Package ‘PanelCount’

October 12, 2022

Type Package
Title Random Effects and/or Sample Selection Models for Panel Count Data
Version 2.0.0
Date 2022-10-05
Author Jing Peng
Maintainer Jing Peng <jing.peng@uconn.edu>
Description A high performance package implementing random effects and/or sample selection models for panel count data. The details of the models are discussed in Peng and Van den Bulte (2022) <doi:10.2139/ssrn.2702053>.

Panel Count Models with Random Effects and/or Sample Selection

Description

A high performance package for estimating panel count models with random effects and/or sample selection.

Functions

ProbitRE: Probit model with random effects on individuals

PoissonRE: Poisson model with random effects on individuals

PLN_RE: Poisson Lognormal model with random effects on individuals

ProbitRE_PoissonRE: PoissonRE and ProbitRE model with correlated random effects on individuals

ProbitRE_PLNRE: PLN_RE and ProbitRE model with correlated random effects on individual level and correlated error terms on individual-time level

References

Description

Estimate a Poisson model with random effects at the individual and individual-time levels.

\[ E[y_{it} | x_{it}, v_i, \epsilon_{it}] = \exp(\beta x_{it}' + \sigma v_i + \gamma \epsilon_{it}) \]

Notations:

- \( x_{it} \): variables influencing the selection decision \( y_{it} \), which could be a mixture of time-variant variables, time-invariant variables, and time dummies
- \( v_i \): individual level random effect
- \( \epsilon_{it} \): individual-time level random effect

\( v_i \) and \( \epsilon_{it} \) can both account for overdispersion.

Usage

```r
PLN_RE(
  formula, 
  data, 
  id.name, 
  par = NULL, 
  sigma = NULL, 
  gamma = NULL, 
  method = "BFGS", 
  adaptiveLL = TRUE, 
  stopUpdate = FALSE, 
  se_type = c("BHHH", "Hessian")[1], 
  H = 12, 
  psnH = 12, 
  reltol = sqrt(.Machine$double.eps), 
  verbose = 0 
)
```

Arguments

- `formula`: Formula of the model
- `data`: Input data, a data.frame object
- `id.name`: The name of the column representing id. Data will be sorted by id to improve estimation speed.
- `par`: Starting values for estimates. Default to estimates of Poisson RE model.
- `sigma`: Starting value for sigma. Defaults to 1 and will be ignored if par is provided.
- `gamma`: Starting value for gamma. Defaults to 1 and will be ignored if par is provided.
**method**
Optimization method used by optim. Defaults to 'BFGS'.

**adaptiveLL**
Whether to use Adaptive Gaussian Quadrature. Defaults to TRUE because it is more reliable (though slower) for long panels.

**stopUpdate**
Whether to disable update of Adaptive Gaussian Quadrature parameters. Defaults to FALSE.

**se_type**
Report Hessian or BHHH standard errors. Defaults to BHHH.

**H**
Number of Quadrature points used for numerical integration using the Gaussian-Hermite Quadrature method. Defaults to 20.

**psnH**
Number of Quadrature points for Poisson RE model

**reltol**
Relative convergence tolerance. The algorithm stops if it is unable to reduce the value by a factor of reltol * (abs(val) + reltol) at a step. Defaults to sqrt(.Machine$double.eps), typically about 1e-8.

**verbose**
A integer indicating how much output to display during the estimation process.
- `<0` - No output
- `0` - Basic output (model estimates)
- `1` - Moderate output, basic output + parameter and likelihood in each iteration
- `2` - Extensive output, moderate output + gradient values on each call

**Value**
A list containing the results of the estimated model, some of which are inherited from the return of optim

- **estimates**: Model estimates with 95% confidence intervals
- **par**: Point estimates
- **var_bhhh**: BHHH covariance matrix, inverse of the outer product of gradient at the maximum
- **var_hessian**: Inverse of negative Hessian matrix (the second order derivative of likelihood at the maximum)
- **se_bhhh**: BHHH standard errors
- **g**: Gradient function at maximum
- **gtHg**: $g' H^{-1} g$, where $H^{-1}$ is approximated by var_bhhh. A value close to zero (e.g., <1e-3 or 1e-6) indicates good convergence.
- **LL**: Likelihood
- **AIC**: AIC
- **BIC**: BIC
- **n_obs**: Number of observations
- **time**: Time takes to estimate the model
- **partial**: Average partial effect at the population level
- **partialAvgObs**: Partial effect for an individual with average characteristics
- **predict**: A list with predicted participation probability (prob), predicted potential outcome (outcome), and predicted actual outcome (actual_outcome).
• counts: From optim. A two-element integer vector giving the number of calls to fn and gr respectively. This excludes those calls needed to compute the Hessian, if requested, and any calls to fn to compute a finite-difference approximation to the gradient.

• message: From optim. A character string giving any additional information returned by the optimizer, or NULL.

• convergence: From optim. An integer code. 0 indicates successful completion. Note that the list inherits all the complements in the output of optim. See the documentation of optim for more details.

Other PanelCount: `PoissonRE()`, `ProbitRE_PLNRE()`, `ProbitRE_PoissonRE()`, `ProbitRE()`

Examples

```r
# Use the simulated dataset, in which the true coefficient of x is 1.
# Estimated coefficient is biased due to omission of self-selection
res = PLN_RE(y~x, data=sim[!is.na(sim$y), ], id.name='id', verbose=-1)
res$estimates
```

### PoissonRE

#### A Poisson Model with Random Effects

**Description**

Estimate a Poisson model with random effects at the individual level.

\[
E[y_{it}|x_{it}, v_i] = exp(\beta x_{it}^T + \sigma v_i)
\]

Notations:

- \( x_{it} \): variables influencing the outcome \( y_{it} \), which could be a mixture of time-variant variables, time-invariant variables, and time dummies
- \( v_i \): individual level random effect
Usage

PoissonRE(
  formula,
  data,
  id.name,
  par = NULL,
  sigma = NULL,
  method = "BFGS",
  stopUpdate = FALSE,
  se_type = c("Hessian", "BHHH")[1],
  H = 20,
  reltol = sqrt(.Machine$double.eps),
  verbose = 0
)

**predict_ProbitRE_PLNRE**

*Predictions of CRE_SS model on new sample*

**Description**

Predictions of CRE_SS model on new sample. Please make sure the factor variables in the test data do not have levels not shown in the training data.

**Usage**

```r
predict_ProbitRE_PLNRE(
  par,
  sel_form,
  out_form,
  data,
  offset_w_name = NULL,
  offset_x_name = NULL
)
```

**Arguments**

- **par**: Model estimates
- **sel_form**: Formula for selection equation, a Probit model with random effects
- **out_form**: Formula for outcome equation, a Poisson Lognormal model with random effects
- **data**: Input data, a data.frame object
- **offset_w_name**: Offset variables in selection equation, if any.
- **offset_x_name**: Offset variables in outcome equation, if any.

**Value**

A list with three sets of predictions

- **prob**: Predicted probability to participate
- **outcome**: Predicted potential outcome
- **actual_outcome**: Predicted actual outcome
**predict_ProbitRE_PoissonRE**

**Predictions of CRE model on new sample**

**Description**

Predictions of CRE model on new sample. Please make sure the factor variables in the test data do not have levels not shown in the training data.

**Usage**

```r
predict_ProbitRE_PoissonRE(par, sel_form, out_form, data, offset_w_name = NULL, offset_x_name = NULL)
```

**Arguments**

- **par**: Model estimates
- **sel_form**: Formula for selection equation, a Probit model with random effects
- **out_form**: Formula for outcome equation, a Poisson Lognormal model with random effects
- **data**: Input data, a data.frame object
- **offset_w_name**: Offset variables in selection equation, if any.
- **offset_x_name**: Offset variables in outcome equation, if any.

**Value**

A list with three sets of predictions

- **prob**: Predicted probability to participate
- **outcome**: Predicted potential outcome
- **actual_outcome**: Predicted actual outcome
A Probit Model with Random Effects

Description

Estimate a Probit model with random effects at the individual level.

\[ z_{it} = 1(\alpha w_{it}' + \delta u_i + \xi_{it} > 0) \]

Notations:

- \( w_{it} \): variables influencing the selection decision \( z_{it} \), which could be a mixture of time-variant variables, time-invariant variables, and time dummies
- \( u_i \): individual level random effect
- \( \xi_{it} \): error term

Usage

```r
ProbitRE(
  formula, data, id.name, par = NULL, delta = NULL, method = "BFGS", se_type = c("Hessian", "BHHH")[1], H = 20, reltol = sqrt(.Machine$double.eps), verbose = 0)
```

Arguments

- `formula`: Formula of the model
- `data`: Input data, a data.frame object
- `id.name`: The name of the column representing id. Data will be sorted by id to improve estimation speed.
- `par`: Starting values for estimates. Default to estimates of Probit model.
- `delta`: Starting value for delta. Defaults to 1 and will be ignored if par is provided.
- `method`: Optimization method used by optim. Defaults to 'BFGS'.
- `se_type`: Report Hessian or BHHH standard errors. Defaults to Hessian.
- `H`: Number of Quadrature points used for numerical integration using the Gaussian-Hermite Quadrature method. Defaults to 20.
ProbitRE

**reltol**
Relative convergence tolerance. The algorithm stops if it is unable to reduce the value by a factor of reltol * (abs(val) + reltol) at a step. Defaults to sqrt(.Machine$double.eps), typically about 1e-8.

**verbose**
A integer indicating how much output to display during the estimation process.
- <0 - No output
- 0 - Basic output (model estimates)
- 1 - Moderate output, basic output + parameter and likelihood in each iteration
- 2 - Extensive output, moderate output + gradient values on each call

**Value**
A list containing the results of the estimated model, some of which are inherited from the return of optim
- estimates: Model estimates with 95% confidence intervals
- par: Point estimates
- var_bhhh: BHHH covariance matrix, inverse of the outer product of gradient at the maximum

ProbitRE_PLNRE

Poisson Lognormal Model with Random Effects and Sample Selection

Description

Estimates the following two-stage model:

Selection equation (ProbitRE - Probit model with individual level random effects):

$$z_{it} = 1(\alpha w_{it}' + \delta u_i + \xi_{it} > 0)$$

Outcome Equation (PLN_RE - Poisson Lognormal model with individual-time level random effects):

$$E[y_{it}|x_{it}, v_i, \epsilon_{it}] = \exp(\beta x_{it}' + \sigma v_i + \gamma \epsilon_{it})$$

Correlation (self-selection at both individual and individual-time level):

- $u_i$ and $v_i$ are bivariate normally distributed with a correlation of $\rho$.
- $\xi_{it}$ and $\epsilon_{it}$ are bivariate normally distributed with a correlation of $\tau$.

Notations:

- $w_{it}$: variables influencing the selection decision $z_{it}$, which could be a mixture of time-variant variables, time-invariant variables, and time dummies
- $x_{it}$: variables influencing the outcome $y_{it}$, which could be a mixture of time-variant variables, time-invariant variables, and time dummies
- $u_i$: individual level random effect in the selection equation
- $v_i$: individual level random effect in the outcome equation
- $\xi_{it}$: error term in the selection equation
- $\epsilon_{it}$: individual-time level random effect in the outcome equation

Usage

ProbitRE_PLNRE(
    sel_form,
    out_form,
    data,
    id.name,
    testData = NULL,
    par = NULL,
    disable_rho = FALSE,
    disable_tau = FALSE,
    delta = NULL,
    sigma = NULL,
    gamma = NULL,
    rho = NULL,
    tau = NULL,
method = "BFGS",
se_type = c("BHHH", "Hessian")[1],
H = c(10, 10),
psnH = 20,
prbH = 20,
plnreH = 20,
reltol = sqrt(.Machine$double.eps),
factr = 1e+07,
verbose = 1,
offset_w_name = NULL,
offset_x_name = NULL
)

Arguments

sel_form  Formula for selection equation, a Probit model with random effects
out_form  Formula for outcome equation, a Poisson Lognormal model with random effects
data      Input data, a data.frame object
id.name   The name of the column representing id. Data will be sorted by id to improve estimation speed.
testData  Test data for prediction, a data.frame object
par       Starting values for estimates. Default to estimates of standalone selection and outcome models.
disable_rho Whether to disable correlation at the individual level random effect. Defaults to FALSE.
disable_tau Whether to disable correlation at the individual-time level random effect / error term. Defaults to FALSE.
delta     Starting value for delta. Will be ignored if par is provided.
sigma     Starting value for sigma. Will be ignored if par is provided.
gamma     Starting value for gamma. Will be ignored if par is provided.
rho       Starting value for rho. Defaults to 0 and will be ignored if par is provided.
tau       Starting value for tau. Defaults to 0 and will be ignored if par is provided.
method    Optimization method used by optim. Defaults to 'BFGS'.
se_type   Report Hessian or BHHH standard errors. Defaults to BHHH. Hessian matrix is extremely time-consuming to calculate numerically for large datasets.
H         A integer vector of length 2, specifying the number of points for inner and outer Quadratures
psnH      Number of Quadrature points for Poisson RE model
prbH      Number of Quadrature points for Probit RE model
plnreH    Number of Quadrature points for PLN_RE model
reltol    Relative convergence tolerance. The algorithm stops if it is unable to reduce the value by a factor of reltol * (abs(val) + reltol) at a step. Defaults to sqrt(.Machine$double.eps), typically about 1e-8.
factr  

L-BFGS-B method uses factr instead of reltol to control for precision. Default is 1e7, that is a tolerance of about 1e-8.

verbose  

A integer indicating how much output to display during the estimation process.

• <0 - No output
• 0 - Basic output (model estimates)
• 1 - Moderate output, basic output + parameter and likelihood in each iteration
• 2 - Extensive output, moderate output + gradient values on each call

offset_w_name  

An offset variable whose coefficient is assumed to be 1 in the selection equation

offset_x_name  

An offset variable whose coefficient is assumed to be 1 in the outcome equation

Value  

A list containing the results of the estimated model, some of which are inherited from the return of optim

• estimates: Model estimates with 95% confidence intervals
• par: Point estimates
• var_bhhh: BHHH covariance matrix, inverse of the outer product of gradient at the maximum
• se_bhhh: BHHH standard errors
• g: Gradient function at maximum
• g'Hg: \( g' H^{-1} g \), where \( H^{-1} \) is approximated by var_bhhh. A value close to zero (e.g., <1e-3 or 1e-6) indicates good convergence.
• LL: Likelihood
• AIC: AIC
• BIC: BIC
• n_obs: Number of observations
• time: Time takes to estimate the model
• partial: Average partial effect at the population level
• paritalAvgObs: Partial effect for an individual with average characteristics
• predict: A list with predicted participation probability (prob), predicted potential outcome (outcome), and predicted actual outcome (actual_outcome).
• counts: From optim. A two-element integer vector giving the number of calls to fn and gr respectively. This excludes those calls needed to compute the Hessian, if requested, and any calls to fn to compute a finite-difference approximation to the gradient.
• message: From optim. A character string giving any additional information returned by the optimizer, or NULL.
• convergence: From optim. An integer code. 0 indicates successful completion. Note that the list inherits all the complements in the output of optim. See the documentation of optim for more details.

ProbitRE_PoissonRE

Poisson RE model with Sample Selection

Description

Estimates the following two-stage model

Selection equation (ProbitRE - Probit model with individual level random effects):

\[ z_{it} = 1(\alpha w_{it}' + \delta u_i + \xi_{it} > 0) \]

Outcome Equation (PoissonRE - Poisson with individual level random effects):

\[ E[y_{it}|x_{it}, v_i] = exp(\beta x_{it}' + \sigma v_i) \]

Correlation (self-selection at individual level):

- \( u_i \) and \( v_i \) are bivariate normally distributed with a correlation of \( \rho \).

Notations:

- \( w_{it} \): variables influencing the selection decision \( z_{it} \), which could be a mixture of time-variant variables, time-invariant variables, and time dummies
- \( x_{it} \): variables influencing the outcome \( y_{it} \), which could be a mixture of time-variant variables, time-invariant variables, and time dummies
- \( u_i \): individual level random effect in the selection equation
- \( v_i \): individual level random effect in the outcome equation
- \( \xi_{it} \): error term in the selection equation
Usage

sim          Simulated dataset with self-selection at both individual and individual-time level

Description
A simulated dataset with 200 individuals and 10 periods. The true data generating process is the following:

Selection equation (ProbitRE - Probit model with individual level random effects):
\[ z_{it} = 1(1 + x_{it} + w_{it} + u_i + \xi_{it}) > 0 \]

Outcome Equation (PLN_RE - Poisson Lognormal model with individual-time level random effects):
\[ E[y_{it}|x_{it}, v_i, \epsilon_{it}] = \exp(-1 + x_{it} + v_i + \epsilon_{it}) \]

Correlation (self-selection at both individual and individual-time level):
- \( u_i \) and \( v_i \) are bivariate normally distributed with a correlation of 0.25.
- \( \xi_{it} \) and \( \epsilon_{it} \) are bivariate normally distributed with a correlation of 0.5.

Usage
sim

Format
A simulated dataset with 200 individuals and 10 periods.

id  id, from 1-200

forcing Time periods, from 1-10

z  Whether an individual is selected in a given period. Outcome is observed only when z=1

y  The outcome of an individual in a given period

x  A covariate influencing both z and y, with true effects being 1

w  A covariate influencing only z, with true effect being 1
