Package ‘RGraphics’

June 30, 2020

Title  Data and Functions from the Book R Graphics, Third Edition
Version  3.0-2
Author  Paul Murrell
Description  Data and Functions from the book R Graphics, Third Edition. There is a function to produce each figure in the book, plus several functions, classes, and methods defined in Chapter 8.
Maintainer  Paul Murrell <paul@stat.auckland.ac.nz>
Depends  R (>= 3.4.0), datasets, stats, grDevices, graphics, methods, grid
Imports  lattice, ggplot2, grImport, grImport2, gridBase, gridGraphics, gridSVG
Suggests  cluster, colorspace, jpeg, KernSmooth, mapdata, maps, party, pixmap, png, quantmod, rsvg, showtext, sysfonts, tikzDevice, XML, zoo
License  GPL
LazyData  yes
NeedsCompilation  no
Repository  CRAN
Date/Publication  2020-06-30 04:30:03 UTC

Description

Usage

AABA

Format

A time series.

face

Draw a face

Description

Draws a face, consisting of a rectangle for the border, circles for eyes, and a line for the mouth.

Usage

faceA(x, y, width, height)
faceB(x, y, width, height)
faceC(x, y, width, height)
faceD(x, y, width, height)

Arguments

x, y, width, height

Numeric values or unit objects specifying the location and size of the face.

Details

The functions `faceA` and `faceB` are graphics functions to be used for their side effect of producing graphical output. The functions `faceC` and `faceD` return a grob representing a face (and produce no output).
fluoro.predict

---

**fluoro.predict**

*Predicted Surface of Fluorescence*

---

**Description**

These data give a prediction surface for fluorescence at the thermocline over a region off the coast of South Australia.

**Usage**

```r
fluoro.predict
```

**Format**

A list with elements:

- `x` containing longitude at 50 locations;
- `y` containing latitude at 50 locations;
- `z` containing a 50 by 50 matrix of surface predictions.

**References**

---

**grid.utex**

*Draw Underlined Text*

---

**Description**

Draws a single piece of text with a line beneath.

**Usage**

```r
grid.utex(label, x=.5, y=.5, ..., name="utex")
textCorners(x)
```

**Arguments**

- `label` A character value.
- `x, y` Numeric or unit value.
- `...` Further arguments passed to `grid.text`.
- `name` Character value.
grid.utextvp  

*Draw Underlined Text*

**Description**

Draws a single piece of text with a line beneath.

**Usage**

```r
grid.utextvp(label, x=.5, y=.5, ..., name="utext")
utextvp(label, x, y, ..., name="utextvp")
```

**Arguments**

- `label` A character value.
- `x, y` Numeric or unit value.
- `...` Further arguments passed to `grid.text`.
- `name` Character value.

**hourlySpeed**  

*Auckland Wind Data*

**Description**

These data give measurements of hourly average wind speed based on data from 11 weather stations located around Auckland, New Zealand. There are hourly readings every day for one month (September 2010).

**Usage**

```r
hourlySpeed
```

**Format**

A data frame with columns:

- **Speed** The wind speed.
- **day** Day of the year, from 237 to 271.
- **hour** Hour of the day, from 0 to 23.

**References**

The data were obtained from the New Zealand National Climate Database ([http://cliflo.niwa.co.nz/](http://cliflo.niwa.co.nz/)).
ozTemp

**Temperatures for Australian Cities**

**Description**
These data give average minimum and maximum monthly temperatures for several major cities in Australia. The longitude and latitude for each city is also given.

**Usage**
data(ozTemp)

**Format**
A data frame with elements: city names of cities; min and max average minimum and maximum monthly temperatures; long and lat longitudes and latitudes of cities.

**Source**
Was originally http://www.auinfo.com/sydney-climate.html but that URL is no longer alive.

---

**plot.newclass**

**A Traditional Graphics Function Template**

**Description**
A template that provides a starting point for writing a new traditional graphics function.

**Details**
Type plot.newclass to see the body of this template.

---

**splitString**

**Split text into multiple lines**

**Description**
Splits a single string into multiple lines (by inserting line breaks) so that the output will fit within the current viewport.

**Usage**
splitString(text)

**Arguments**
- text The string to split.
splitTextGrob  
*Split text into multiple lines*

**Description**

Splits a single string into multiple lines (by inserting line breaks) so that the output will fit within the current viewport.

**Usage**

```r
splitTextGrob(text, ...)
```

**Arguments**

- `text`  
The string to split.
- `...`  
Arguments passed to the `grob()` function.

---

utextDynamic  
*Draw Underlined Text*

**Description**

Creates a grob representing underlined text.

**Usage**

```r
utextDynamic(label, x=.5, y=.5, default.units="npc", just="centre", name="utext")
```

**Arguments**

- `label`  
A character value.
- `x, y`  
Numeric or unit value.
- `default.units`  
Units to use if location is not a unit.
- `just`  
Character vector indicating justification of text relative to its location.
- `name`  
Character value.
**utextStatic**

*Draw Underlined Text*

**Description**

Creates a grob representing underlined text.

**Usage**

```r
utextStatic(label, x=.5, y=.5, default.units="npc", just="centre", name="utext")
utextChildren(label, x, y, just, name)
```

**Arguments**

- `label`: A character value.
- `x, y`: Numeric or unit value.
- `default.units`: Units to use if location is not a unit.
- `just`: Character vector indicating justification of text relative to its location.
- `name`: Character value.

---

**utextvpDynamic**

*Draw Underlined Text*

**Description**

Creates a grob representing underlined text.

**Usage**

```r
utextvpDynamic(label, x=.5, y=.5, default.units="npc", just="centre", angle=0, name="utext")
```

**Arguments**

- `label`: A character value.
- `x, y`: Numeric or unit value.
- `default.units`: Units to use if location is not a unit.
- `just`: Character vector indicating justification of text relative to its location.
- `angle`: Numeric angle of text (in degrees).
- `name`: Character value.
utextvpStatic  
*Draw Underlined Text*

**Description**

Creates a grob representing underlined text.

**Usage**

```r
utextvpStatic(label, x=.5, y=.5, default.units="npc", angle=0, just="centre", name="utext")
```

```r
utextvpChildren(label, name)
```

**Arguments**

- `label`: A character value.
- `x, y`: Numeric or unit value.
- `default.units`: Units to use if location is not a unit.
- `angle`: Numeric angle of text (in degrees).
- `just`: Character vector indicating justification of text relative to its location.
- `name`: Character value.

---

wind9am  
*Auckland Wind Data*

**Description**

These data give measurements of wind speed and direction at several weather stations located around Auckland New Zealand. The measurements are daily recordings taken at 9:00am each day spanning a period of approximately two years (September 2008 to September 2010).

**Usage**

`wind9am`

**Format**

A data frame with columns:

- **Station**: A unique identifier for each weather station.
- **Date**: A Date-Time for each observation (essentially just the day).
- **Speed**: The wind speed.
- **Dir**: The wind direction (in degrees).
References

The data were obtained from the New Zealand National Climate Database (http://cliflo.niwa.co.nz/).
