Package ‘EMDSVRhybrid’

January 9, 2021

**Type** Package

**Title** Hybrid Machine Learning Model

**Version** 0.1.0

**Author** Pankaj Das [aut, cre], Achal Lama [aut], Girish Jha [aut]

**Maintainer** Pankaj Das <pankaj.das2@icar.gov.in>

**Depends** R (>= 3.3.0), EMD, e1071

**Description** Researchers can fit Empirical Mode Decomposition and Support Vector Regression based hybrid model for nonlinear and non-stationary time series data using this package.

**Encoding** UTF-8

**LazyData** true

**License** GPL-3

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2021-01-09 13:50:13 UTC

| EMDSVRhybrid | Hybrid Machine Learning Model | 1 |
Description

It fits Empirical Mode Decomposition and Support Vector Regression based hybrid model for non-linear and nonstationary timeseries data. It will also provide you with accuracy measures along with an option to select the proportion of training and testing data sets. Users can choose among the available choices of kernel for fitting the Support Vector Regression model. In this package we have modelled the dependency of the study variable assuming first order autocorrelation. This package will help the researchers working in the area of hybrid machine learning models.

Usage

```R
EMDSVRhybrid(data,k,funct)
```

Arguments

data  
a univariate time series data

k  
partition value for splitting the data set into training and testing

funct  
the available choices of kernel functions for fitting Support Vector Regression

Details

The package implements EMD-SVR hybrid approach for forecasting nonlinear and nonstationary time series data proposed by Das et al (2020). In this method, EMD was used for decomposing the nonlinear and nonstationary series into finite and small numbers of sub-signals. Then these sub-signals were individually modelled and forecasted using SVR technique. Finally, all forecasted values of sub-signals were aggregated to make final ensemble forecast. This package is used to investigate the accuracy of the EMD SVR based hybrid machine learning model.

Value

It returns the accuracy measures of the fitted model.

Examples

```R
set.seed(6)
example_data=rnorm(500,30,5)
EMDSVRhybrid(example_data,0.9,funct="radial")
```
