

# Package ‘Lahman’

August 15, 2017

**Type** Package

**Title** Sean 'Lahman' Baseball Database

**Version** 6.0-0

**Date** 2017-08-07

**Author** Michael Friendly [aut], Dennis Murphy [ctb], Martin Monkman [ctb], Chris Dalzell [cre, ctb]

**Maintainer** Chris Dalzell <cdalzell@gmail.com>

**Description** Provides the tables from the 'Sean Lahman Baseball Database' as a set of R data.frames. It uses the data on pitching, hitting and fielding performance and other tables from 1871 through 2015, as recorded in the 2016 version of the database.

**Depends** R (>= 2.10)

**Suggests** lattice, ggplot2, googleVis, data.table, vcd, reshape2, tidyr, zipcode

**Imports** dplyr

**License** GPL

**URL** <http://lahman.r-forge.r-project.org/>

**LazyLoad** yes

**LazyData** yes

**Repository** CRAN

**Repository/R-Forge/Project** lahman

**Repository/R-Forge/Revision** 39

**Repository/R-Forge/DateTimeStamp** 2013-06-01 03:33:30

**Date/Publication** 2017-08-15 05:14:24 UTC

**NeedsCompilation** no

**RoxygenNote** 6.0.1

**R topics documented:**

Lahman-package	<i>Sean Lahman's Baseball Database</i>
----------------	--

---

**Description**

This database contains pitching, hitting, and fielding statistics for Major League Baseball from 1871 through 2016. It includes data from the two current leagues (American and National), the four other "major" leagues (American Association, Union Association, Players League, and Federal League), and the National Association of 1871-1875.

This database was created by Sean Lahman, who pioneered the effort to make baseball statistics freely available to the general public. What started as a one man effort in 1994 has grown tremendously, and now a team of researchers have collected their efforts to make this the largest and most accurate source for baseball statistics available anywhere.

This database, in the form of an R package offers a variety of interesting challenges and opportunities for data processing and visualization in R.

In the current version, the examples make extensive use of the `dplyr` package for data manipulation (tabulation, queries, summaries, merging, etc.), reflecting the original relational database design and `ggplot2` for graphics.

## Details

Package:	Lahman
Type:	Package
Version:	6.0-0
Date:	2017-07-04
License:	GPL version 2 or newer
LazyLoad:	yes
LazyData:	yes

The main form of this database is a relational database in Microsoft Access format. The design follows these general principles: Each player is assigned a unique code (`playerID`). All of the information in different tables relating to that player is tagged with his `playerID`. The `playerIDs` are linked to names and birthdates in the [Master](#) table. Similar links exist among other tables via analogous `*ID` variables.

The database is composed of the following main tables:

[Master](#) Player names, dates of birth, death and other biographical info

[Batting](#) batting statistics

[Pitching](#) pitching statistics

[Fielding](#) fielding statistics

A collection of other tables is also provided:

Teams:

<a href="#">Teams</a>	yearly stats and standings
<a href="#">TeamsHalf</a>	split season data for teams
<a href="#">TeamsFranchises</a>	franchise information

Post-season play:

<a href="#">BattingPost</a>	post-season batting statistics
<a href="#">PitchingPost</a>	post-season pitching statistics
<a href="#">FieldingPost</a>	post-season fielding data
<a href="#">SeriesPost</a>	post-season series information

Awards:

<a href="#">AwardsManagers</a>	awards won by managers
<a href="#">AwardsPlayers</a>	awards won by players
<a href="#">AwardsShareManagers</a>	award voting for manager awards
<a href="#">AwardsSharePlayers</a>	award voting for player awards

Hall of Fame: links to Master via hofID

[HallofFame](#) Hall of Fame voting data

Other tables:

[AllstarFull](#) - All-Star games appearances; [Managers](#) - managerial statistics; [FieldingOF](#) - out-field position data; [ManagersHalf](#) - split season data for managers; [Salaries](#) - player salary data; [Appearances](#) - data on player appearances; [Schools](#) - Information on schools players attended; [CollegePlaying](#) - Information on schools players attended, by player and year;

Variable label tables are provided for some of the tables:

[battingLabels](#), [pitchingLabels](#), [fieldingLabels](#)

AllstarFull

*AllstarFull table*

---

#### Description

All Star appearances by players

#### Usage

data(AllstarFull)

**Format**

A data frame with 5148 observations on the following 8 variables.

playerID Player ID code

yearID Year

gameNum Game number (for years in which more than one game was played)

gameID Game ID code

teamID Team; a factor

lgID League; a factor with levels AL NL

GP Game played (zero if player did not appear in game)

startingPos If the player started, what position he played

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```
data(AllstarFull)

# find number of appearances by players in the All Star games
player_appearances <- with(AllstarFull, rev(sort(table(playerID))))

# How many All-Star players, in total?
length(player_appearances)

# density plot of the whole distribution
plot(density(player_appearances), main="Player appearances in All Star Games")
rug(jitter(player_appearances))

# who has played in more than 10 ASGs?
player_appearances[player_appearances > 10]
hist(player_appearances[player_appearances > 10])

# Hank Aaron's All-Star record:
subset(AllstarFull, playerID == "aaronha01")

# Years that Stan Musial played in the ASG:
with(AllstarFull, yearID[playerID == "musiast01"])

# Starting positions he played (NA means did not start)
with(AllstarFull, startingPos[playerID == "musiast01"])

# All-Star rosters from the 1966 ASG
subset(AllstarFull, gameID == "NLS196607120")

# All-Stars from the Washington Nationals
```

```

subset(AllstarFull, teamID == "WAS")

# Teams with the fewest All-Stars
rare <- names(which(table(AllstarFull$teamID) < 10))

# Records associated with the 'rare' teams:
# (There are a few teamID typos: can you spot them?)
subset(AllstarFull, teamID %in% rare)

```

---

Appearances

*Appearances table*

---

### Description

Data on player appearances

### Usage

```
data(Appearances)
```

### Format

A data frame with 102761 observations on the following 21 variables.

```

yearID Year
teamID Team; a factor
lgID League; a factor with levels AA AL FL NL PL UA
playerID Player ID code
G_all Total games played
GS Games started
G_batting Games in which player batted
G_defense Games in which player appeared on defense
G_p Games as pitcher
G_c Games as catcher
G_1b Games as firstbaseman
G_2b Games as secondbaseman
G_3b Games as thirdbaseman
G_ss Games as shortstop
G_1f Games as leftfielder
G_cf Games as centerfielder
G_rf Games as right fielder
G_of Games as outfielder
G_dh Games as designated hitter
G_ph Games as pinch hitter
G_pr Games as pinch runner

```

## Details

The Appearances table in the original version has some incorrect variable names. In particular, the 5th column is career\_year.

## Source

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

## Examples

```
data(Appearances)
library("dplyr")
library("tidyr")

# Henry Aaron's last two years as a DH in Milwaukee
Appearances %>%
  filter(playerID == "aaronha01" & teamID == "ML4") %>%
  select(yearID:G_batting, G_of:G_ph) # subset variables

# Herb Washington, strictly a pinch runner for Oakland in 1974-5
Appearances %>%
  filter(playerID == "washihe01")

# A true utility player - Jerry Hairston, Jr.
Appearances %>%
  filter(playerID == "hairsje02")

# Appearances for the 1984 Cleveland Indians
Appearances %>%
  filter(teamID == "CLE" & yearID == 1984)

# Pete Rose's primary position each year of his career
Appearances %>%
  filter(playerID == "rosepe01") %>%
  group_by(yearID, teamID) %>%
  gather(pos, G, G_1b:G_rf) %>%
  filter(G == max(G)) %>%

  summarise(G = sum(G)) %>%
  arrange(desc(G)) %>%
  do(head(., 1))

```

---

AwardsManagers

*AwardsManagers table*

---

### Description

Award information for managers awards

### Usage

```
data(AwardsManagers)
```

### Format

A data frame with 179 observations on the following 6 variables.

playerID Manager (player) ID code

awardID Name of award won

yearID Year

lgID League; a factor with levels AL NL  
 tie Award was a tie (Y or N)  
 notes Notes about the award

### Source

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

### Examples

```
# Post-season managerial awards

# Number of recipients of each award by year
with(AwardsManagers, table(yearID, awardID))

# 1996 award winners
subset(AwardsManagers, yearID == 1996)

# AL winners of the BBWAA managerial award
subset(AwardsManagers, awardID == "BBWAA Manager of the year" &
       lgID == "AL")

# Tony LaRussa's manager of the year awards
subset(AwardsManagers, playerID == "larusto01")
```

---

AwardsPlayers

*AwardsPlayers table*

---

### Description

Award information for players awards

### Usage

```
data(AwardsPlayers)
```

### Format

A data frame with 6158 observations on the following 6 variables.

playerID Player ID code  
 awardID Name of award won  
 yearID Year  
 lgID League; a factor with levels AA AL ML NL  
 tie Award was a tie (Y or N)  
 notes Notes about the award

**Source**

filter(n_top3 > 6)
```

---

Batting

*Batting table*

---

### Description

Batting table - batting statistics

### Usage

```
data(Batting)
```

### Format

A data frame with 102816 observations on the following 22 variables.

playerID Player ID code

yearID Year

stint player's stint (order of appearances within a season)

teamID Team; a factor

lgID League; a factor with levels AA AL FL NL PL UA

G Games: number of games in which a player played

AB At Bats

R Runs

H Hits: times reached base because of a batted, fair ball without error by the defense

X2B Doubles: hits on which the batter reached second base safely

X3B Triples: hits on which the batter reached third base safely

HR Homeruns

RBI Runs Batted In

SB Stolen Bases

CS Caught Stealing

BB Base on Balls

SO Strikeouts

IBB Intentional walks

HBP Hit by pitch

SH Sacrifice hits

SF Sacrifice flies

GIDP Grounded into double plays

**Details**

Variables X2B and X3B are named 2B and 3B in the original database

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**See Also**

[battingStats](#) for calculating batting average (BA) and other derived statistics

[baseball](#) for a similar dataset, but a subset of players who played 15 or more seasons.

[Baseball](#) for data on batting in the 1987 season.

**Examples**

```
data(Batting)
head(Batting)
require("dplyr")

## Prelude: Extract information from Salaries and Master
## to be merged with the batting data.

# Subset of Salaries data
salaries <- Salaries %>%
  select(playerID, yearID, teamID, salary)

# Subset of Master table (player metadata)
masterInfo <- Master %>%
  select(playerID, birthYear, birthMonth, nameLast,
         nameFirst, bats)

# Left join salaries and masterInfo to batting data,
# create an age variable and sort by playerID, yearID and stint
# Returns an ignorable warning.
batting <- battingStats() %>%
  left_join(salaries,
            by =c("playerID", "yearID", "teamID")) %>%
  left_join(masterInfo, by = "playerID") %>%
  mutate(age = yearID - birthYear -
         1L *(birthMonth >= 10)) %>%
  arrange(playerID, yearID, stint)

## Generate a ggplot similar to the NYT graph in the story about Ted
## Williams and the last .400 MLB season
# http://www.nytimes.com/interactive/2011/09/18/sports/baseball/WILLIAMS-GRAPHIC.html

# Restrict the pool of eligible players to the years after 1899 and
# players with a minimum of 450 plate appearances (this covers the
# strike year of 1994 when Tony Gwynn hit .394 before play was suspended
# for the season - in a normal year, the minimum number of plate appearances is 502)
```

```

eligibleHitters <- batting %>%

battingLabels

*Variable Labels*

---

### Description

These data frames provide descriptive labels for the variables in the [Batting](#), [Pitching](#) and [Fielding](#) files (and related \*Post files). They are useful for plots and other output using [Label](#).

### Usage

```
data(battingLabels)
```

```
data(fieldingLabels)
```

```
data(pitchingLabels)
```

**Format**

Each is data frame with observations on the following 2 variables.

variable variable name

label variable label

**See Also**

[Label](#)

**Examples**

```
data(battingLabels)
str(battingLabels)

require("dplyr")

# find and plot maximum number of homers per year
batHR <- Batting %>%
  filter(!is.na(HR)) %>%
  group_by(yearID) %>%
  summarise(max=max(HR))

with(batHR, {
  plot(yearID, max,
       xlab=Label("yearID"), ylab=paste("Maximum", Label("HR")),
       cex=0.8)

  abline(lm(max ~ yearID), col="red", lwd=2)
})
```

---

BattingPost

*BattingPost table*

---

**Description**

Post season batting statistics

**Usage**

```
data(BattingPost)
```

**Format**

A data frame with 13543 observations on the following 22 variables.

yearID Year  
round Level of playoffs  
playerID Player ID code  
teamID Team  
lgID League; a factor with levels AA AL NL  
G Games  
AB At Bats  
R Runs  
H Hits  
X2B Doubles  
X3B Triples  
HR Homeruns  
RBI Runs Batted In  
SB Stolen Bases  
CS Caught stealing  
BB Base on Balls  
SO Strikeouts  
IBB Intentional walks  
HBP Hit by pitch  
SH Sacrifices  
SF Sacrifice flies  
GIDP Grounded into double plays

**Details**

Variables X2B and X3B are named 2B and 3B in the original database

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```
# Post-season batting data  
# Requires care since intra-league playoffs have evolved since 1969  
# Simplest case: World Series  
  
require("dplyr")
```

```

# Create a sub-data frame for modern World Series play
ws <- BattingPost %>%
  filter(round == "WS" & yearID >= 1903) %>%
  mutate(BA = 0 + (AB > 0) * round(H/AB, 3),
         TB = H + X2B + 2 * X3B + 3 * HR,
         SA = 0 + (AB > 0) * round(TB/AB, 3),
         PA = AB + BB + IBB + HBP + SH + SF,
         OB = H + BB + IBB + HBP,
         OBP = 0 + (AB > 0) * round(OB/PA, 3) )

# Players with most appearances in the WS:
ws %>% group_by(playerID) %>%
  summarise(appearances = n()) %>%
  arrange(desc(appearances)) %>%
  head(., 10)

# Non-Yankees with most WS appearances
ws %>% filter(teamID != "NYA") %>%
  group_by(playerID) %>%
  summarise(appearances = n()) %>%
  arrange(desc(appearances)) %>%
  head(., 10)

# Top ten single WS batting averages ( >= 10 AB )
ws %>% filter(AB > 10) %>%
  arrange(desc(BA)) %>%
  head(., 10)

# Top ten slugging averages in a single WS
ws %>% filter(AB > 10) %>%
  arrange(desc(SA)) %>%
  head(., 10)

# Hitting stats for the 1946 St. Louis Cardinals, ordered by BA
ws %>%
  filter(teamID == "SLN" & yearID == 1946) %>%
  arrange(desc(BA))

# Babe Ruth's WS profile
ws %>%
  filter(playerID == "ruthba01") %>%
  arrange(yearID)

```

## Description

The `Batting` does not contain batting statistics derived from those present in the `data.frame`. This function calculates batting average (BA), plate appearances (PA), total bases (TB), slugging percentage (SlugPct), on-base percentage (OBP), on-base percentage + slugging (OPS), and batting average on balls in play (BABIP) for each record in a `Batting`-like `data.frame`.

## Usage

```
battingStats(data = Lahman::Batting,  
             idvars = c("playerID", "yearID", "stint", "teamID", "lgID"),  
             cbind = TRUE)
```

## Arguments

<code>data</code>	input data, typically <code>Batting</code>
<code>idvars</code>	ID variables to include in the output <code>data.frame</code>
<code>cbind</code>	If TRUE, the calculated statistics are appended to the input data as additional columns

## Details

Standard calculations, e.g.,  $BA \leftarrow H/AB$  are problematic because of the presence of NAs and zeros. This function tries to deal with those problems.

## Value

A `data.frame` with all the observations in `data`. If `cbind==FALSE`, only the `idvars` and the calculated variables are returned.

## Author(s)

Michael Friendly, Dennis Murphy

## See Also

[Batting](#), [BattingPost](#)

## Examples

```
bstats <- battingStats()  
str(bstats)  
bstats <- battingStats(cbind=FALSE)  
str(bstats)
```

---

CollegePlaying	<i>CollegePlaying table</i>
----------------	-----------------------------

---

**Description**

Information on schools players attended, by player

**Usage**

```
data(CollegePlaying)
```

**Format**

A data frame with 17350 observations on the following 3 variables.

```
playerID Player ID code  
schoolID school ID code  
yearID Year player attended school
```

**Details**

This data set reflects a change in the Lahman schema for the 2015 version. The old SchoolsPlayers table was replaced with this new table called CollegePlaying.

According to the documentation, this change reflects advances in the compilation of this data, largely led by Ted Turocy. The old table reported college attendance for major league players by listing a start date and end date. The new version has a separate record for each year that a player attended. This allows us to better account for players who attended multiple colleges or skipped a season, as well as to identify teammates.

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```
data(CollegePlaying)  
head(CollegePlaying)  
  
## Q: What are the top universities for producing MLB players?  
SPcount <- table(CollegePlaying$schoolID)  
SPcount[SPcount>50]  
  
library("lattice")  
dotplot(SPcount[SPcount>50])  
dotplot(sort(SPcount[SPcount>50]))  
  
## Q: How many schools are represented in this dataset?
```

```
length(table(CollegePlaying$schoolID))

# Histogram of the number of players from each school who played in MLB:
with(CollegePlaying,
      hist(table(schoolID), xlab = "Number of players",
            main = ""))
```

 Fielding

*Fielding table*

---

### Description

Fielding table

### Usage

```
data(Fielding)
```

### Format

A data frame with 136815 observations on the following 18 variables.

playerID Player ID code

yearID Year

stint player's stint (order of appearances within a season)

teamID Team; a factor

lgID League; a factor with levels AA AL FL NL PL UA

POS Position

G Games

GS Games Started

InnOuts Time played in the field expressed as outs

PO Putouts

A Assists

E Errors

DP Double Plays

PB Passed Balls (by catchers)

WP Wild Pitches (by catchers)

SB Opponent Stolen Bases (by catchers)

CS Opponents Caught Stealing (by catchers)

ZR Zone Rating

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```

data(Fielding)
# Basic fielding data

require("dplyr")

# Roberto Clemente's fielding profile
# pitching and catching related data removed
# subset(Fielding, playerID == "clemero01")[, 1:13]
Fielding %>%
  filter(playerID == "clemero01") %>%
  select(1:13)

# Yadier Molina's fielding profile
# PB, WP, SP and CS apply to catchers
Fielding %>%
  subset(playerID == "molinya01") %>%
  select(-WP, -ZR)

# Pedro Martinez's fielding profile
Fielding %>% subset(playerID == "martipe02")

# Table of games played by Pete Rose at different positions
with(subset(Fielding, playerID == "rosepe01"), xtabs(G ~ POS))

# Career total G/P0/A/E/DP for Luis Aparicio
Fielding %>%
  filter(playerID == "aparilu01") %>%
  select(G, P0, A, E, DP) %>%
  summarise_each(funs(sum))

# Top ten 2B/SS in turning DPs
Fielding %>%
  subset(POS %in% c("2B", "SS")) %>%
  group_by(playerID) %>%
  summarise(TDP = sum(DP, na.rm = TRUE)) %>%
  arrange(desc(TDP)) %>%
  head(., 10)

# League average fielding statistics, 1961-present
Fielding %>%
  filter(yearID >= 1961 & POS != "DH") %>%
  select(yearID, lgID, POS, InnOuts, P0, A, E) %>%
  group_by(yearID, lgID) %>%
  summarise_at(vars(InnOuts, P0, A, E), funs(sum), na.rm = TRUE) %>%

```

```
mutate(fpct = round( (PO + A)/(PO + A + E), 3),
       OPE = round(InnOuts/E, 3))
```

---

 FieldingOF

*FieldingOF table*

---

### Description

Outfield position data: information about positions played in the outfield

### Usage

```
data(FieldingOF)
```

### Format

A data frame with 12028 observations on the following 6 variables.

playerID Player ID code

yearID Year

stint player's stint (order of appearances within a season)

GlF Games played in left field

GcF Games played in center field

GrF Games played in right field

### Source

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

### Examples

```
require("dplyr")
require("tidyr")

## Data set only goes through 1955
## Can get a more complete record from the Fielding data frame
## or from the Appearances data (see below)

## Output directly from the FieldingOF data

## Barry Bonds (no records: post-1955 player)
FieldingOF %>%
  filter(playerID == "bondsba01")

## Willie Mays (first few years)
```

```

FieldingOF %>%
  filter(playerID == "mayswi01")

## Ty Cobb (complete)
FieldingOF %>%
  filter(playerID == "cobbty01")

## One way to get OF game information from the Fielding data
## Note: OF games != sum(LF, CF, RF) because players can switch
## OF positions within a game. Players can also switch from
## other positions to outfield during a game. OF represents
## the number of games a player started in the outfield.
Fielding %>%
  select(playerID, yearID, stint, POS, G) %>%
  filter(POS %in% c("LF", "CF", "RF", "OF")) %>%
  tidyr::spread(POS, G, fill = 0) %>%
  filter(playerID == "trumbma01")

## Another way is through the Appearances data (no stint).
## Provides a somewhat nicer table than the above.

## Mark Trumbo (active player)
Appearances %>%
  select(playerID, yearID, G_1f, G_cf, G_rf, G_of) %>%
  filter(playerID == "trumbma01")

## A slightly better format, perhaps
Appearances %>%
  select(playerID, yearID, G_1f, G_cf, G_rf, G_of) %>%
  rename(LF = G_1f, CF = G_cf, RF = G_rf, OF = G_of) %>%
  filter(playerID == "trumbma01")

## Willie Mays (1951-1973)
Appearances %>%
  select(playerID, yearID, G_1f, G_cf, G_rf, G_of) %>%
  filter(playerID == "mayswi01")

## Joe DiMaggio (1936-1951)
Appearances %>%
  select(playerID, yearID, G_1f, G_cf, G_rf, G_of) %>%
  filter(playerID == "dimagjo01")

```

---

FieldingPost

*FieldingPost data*

---

## Description

Post season fielding data

**Usage**

```
data(FieldingPost)
```

**Format**

A data frame with 12714 observations on the following 17 variables.

```
playerID Player ID code
yearID Year
teamID Team; a factor
lgID League; a factor with levels AL NL
round Level of playoffs
POS Position
G Games
GS Games Started
InnOuts Time played in the field expressed as outs
PO Putouts
A Assists
E Errors
DP Double Plays
TP Triple Plays
PB Passed Balls
SB Stolen Bases allowed (by catcher)
CS Caught Stealing (by catcher)
```

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```
require("dplyr")

## World Series fielding record for Yogi Berra
FieldingPost %>%
  filter(playerID == "berrayo01" & round == "WS")

## Yogi's career efficiency in throwing out base stealers
## in his WS appearances and CS as a percentage of his
## overall assists
FieldingPost %>%
  filter(playerID == "berrayo01" & round == "WS" & POS == "C") %>%
  summarise(cs_pct = round(100 * sum(CS)/sum(SB + CS), 2),
            cs_assists = round(100 * sum(CS)/sum(A), 2))
```

```

## Innings per error for several selected shortstops in the WS
FieldingPost %>%
  filter(playerID %in% c("belanma01", "jeterde01", "campabe01",
                        "conceda01", "bowala01"), round == "WS") %>%
  group_by(playerID) %>%
  summarise(G = sum(G),
            InnOuts = sum(InnOuts),
            Eper9 = round(27 * sum(E)/sum(InnOuts), 3))

## Top 10 center fielders in innings played in the WS
FieldingPost %>%

```

---

HallofFame

*Hall of Fame Voting Data*

---

## Description

Hall of Fame table. This is composed of the voting results for all candidates nominated for the Baseball Hall of Fame.

## Usage

```
data(HallofFame)
```

## Format

A data frame with 4156 observations on the following 9 variables.

playerID Player ID code

yearID Year of ballot

votedBy Method by which player was voted upon. See Details

ballots Total ballots cast in that year

needed Number of votes needed for selection in that year

votes Total votes received  
 inducted Whether player was inducted by that vote or not (Y or N)  
 category Category of candidate; a factor with levels Manager Pioneer/Executive Player Umpire  
 needed\_note Explanation of qualifiers for special elections

## Details

This table links to the [Master](#) table via the playerID.

votedBy: Most Hall of Fame inductees have been elected by the Baseball Writers Association of America (BBWAA). Rules for election are described in [http://en.wikipedia.org/wiki/National\\_Baseball\\_Hall\\_of\\_Fame\\_and\\_Museum#Selection\\_process](http://en.wikipedia.org/wiki/National_Baseball_Hall_of_Fame_and_Museum#Selection_process).

```

```

    rename(lastYear = yearID)

#####
# How many voting years until election?
inducted <- subset(playerOutcomes, inducted == "Y")
table(inducted$nyears)

# Bar chart of years to induction for inductees
barplot(table(inducted$nyears),
        main="Number of voting years until election",
        ylab="Number of players", xlab="Years")
box()

# What is the form of this distribution?
require("vcd")
goodfit(inducted$nyears)
plot(goodfit(inducted$nyears), xlab="Number of years",
     main="Poissonness plot of number of years voting until election")
Ord_plot(table(inducted$nyears), xlab="Number of years")

# First ballot inductees sorted by vote percentage:
playerOutcomes %>%
  filter(nyears == 1L & inducted == "Y") %>%
  arrange(desc(lastPct))

# Who took at least ten years on the ballot before induction?
playerOutcomes %>%
  filter(nyears >= 10L & inducted == "Y")

#####
## Plots of voting percentages over time for the borderline
## HOF candidates, according to the BBWAA:

# Identify players on the BBWAA ballot for at least 10 years
# Returns a character vector of playerIDs
longTimers <- as.character(unlist(subset(playerOutcomes,
                                       nyears >= 10, select = "playerID")))

# Extract their information from the HallOfFame data
HOF1t <- HallOfFame %>%
  filter(playerID %in% longTimers & votedBy == "BBWAA") %>%
  group_by(playerID) %>%
  mutate(elected = ifelse(any(inducted == "Y"),
                          "Elected", "Not elected"),
         pct = 100 * round(votes/ballots, 3))

# Plot the voting profiles:
ggplot(HOF1t, aes(x = yearID, y = pct,
                 group = playerID)) +
  ggtitle("Profiles of BBWAA voting percentage, long-time HOF candidates") +

```

```

geom_line() +
geom_hline(yintercept = 75, colour = 'red') +
labs(x = "Year", y = "Percentage of votes") +
facet_wrap(~ elected, ncol = 1)

## Eventual inductees tend to have increasing support over time.
## Fit simple linear regression models to each player's voting
## percentage profile and extract the slopes. Then compare the
## distributions of the slopes in each group.

# data frame for playerID and induction status among
# long term candidates
HOFstatus <- HOF1t %>%
  group_by(playerID) %>%
  select(playerID, elected, inducted) %>%
  do(tail(., 1))

# data frame of regression slopes, which represent average
# increase in percentage support by BBWAA members over a
# player's candidacy.
HOFslope <- HOF1t %>%
  group_by(playerID) %>%
  do(mod = lm(pct ~ yearID, data = .)) %>%
  do(data.frame(slope = coef(.$mod)[2]))

## Boxplots of regression slopes by induction group
ggplot(data.frame(HOFstatus, HOFslope),
  aes(x = elected, y = slope)) +
  geom_boxplot(width = 0.5) +
  geom_point(position = position_jitter(width = 0.2))

# Note 1: Only two players whose maximum voting percentage
# was over 60% were not eventually inducted
# into the HOF: Gil Hodges and Jack Morris.
# Red Ruffing was elected in a 1967 runoff election while
# the others have been voted in by the Veterans Committee.

# Note 2: Of the players whose slope was >= 2.5 among
# non-inductees, only Jack Morris has not (yet) been
# subsequently inducted into the HOF; however, his last year of
# eligibility was 2014 so he could be inducted by a future
# Veterans Committee.

```

**Description**

Extracts the label for a variable from one or more of the \*Labels files. This is useful for plots and other displays because the variable names are often cryptically short.

**Usage**

```
Label(var, labels = rbind(Lahman::battingLabels,
                          Lahman::pitchingLabels,
                          Lahman::fieldingLabels))
```

**Arguments**

var	name of a variable
labels	label table(s) to search, a 2-column dataframe containing variable names and labels.

**Value**

Returns the variable label, or var if no label is found

**Author(s)**

Michael Friendly

**See Also**

[battingLabels](#), [pitchingLabels](#), [fieldingLabels](#)

**Examples**

```
require("dplyr")
# find and plot maximum number of homers per year
batHR <- Batting %>%
  filter(!is.na(HR)) %>%
  group_by(yearID) %>%
  summarise(max = max(HR))

with(batHR, {

LahmanData

*Lahman Datasets*

---

### Description

This dataset gives a concise description of the data files in the Lahman package. It may be useful for computing on the various files.

### Usage

```
data(LahmanData)
```

### Format

A data frame with 24 observations on the following 5 variables.

file name of dataset

class class of dataset

nobs number of observations

nvar number of variables

title dataset title

### Details

This dataset is generated using `vcdExtra::datasets(package="Lahman")` with some post-processing.

### Examples

```
data(LahmanData)

# find ID variables in the datasets
IDvars <- lapply(LahmanData[, "file"], function(x) grep('.*ID$', colnames(get(x)), value=TRUE))
names(IDvars) <- LahmanData[, "file"]
str(IDvars)
# vector of unique ID variables
unique(unlist(IDvars))

# which datasets have playerID?
names(which(sapply(IDvars, function(x) "playerID" %in% x)))

#####
# Visualize relations among datasets via an MDS
#####
# jaccard distance between two sets; assure positivity
jaccard <- function(A, B) {
  max(1 - length(intersect(A,B)) / length(union(A,B)), .00001)
}
```

```

distmat <- function(vars, FUN=jaccard) {
  nv <- length(vars)
  d <- matrix(0, nv, nv, dimnames=list(names(vars), names(vars)))
  for(i in 1:nv) {
    for (j in 1:nv) {
      if (i != j) d[i,j] <- FUN(vars[[i]], vars[[j]])
    }
  }
  d
}

# do an MDS on distances
distID <- distmat(IDvars)
config <- cmdscale(distID)

pos=rep(1:4, length=nrow(config))
plot(config[,1], config[,2], xlab = "", ylab = "", asp = 1, axes=FALSE,
main="MDS of ID variable distances of Lahman tables")
abline(h=0, v=0, col="gray80")
text(config[,1], config[,2], rownames(config), cex = 0.75, pos=pos, xpd=NA)

```

---

Managers

*Managers table*

---

### Description

Managers table: information about individual team managers, teams they managed and some basic statistics for those teams in each year.

### Usage

```
data(Managers)
```

### Format

A data frame with 3436 observations on the following 10 variables.

playerID Manager (player) ID code

yearID Year

teamID Team; a factor

lgID League; a factor with levels AA AL FL NL PL UA

inseason Managerial order. Zero if the individual managed the team the entire year. Otherwise denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.)

G Games managed

W Wins

L Losses  
 rank Team's final position in standings that year  
 plyrMgr Player Manager (denoted by 'Y'); a factor with levels N Y

### Source

ManagersHalf

*ManagersHalf table*

---

### Description

Split season data for managers

**Usage**

```
data(ManagersHalf)
```

**Format**

A data frame with 93 observations on the following 10 variables.

playerID Manager (player) ID code

yearID Year

teamID Team; a factor

lgID League; a factor with levels AL NL

inseason Managerial order. One if the individual managed the team the entire year. Otherwise denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.). A factor with levels 1 2 3 4 5

half First or second half of season

G Games managed

W Wins

L Losses

rank Team's position in standings for the half

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```
library("dplyr")
library("reshape2")

# Only have data for 1892 and 1981

# League rank by half for 1981 teams with the same
# manager in both halves who were hired in-season
ManagersHalf %>%
  filter(yearID >= 1901) %>%
  group_by(teamID, yearID) %>%
  filter(all(playerID == playerID[1])) %>% # same manager in both halves
  mutate(winPct = round(W/G, 3)) %>%
  reshape2::dcast(playerID + yearID + teamID + lgID ~ half,
                 value.var = "rank") %>%
  rename(rank1 = `1`, rank2 = `2`)
```

Master	<i>Master table</i>
--------	---------------------

---

### Description

Master table - Player names, DOB, and biographical info. This file is to be used to get details about players listed in the [Batting](#), [Pitching](#), and other files where players are identified only by playerID.

### Usage

```
data(Master)
```

### Format

A data frame with 19105 observations on the following 26 variables.

playerID A unique code assigned to each player. The playerID links the data in this file with records on players in the other files.

birthYear Year player was born

birthMonth Month player was born

birthDay Day player was born

birthCountry Country where player was born

birthState State where player was born

birthCity City where player was born

deathYear Year player died

deathMonth Month player died

deathDay Day player died

deathCountry Country where player died

deathState State where player died

deathCity City where player died

nameFirst Player's first name

nameLast Player's last name

nameGiven Player's given name (typically first and middle)

weight Player's weight in pounds

height Player's height in inches

bats a factor: Player's batting hand (left (L), right (R), or both (B))

throws a factor: Player's throwing hand (left(L) or right(R))

debut Date that player made first major league appearance

finalGame Date that player made first major league appearance (blank if still active)

retroID ID used by retrosheet, <http://www.retrosheet.org/>

bbrefID ID used by Baseball Reference website, <http://www.baseball-reference.com/>

birthDate Player's birthdate, in as.Date format

deathDate Player's deathdate, in as.Date format

**Details**

debut, finalGame were converted from character strings with as.Date.

**Source**

Lahman, S. (2016) Lahman's Baseball Database, 1871-2015, 2015 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```
data(Master); data(Batting)

## add player's name to Batting data
Master$name <- paste(Master$nameFirst, Master$nameLast, sep=" ")

 playerInfo

*Lookup Information for Players and Teams*

---

## Description

These functions use `grep` to lookup information about players (from the [Master](#) file) and teams (from the [Teams](#) file).

## Usage

```
playerInfo(playerID, nameFirst, nameLast, data = Lahman::Master, extra = NULL, ...)
```

```
teamInfo(teamID, name, data = Lahman::Teams, extra = NULL, ...)
```

## Arguments

playerID	pattern for playerID
nameFirst	pattern for first name
nameLast	pattern for last name
data	The name of the dataset to search
extra	A character vector of other fields to include in the result
...	other arguments passed to <code>grep</code>
teamID	pattern for teamID
name	pattern for team name

**Value**

Returns a data frame for unique matching rows from data

**Author(s)**

Michael Friendly

**See Also**

[grep](#), [~~~](#)

**Examples**

```
playerInfo("aaron")  
  
teamInfo("CH", extra="park")
```

---

Salaries

*Salaries table*

---

**Description**

Player salary data.

**Usage**

Teams

*Teams table*

---

## Description

Yearly statistics and standings for teams

## Usage

```
data(Teams)
```

## Format

A data frame with 2835 observations on the following 48 variables.

yearID Year

lgID League; a factor with levels AA AL FL NL PL UA

teamID Team; a factor

franchID Franchise (links to [TeamsFranchises](#) table)

divID Team's division; a factor with levels C E W

Rank Position in final standings  
G Games played  
Ghome Games played at home  
W Wins  
L Losses  
DivWin Division Winner (Y or N)  
WCWin Wild Card Winner (Y or N)  
LgWin League Champion(Y or N)  
WSWin World Series Winner (Y or N)  
R Runs scored  
AB At bats  
H Hits by batters  
X2B Doubles  
X3B Triples  
HR Homeruns by batters  
BB Walks by batters  
SO Strikeouts by batters  
SB Stolen bases  
CS Caught stealing  
HBP Batters hit by pitch  
SF Sacrifice flies  
RA Opponents runs scored  
ER Earned runs allowed  
ERA Earned run average  
CG Complete games  
SHO Shutouts  
SV Saves  
IPouts Outs Pitched (innings pitched x 3)  
HA Hits allowed  
HRA Homeruns allowed  
BBA Walks allowed  
SOA Strikeouts by pitchers  
E Errors  
DP Double Plays  
FP Fielding percentage  
name Team's full name  
park Name of team's home ballpark

attendance Home attendance total  
 BPF Three-year park factor for batters  
 PPF Three-year park factor for pitchers  
 teamIDBR Team ID used by Baseball Reference website  
 teamIDlahman45 Team ID used in Lahman database version 4.5  
 teamIDretro Team ID used by Retrosheet

## Details

Variables X2B and X3B are named 2B and 3B in the original database

TeamsFranchises

*TeamFranchises table*

---

### Description

Information about team franchises

### Usage

```
data(TeamsFranchises)
```

**Format**

A data frame with 120 observations on the following 4 variables.

franchID Franchise ID; a factor

franchName Franchise name

active Whether team is currently active (Y or N)

NAassoc ID of National Association team franchise played as

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```
data(TeamsFranchises)

# Which of the active Major League Baseball teams had a National Association predecessor?

# Notes:
# - the National Association was founded in 1871, and continued through the
# 1875 season. In 1876, six clubs from the National Association and two other
# independent clubs formed the National League, which exists to this day.
# - the `active` field has "NA" for the National Association franchises
# - where appropriate, the `NAassoc` field has the `franchID` of the successor National League team

# using the dplyr data manipulation package
library("dplyr")

NatAssoc_active_table <- TeamsFranchises %>%
  filter(active == "Y") %>%
  filter(!is.na(NAassoc))
NatAssoc_active_table

# Merge current team IDs with franchise IDs
currentTeams <- Teams %>%
  filter(yearID == 2014) %>%
  select(teamID, franchID, lgID, park)

# Merge TeamsFranchises with currentTeams
TeamsFranchises %>%
  filter(active == "Y") %>%
  select(-active, -NAassoc) %>%
  left_join(currentTeams, by = "franchID")
```

---

TeamsHalf	<i>TeamsHalf table</i>
-----------	------------------------

---

**Description**

Split season data for teams

**Usage**

```
data(TeamsHalf)
```

**Format**

A data frame with 52 observations on the following 10 variables.

yearID Year

lgID League; a factor with levels AL NL

teamID Team; a factor

Half First or second half of season

divID Division

DivWin Won Division (Y or N)

Rank Team's position in standings for the half

G Games played

W Wins

L Losses

**Source**

Lahman, S. (2017) Lahman's Baseball Database, 1871-2016, 2016 version, <http://www.seanlahman.com/baseball-archive/statistics/>

**Examples**

```
# 1981 season team data split into half seasons
data(TeamsHalf)
library("dplyr")

# List standings with winning percentages by
# season half, league and division
TeamsHalf %>%
  group_by(Half, lgID, divID) %>%
  mutate(WinPct = round(W/G, 3)) %>%
  arrange(Half, lgID, divID, Rank) %>%
  select(Half, lgID, divID, Rank, teamID, WinPct)
```
