical default.

**Usage**

```r
plotFluxPred(eList, fluxUnit = 3, fluxMax = NA, printTitle = TRUE, oneToOneLine = TRUE, customPar = FALSE, col = "black", lwd = 1, cex = 0.8, cex.axis = 1.1, cex.main = 1.1, tinyPlot = FALSE, usgsStyle = FALSE, logScale = FALSE, randomCensored = FALSE, ...)
```

**Arguments**

- **eList**: named list with at least the Sample and INFO dataframes
  - **fluxUnit**: number representing entry in pre-defined fluxUnit class array. [printFluxUnitCheatsheet](#)
  - **fluxMax**: number specifying the maximum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data)
  - **printTitle**: logical variable if TRUE title is printed, if FALSE not printed (this is best for a multi-plot figure)
  - **oneToOneLine**: inserts 1:1 line
  - **customPar**: logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
  - **col**: color of points on plot, see `?par 'Color Specification'`
  - **lwd**: number line width
  - **cex**: numerical value giving the amount by which plotting symbols should be magnified
  - **cex.axis**: magnification to be used for axis annotation relative to the current setting of cex
  - **cex.main**: magnification to be used for main titles relative to the current setting of cex
Concentration and discharge data used to compute flux come from a data frame named Sample which contains the sample data. The metadata come from a data frame named INFO.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata.

Usage

```r
plotFluxQ(eList, qUnit = 2, logScale = TRUE, fluxUnit = 3,
          tinyPlot = FALSE, fluxMax = NA, fluxMin = NA, col = "black",
          lwd = 1, printTitle = TRUE, usgsStyle = FALSE, cex = 0.8,
          cex.axis = 1.1, cex.main = 1.1, customPar = FALSE, ...)
```
Arguments

- **eList**: named list with at least the Sample and INFO dataframes.
- **qUnit**: object of qUnit class. `printqUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name.
- **logScale**: logical, default TRUE. TRUE creates a log-log scale, FALSE creates an arithmetic scale.
- **fluxUnit**: object of fluxUnit class. `printfluxUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name.
- **tinyPlot**: logical variable if TRUE plot is designed to fit into a multi-plot array, default is FALSE.
- **fluxMax**: numeric specifying the maximum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data).
- **fluxMin**: numeric specifying the minimum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data).
- **col**: color of points on plot, see `?par 'Color Specification'
- **lwd**: number line width
- **printTitle**: logical variable if TRUE title is printed, if FALSE not printed (this is best for a multi-plot figure)
- **usgsStyle**: logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.
- **cex**: numerical value giving the amount by which plotting symbols should be magnified
- **cex.axis**: magnification to be used for axis annotation relative to the current setting of cex
- **cex.main**: magnification to be used for main titles relative to the current setting of cex
- **customPar**: logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with `par(mar=c(5,5,5,5))`). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
- **...**: arbitrary graphical parameters that will be passed to `genericEGRETDotPlot` function (see `?par for options)

# Graphs consisting of Jun-Aug
eList <- setPA(eList, paStart=6,paLong=3)
plotFluxQ(eList)
```
plotFluxTimeDaily

Plot of the time series of daily flux estimates and the sample values for the days that were sampled

Description

This plot is useful for visual examination of the ability of the WRTDS, or other model, to fit the data, as seen in a time-series perspective.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Usage

plotFluxTimeDaily(eList, yearStart = NA, yearEnd = NA, 
                 tinyPlot = FALSE, fluxUnit = 3, fluxMax = NA, printTitle = TRUE, 
                 usgsStyle = FALSE, cex = 0.8, cex.axis = 1.1, cex.main = 1.1, 
                 customPar = FALSE, col = "black", lwd = 1, prettyDate = TRUE, 
                 ...) 

Arguments

eList
  named list with at least the Daily, Sample, and INFO dataframes

yearStart
  numeric specifying the starting date (expressed as decimal years, for example 1989.0) for the plot

yearEnd
  numeric specifying the ending date for the plot

tinyPlot
  logical variable, if TRUE plot is designed to be short and wide, default is FALSE.

fluxUnit
  number representing in pre-defined fluxUnit class array. printFluxUnitCheatsheet

fluxMax
  number specifying the maximum value to be used on the vertical axis, default is NA (which allows it to be set automatically by the data)

printTitle
  logical variable if TRUE title is printed, if FALSE title is not printed (this is best for a multi-plot figure)

usgsStyle
  logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.

cex
  numerical value giving the amount by which plotting symbols should be magnified

cex.axis
  magnification to be used for axis annotation relative to the current setting of cex

cex.main
  magnification to be used for main titles relative to the current setting of cex

customPar
  logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.

col
  color of points on plot, see ?par 'Color Specification'
plotFour

Description

Part of the flowHistory system. The four statistics are 1-day maximum, annual mean, annual 7-day minimum, and the running standard deviation of the log daily discharge values.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Usage

plotFour(eList, yearStart = NA, yearEnd = NA, printTitle = TRUE, runoff = FALSE, qUnit = 1, window = 15, cex = 0.8, cex.axis = 1.2, cex.main = 1.2, col = "black", lwd = 1, ...)

Arguments

eList: named list with at least Daily and INFO dataframes

yearStart: A numeric value for year in which the graph should start, default is NA, which indicates that the graph should start with first annual value

yearEnd: A numeric value for year in which the graph should end, default is NA, which indicates that the graph should end with last annual value

printTitle: logical variable, if TRUE title is printed, if FALSE title is not printed, default is TRUE
plotFourStats

runoff

logical variable, if TRUE the streamflow data are converted to runoff values in mm/day

qUnit

object of qUnit class `printUnitCheatsheet`, or numeric represented the short code, or character representing the descriptive name.

window

numeric which is the full width, in years, of the time window over which the standard deviation is computed, default = 15

cex

numerical value giving the amount by which plotting symbols should be magnified

cex.axis

magnification to be used for axis annotation relative to the current setting of cex

cex.main

magnification to be used for main titles relative to the current setting of cex

col

color of points on plot, see `?par `Color Specification'`

lwd

number line width

... arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see `?par for options`)

See Also

`plotFlowSingle`

Examples

```r
el <- Choptank_elist
## Not run:
# Water year:
plotFour(elist)
# Graphs consisting of Jun-Aug
el <- setPA(elist,paStart=6,paLong=3)
plotFour(elist)
## End(Not run)
```

plotFourStats `Makes four graphs of annual streamflow statistics on a single page`

Description

Part of the flowHistory system. The four statistics are 1-day maximum, annual mean, annual median, and annual 7-day minimum. Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Usage

```r
plotFourStats(elist, yearStart = NA, yearEnd = NA, printTitle = TRUE, 
    runoff = FALSE, cex.main = 1.2, qUnit = 1, cex.axis = 1.2, 
    cex = 0.8, col = "black", lwd = 1, ...)
```
Arguments

- **eList**: named list with at least Daily and INFO dataframes
- **yearStart**: A numeric value for year in which the graph should start, default is NA, which indicates that the graph should start with first annual value
- **yearEnd**: A numeric value for year in which the graph should end, default is NA, which indicates that the graph should end with last annual value
- **printTitle**: logical variable, if TRUE title is printed, if FALSE title is not printed, default is TRUE
- **runoff**: logical variable, if TRUE the streamflow data are converted to runoff values in mm/day
- **cex.main**: magnification to be used for main titles relative to the current setting of cex
- **qUnit**: object of qUnit class `printqUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name.
- **cex.axis**: magnification to be used for axis annotation relative to the current setting of cex
- **cex**: numerical value giving the amount by which plotting symbols should be magnified
- **col**: color of points on plot, see `?par 'Color Specification'
- **lwd**: number line width
- **...**: arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see `?par for options`

See Also

- `plotFlowSingle`

Examples

```r
eList <- Choptank_eList
## Not run:
# Water year:
plotFourStats(eList)
# Graphs consisting of Jun-Aug
eList <- setPA(eList,paStart=6,paLong=3)
plotFourStats(eList)
## End(Not run)
```
Description

Part of flowHistory component. Allows discharge record to only show those discharges above a given threshold.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Usage

plotQTimeDaily(eList, yearStart = NA, yearEnd = NA, qLower = NA, qUnit = 1, logScale = FALSE, tinyPlot = FALSE, printTitle = TRUE, usgsStyle = FALSE, lwd = 3, col = "red", cex.main = 1.2, cex.lab = 1.2, customPar = FALSE, prettyDate = TRUE, ...)

Arguments

eList named list with at least the Daily and INFO dataframes
yearStart numeric indicating the starting year for the graph
yearEnd numeric indicating the ending year for the graph (should be a time in decimal years that is after the last observations to be plotted)
qLower numeric specifying the lower bound on discharges that are to be plotted, must be in the units specified by qUnit, default is NA (lower bound is zero)
qUnit object of qUnit class. printqUnitCheatsheet, or numeric represented the short code, or character representing the descriptive name. Default is qUnit=1 (cubic feet per second)
logScale logical whether or not to use a log scale in the y axis. Default is FALSE.
tinyPlot logical variable, if TRUE plot is designed to be short and wide, default is FALSE.
printTitle logical variable if TRUE title is printed, if FALSE title is not printed (this is best for a multi-plot figure)
usgsStyle logical option to use USGS style guidelines. Setting this option to TRUE does NOT guarantee USGS compliance. It will only change automatically generated labels.
lwd line width, a positive number, defaulting to 1
col specification for the default plotting color
cex.main magnification to be used for main titles relative to the current setting of cex
cex.lab magnification to be used for x and y labels relative to the current setting of cex
customPar logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
plotResidPred

plotResidPred(eList, stdResid = FALSE, tinyPlot = FALSE, 
printTitle = TRUE, col = "black", lwd = 1, cex = 0.8, cex.axis = 1.1, cex.main = 1.1, customPar = FALSE, 
randomCensored = FALSE, ...)

Arguments

- **eList** named list with at least the Sample and INFO dataframes
- **stdResid** logical variable, if TRUE it uses the standardized residual, if FALSE it uses the actual, default is FALSE
plotResidQ

```r
plotResidQ

Description

This function produces a plot of the residuals from WRTDS, expressed in natural log concentration units versus the discharge shown on a log scale. The function also provides an alternative for viewing the standardized residuals, where the each residual is divided by its estimated standard error.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata.

```
Usage

plotResidQ(elist, qUnit = 2, tinyPlot = FALSE, stdResid = FALSE,
printTitle = TRUE, col = "black", lwd = 1, cex = 0.8,
cex.axis = 1.1, cex.main = 1.1, rmSciX = FALSE,
customPar = FALSE, randomCensored = FALSE, usgsStyle = FALSE, ...)

Arguments

elist named list with at least the Sample and INFO dataframes
qUnit object of qUnit class printqUnitCheatSheet, or numeric represented the short
code, or character representing the descriptive name.
tinyPlot logical variable, if TRUE plot is designed to be plotted small as part of a multi-
part figure, default is FALSE.
stdResid logical variable, if TRUE it uses the standardized residual, if FALSE it uses the
actual, default is FALSE
printTitle logical variable if TRUE title is printed, if FALSE not printed (this is best for a
multi-plot figure)
col color of points on plot, see ?par 'Color Specification'
lwd number line width
cex numerical value giving the amount by which plotting symbols should be magni-
fied
cex.axis magnification to be used for axis annotation relative to the current setting of cex
cex.main magnification to be used for main titles relative to the current setting of cex
rmSciX logical defaults to FALSE, changes x label from scientific to fixed
customPar logical defaults to FALSE. If TRUE, par() should be set by user before call-
ing this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If
customPar FALSE, EGRET chooses the best margins depending on tinyPlot.
randomCensored logical. Show censored residuals as randomized.
usgsStyle logical option to use USGS style guidelines. Setting this option to TRUE does
NOT guarantee USGS compliance. It will only change automatically generated
labels.
... arbitrary graphical parameters that will be passed to genericEGRETDotPlot func-
tion (see ?par for options)

Examples

eList <- Choptank_elist
# Water year:
plotResidQ(eList)
# Graphs consisting of Jun-Aug
eList <- setPA(eList, paStart=6,paLong=3)
plotResidQ(eList)
**plotResidTime**  

*Plot of the residuals from WRTDS (in log concentration units) versus time*

**Description**

This function produces a plot of the residuals from WRTDS, expressed in natural log concentration units versus time. It also provides an alternative for viewing the standardized residuals, where the each residual is divided by its estimated standard error.

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Sample dataframe with the sample data, and an INFO dataframe with metadata.

**Usage**

```r
plotResidTime(elist, stdResid = FALSE, printTitle = TRUE,
               hLine = TRUE, tinyPlot = FALSE, col = "black", lwd = 1,
               cex = 0.8, cex.axis = 1.1, cex.main = 1.1, customPar = FALSE,
               randomCensored = FALSE, ...)
```

**Arguments**

- **elist**
  - named list with at least the Sample and INFO dataframes

- **stdResid**
  - logical variable, if TRUE it uses the standardized residual, if FALSE it uses the actual, default is FALSE

- **printTitle**
  - logical variable if TRUE title is printed, if FALSE not printed (this is best for a multi-plot figure)

- **hLine**
  - inserts horizontal line at zero

- **tinyPlot**
  - logical variable, if TRUE plot is designed to be plotted small, as a part of a multipart figure, default is FALSE

- **col**
  - color of points on plot, see ?par 'Color Specification'

- **lwd**
  - number line width

- **cex**
  - numerical value giving the amount by which plotting symbols should be magnified

- **cex.axis**
  - magnification to be used for axis annotation relative to the current setting of cex

- **cex.main**
  - magnification to be used for main titles relative to the current setting of cex

- **customPar**
  - logical defaults to FALSE. If TRUE, par() should be set by user before calling this function (for example, adjusting margins with par(mar=c(5,5,5,5))). If customPar FALSE, EGRET chooses the best margins depending on tinyPlot.

- **randomCensored**
  - logical. Show censored residuals as randomized.

- **...**
  - arbitrary graphical parameters that will be passed to genericEGRETDotPlot function (see ?par for options)
Graph of the standard deviation of the log of daily discharge versus year

Although there are a lot of optional arguments to this function, most are set to a logical default.

Data come from named list, which contains a Daily dataframe with the daily flow data, and an INFO dataframe with metadata.

Usage

```r
plotSDLogQ(eList, yearStart = NA, yearEnd = NA, window = 15,
            sdMax = NA, printTitle = TRUE, tinyPlot = FALSE,
            printStaName = TRUE, printPA = TRUE, cex = 0.8, cex.main = 1.1,
            cex.axis = 1.1, lwd = 2, customPar = FALSE, ...)
```

Arguments

- **eList**: named list with at least the Daily and INFO dataframes
- **yearStart**: numeric is the calendar year of the first value to be included in graph, default is NA, which plots from the start of the period of record
- **yearEnd**: numeric is the calendar year of the last value to be included in graph, default is NA, which plots to the end of the period of record
- **window**: numeric which is the full width, in years, of the time window over which the standard deviation is computed, default = 15
- **sdMax**: numeric is the maximum value to be used on the vertical axis of the graph, default is NA (which allows it to be set automatically by the data)
- **printTitle**: logical variable if TRUE title is printed, if FALSE title is not printed (this is best for a multi-plot figure), default is TRUE
- **tinyPlot**: logical variable if TRUE plot is designed to be small, if FALSE it is designed for page size, default is FALSE (not fully implemented yet)
populateConcentrations

Populate Concentration Columns

Description

Creates ConcLow, ConcHigh, Uncen (0 if censored, 1 if uncensored) columns for Sample data frame for WRTDS analysis.

Usage

populateConcentrations(rawData)
Arguments

rawData vector with value and code columns

Value

collectionColumns dataframe

Examples

code <- c("","","")
value <- c(1,2,3)
dataInput <- data.frame(value, code, stringsAsFactors=FALSE)
concentrationDF <- populateConcentrations(dataInput)

Description

Using raw data that has at least dateTime, value, code, populates the rest of the basic Daily data frame used in EGRET analysis.

Usage

populateDaily(rawData, qConvert, verbose = TRUE, interactive = NULL)

Arguments

rawData dataframe contains at least dateTime, value, code columns
qConvert character conversion to cubic meters per second
verbose logical specifying whether or not to display progress message
interactive logical deprecated. Use ‘verbose’ instead If true, there is user interaction for error handling and data checks.

Value

A data frame 'Daily' with the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q</td>
<td>numeric</td>
<td>Discharge in m^3/s</td>
</tr>
<tr>
<td>Julian</td>
<td>integer</td>
<td>Number of days since Jan. 1, 1850</td>
</tr>
<tr>
<td>Month</td>
<td>integer</td>
<td>Month of the year [1-12]</td>
</tr>
<tr>
<td>Day</td>
<td>integer</td>
<td>Day of the year [1-366]</td>
</tr>
<tr>
<td>DecYear</td>
<td>numeric</td>
<td>Decimal year</td>
</tr>
<tr>
<td>MonthSeq</td>
<td>integer</td>
<td>Number of months since January 1, 1850</td>
</tr>
<tr>
<td>Qualifier</td>
<td>character</td>
<td>Qualifying code</td>
</tr>
<tr>
<td>i</td>
<td>integer</td>
<td>Index of days, starting with 1</td>
</tr>
</tbody>
</table>
populateDateColumns

<table>
<thead>
<tr>
<th>LogQ</th>
<th>numeric</th>
<th>Natural logarithm of Q</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q7</td>
<td>numeric</td>
<td>7 day running average of Q</td>
</tr>
<tr>
<td>Q30</td>
<td>numeric</td>
<td>30 day running average of Q</td>
</tr>
</tbody>
</table>

readNWISDaily, readUserDaily

Examples

datetime <- as.character(seq(as.Date("2001/1/1"),
as.Date("2001/12/31"), by = "day"))
value <- 1:365
code <- rep("",365)
dataInput <- data.frame(dateTime, value, code, stringsAsFactors=FALSE)
Daily <- populateDaily(dataInput, 2)

Description

Creates various date columns for WRTDS study.

Usage

populateDateColumns(rawData)
decimalDate(rawData)

Arguments

rawData vector with dateTime

Value

DataFrame dataframe

Examples

datetime <- c("1984-02-28 13:56", "1984-03-01 00:00", "1986-03-01 00:00","1986-10-15 00:00")
expandedDateDF <- populateDateColumns(dateTime)
expandedDateDF <- populateDateColumns(dateTime)
datetime <- c("1984-02-28 13:56", "1984-03-01 00:00", "1986-03-01 00:00","1986-10-15 00:00")
decimalDate(dateTime)
**populateParameterINFO**  
*Populate Parameter Information Columns*

**Description**

Populates INFO data frame with additional user-supplied information concerning the measured parameter.

**Usage**

```r
callpopulateParameterINFO(parameterCd, INFO, interactive = TRUE)
```

**Arguments**

- `parameterCd`: character USGS parameter code
- `INFO`: dataframe with value and code columns. Default is INFO
- `interactive`: logical. Option for interactive mode. If TRUE, there is user interaction for error handling and data checks. Default is TRUE. If running in batch, should be set to FALSE.

**Value**

INFO dataframe

**Examples**

```r
# Not run:
library(dataRetrieval)
INFO <- readNWISsite('01594440')
parameterCd <- '01075'
parameterData <- readNWISpCode(parameterCd)
INFO$param_nm <- parameterData$parameter_nm
INFO$param_units <- parameterData$parameter_units
INFO$paramShortName <- parameterData$srsname
INFO$paramNumber <- parameterData$parameter_cd

INFO <- populateParameterINFO(parameterCd, INFO)

# End(Not run)
```
**populateSampleColumns**  
*Populate Sample Columns*

**Description**

Creates ConcAve and ConcLow based on Uncen. Removes any samples with NA values in ConcHigh.

**Usage**

```r
populateSampleColumns(rawData)
```

**Arguments**

- `rawData`: dataframe with dateTime, ConcLow, ConcHigh, Uncen

**Value**

Sample dataframe with columns: Date, ConcLow, ConcHigh, Uncen, ConcAve, Julian, Month, Day, DecYear, MonthSeq, waterYear, SinDY, and CosDY (DY = decimal year)

**Examples**

```r
dateTime <- c('1985-01-01', '1985-01-02', '1985-01-03')
ConcLow <- c(1,2,0)
ConcHigh <- c(1,2,3)
Uncen <- c(1,1,0)
dataInput <- data.frame(dateTime, ConcLow, ConcHigh, Uncen, stringsAsFactors=FALSE)
Sample <- populateSampleColumns(dataInput)
```

---

**populateSiteINFO**  
*Populate Site Information Columns*

**Description**

Populates INFO data frame with additional user-supplied information. Also removes fields not related to WRTDS study.

**Usage**

```r
populateSiteINFO(INFO, siteNumber, interactive = TRUE)
```

**Arguments**

- `INFO`: dataframe with value and code columns
- `siteNumber`: character USGS site number
- `interactive`: logical Option for interactive mode. If TRUE, there is user interaction for error handling and data checks. Default is TRUE. If running in batch, should be set to FALSE.
Value

INFO dataframe

Examples

```r
## Not run:
library(dataRetrieval)
INFO <- readNWISsite('01594440')
siteNumber <- "01594440"
siteINFO <- populateSiteINFO(INFO, siteNumber)

## End(Not run)
```

print.egret  

**EGRET helper functions**

Description

A small collection of helper functions

Usage

```r
## S3 method for class 'egret'
print(x, ...)

## S3 method for class 'egret'
plot(x, ...)

nDischarge(x)

nObservations(x)

nCensoredVals(x)
```

Arguments

- `x`  
  EGRET object

- `...`  
  additional parameters

See Also

- `multiPlotDataOverview`
Examples

print(Arkansas_elist)
plot(choptank_elist)
plot(choptank_elist, cex.main=0.7)
ndischarge(Arkansas_elist)
nobservations(Arkansas_elist)
censoredvals(Arkansas_elist)

printFluxUnitCheatSheet
Reminder to user of flux unit properties (such as kg/day, tons/year, etc).

Description

Cheat sheet to print out pre-defined flux unit properties from fluxUnit class. Flux units included:

<table>
<thead>
<tr>
<th>Number</th>
<th>ObjectName</th>
<th>shortName</th>
<th>unitFactor</th>
<th>unitName</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>POUNDS_DAY</td>

<td>mm per year</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

`printqUnitCheatSheet()`

**Examples**

`printqUnitCheatSheet()`

**printSeries**

*Print annual results for a given streamflow statistic*

**Description**

Part of the flowHistory system. The index of the flow statistics is istat. These statistics are: (1) 1-day minimum, (2) 7-day minimum, (3) 30-day minimum, (4) median (5) mean, (6) 30-day maximum, (7) 7-day maximum, and (8) 1-day maximum.

**Usage**

`printSeries(eList, istat, qUnit = 1, runoff = FALSE)`

**Arguments**

- `eList` named list with at least the Daily and INFO dataframes
- `istat` A numeric value for the flow statistic to be graphed (possible values are 1 through 8)
- `qUnit` object of qUnit class `printqUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name. Default is 1, which is cubic feet per second.
- `runoff` logical variable, if TRUE the streamflow data are converted to runoff values in mm/day

**Value**

data frame with:
processQWData

### Description

Processes water quality data. This function looks at detection limit and detection conditions to determine if a value is left censored or not. Censored values are given the qualifier "<". The dataframe is also converted from a long to wide format.

### Usage

```r
processQWData(data, pCode = TRUE)
```

### Arguments

- `data`: dataframe from Water Quality Portal
- `pCode`: logical if TRUE, assume data came from a pCode search, if FALSE, characteristic name.

### Value

Data dataframe with first column `dateTime`, and at least one qualifier and value columns (subsequent qualifier/value columns could follow depending on the number of parameter codes).

### See Also

- `readWQPqw`

### Examples

```r
## Not run:
library(dataRetrieval)

rawWQP <- readWQPqw('21FLECQ_WQX-IMPRGR80', 'Phosphorus', ' ', '')
Sample2 <- processQWData(rawWQP, pCode=FALSE)

## End(Not run)
```
qUnit-class  

Description

Some details about the qUnit class

Details

qshortName  A character specifying the short name.
qUnitFactor  A numeric representing the conversion factor
qUnitName  A character specifying the full name.
qUnitExpress  An expression specifying the full name.
unitUSGS  A character specifying flux with full text.
qUnitTiny  An expression specifying the abbreviated name.
shortCode  A number for quick lookup

readDataFromFile  

Basic Data Import for Water Flow Data

Description

Imports data from user-supplied data file. Specifically used to import water flow data for use in the EGRET package. For EGRET usage, the first column is expected to be dates. If the data is daily data, then next column is expected to be the measured values. If the data is sampled data, the next column is remark codes, and the third column is values.

Usage

readDataFromFile(filePath, fileName, hasHeader = TRUE, separator = "", )

Arguments

filePath  character specifying the path to the file
fileName  character name of file to open
hasHeader  logical true if the first row of data is the column headers
separator  character character that separates data cells

Value

retval dataframe with dateTime, value, and code columns
Examples

```r
filePath <- system.file("extdata", package="EGRET")
fileName <- 'ChoptankRiverFlow.txt'
ChopData <- readDataFromFile(filePath, fileName, separator="\t")
```

Description

Imports daily data from NWIS web service. This function gets the data from here: https://waterservices.usgs.gov/

Usage

```r
readNWISDaily(sitenumber, parameterCd = "00060", startDate = ",",
              endDate = ",", verbose = TRUE, interactive = NULL, convert = TRUE)
```

Arguments

- `sitenumber`: character USGS site number. This is usually an 8 digit number.
- `parameterCd`: character USGS parameter code. This is usually an 5 digit number.
- `startDate`: character starting date for data retrieval in the form YYYY-MM-DD.
- `endDate`: character ending date for data retrieval in the form YYYY-MM-DD.
- `verbose`: logical specifying whether or not to display progress message
- `interactive`: logical deprecated. Use ‘verbose’ instead
- `convert`: logical Option to include a conversion from cfs to cms (35.314667). The default is TRUE, which is appropriate for using NWIS data in the EGRET package. Set this to FALSE to not include the conversion. If the parameter code is not 00060 (NWIS discharge), there is no conversion applied.

Value

A data frame 'Daily' with the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q</td>
<td>numeric</td>
<td>Discharge in m^3/s</td>
</tr>
<tr>
<td>Julian</td>
<td>integer</td>
<td>Number of days since Jan. 1, 1850</td>
</tr>
<tr>
<td>Month</td>
<td>integer</td>
<td>Month of the year [1-12]</td>
</tr>
<tr>
<td>Day</td>
<td>integer</td>
<td>Day of the year [1-366]</td>
</tr>
<tr>
<td>DecYear</td>
<td>numeric</td>
<td>Decimal year</td>
</tr>
<tr>
<td>MonthSeq</td>
<td>integer</td>
<td>Number of months since January 1, 1850</td>
</tr>
<tr>
<td>Qualifier</td>
<td>character</td>
<td>Qualifying code</td>
</tr>
<tr>
<td>i</td>
<td>integer</td>
<td>Index of days, starting with 1</td>
</tr>
</tbody>
</table>
readNWISSample

LogQ numeric Natural logarithm of Q
Q7 numeric 7 day running average of Q
Q30 numeric 30 day running average of Q

See Also
    readNWISdv, populateDaily

Examples
    ## Not run:
    Daily <- readNWISDaily('01594440', '00060', '1985-01-01', '1985-03-31')

readNWISSample  Import NWIS Sample Data for EGRET analysis

Description
    Imports data from NWIS web service. A list of parameter and statistic codes can be found here: https://help.waterdata.usgs.gov/codes-and-parameters For raw data, use readNWISqw from the dataRetrieval package. This function will retrieve the raw data, and compress it (summing constituents). See section 3.2.4 of the vignette for more details.

Usage
    readNWISSample(siteNumber, parameterCd, startDate = "", endDate = "", verbose = TRUE, interactive = NULL)

Arguments
    siteNumber character USGS site number. This is usually an 8 digit number
    parameterCd character USGS parameter code. This is usually an 5 digit number.
    startDate character starting date for data retrieval in the form YYYY-MM-DD.
    endDate character ending date for data retrieval in the form YYYY-MM-DD.
    verbose logical specifying whether or not to display progress message
    interactive logical deprecated. Use 'verbose' instead
**Value**

A data frame 'Sample' with the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Date</td>
<td>Date</td>
</tr>
<tr>
<td>ConcLow</td>
<td>numeric</td>
<td>Lower limit of concentration</td>
</tr>
<tr>
<td>ConcHigh</td>
<td>numeric</td>
<td>Upper limit of concentration</td>
</tr>
<tr>
<td>Uncen</td>
<td>integer</td>
<td>Uncensored data (1=TRUE, 0=FALSE)</td>
</tr>
<tr>
<td>ConcAve</td>
<td>numeric</td>
<td>Average concentration</td>
</tr>
<tr>
<td>Julian</td>
<td>integer</td>
<td>Number of days since Jan. 1, 1850</td>
</tr>
<tr>
<td>Month</td>
<td>integer</td>
<td>Month of the year [1-12]</td>
</tr>
<tr>
<td>Day</td>
<td>integer</td>
<td>Day of the year [1-366]</td>
</tr>
<tr>
<td>DecYear</td>
<td>numeric</td>
<td>Decimal year</td>
</tr>

```r
## Not run:
# These examples require an internet connection to run

Sample_01075 <- readNWISSample('01594440','01075', '1985-01-01', '1985-03-31')

## End(Not run)
```

---

**readUserDaily**

*Import user daily data for EGRET analysis*

**Description**

Imports data from a user-supplied file, and converts it to a Daily data frame, appropriate for WRTDS calculations.

**Usage**

```r
readUserDaily(filePath, fileName, hasHeader = TRUE, separator = ",", qUnit = 1, verbose = TRUE, interactive = NULL)
```
Arguments

- **filePath**: character specifying the path to the file
- **fileName**: character name of file to open
- **hasHeader**: logical true if the first row of data is the column headers
- **separator**: character character that separates data cells
- **qUnit**: number 1 is cubic feet per second, 2 is cubic meters per second, 3 is $10^3$ cubic feet per second, and 4 is $10^3$ cubic meters per second
- **verbose**: logical specifying whether or not to display progress message
- **interactive**: logical deprecated. Use 'verbose' instead

Value

A data frame 'Daily' with the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Date</td>
<td>Date</td>
</tr>
<tr>
<td>Q</td>
<td>numeric</td>
<td>Discharge in $m^3/s$</td>
</tr>
<tr>
<td>Julian</td>
<td>integer</td>
<td>Number of days since Jan. 1, 1850</td>
</tr>
<tr>
<td>Month</td>
<td>integer</td>
<td>Month of the year [1-12]</td>
</tr>
<tr>
<td>Day</td>
<td>integer</td>
<td>Day of the year [1-366]</td>
</tr>
<tr>
<td>DecYear</td>
<td>numeric</td>
<td>Decimal year</td>
</tr>
<tr>
<td>MonthSeq</td>
<td>integer</td>
<td>Number of months since January 1, 1850</td>
</tr>
<tr>
<td>Qualifier</td>
<td>character</td>
<td>Qualifying code</td>
</tr>
<tr>
<td>i</td>
<td>integer</td>
<td>Index of days, starting with 1</td>
</tr>
<tr>
<td>LogQ</td>
<td>numeric</td>
<td>Natural logarithm of Q</td>
</tr>
<tr>
<td>Q7</td>
<td>numeric</td>
<td>7 day running average of $Q$</td>
</tr>
<tr>
<td>Q30</td>
<td>numeric</td>
<td>30 day running average of $Q$</td>
</tr>
</tbody>
</table>

Examples

```r
filePath <- system.file("extdata", package="EGRET")
fileName <- "ChoptankRiverFlow.txt"
Daily <- readUserDaily(filePath, fileName, separator="\t")
```

Description

Imports data from a user-supplied file, and converts it to a Sample data frame (including summing multiple constituents), appropriate for EGRET analysis. First column is date, second is remark code, and third is value. If multiple constituents are to be combined with interval censoring, additional columns can be inserted, each starting with remark code (specifically looking for <), and values.
Usage

readUserSample(filePath, fileName, hasHeader = TRUE, separator = ",", verbose = TRUE, interactive = NULL)

Arguments

filePath character specifying the path to the file
fileName character name of file to open
hasHeader logical true if the first row of data is the column headers
separator character character that separates data cells. , default is "," which is separator used in a .csv file.
verbose logical specifying whether or not to display progress message
interactive logical deprecated. Use 'verbose' instead

Value

A data frame 'Sample' with the following columns:

Name    Type    Description
Date    Date    Date
ConcLow numeric Lower limit of concentration
ConcHigh numeric Upper limit of concentration
Uncen   integer Uncensored data (1=TRUE, 0=FALSE)
ConcAve  numeric Average concentration
Julian   integer Number of days since Jan. 1, 1850
Month   integer Month of the year [1-12]
Day     integer Day of the year [1-366]
DecYear numeric Decimal year
MonthSeq integer Number of months since January 1, 1850
SinDY   numeric Sine of the DecYear
CosDY   numeric Cosine of the DecYear

See Also

compressData, populateSampleColumns

Examples

filePath <- system.file("extdata", package="EGRET")
fileName <- 'ChoptankRiverNitrate.csv'
Sample <- readUserSample(filePath,fileName, separator=";",verbose=FALSE)
Description

Imports data from the Water Quality Portal, so it could be STORET, USGS, or USDA data. This function gets the data from: https://www.waterqualitydata.us For raw data, use readWQPdata. This function will retrieve the raw data, and compress it (summing constituents). See chapter 7 of the EGRET user guide for more details, then converts it to the Sample data frame structure.

Usage

readWQP Sample(siteNumber, characteristicName, startDate, endDate, verbose = TRUE, interactive = NULL)

Arguments

siteNumber character site number. If USGS, it should be in the form: 'USGS-XXXXXXXXX...' characteristicName character startDate character starting date for data retrieval in the form YYYY-MM-DD. endDate character ending date for data retrieval in the form YYYY-MM-DD. verbose logical specifying whether or not to display progress message interactive logical deprecated. Use 'verbose' instead

Value

A data frame 'Sample' with the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Date</td>
<td>Date</td>
</tr>
<tr>
<td>ConcLow</td>
<td>numeric</td>
<td>Lower limit of concentration</td>
</tr>
<tr>
<td>ConcHigh</td>
<td>numeric</td>
<td>Upper limit of concentration</td>
</tr>
<tr>
<td>Uncen</td>
<td>integer</td>
<td>Uncensored data (1=TRUE, 0=FALSE)</td>
</tr>
<tr>
<td>ConcAve</td>
<td>numeric</td>
<td>Average concentration</td>
</tr>
<tr>
<td>Julian</td>
<td>integer</td>
<td>Number of days since Jan. 1, 1850</td>

runGroups

## End(Not run)

removeDuplicates Remove duplicates values from Sample data frame.

### Description

Removes observations from the data frame Sample when the observation has the identical date and value as another observation.

### Usage

```r
removeDuplicates(Sample)
```

### Arguments

- **Sample**: dataframe with at least DecYear and ConcHigh, default name is Sample.

### Value

A data frame `Sample` with the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Date</td>
<td>Date</td>
</tr>
<tr>
<td>ConcLow</td>
<td>numeric</td>
<td>Lower limit of concentration</td>
</tr>
<tr>
<td>ConcHigh</td>
<td>numeric</td>
<td>Upper limit of concentration</td>
</tr>
<tr>
<td>Uncen</td>
<td>integer</td>
<td>Uncensored data (1=TRUE, 0=FALSE)</td>
</tr>
<tr>
<td>ConcAve</td>
<td>numeric</td>
<td>Average concentration</td>
</tr>
<tr>
<td>Julian</td>
<td>integer</td>
<td>Number of days since Jan. 1, 1850</td>
</tr>
<tr>
<td>Month</td>
<td>integer</td>
<td>Month of the year [1-12]</td>
</tr>
<tr>
<td>Day</td>
<td>integer</td>
<td>Day of the year [1-366]</td>
</tr>
<tr>
<td>DecYear</td>
<td>numeric</td>
<td>Decimal year</td>
</tr>
<tr>
<td>MonthSeq</td>
<td>integer</td>
<td>Number of months since January 1, 1850</td>
</tr>
<tr>
<td>SinDY</td>
<td>numeric</td>
<td>Sine of the DecYear</td>
</tr>
<tr>
<td>CosDY</td>
<td>numeric</td>
<td>Cosine of the DecYear</td>
</tr>
</tbody>
</table>

### Examples

```r
ConcHigh <- c(1,2,3,3,5)
dataInput <- data.frame(DecYear, ConcHigh, stringsAsFactors=FALSE)
Sample <- removeDuplicates(dataInput)
```

runGroups Runs a comparison of any group of years in the record.
runGroups provides comparisons of results, in terms of flow-normalized concentration and flow-normalized flux for any groups of years of years in the water quality record. Comparison could involve the use of the "wall" and/or use of "generalized flow normalization". These two concepts are described in detail in the vignette.

Usage

runGroups(eList, windowSide, group1firstYear, group1lastYear, group2firstYear, group2lastYear, surfaceStart = NA, surfaceEnd = NA, flowBreak = FALSE, Q1EndDate = NA, QStartDate = NA, QEndDate = NA, wall = FALSE, oldSurface = FALSE, fractMin = 0.75, sample1EndDate = NA, sampleStartDate = NA, sampleEndDate = NA, paStart = 10, paLong = 12, minNumObs = 100, minNumUncen = 50, windowY = 7, windowQ = 2, windowS = 0.5, edgeAdjust = TRUE, verbose = TRUE)

Arguments

eList named list with at least the Daily, Sample, and INFO dataframes
windowSide integer. The width of the flow normalization window on each side of the year being estimated. A common value is 7, but no default is specified. If stationary flow normalization is to be used, then windowSide = 0 (this means that flow-normalization period for all years is the same).
group1firstYear integer year. Starting year of first group.
group1lastYear integer year. Ending year of first group.
group2firstYear integer year. Starting year of second group.
group2lastYear integer year. Ending year of second group.
surfaceStart The Date (or character in YYYY-MM-DD) that is the start of the WRTDS model to be estimated and the first of the daily outputs to be generated. Default is NA, which means that the surfaceStart is based on the date of the first sample.
surfaceEnd The Date (or character in YYYY-MM-DD) that is the end of the WRTDS model to be estimated and the last of the daily outputs to be generated. Default is NA, which means that the surfaceEnd is based on the date of the last sample.
flowBreak logical. Is there an abrupt break in the discharge record, default is FALSE.
Q1EndDate The Date (as character in YYYY-MM-DD) which is the last day, just before the flowBreak.
QStartDate The first Date (as character in YYYY-MM-DD) used in the flow normalization method. Default is NA, which makes the QStartDate become the first Date in eList$Daily.
QEndDate The last Date (as character in YYYY-MM-DD) used in the flow normalization method. Default is NA, which makes the QEndDate become the last Date in eList$Daily.
wall logical. Whether there is an abrupt break in the concentration versus discharge relationship. Default is FALSE.

oldSurface logical specifying whether to use the original surface, or create a new one. Default is FALSE.

fractMin numeric specifying the minimum fraction of the observations required to run the weighted regression, default is 0.75. The minimum number will be the maximum of minNumObs and fractMin multiplied by total number of observations.

sample1EndDate The Date (as character in YYYY-MM-DD) of the last date just before the wall. Default = NA. A date must be specified if wall = TRUE.

sampleStartDate The Date (as character in YYYY-MM-DD) of the first sample to be used. Default is NA which sets it to the first Date in eList$Sample.

sampleEndDate The Date (as character in YYYY-MM-DD) of the last sample to be used. Default is NA which sets it to the last Date in eList$Sample.

paStart numeric integer specifying the starting month for the period of analysis, 1<=paStart<=12, default is 10 (used when period is water year).

paLong numeric integer specifying the length of the period of analysis, in months, 1<=paLong<=12, default is 12.

minNumObs numeric specifying the minimum number of observations required to run the weighted regression, default is 100

minNumUncen numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50

windowY numeric specifying the half-window width in the time dimension, in units of years, default is 7

windowQ numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2

windowS numeric specifying the half-window with in the seasonal dimension, in units of years, default is 0.5

edgeAdjust logical specifying whether to use the modified method for calculating the windows at the edge of the record. The edgeAdjust method tends to reduce curvature near the start and end of record. Default is TRUE.

verbose logical specifying whether or not to display progress message

Value
data frame with the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Change</td>
<td>The difference between the results for year2 - year1</td>
</tr>
<tr>
<td>CQTC</td>
<td>this number is the difference between between the two years, but only the part that is due to the change in the CQR</td>
</tr>
<tr>
<td>QTC</td>
<td>The difference between the two years, but only the part that is due to the change in the QD. It is the Total Change - CQTC - x10 - x20 + x10. In the results reported above as, “Concentration v. Q Trend Component” it is computed as 100 * (x22 - x11 - x20 + x10) / x11.</td>
</tr>
<tr>
<td>x10</td>
<td>The results using the concentration versus discharge relationship (CQR) for year 1, but using the discharge data specified by the user for year 1.</td>
</tr>
<tr>
<td>x11</td>
<td>The results using the CQR for year 1, but using the QD specified by the user for year 1.</td>
</tr>
<tr>
<td>x20</td>
<td>The results using the CQR for year 2, but using the QD for the entire period.</td>
</tr>
<tr>
<td>x22</td>
<td>The results for the CQR for year 2, but using the QD specified by the user for year 2.</td>
</tr>
</tbody>
</table>
Examples

eList <- Choptank_eList
## Not run:

# Option 1: Use all years for group flow normalization.
groupOut_1 <- runGroups(eList, windowSide = 0,

                         Q1EndDate = "1990-09-30")

# Option 4: Flow normalization is based on splitting the flow record at 1990-09-30
# but before the break uses a 15 year window of years before the break
# after the break uses a 15 year window of years after the break

groupOut_4 <- runGroups(eList, windowSide = 7,
                         group1firstYear = 1980, group1lastYear = 1990,
                         group2firstYear = 1995, group2lastYear = 2005,
                         flowBreak = TRUE,
                         Q1EndDate = "1990-09-30")

## End(Not run)

runPairs  

Runs a comparison of any two years in the record.

Description

runPairs provides comparisons of results, in terms of flow-normalized concentration and flow-normalized flux for any pair of years in the water quality record. Comparison could involve the use of the "wall" and/or use of "generalized flow normalization". These two concepts are described in detail in the vignette.
runPairs

Usage

runPairs(eList, year1, year2, windowSide, flowBreak = FALSE,
QEndDate = NA, QStartDate = NA, QEndDate = NA, wall = FALSE,
oldSurface = FALSE, sample1EndDate = NA, sampleStartDate = NA,
sampleEndDate = NA, paStart = 10, paLong = 12, minNumObs = 100,
minNumUncen = 50, fractMin = 0.75, windowY = 7, windowQ = 2,
windowS = 0.5, edgeAdjust = TRUE)

Arguments

eList named list with at least the Daily, Sample, and INFO dataframes
yearQ integer the ending year of the first year in the pair
yearR integer the ending year of the second year in the pair
windowSide integer. The width of the flow normalization window on each side of the year being estimated. A common value is 7, but no default is specified. If stationary flow normalization is to be used, then windowSide = 0 (this means that flow-normalization period for all years is the same).
flowBreak logical. Is there an abrupt break in the discharge record, default is FALSE.
QEndDate The Date (as character in YYYY-MM-DD) which is the last day, just before the flowBreak.
QStartDate The first Date (as character in YYYY-MM-DD) used in the flow normalization method. Default is NA, which makes the QStartDate become the first Date in eList$Daily.
QEndDate The last Date (as character in YYYY-MM-DD) used in the flow normalization method. Default is NA, which makes the QEndDate become the last Date in eList$Daily.
wall logical. Whether there is an abrupt break in the concentration versus discharge relationship. Default is FALSE.
oldSurface logical specifying whether to use the original surface, or create a new one. Default is FALSE.
sample1EndDate The Date (as character in YYYY-MM-DD) of the last date just before the wall. Default = NA. A date must be specified if wall = TRUE.
sampleStartDate The Date (as character in YYYY-MM-DD) of the first sample to be used. Default is NA which sets it to the first Date in eList$Sample.
sampleEndDate The Date (as character in YYYY-MM-DD) of the last sample to be used. Default is NA which sets it to the last Date in eList$Sample.
paStart numeric integer specifying the starting month for the period of analysis, 1<=paStart<=12, default is 10 (used when period is water year).
paLong numeric integer specifying the length of the period of analysis, in months, 1<=paLong<=12, default is 12.
minNumObs numeric specifying the minimum number of observations required to run the weighted regression, default is 100.
runPairs

**minNumUncen** numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50

**fractMin** numeric specifying the minimum fraction of the observations required to run the weighted regression, default is 0.75. The minimum number will be the maximum of minNumObs and fractMin multiplied by total number of observations.

**windowY** numeric specifying the half-window width in the time dimension, in units of years, default is 7

**windowQ** numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2

**windowS** numeric specifying the half-window width in the seasonal dimension, in units of years, default is 0.5

**edgeAdjust** logical specifying whether to use the modified method for calculating the windows at the edge of the record. The edgeAdjust method tends to reduce curvature near the start and end of record. Default is TRUE.

**Value**

data frame with the following columns:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Change</td>
<td>The difference between the results for year2 - year1</td>
</tr>
<tr>
<td>CQTC</td>
<td>this number is the difference between the two years, but only the part that is due to the change in the QD. It is the Total Change - x10 - x11 - x20 + x10. In the results reported above as, &quot;Concentration v. Q Trend Component&quot; it is computed as 100 * (x20 - x11 - x20 + x10) / x11.</td>
</tr>
<tr>
<td>QTC</td>
<td>The difference between the two years, but only the part that is due to the change in the CQR. It is the Total Change - x10 - x11 - x20 + x10. In the results reported above as, &quot;Q Trend Component&quot; it is computed as 100 * (x20 - x11 - x20 + x10) / x11.</td>
</tr>
<tr>
<td>x10</td>
<td>The results using the concentration versus discharge relationship (CQR) for year 1, but using the discharge data for the entire period.</td>
</tr>
<tr>
<td>x11</td>
<td>The results using the CQR for year 1, but using the QD specified by the user for year 1.</td>
</tr>
<tr>
<td>x20</td>
<td>The results using the CQR for year 2, but using the QD for the entire period.</td>
</tr>
<tr>
<td>x22</td>
<td>The results for the CQR for year 2, but using the QD specified by the user for year 2.</td>
</tr>
</tbody>
</table>

Additionally, there is an attribute on the data frame "Other", containing a list that includes minNumObs=minNumObs, minNumUncen, windowY, windowQ, windowS, wall, edgeAdjust, QStartDate, QEndDate, PercentChangeConc, and PercentChangeFlux.

PercentChangeConc, and PercentChangeFlux are vectors with: Total Percent Change is the Total Change divided by x11 CQTC Percent is the CQTC divided by x11 QTC Percent is the QTC divided by x11

**Examples**

eList <- Choptank_eList
year1 <- 1985
year2 <- 2010

## Not run:
# Automatic calculations based on windowSide=7
# four possible ways to do generalized flow normalization:

#Option 1: Use all years for flow normalization.
runSeries <- runPairs(eList, year1, year2, windowSide = 0)

# Option 2: Use different windows for flow normalization for year1 versus year2
# In each case it is a 15 year window (15 = 1 + 2*7)

pairOut_2 <- runPairs(eList, year1, year2, windowSide = 7)

# Option 3: Flow normalization is based on splitting the flow record at 1990-09-30
# But year1 uses all flow data from before the break,
# year2 uses all flow data after the break

pairOut_3 <- runPairs(eList, year1, year2, windowSide = 0, flowBreak = TRUE, Q1EndDate = "1990-09-30")

# Option 4: Flow normalization is based on splitting the flow record at 1990-09-30
# but year1 uses a 15 year window before the break
# year2 uses a 15 year window after the break

pairOut_4 <- runPairs(eList, year1, year2, windowSide = 7, flowBreak = TRUE, Q1EndDate = "1990-09-30")

## End(Not run)

runSeries  # Annual series of flow-normalized concentration and flow-normalized flux

Description

runSeries provides annual series of flow-normalized concentration and flow-normalized flux for the water quality record. Computations could involve the use of the "wall" and/or use of "generalized flow normalization". These two concepts are described in detail in the vignette [need a simple name for it here].

Usage

runSeries(eList, windowSide, surfaceStart = NA, surfaceEnd = NA, flowBreak = FALSE, Q1EndDate = NA, QStartDate = NA, QEndDate = NA, wall = FALSE, oldSurface = FALSE, sample1EndDate = NA, sampleStartDate = NA, sampleEndDate = NA, paStart = 10, paLong = 12, fractMin = 0.75, minNumObs = 100, minNumUncen = 50, windowY = 7, windowQ = 2, windowS = 0.5, edgeAdjust = TRUE, verbose = TRUE)
Arguments

eList
integer The width of the flow normalization window on each side of the year being estimated. A common value is 7, but no default is specified. If stationary flow normalization is to be used, then windowSide = 0 (this means that flow-normalization period for all years is the same).

windowSide
integer The width of the flow normalization window on each side of the year being estimated. A common value is 7, but no default is specified. If stationary flow normalization is to be used, then windowSide = 0 (this means that flow-normalization period for all years is the same).

surfaceStart
The Date (or character in YYYY-MM-DD) that is the start of the WRTDS model to be estimated and the first of the daily outputs to be generated. Default is NA, which means that the surfaceStart is based on the date of the first sample.

surfaceEnd
The Date (or character in YYYY-MM-DD) that is the end of the WRTDS model to be estimated and the last of the daily outputs to be generated. Default is NA, which means that the surfaceEnd is based on the date of the last sample.

flowBreak
logical, is there an abrupt break in the discharge record, default is FALSE.

QEndDate
The Date (as character in YYYY-MM-DD format) which is the last day, just before the flowBreak. Required if flowBreak = TRUE.

QStartDate
The first Date (as character in YYYY-MM-DD format) used in the flow normalization. Default is NA, which makes the QStartDate become the first Date in eList$Daily.

QEndDate
The last Date (as character in YYYY-MM-DD format) used in the flow normalization. Default is NA, which makes the QEndDate become the last Date in eList$Daily.

wall
logical, there is an abrupt break in concentration versus discharge relationship. Default is FALSE.

oldSurface
logical, if TRUE, use surface previously estimated using modelEstimation. Default is FALSE.

sampleEndDate
The Date (as character in YYYY-MM-DD format) of the last day just before the wall. Default = NA. A date must be specified if wall = TRUE.

sampleStartDate
The Date (as character in YYYY-MM-DD format) of the first sample to be used. Default is NA which sets it to the first Date in eList$Sample.

sampleEndDate
The Date (as character in YYYY-MM-DD format) of the last sample to be used. Default is NA which sets it to the last Date in eList$Sample.

paStart
numeric integer specifying the starting month for the period of analysis, 1<=paStart<=12, default is 10 (used when period is water year).

paLong
numeric integer specifying the length of the period of analysis, in months, 1<=paLong<=12, default is 12.

fractMin
numeric specifying the minimum fraction of the observations required to run the weighted regression, default is 0.75. The minimum number will be the maximum of minNumObs and fractMin multiplied by total number of observations.

minNumObs
numeric specifying the minimum number of observations required to run the weighted regression, default is 100.

minNumUncen
numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50.
runSeries

windowY  numeric specifying the half-window width in the time dimension, in units of years, default is 7
windowQ  numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2
windowS  numeric specifying the half-window with in the seasonal dimension, in units of years, default is 0.5
default is 0.5
edgeAdjust  logical specifying whether to use the modified method for calculating the windows at the edge of the record. The edgeAdjust method tends to reduce curvature near the start and end of record. Default is TRUE.
verbose  logical specifying whether to output status messages.

Value
eList named list with INFO, Daily, and Sample dataframes, along with the surfaces matrix.

Examples
eList <- Choptank_eList

## Not run:
## Automatic calculations based on windowSide=7
## four possible ways to do generalized flow normalization

#Option 1: Use all years for flow normalization.
seriesOut_1 <- runSeries(eList, windowSide = 0)
plotConcHist(seriesOut_1)
plotFluxHist(seriesOut_1)

# Option 2: Use sliding window throughout the whole flow normalization process.
# In each case it is a 15 year window \((15 = 1 + 2\times7)\)
seriesOut_2 <- runSeries(eList, windowSide = 7)

plotConcHist(seriesOut_2)
plotFluxHist(seriesOut_2)

# Option 3: Flow normalization is based on splitting the flow record at 1990-09-30
# But in years before the break it uses all flow data from before the break,
# and years after the break uses all flow data after the break
seriesOut_3 <- runSeries(eList,
                        windowSide = 0,
                        flowBreak = TRUE,
                        QEndDate = "1990-09-30")

plotConcHist(seriesOut_3)
plotFluxHist(seriesOut_3)

# Option 4: Flow normalization is based on splitting the flow record at 1990-09-30
# but before the break uses a 15 year window of years before the break
# after the break uses a 15 year window of years after the break
seriesOut_4 <- runSeries(eList,
                        windowSide = 7, flowBreak = TRUE,
runSurvReg

Run the weighted survival regression for a set of estimation points
(defined by DecYear and Log(Q))

Description
This function runs the survival regression which is the concentration estimation method of WRTDS. It uses sample data from the data frame Sample. It does the estimation for a set of data points defined by two vectors: estPtYear and estPtLQ. It returns an array of results for the estimation points. The array returned contains yHat, SE and ConcHat (in that order). yHat is the expected value of log(concentration), SE is the standard error of log(concentration) and ConcHat is the expected value of concentration.

Usage
runSurvReg(estPtYear, estPtLQ, DecLow, DecHigh, Sample, windowY = 7, windowQ = 2, windowS = 0.5, minNumObs = 100, minNumUncen = 50, verbose = TRUE, interactive = NULL, edgeAdjust = TRUE, run.parallel = FALSE)
run_WRTDS(estY, estLQ, localSample, DecLow, DecHigh, minNumObs, minNumUncen, windowY, windowQ, windowS, edgeAdjust)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>estPtYear</td>
<td>numeric vector of Decimal Year values at the estimation points</td>
</tr>
<tr>
<td>estPtLQ</td>
<td>numeric vector of ln(Q) values at the estimation points, must be the same length as estPtYear</td>
</tr>
<tr>
<td>DecLow</td>
<td>number specifying minimum decimal year (left edge of the estimated surfaces)</td>
</tr>
<tr>
<td>DecHigh</td>
<td>number specifying maximum decimal year (right edge of the estimated surfaces)</td>
</tr>
<tr>
<td>Sample</td>
<td>dataframe created for EGRET analysis</td>
</tr>
<tr>
<td>windowY</td>
<td>numeric specifying the half-window width in the time dimension, in units of years, default is 7</td>
</tr>
<tr>
<td>windowQ</td>
<td>numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2</td>
</tr>
<tr>
<td>windowS</td>
<td>numeric specifying the half-window width in the seasonal dimension, in units of years, default is 0.5</td>
</tr>
</tbody>
</table>
saveResults

minNumObs numeric specifying the minimum number of observations required to run the weighted regression, default is 100

minNumUncen numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50

verbose logical specifying whether or not to display progress message

interactive logical deprecated. Use 'verbose' instead

edgeAdjust logical specifying whether to use the modified method for calculating the windows at the edge of the record. The modified method tends to reduce curvature near the start and end of record. Default is TRUE.

run.parallel logical to run bootstrapping in parallel or not

estY numeric decimal year values at the estimation point

estLQ numeric ln(Q) values at the estimation point

localSample "Sample" data frame from the eList.

Value

resultSurvReg numeric array containing the yHat, SE, and ConcHat values array dimensions are (numEstPts,3)

Examples

elst <- Choptank_eList
estPtYear<-c(2001.0,2005.0,2009.0)
estPtLQ<-c(1,1,1)
Sample <- getSample(elst)
DecLow <- Sample$DecYear[1]
DecHigh <- Sample$DecYear[nrow(Sample)]
resultSurvReg <- runSurvReg(estPtYear,estPtLQ,
DecLow,DecHigh,Sample,
run.parallel = FALSE)

saveResults A utility program for saving the contents of the workspace This function saves the workspace. It assigns the file a name using the abbreviations for station and constituent.

Description

A utility program for saving the contents of the workspace

This function saves the workspace. It assigns the file a name using the abbreviations for station and constituent.

Usage

saveResults(savePath, eList)
selectDays

Arguments

savePath  character specifying the full pathname of the folder where the file is to be saved ending with the final slash

eList  named list with at least the INFO dataframe

Examples

eList <- Choptank_elist
savePath <- "~/"
## Not run: saveResults(savePath, eList)

#To load:
load(paste(savePath,"Chop.nitrogen.RData",sep=""))
## End(Not run)

selectDays  Creates a subset Daily data frame that only contains daily estimates for the specified period of analysis

Description

This function uses the user-defined 'period of analysis', and subsets the Daily data frame, it doesn't have any effect on the Sample data frame. If you want to examine your data set as a time series of water years, then the period of analysis is October through September. If you want to examine the data set as calendar years then the period of analysis is January through December. You might want to examine the winter season, which you could define as December through February, then those 3 months become the period of analysis. The only constraints on the definition of a period of analysis are these: it must be defined in terms of whole months; it must be a set of contiguous months (like March-April-May), and have a length that is no less than 1 month and no more than 12 months. Define the PA by using two arguments: paLong and paStart. paLong is the length of the period of analysis, and paStart is the starting month.

Usage

selectDays(df, paLong, paStart)

Arguments

df  dataframe which must contain a column named Month (for month of the calendar year, typically this is a Daily data frame.

paLong  a numeric value for the length of the period of analysis, must be an integer from 1 to 12

paStart  a numeric value for the starting month of the period of analysis, must be an integer from 1 to 12
Value

localDaily a data frame containing the daily data but only for the period of analysis (not all months)

Examples

```r
elist <- Choptank_elist
daily <- getDaily(elist)
DailySubset <- selectDays(Daily, 4, 11)
```

--

**setPA**  
Sets up the period of analysis (the portion of the year being evaluated).

Description

Period of analysis is defined by the starting month (paStart) and length in months (paLong). paStart and paLong are constrained to be integers from 1 to 12. For example, a water year would be paStart = 10 and paLong = 12. For example, the winter season, defined by Dec, Jan, Feb would be paStart = 12 and paLong = 3.

Usage

```r
setPA(eList, paStart = 10, paLong = 12, window = 20)
```

Arguments

- `eList`: named list with at least the INFO dataframe
- `paStart`: A numeric value for the starting month of the Period of Analysis, default is 10
- `paLong`: A numeric value for the length of the Period of Analysis in months, default is 12
- `window`: A numeric value for the half-width of a smoothing window for annual streamflow values, default is 20

Value

`eList` named list with at least the INFO dataframe, along any other part of the list that was input. Any of these values can be NA, not all EGRET functions will work with missing parts of the named list `eList`.

Examples

```r
eList <- Choptank_elist
eList <- setPA(eList, paStart=12, paLong=3)
```
setSeasonLabel

Create a character variable that describes the period of analysis, when period of analysis has already been set in AnnualResults

Description

The period of analysis can be of any length from 1 month to 12 months. The period of analysis can have any starting month from 1 (January) through 12 (December). This function produces a character that describes this period of analysis. For example "water year", "calendar year", "year starting with April", or "Season consisting of April, May, June". There is an alternative version of this function for the case where AnnualResults does not exist. This might arise in a call from plotConcTime or plotLogConcTime. That function is called setSeasonLabelByUser.

Usage

setSeasonLabel(localAnnualResults)

Arguments

localAnnualResults
data frame that contains the annual results, default is AnnualResults

Value

periodName character which describes the period of analysis

Examples

eList <- Choptank_eList
Daily <- getDaily(eList)
AnnualResults <- setupYears(Daily)
setSeasonLabel(AnnualResults)

setSeasonLabelByUser

Creates a character variable that describes the period of analysis, when the period of analysis is being set by the user and not from AnnualResults

Description

The period of analysis can be of any length from 1 month to 12 months. The period of analysis can have any starting month from 1 (January) through 12 (December). This function produces a character that describes this period of analysis. For example "water year", "calendar year", "year starting with April", or "Season consisting of April, May, June". There is an alternative version of this function for the case where AnnualResults exists. And we want to use the period of analysis defined there. That function is called setSeasonLabel.
**setUpEstimation**

**Usage**

```r
setSeasonLabelByUser(paStartInput = 10, paLongInput = 12)
```

**Arguments**

- `paStartInput` numeric the month which is the start of the period of analysis, default is 10 which would be the case if the period of analysis is the water year
- `paLongInput` numeric the length of the period of analysis, in months, default is 12 which would be the case if the period of analysis is the water year

**Value**

- `periodName` character which describes the period of analysis

**Examples**

```r
setSeasonLabelByUser(paStartInput = 1, paLongInput = 12)
setSeasonLabelByUser(paStartInput = 4, paLongInput = 3)
```

**setUpEstimation**

**Description**

Set up the INFO data frame for a modelEstimation

**Usage**

```r
setUpEstimation(eList, windowY = 7, windowQ = 2, windowS = 0.5, 
minNumObs = 100, minNumUncen = 50, edgeAdjust = TRUE, 
verbose = TRUE, interactive = NULL)
```

**Arguments**

- `eList` named list with at least the Daily, Sample, and INFO dataframes
- `windowY` numeric specifying the half-window width in the time dimension, in units of years, default is 7
- `windowQ` numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2
- `windowS` numeric specifying the half-window with in the seasonal dimension, in units of years, default is 0.5
- `minNumObs` numeric specifying the minimum number of observations required to run the weighted regression, default is 100
- `minNumUncen` numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50
edgeAdjust logical specifying whether to use the modified method for calculating the windows at the edge of the record. The modified method tends to reduce curvature near the start and end of record. Default is TRUE.

verbose logical specifying whether or not to display progress message

interactive logical deprecated. Use 'verbose' instead

Value

eList named list with Daily, Sample, and INFO dataframes.

Examples

eList <- Choptank_elist
eList <- setUpEstimation(eList)

setupyears Creates the AnnualResults data frame from the Daily data frame

Description

This function aggregates the results stored on a daily basis in the Daily data frame and stores the average values of these in the new data frame called AnnualResults. The "annual values" can be a full 12 months, or they can be shorter. See manual to understand paLong and paStart arguments. The simplest case, a Water Year (October through September), would have paLong=12, and paStart=10. A calendar year would be paLong=12 and paStart=1. A winter season of Dec, Jan, Feb would be paLong=3 and paStart=12

Usage

setupYears(localDaily, paLong = 12, paStart = 10)

Arguments

localDaily data frame containing the daily values, default is Daily

paLong numeric integer specifying the length of the period of analysis, in months, 1<=paLong<=12, default is 12

paStart numeric integer specifying the starting month for the period of analysis, 1<=paStart<=12, default is 10

Value

AnnualResults data frame with one row per year
Examples

eList <- Choptank_elist
Daily <- getDaily(eList)
AnnualResults <- setupYears(Daily, 4, 10)

Description

Returns two date variables representing the starting date and ending date for a combination of paStart, paLong, and year

Usage

startEnd(paStart, paLong, year)

Arguments

paStart numeric integer specifying the starting month for the period of analysis, 1<=paStart<=12, default is 10
paLong numeric integer specifying the length of the period of analysis, in months, 1<=paLong<=12, default is 12
year integer year, which is the calendar year in which the period ends

Value

Date list

Examples

paStart <- 10
paLong <- 12
year <- 1999
startEnd(paStart, paLong, year)
stitch

**Description**

This function creates a continuous surfaces object that starts just before surfaceStart and ends just after surfaceEnd. It is made up from two surfaces objects created when there is a wall specified for the analysis. The first surfaces object is based on data prior to the wall and the second surfaces object is based on data after the wall. The wall is located just after sample1EndDate. The Daily data frame is used only to set the minimum and maximum discharges used to construct the indices for discharges in the surfaces.

**Usage**

```r
stitch(eList, sample1StartDate, sample1EndDate, sample2StartDate, 
       sample2EndDate, surfaceStart = NA, surfaceEnd = NA, 
       minNumObs = 100, minNumUncen = 50, fractMin = 0.75, windowY = 7, 
       windowQ = 2, windowS = 0.5, edgeAdjust = TRUE, verbose = FALSE, 
       runParallel = FALSE)
```

**Arguments**

- `eList` named list with at least the Daily, Sample, and INFO dataframes
- `sample1StartDate` The Date (or character in YYYY-MM-DD) of the first sample to be used in estimating the first segment of the surfaces object.
- `sample1EndDate` The Date (or character in YYYY-MM-DD) of the last sample to be used in the first segment of the surfaces object.
- `sample2StartDate` The Date (or character in YYYY-MM-DD) of the first sample to be used in the second segment of the surfaces object.
- `sample2EndDate` The Date (or character in YYYY-MM-DD) of the last sample to be used in the second segment of the surfaces object.
- `surfaceStart` The Date (or character in YYYY-MM-DD) that is the start of the WRTDS model to be estimated and the first of the daily outputs to be generated. Default is NA, which means that the surfaceStart is based on the date of the first sample.
- `surfaceEnd` The Date (or character in YYYY-MM-DD) that is the end of the WRTDS model to be estimated and the last of the daily outputs to be generated. Default is NA, which means that the surfaceEnd is based on the date of the last sample.
- `minNumObs` numeric specifying the minimum number of observations required to run the weighted regression, default is 100
- `minNumUncen` numeric specifying the minimum number of uncensored observations to run the weighted regression, default is 50
fractMin numeric specifying the minimum fraction of the observations required to run the weighted regression, default is 0.75. The minimum number will be the maximum of minNumObs and fractMin multiplied by total number of observations.

windowY numeric specifying the half-window width in the time dimension, in units of years, default is 7.

windowQ numeric specifying the half-window width in the discharge dimension, units are natural log units, default is 2.

windowS numeric specifying the half-window width in the seasonal dimension, in units of years, default is 0.5.

dedgeAdjust logical specifying whether to use the modified method for calculating the windows at the edge of the record. The edgeAdjust method tends to reduce curvature near the start and end of record. Default is TRUE.

verbose logical specifying whether or not to display progress message.

run.parallel logical to run bootstrapping in parallel or not.

Examples

```r
elist <- Choptank_elist

surfaceStart <- "1986-10-01"
surfaceEnd <- "2010-09-30"

# Surface skips a few years:
sample1StartDate <- "1986-10-01"
sample1EndDate <- "1992-09-30"
sample2StartDate <- "1996-10-01"
sample2EndDate <- "2011-09-30"

## Not run:
surface_skip <- stitch(elist,
                        sample1StartDate, sample1EndDate,
                        sample2StartDate, sample2EndDate,
                        surfaceStart, surfaceEnd)

# Surface overlaps a few years:
sample1StartDate <- "1986-10-01"
sample1EndDate <- "1996-09-30"
sample2StartDate <- "1992-10-01"
sample2EndDate <- "2011-09-30"

surface_overlap <- stitch(elist,
                        sample1StartDate, sample1EndDate,
                        sample2StartDate, sample2EndDate)

## End(Not run)
```
**surfaceIndex**

*Compute the 6 parameters needed to lay out the grid for the surfaces computed in estSurfaces*

**Description**

The code here is a repetition of the first part of the code for estSurfaces

**Usage**

`surfaceIndex(Daily)`

**Arguments**

- **Daily**
  - data frame containing the daily values, default is Daily

**Value**

- **surfaceIndexParameters** a numeric vector of length 6, defining the grid for the surfaces

**Examples**

```r
eList <- Choptank_eList
daily <- getDaily(eList)
surfaceIndex(Daily)
```

---

**surfaceStartEnd**

*Surface date limits*

**Description**

Sets the Date limits to the surfaces being estimated from the Sample data set. The start is less than a year prior to the first date (typically the date of the first sample) and the end is less than a year after the last date (typically the date of the last sample). The start is constrained to be on the first day of the period of analysis and the end is constrained to be on the last day of the the period of analysis

**Usage**

`surfaceStartEnd(paStart, paLong, Date1, Date2)`

**Arguments**

- **paStart**
  - numeric integer specifying the starting month for the period of analysis, 1<=paStart<=12, default is 10
- **paLong**
  - numeric integer specifying the length of the period of analysis, in months, 1<=paLong<=12, default is 12
- **Date1**
  - Date set to Date of earliest data in Sample.
- **Date2**
  - Date set to Date of latest data in Sample.
TableChange

Examples

```r
eList <- Choptank_elist
Date1 <- eList$Sample$Date[1]
Date2 <- range(eList$Sample$Date)[2]
surfaceStartEnd(10, 12, Date1, Date2)
```

Create a table of the changes in flow-normalized values between various points in time in the record

Description

These tables describe trends in flow-normalized concentration and in flow-normalized flux. They are described as changes in real units or in percent and as slopes in real units per year or in percent per year. They are computed over pairs of time points. These time points can be user-defined or they can be set by the program to be the final year of the record and a set of years that are multiples of 5 years prior to that.

Usage

```r
tableChange(eList, fluxUnit = 9, yearPoints = NA)
tableChangeSingle(eList, fluxUnit = 9, yearPoints = NA, flux = FALSE)
```

Arguments

- `eList`: named list with at least the Daily and INFO dataframes
- `fluxUnit`: object of fluxUnit class. `printFluxUnitCheatSheet`, or numeric represented the short code, or character representing the descriptive name.
- `yearPoints`: numeric vector listing the years for which the change or slope computations are made, they need to be in chronological order. For example `yearPoints=c(1975, 1985, 1995, 2005)`, default is NA (which allows the program to set yearPoints automatically)
- `flux`: logical if TRUE results are returned in flux, if FALSE concentration. Default is set to FALSE.

Value

dataframe with Year1, Year2, change[mg/L], slope[mg/L], change[percent], slope[percent] columns. The data in each row is the change or slope calculated from Year1 to Year2

Examples

```r
eList <- Choptank_elist
# Water Year:
## Not run:
tableChange(eList, fluxUnit=9)
```
tableFlowChange

Prints table of change metrics for a given streamflow statistic

Description

Part of the flowHistory system. The index of the flow statistics is istat. These statistics are: (1) 1-day minimum, (2) 7-day minimum, (3) 30-day minimum, (4) median (5) mean, (6) 30-day maximum, (7) 7-day maximum, and (8) 1-day maximum. A dataframe is returned, as well as a printout in the R console.

Usage

tableFlowChange(eList, istat, qUnit = 1, runoff = FALSE, yearPoints = NA)

Arguments

eList
named list with at least Daily and INFO dataframes

istat
A numeric value for the flow statistic to be graphed (possible values are 1 through 8)

qUnit
object of qUnit class printqUnitCheatSheet, or numeric represented the short code, or character representing the descriptive name.

runoff
logical variable, if TRUE the streamflow data are converted to runoff values in mm/day

yearPoints
A vector of numeric values, specifying the years at which change metrics are to be calculated, default is NA (which allows the function to set these automatically), yearPoints must be in ascending order
### Examples

```r
eList <- Choptank_elist
```

---

### Description

Produce an ASCII table showing: year, mean discharge, mean concentration, flow-normalized concentration, mean flux, and flow-normalized flux. Note that the flux and flow-normalized flux are rates and not a mass. As such a value for some period shorter than a full year could be larger than the value for a full year.

### Usage

```r
tableResults(eList, qUnit = 2, fluxUnit = 9, localDaily = NA)
```

### Arguments

- **eList**: named list with at least Daily and INFO dataframes
- **qUnit**: object of qUnit class. `printqUnitCheatsheet`, or numeric represented the short code, or character representing the descriptive name.
- **fluxUnit**: object of fluxUnit class. `printFluxUnitCheatsheet`, or numeric represented the short code, or character representing the descriptive name.
- **localDaily**: data frame to override eList$Daily

### Value

results dataframe, if returnDataFrame=TRUE

dataframe with year, discharge, concentration, flow-normalized concentration, flux, and flow-normalized concentration columns.

### Examples

```r
eList <- Choptank_elist
# Water Year:
## Not run:
tableResults(eList, fluxUnit = 1)
tableResults(eList, fluxUnit = 'kgDay', qUnit = 'cms')
returnedTable <- tableResults(eList, fluxUnit = 1)
# Winter:
eList <- setPA(eList, paLong=3, paStart=12)
tableResults(eList, fluxUnit = 1)
## End(Not run)
```
**triCube**

*Tricube weight function*

**Description**
Computes the tricube weight function on a vector of distance values (d), based on a half-window width of h, and returns a vector of weights that range from zero to 1.

**Usage**

\[ \text{triCube}(d, h) \]

**Arguments**

- **d**
  numeric vector of distances from the point of estimation to the given sample value
- **h**
  numeric value, the half-window width, measured in the same units as d

**Details**
See Cleveland, W. S. (1979). Robust locally weighted regression and smoothing scatterplots, JASA, 74, 829-836

**Value**

w numeric vector of weights, all 0<=w<=1

**Examples**

```r
h <- 10
d <- c(-11,-10,-5,-1,0.01,0,5,9.9,10,20)
triCube(d, h)
```

---

**yPretty**

*Sets up tick marks for an axis for a graph with an arithmetic scale which starts at zero*

**Description**
Axis tick marks that run from zero to some specified maximum, creates about 4 to 8 ticks marks.

**Usage**

\[ yPretty(yMax) \]
Arguments

ymax A numeric value for the maximum value to be plotted, it must be >0

Value

yTicks A numeric vector representing the values for each of the tick marks

Examples

yTicks <- yPretty(7.8)
yTicks <- yPretty(125)
