Package ‘PhitestR’

October 12, 2022

Type Package

Title Analyzing the Heterogeneity of Single-Cell Populations

Version 0.2.0

Description A bioinformatics method developed for analyzing the heterogeneity of single-cell populations. Phitest provides an objective and automatic method to evaluate the performance of clustering and quality of cell clusters.

Index 3

1
Phitest for analyzing the heterogeneity of single-cell populations

Usage

phitest(object, label, ncores = 1, min.cell = 10)

Arguments

object A matrix of single-cell UMI counts (rows for genes and columns for cells).
label A character or numeric vector of cluster labels. Length should be the same as cell number and order should match the order in object.
ncores Number of cores used for parallel computation.
min.cell An integer specifying a threshold to filter genes. Genes expressed in fewer than min.cell cells are filtered out.

Value

A list of two elements: pval contains the P values, and par contains the estimated parameters.
