Package ‘MSigSeg’

November 13, 2023

Type  Package
Title  Multiple SIGnal SEGmentation
Version  0.2.0
Description  Traditional methods typically detect breakpoints from individual signals, which means that when applied separately to multiple signals, the breakpoints are not aligned. However, this package implements a common breakpoint detection approach for multiple piece-wise constant signals, resulting in increased detection sensitivity and specificity. By employing various techniques, optimal performance is ensured, and computation is accelerated. We hope that this package will be beneficial for researchers in signal processing, bioinformatics, economy, and other related fields. The segmentation(), lambda_estimator() functions are the main functions of this package.

License  GPL-3
Encoding  UTF-8
LazyData  true
RoxygenNote  7.2.3

Depends  R (>= 4.0.0), methods
Imports  MASS, ggpubr, ggplot2
NeedsCompilation  no

**brkps**

Generic Function-brkps.

**Description**

This function returns the brkps slot of MSigSeg object.

**Usage**

```r
## S4 method for signature 'MSigSeg'
brkps(object)
```

**Arguments**

- `object` A 'MSigSeg' object.

**Details**

This function is a S4 method for MSigSeg object. It retrieves brkps slot, which contains the locations of break points.

**Value**

The brkps slot of MSigSeg object.
Examples

x = new("MSigSeg") # Creating a new MSigSeg object.
brkps(x)

Description

Breakpoints matrix generation.

Usage

change(M, p = 0.01)

Arguments

M                                   A matrix users aimed to add breakpoints.
ρ                                   Probability of occurrence of breakpoints.

Details

Generate matrix with common breakpoints, based on specific probability of occurrence.

Value

A list containing the matrix with specified change point and the location of breakpoints.

data.input

Generic Function-data.input.

Description

This function returns the data.input slot of MSigSeg object.

Usage

## S4 method for signature 'MSigSeg'
data.input(object)

Arguments

object               A MSigSeg object.
Details

This function is a S4 method for MSigSeg object. It retrieves data.input slot, which contains the data users input.

Value

The data.input slot of MSigSeg object.

Examples

```r
x=new("MSigSeg") # Creating a new MSigSeg object.
data.input(x)
```

```
data.output
Generic Function-data.output.
```

Description

This function returns the data.output slot of MSigSeg object.

Usage

```r
## S4 method for signature 'MSigSeg'
data.output(object)
```

Arguments

object A MSigSeg object.

Details

This function is a S4 method for MSigSeg object. It retrieves data.output slot, which contains the input data which has been smoothed.

Value

The data.output slot of MSigSeg object.

Examples

```r
x=new("MSigSeg") # Creating a new MSigSeg object.
data.output(x)
```
**data_test**

A simulated data set used for testing.

**Description**

A simulated data set used for testing.

**Usage**

data_test

**Format**

A matrix with 1000 rows and 20 columns.

**Examples**

data("data_test", package = "MSigSeg")

---

**lambda**

Generic Function-lambda.

**Description**

This function returns the lambda slot of MSigSeg object.

**Usage**

```r
## S4 method for signature 'MSigSeg'
lambda(object)
```

**Arguments**

- `object`  
  A MSigSeg object.

**Details**

This function is a S4 method for MSigSeg object. It retrieves lambda slot, which contains penalty coefficient to prevent over fitting.

**Value**

The lambda slot of MSigSeg object.

**Examples**

```r
x = new("MSigSeg")  # Creating a new MSigSeg object.
lambda(x)
```
lambda_estimator

Detecting common breakpoints with designated number.

Description

Automatic estimation of penalty parameter lambda for user defined breakpoints number.

Usage

lambda_estimator(Y, K)

Arguments

Y  An data.frame/matrix containing the data to be segmented. Each column stores a signal.
K  Number of change points users want to detect.

Details

This function is based on the segmentation() function. Number of breakpoints are defined by users and lambda is calculated by algorithm automatically.

Value

An object of S4 class "MSigSeg".

Examples

data(data_test)
lambda_estimator(data_test, 5)

MSigSeg-class

An S4 class to encapsulation the result of breakpoints analysis.

Description

An S4 class to encapsulation the result of breakpoints analysis.
**multi_plot**

**Slots**

- **data.input** An `data.frame`/matrix containing the data to be segmented. Each column stores a signal.
- **data.output** A matrix containing the input data which has been smoothed.
- **lambda** A penalty term, small value leads to large number of breakpoints, and vice versa.
- **brkps** A vector containing the locations of common breakpoints.
- **fmin** A numeric containing the optimal numerical value calculated.
- **date** Character string containing date information.

---

**multi_plot**  
*Plot function of MSigSeg package.*

**Description**

Graph signals and breakpoints based on ggplot2 and ggarange packages.

**Usage**

```r
multi_plot(m, ncol, nrow)
```

**Arguments**

- `m` An object of S4 class "MSigSeg".
- `ncol` Column numbers of signals arrangement in the graph.
- `nrow` Row numbers of signals arrangement in the graph

**Value**

A list, first item in the list is a graphic objects with all signals drawn and second is a list with individual signals.

**Examples**

```r
data(data_test)
m <- segmentation(data_test,100)
p <- multi_plot(m,4,5)
```
NCHSData

*influenza data set from CDC used as an example.*

**Description**

*influenza data set from CDC used as an example.*

**Usage**

NCHSData

**Format**

A matrix with 52 rows and 10 columns.

**Examples**

```r
data("NCHSData",package = "MSigSeg")
```

noisegen

*Noisegen.*

**Description**

Generate matrix based on signal-to-noise ratio.

**Usage**

noisegen(X, SNR)

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>A matrix users aimed to add signal-to-noise ratio.</td>
</tr>
<tr>
<td>SNR</td>
<td>Signal-to-noise ratio.</td>
</tr>
</tbody>
</table>

**Value**

A matrix with specified signal-to-noise ratio.
**print**  
*

Generic Function-print.

---

**Description**

This function print the basic information of MSigSeg object.

**Usage**

```r
## S4 method for signature 'MSigSeg'
print(object)
```

**Arguments**

- `object` A MSigSeg object.

**Details**

This function is a S4 method for MSigSeg object. It prints class, slots, created date and summary of MSigSeg object.

**Value**

The the basic information of MSigSeg object.

**Examples**

```r
x=new("MSigSeg") # Creating a new MSigSeg object.
print(x)
```

---

**seg.len**  
*

Generic Function-seg.len.

---

**Description**

This function returns the length of segmentation.

**Usage**

```r
## S4 method for signature 'MSigSeg'
seg.len(object)
```

**Arguments**

- `object` A MSigSeg object.
segmentation

Details

This function is a S4 method for MSigSeg object. It calculates the distance between each change points.

Value

A vector contains length of segmentation.

Examples

x=new("MSigSeg") # Creating a new MSigSeg object.
seg.len(x)

data(data_test)
segmentation(data_test,100)
### stock

**Description**

A stock data set used as an example.

**Usage**

stock

**Format**

A data.frame with 757 rows and 488 columns.

**Examples**

```r
data("stock", package = "MSigSeg")
```

### summary

**Generic Function**

**summary**

**Description**

This function summarize the information of MSigSeg object.

**Usage**

```r
## S4 method for signature 'MSigSeg'
summary(object)
```

**Arguments**

- **object**: A MSigSeg object.

**Details**

This function is a S4 method for MSigSeg object. It summarizes the number of signals, length of signals, number of change points and fmin.

**Value**

A summary of MSigSeg object.

**Examples**

```r
x = new("MSigSeg") # Creating a new MSigSeg object.
summary(x)
```
T16M

A chromosome sequencing data set used as an example.

Description

A chromosome sequencing data set used as an example.

Usage

T16M

Format

A data.frame with 2928 rows and 22 columns.

References

Examples

data("T16M",package = "MSigSeg")

T16P

A chromosome sequencing data set used as an example.

Description

A chromosome sequencing data set used as an example.

Usage

T16P

Format

A data.frame with 2928 rows and 16 columns.

References

Examples

data("T16P",package = "MSigSeg")
