Package ‘RMariaDB’

May 27, 2024

Title Database Interface and MariaDB Driver

Version 1.3.2

Description Implements a DBI-compliant interface to MariaDB
(<https://mariadb.org/>) and MySQL (<https://www.mysql.com/>)
databases.

Client-flags  

### Description

Use for the client.flag argument to `dbConnect()`, multiple flags can be combined with + or `bitwOr()`. The flags are provided for completeness. To enforce SSL for the DB connection, add the flag `CLIENT_SSL`.

### See Also

### Examples

```r
## Not run:
library(DBI)
library(RMariaDB)
con1 <- dbConnect(MariaDB(), client.flag = CLIENT_COMPRESS)
con2 <- dbConnect(
  MariaDB(),
  client.flag = bitwOr(CLIENT_COMPRESS, CLIENT_SSL)
)
## End(Not run)
```

---

## dbDataType

**Determine the SQL Data Type of an S object**

### Description

This method is a straightforward implementation of the corresponding generic function.

### Usage

```r
## S4 method for signature 'MariaDBConnection'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'MariaDBDriver'
dbDataType(dbObj, obj, ...)
```

### Arguments

- `dbObj`  
  A `MariaDBDriver` or `MariaDBConnection` object.
- `obj`  
  R/S-Plus object whose SQL type we want to determine.
- `...`  
  any other parameters that individual methods may need.
**MariaDB**  

**Examples**

```r
dbDataType(RMariaDB::MariaDB(), "a")
```

```r
dbDataType(RMariaDB::MariaDB(), 1:3)
```

```r
dbDataType(RMariaDB::MariaDB(), 2.5)
```

---

**MariaDB**  

*Connect/disconnect to a MariaDB DBMS*

---

**Description**

These methods are straight-forward implementations of the corresponding generic functions.

**Usage**

```r
MariaDB()
```

```r
## S4 method for signature 'MariaDBDriver'
dbConnect(
 drv,
  dbname = NULL,
  username = NULL,
  password = NULL,
  host = NULL,
  unix.socket = NULL,
  port = 0,
  client.flag = 0,
  group = "rs-dbi",
  default.file = NULL,
  ssl.key = NULL,
  ssl.cert = NULL,
  ssl.ca = NULL,
  ssl.capath = NULL,
  ssl.cipher = NULL,
  ...
)
```

```r
load_data_local_infile = FALSE,
bigint = c("integer64", "integer", "numeric", "character"),
timeout = 10,
timezone = "+00:00",
timezone_out = NULL,
reconnect = FALSE,
mysql = NULL
)```
Arguments

</tr>
<tr>
<td></td>
<td>setting does not change the time values returned, only their display.</td>
</tr>
</tbody>
</table>
reconnect (experimental) Set to TRUE to use MYSQL_OPT_RECONNECT to enable automatic reconnection. This is experimental and could be dangerous if the connection is lost in the middle of a transaction.

mysql Set to TRUE/FALSE to connect to a MySQL server or to a MariaDB server, respectively. The RMariaDB package supports both MariaDB and MySQL servers, but the SQL dialect and other details vary. The default is to assume MariaDB if the version is >= 10.0.0, and MySQL otherwise.

Time zones

MySQL and MariaDB support named time zones, they must be installed on the server. See https://dev.mysql.com/doc/mysql-g11n-excerpt/8.0/en/time-zone-support.html for more details. Without installation, time zone support is restricted to UTC offset, which cannot take into account DST offsets.

Secure passwords

Avoid storing passwords hard-coded in the code, use e.g. the keyring package to store and retrieve passwords in a secure way.

The MySQL client library (but not MariaDB) supports a .mylogin.cnf file that can be passed in the default.file argument. This file can contain an obfuscated password, which is not a secure way to store passwords but may be acceptable if the user is aware of the restrictions. The availability of this feature depends on the client library used for compiling the RMariaDB package. Windows and macOS binaries on CRAN are compiled against the MariaDB Connector/C client library which do not support this feature.

References

Examples

```r
if (mariadbHasDefault()) {
  # connect to a database and load some data
  con <- dbConnect(RMariaDB::MariaDB(), dbname = "test")
  dbWriteTable(con, "USArrests", datasets::USArrests, temporary = TRUE)
  
  # query
  rs <- dbSendQuery(con, "SELECT * FROM USArrests")
  d1 <- dbFetch(rs, n = 10)  # extract data in chunks of 10 rows
  dbHasCompleted(rs)
  d2 <- dbFetch(rs, n = -1)  # extract all remaining data
  dbHasCompleted(rs)
  dbClearResult(rs)
  dbListTables(con)
  
  # clean up
  dbDisconnect(con)
}
```

## Not run:
# Connect to a MariaDB database running locally
con <- dbConnect(RMariaDB::MariaDB(), dbname = "mydb")
# Connect to a remote database with username and password
con <- dbConnect(RMariaDB::MariaDB(),
  host = "mydb.mycompany.com",
  user = "abc", password = "def"
)
# But instead of supplying the username and password in code, it's usually
# better to set up a group in your .my.cnf (usually located in your home
# directory). Then it's less likely you'll inadvertently share them.
con <- dbConnect(RMariaDB::MariaDB(), group = "test")

# To connect to a remote database and require the use of SSL
(and an example of using environment variables for your sensitive info)
con <- dbConnect(RMariaDB::MariaDB(),
  dbname = Sys.getenv("DB_NAME"),
  host = Sys.getenv("DB_HOST"),
  user = Sys.getenv("DB_USER"),
  password = Sys.getenv("DB_PASSWORD"),
  client.flag = CLIENT_SSL
)

# Always cleanup by disconnecting the database
dbDisconnect(con)

## End(Not run)

if (mariadbHasDefault()) {
  con <- dbConnect(RMariaDB::MariaDB(), dbname = "test")
  con
dbDisconnect(con)
}

---

## mariadb-tables

Read and write MariaDB tables.

### Description

These methods read or write entire tables from a MariaDB database.

### Usage

```r
## S4 method for signature 'MariaDBConnection'
dbAppendTable(conn, name, value, ..., row.names = NULL)
```

```r
## S4 method for signature 'MariaDBConnection,character'
dbExistsTable(conn, name, ...)```

## S4 method for signature 'MariaDBConnection'
dbListObjects(conn, prefix = NULL, ...)

## S4 method for signature 'MariaDBConnection'
dbListTables(conn, ...)

## S4 method for signature 'MariaDBConnection,character'
dbReadTable(conn, name, ..., row.names = FALSE, check.names = TRUE)

## S4 method for signature 'MariaDBConnection,character'
dbRemoveTable(conn, name, ..., temporary = FALSE, fail_if_missing = TRUE)

## S4 method for signature 'MariaDBConnection,character,character'
dbWriteTable(
  conn,
  name,
  value,
  field.types = NULL,
  overwrite = FALSE,
  append = FALSE,
  header = TRUE,
  row.names = FALSE,
  nrows = 50,
  sep = ",",
  eol = "\n",
  skip = 0,
  quote = "\\",
  temporary = FALSE,
  ...
)

## S4 method for signature 'MariaDBConnection,character,data.frame'
dbWriteTable(
  conn,
  name,
  value,
  field.types = NULL,
  row.names = FALSE,
  overwrite = FALSE,
  append = FALSE,
  ..., temporary = FALSE
)

### Arguments

- **conn**  
  a `MariaDBConnection` object, produced by `DBI::dbConnect()`

- **name**  
  a character string specifying a table name.
value

A data frame.

...Unused, needed for compatibility with generic.

row.names

Either TRUE, FALSE, NA or a string.

If TRUE, always translate row names to a column called "row_names". If FALSE, never translate row names. If NA, translate rownames only if they're a character vector.

A string is equivalent to TRUE, but allows you to override the default name.

For backward compatibility, NULL is equivalent to FALSE.

prefix

A fully qualified path in the database's namespace, or NULL. This argument will be processed with dbUnquoteIdentifier(). If given the method will return all objects accessible through this prefix.

check.names

If TRUE, the default, column names will be converted to valid R identifiers.

temporary

If TRUE, creates a temporary table that expires when the connection is closed. For dbRemoveTable(), only temporary tables are considered if this argument is set to TRUE.

fail_if_missing

If FALSE, dbRemoveTable() succeeds if the table doesn't exist.

field.types

Optional, overrides default choices of field types, derived from the classes of the columns in the data frame.

overwrite

a logical specifying whether to overwrite an existing table or not. Its default is FALSE.

append

a logical specifying whether to append to an existing table in the DBMS. If appending, then the table (or temporary table) must exist, otherwise an error is reported. Its default is FALSE.

header

logical, does the input file have a header line? Default is the same heuristic used by read.table(), i.e., TRUE if the first line has one fewer column than the second line.

nrows

number of lines to rows to import using read.table from the input file to create the proper table definition. Default is 50.

sep

field separator character

eol

End-of-line separator

skip

number of lines to skip before reading data in the input file.

quote

the quote character used in the input file (defaults to "").

Details

When using load_data_local_infile = TRUE in dbConnect(), pass safe = FALSE to dbAppendTable() to avoid transactions. Because LOAD DATA INFILE is used internally, this means that rows violating primary key constraints are now silently ignored.

Value

A data.frame in the case of dbReadTable(); otherwise a logical indicating whether the operation was successful.
Note

The data.frame returned by `dbReadTable()` only has primitive data, e.g., it does not coerce character data to factors. Temporary tables are ignored for `dbExistsTable()` and `dbListTables()` due to limitations of the underlying C API. For this reason, a prior existence check is performed only before creating a regular persistent table; an attempt to create a temporary table with an already existing name will fail with a message from the database driver.

Examples

```r
if (mariadbHasDefault()) {
  con <- dbConnect(RMariaDB::MariaDB(), dbname = "test")

  # By default, row names are written in a column to row_names, and
  # automatically read back into the row.names()
  dbWriteTable(con, "mtcars", mtcars[1:5, ], temporary = TRUE)
  dbReadTable(con, "mtcars")
  dbReadTable(con, "mtcars", row.names = FALSE)
}
```

mariadbClientLibraryVersions

MariaDB Check for Compiled Versus Loaded Client Library Versions

Description

This function prints out the compiled and loaded client library versions.

Usage

mariadbClientLibraryVersions()

Value

A named integer vector of length two, the first element representing the compiled library version and the second element representing the loaded client library version.

Examples

mariadbClientLibraryVersions()
mariadbHasDefault  
Check if default database is available.

Description
RMariaDB examples and tests connect to a database defined by the rs-dbi group in ~/.my.cnf. This function checks if that database is available, and if not, displays an informative message. mariadbDefault() works similarly but throws a testthat skip condition on failure, making it suitable for use in tests.

Usage
mariadbHasDefault()
mariadbDefault()

Examples
if (mariadbHasDefault()) {
  db <- dbConnect(RMariaDB::MariaDB(), dbname = "test")
  dbListTables(db)
  dbDisconnect(db)
}

query  
Execute a SQL statement on a database connection.

Description
To retrieve results a chunk at a time, use dbSendQuery(), dbFetch(), then dbClearResult(). Alternatively, if you want all the results (and they’ll fit in memory) use dbGetQuery() which sends, fetches and clears for you. For data manipulation queries (i.e. queries that do not return data, such as UPDATE, DELETE, etc.), dbSendStatement() serves as a counterpart to dbSendQuery(), while dbExecute() corresponds to dbGetQuery().

Usage
## S4 method for signature 'MariaDBResult'
dbBind(res, params, ...)

## S4 method for signature 'MariaDBResult'
dbClearResult(res, ...)

## S4 method for signature 'MariaDBResult'
dbFetch(res, n = -1, ..., row.names = FALSE)
## S4 method for signature 'MariaDBResult'
```
dbGetStatement(res, ...)
```

## S4 method for signature 'MariaDBConnection,character'
```
dbSendQuery(conn, statement, params = NULL, ..., immediate = FALSE)
```

## S4 method for signature 'MariaDBConnection,character'
```
dbSendStatement(conn, statement, params = NULL, ..., immediate = FALSE)
```

### Arguments

- **res**
  A `MariaDBResult` object.
- **params**
  A list of query parameters to be substituted into a parameterised query.
- **...**
  Unused. Needed for compatibility with generic.
- **n**
  Number of rows to retrieve. Use -1 to retrieve all rows.
- **row.names**
  Either `TRUE`, `FALSE`, `NA` or a string.
  - If `TRUE`, always translate row names to a column called "row_names". If `FALSE`, never translate row names. If `NA`, translate rownames only if they’re a character vector.
  - A string is equivalent to `TRUE`, but allows you to override the default name.
  - For backward compatibility, `NULL` is equivalent to `FALSE`.
- **conn**
  A `MariaDBConnection` object.
- **statement**
  A character vector of length one specifying the SQL statement that should be executed. Only a single SQL statement should be provided.
- **immediate**
  If `TRUE`, uses the `mysql_real_query()` API instead of `mysql_stmt_init()`. This allows passing multiple statements (with `CLIENT_MULTI_STATEMENTS`) and turns off the ability to pass parameters.

### Examples

```r
if (mariadbHasDefault()) {
  con <- dbConnect(RMariaDB::MariaDB(), dbname = "test")
  dbWriteTable(con, "arrests", datasets::USArrests, temporary = TRUE)

  # Run query to get results as dataframe
  dbGetQuery(con, "SELECT * FROM arrests limit 3")

  # Send query to pull requests in batches
  res <- dbSendQuery(con, "SELECT * FROM arrests")
  data <- dbFetch(res, n = 2)
  data
  dbHasCompleted(res)
  dbClearResult(res)
  dbDisconnect(con)
}
```
Description

See documentation of generics for more details.

Usage

```r
## S4 method for signature 'MariaDBResult'
dbColumnInfo(res, ...)

## S4 method for signature 'MariaDBResult'
dbGetRowCount(res, ...)

## S4 method for signature 'MariaDBResult'
dbGetRowsAffected(res, ...)

## S4 method for signature 'MariaDBResult'
dbHasCompleted(res, ...)
```

Arguments

- `res` An object of class `MariaDBResult`
- `...` Ignored. Needed for compatibility with generic

Examples

```r
if (mariadbHasDefault()) {
  con <- dbConnect(RMariaDB::MariaDB(), dbname = "test")
  dbWriteTable(con, "t1", datasets::USArrests, temporary = TRUE)

  rs <- dbSendQuery(con, "SELECT * FROM t1 WHERE UrbanPop >= 80")
  rs

  dbGetStatement(rs)
  dbHasCompleted(rs)
  dbColumnInfo(rs)

  dbFetch(rs)
  rs

  dbClearResult(rs)
  dbDisconnect(con)
}
```
**DBMS Transaction Management**

**Description**

Commits or roll backs the current transaction in an MariaDB connection. Note that in MariaDB DDL statements (e.g. `CREATE TABLE`) cannot be rolled back.

**Usage**

```r
## S4 method for signature 'MariaDBConnection'
dbBegin(conn, ...)

## S4 method for signature 'MariaDBConnection'
dbCommit(conn, ...)

## S4 method for signature 'MariaDBConnection'
dbRollback(conn, ...)
```

**Arguments**

- **conn**: a `MariaDBConnection` object, as produced by `DBI::dbConnect()`.
- **...**: Unused.

**Examples**

```r
if (mariadbHasDefault()) {
  con <- dbConnect(RMariaDB::MariaDB(), dbname = "test")
  df <- data.frame(id = 1:5)

  dbWriteTable(con, "df", df, temporary = TRUE)
  dbBegin(con)
  dbExecute(con, "UPDATE df SET id = id * 10")
  dbGetQuery(con, "SELECT id FROM df")
  dbRollback(con)

  dbGetQuery(con, "SELECT id FROM df")

  dbDisconnect(con)
}
```
