Package ‘RoBMA’

October 12, 2022

Title Robust Bayesian Meta-Analyses
Version 2.3.1
Maintainer František Bartoš <f.bartos96@gmail.com>
Description A framework for estimating ensembles of meta-analytic models (assuming either presence or absence of the effect, heterogeneity, and publication bias). The RoBMA framework uses Bayesian model-averaging to combine the competing meta-analytic models into a model ensemble, weights the posterior parameter distributions based on posterior model probabilities and uses Bayes factors to test for the presence or absence of the individual components (e.g., effect vs. no effect; Bartoš et al., 2021, <doi:10.31234/osf.io/kvsp7>; Maier, Bartoš & Wagenmakers, in press, <doi:10.31234/osf.io/u4cns>). Users can define a wide range of non-informative or informative prior distributions for the effect size, heterogeneity, and publication bias components (including selection models and PET-PEESE). The package provides convenient functions for summary, visualizations, and fit diagnostics.

Description

RoBMA: Bayesian model-averaged meta-analysis with adjustments for publication bias and ability to specify informed prior distributions and draw inference with inclusion Bayes factors.

User guide

See Bartoš et al. (2021), Maier et al. (in press), and Bartoš et al. (in press) for details regarding the RoBMA methodology.

More details regarding customization of the model ensembles are provided in the Reproducing BMA, BMA in Medicine, and Fitting Custom Meta-Analytic Ensembles vignettes. Please, use the "Issues" section in the GitHub repository to ask any further questions.

### Anderson2010

**27 experimental studies from Anderson et al. (2010) that meet the best practice criteria**

**Description**

The data set contains correlation coefficients, sample sizes, and labels for 27 experimental studies focusing on the effect of violent video games on aggressive behavior. The full original data can be found at https://github.com/Joe-Hilgard/Anderson-meta.

**Usage**

Anderson2010

**Format**

A data.frame with 3 columns and 23 observations.

**Value**

a data.frame.

**References**

---

### Bem2011

**9 experimental studies from Bem (2011) as described in Bem et al. (2011)**

**Description**

The data set contains Cohen’s d effect sizes, standard errors, and labels for 9 experimental studies of precognition from the infamous Bem (2011) as analyzed in his later meta-analysis (Bem et al. 2011).

**Usage**

Bem2011

**Format**

A data.frame with 3 columns and 9 observations.
References

Description

Checks fitted RoBMA object for warnings and errors and prints them to the console.

Usage

check_RoBMA(fit)

Arguments

fit a fitted RoBMA object.

Value

check_RoBMA returns a vector of error and warning messages.

Description

check_setup prints summary of “RoBMA” ensemble implied by the specified prior distributions. It is useful for checking the ensemble configuration prior to fitting all of the models.
Usage

check_setup(
  model_type = NULL,
  priors_effect = prior(distribution = "normal", parameters = list(mean = 0, sd = 1)),
  priors_heterogeneity = prior(distribution = "invgamma", parameters = list(shape = 1, scale = 0.15)),
  priors_bias = list(prior_weightfunction(distribution = "two.sided", parameters = list(alpha = c(1, 1), steps = c(0.05)), prior_weights = 1/12),
                    prior_weightfunction(distribution = "two.sided", parameters = list(alpha = c(1, 1, 1), steps = c(0.05, 0.1)), prior_weights = 1/12),
                    prior_weightfunction(distribution = "one.sided", parameters = list(alpha = c(1, 1, 1), steps = c(0.05)), prior_weights = 1/12),
                    prior_weightfunction(distribution = "one.sided", parameters = list(alpha = c(1, 1, 1), steps = c(0.05, 0.5)), prior_weights = 1/12),
                    prior_weightfunction(distribution = "one.sided", parameters = list(alpha = c(1, 1, 1, 1), steps = c(0.025, 0.05, 0.5)), prior_weights = 1/12),
                    prior_weightfunction(distribution = "one.sided", parameters = list(alpha = c(1, 1, 1, 1), steps = c(0.025, 0.05, 0.5)), prior_weights = 1/12),
                    prior_weightfunction(distribution = "Cauchy", parameters = list(0, 1), truncation = list(0, Inf), prior_weights = 1/4),
                    prior_weightfunction(distribution = "Cauchy", parameters = list(0, 5), truncation = list(0, Inf), prior_weights = 1/4)),
  priors_effect_null = prior(distribution = "point", parameters = list(location = 0)),
  priors_heterogeneity_null = prior(distribution = "point", parameters = list(location = 0)),
  priors_bias_null = prior_none(),
  priors_rho = prior("beta", parameters = list(alpha = 1, beta = 1)),
  priors_rho_null = NULL,
  models = FALSE,
  silent = FALSE
)

Arguments

model_type string specifying the RoBMA ensemble. Defaults to NULL. The other options are "PSMA", "PP", and "2w" which override settings passed to the priors_effect, priors_heterogeneity, priors_effect, priors_effect_null, priors_heterogeneity_null, priors_bias_null, and priors_effect. See details for more information about the different model types.

priors_effect list of prior distributions for the effect size (mu) parameter that will be treated as belonging to the alternative hypothesis. Defaults to a standard normal distribution prior(distribution = "normal", parameters = list(mean = 0, sd = 1)).

priors_heterogeneity list of prior distributions for the heterogeneity tau parameter that will be treated as belonging to the alternative hypothesis. Defaults to prior(distribution = "invgamma", parameters = list(shape = 1, scale = 0.15)) that is based on heterogeneities estimates from psychology (van Erp et al. 2017).

priors_bias list of prior distributions for the publication bias adjustment component that will be treated as belonging to the alternative hypothesis. Defaults to list(
prior_weightfunction(distribution = "two.sided", parameters = list(alpha = c(1, 1), steps = c(0.05)), prior_weights = 1/12),prior_weightfunction(distribution = "two.sided", parameters = list(alpha = c(1, 1, 1), steps = c(0.05, 0.10)), prior_weights = 1/12),prior_weightfunction(distribution = "one.sided", parameters = list(alpha = c(1, 1), steps = c(0.05)), prior_weights = 1/12),prior_weightfunction(distribution = "one.sided", parameters = list(alpha = c(1, 1, 1), steps = c(0.025, 0.05)), prior_weights = 1/12),prior_weightfunction(distribution = "one.sided", parameters = list(alpha = c(1, 1, 1), steps = c(0.05, 0.5)), prior_weights = 1/12),prior_weightfunction(distribution = "one.sided", parameters = list(alpha = c(1, 1, 1, 1), steps = c(0.025, 0.05, 0.5)), prior_weights = 1/12),prior_weightfunction(distribution = "Cauchy", parameters = list(0,1), truncation = list(0, Inf), prior_weights = 1/4),prior_PEESE(distribution = "Cauchy", parameters = list(0, 5), truncation = list(0, Inf), prior_weights = 1/4)), corresponding to the RoBMA-PSMA model introduce by Bartoš et al. (2021).

priors_effect_null
list of prior distributions for the effect size (\(\mu\)) parameter that will be treated as belonging to the null hypothesis. Defaults to a point null hypotheses at zero, prior(distribution = "point", parameters = list(location = 0)).

priors_heterogeneity_null
list of prior distributions for the heterogeneity \(\tau\) parameter that will be treated as belonging to the null hypothesis. Defaults to a point null hypotheses at zero (a fixed effect meta-analytic models), prior(distribution = "point", parameters = list(location = 0)).

priors_bias_null
list of prior weight functions for the \(\omega\) parameter that will be treated as belonging to the null hypothesis. Defaults no publication bias adjustment, prior_none().

priors_rho
list of prior distributions for the variance allocation (\(\rho\)) parameter that will be treated as belonging to the alternative hypothesis. This setting allows users to fit a three-level meta-analysis when study_ids are supplied. Note that this is an experimental feature and see News for more details. Defaults to a beta distribution prior(distribution = "beta", parameters = list(alpha = 1, beta = 1)).

priors_rho_null
list of prior distributions for the variance allocation (\(\rho\)) parameter that will be treated as belonging to the null hypothesis. Defaults to NULL.

models
should the models' details be printed.
silent
do not print the results.

Value
check_setup invisibly returns list of summary tables.

RoBMA()
**combine_data**

*Combines different effect sizes into a common metric*

**Description**

`combine_data` combines different effect sizes into a common measure specified in `transformation`. Either a data.frame `data` with columns named corresponding to the arguments or vectors with individual values can be passed.

**Usage**

```r
combine_data(
  d = NULL,
  r = NULL,
  z = NULL,
  logOR = NULL,
  t = NULL,
  y = NULL,
  se = NULL,
  v = NULL,
  n = NULL,
  lCI = NULL,
  uCI = NULL,
  study_names = NULL,
  study_ids = NULL,
  data = NULL,
  transformation = "fishers_z",
  return_all = FALSE
)
```

**Arguments**

- `d` a vector of effect sizes measured as Cohen’s d
- `r` a vector of effect sizes measured as correlations
- `z` a vector of effect sizes measured as Fisher’s z
- `logOR` a vector of effect sizes measured as log odds ratios
- `t` a vector of t/z-statistics
- `y` a vector of unspecified effect sizes (note that effect size transformations are unavailable with this type of input)
- `se` a vector of standard errors of the effect sizes
- `v` a vector of variances of the effect sizes
- `n` a vector of overall sample sizes
- `lCI` a vector of lower bounds of confidence intervals
- `uCI` a vector of upper bounds of confidence intervals
**combine_data**

- **study_names**: an optional argument with the names of the studies
- **study_ids**: an optional argument specifying dependency between the studies (for using a multilevel model). Defaults to NULL for studies being independent.
- **data**: a data frame with column names corresponding to the variable names used to supply data individually
- **transformation**: transformation to be applied to the supplied effect sizes before fitting the individual models. Defaults to "fishers_z". We highly recommend using "fishers_z" transformation since it is the only variance stabilizing measure and does not bias PET and PEESE style models. The other options are "cohens_d", correlation coefficient "r" and "logOR". Supplying "none" will treat the effect sizes as unstandardized and refrain from any transformations.
- **return_all**: whether data frame containing all filled values should be returned. Defaults to FALSE

**Details**

The aim of the function is to combine different, already calculated, effect size measures. In order to obtain effect size measures from raw values, e.g. mean differences, standard deviations, and sample sizes, use **escale** function.

The function checks the input values and in transforming the input into a common effect size measure in the following fashion:

1. obtains missing standard errors by squaring variances
2. obtains missing standard errors from confidence intervals (after transformation to Fisher’s z scale for d and r).
3. obtains missing sample sizes (or standard errors for logOR) from t-statistics and effect sizes
4. obtains missing standard errors from sample sizes and effect sizes
5. obtains missing sample sizes from standard errors and effect sizes
6. obtains missing t-statistics from sample sizes and effect sizes (or standard errors and effect sizes for logOR)
7. changes the effect sizes direction to be positive
8. transforms effect sizes into the common effect size
9. transforms standard errors into the common metric

If the **transforms** is NULL or an unstandardized effect size y is supplied, steps 4-9 are skipped.

**Value**

**combine_data** returns a data.frame.

**See Also**

**RoBMA()**, **check_setup()**, **effect_sizes()**, **standard_errors()**, and **sample_sizes()**
diagnostics  

Description

diagnostics creates visual checks of individual models convergence. Numerical overview of individual models can be obtained by summary(object, type = "models", diagnostics = TRUE), or even more detailed information by summary(object, type = "individual").

Usage

diagnostics(
  fit, 
  parameter, 
  type, 
  plot_type = "base", 
  show_models = NULL, 
  lags = 30, 
  title = is.null(show_models) | length(show_models) > 1, 
  ... 
)

Arguments

  fit          a fitted RoBMA object 
  parameter    a parameter to be plotted. Either "mu", "tau", "omega", "PET", or "PEESE". 
  type         type of MCMC diagnostic to be plotted. Options are "chains" for the chains' trace plots, "autocorrelation" for autocorrelation of the chains, and "densities" for the overlaying densities of the individual chains. Can be abbreviated to first letters. 
  plot_type    whether to use a base plot "base" or ggplot2 "ggplot" for plotting. Defaults to "base". 
  show_models  MCMC diagnostics of which models should be plotted. Defaults to NULL which plots MCMC diagnostics for a specified parameter for every model that is part of the ensemble. 
  lags         number of lags to be shown for type = "autocorrelation". Defaults to 30. 
  title        whether the model number should be displayed in title. Defaults to TRUE when more than one model is selected. 
  ...          additional arguments to be passed to par if plot_type = "base". 

Details

  The visualization functions are based on stan_plot function and its color schemes.
Values

diagnostics returns either NULL if plot_type = "base" or an object/list of objects (depending on the number of parameters to be plotted) of class ‘ggplot2’ if plot_type = “ggplot2”.

See Also

RoBMA(), summary.RoBMA()

Examples

### Not run:

# using the example data from Anderson et al. 2010 and fitting the default model
# (note that the model can take a while to fit)
fit <- RoBMA(r = Anderson2010$r, n = Anderson2010$n, study_names = Anderson2010$labels)

### ggplot2 version of all of the plots can be obtained by adding 'model_type = "ggplot"
# diagnostics function allows to visualize diagnostics of a fitted RoBMA object, for example,
# the trace plot for the mean parameter in each model model
diagnostics(fit, parameter = "mu", type = "chain")

# in order to show the trace plot only for the 11th model, add show_models parameter
diagnostics(fit, parameter = "mu", type = "chain", show_models = 11)

# furthermore, the autocorrelations
diagnostics(fit, parameter = "mu", type = "autocorrelation")

# and overlying densities for each plot can also be visualize
diagnostics(fit, parameter = "mu", type = "densities")

### End(Not run)

---

effect_sizes

Effect size transformations

Description

Functions for transforming between different effect size measures.

Usage

d2r(d)
d2z(d)
d2logOR(d)
d2OR(d)
\textbf{Arguments}

- \(d\)  
  Cohen's d.
- \(r\)  
  correlation coefficient.
- \(z\)  
  Fisher's z.
- \(\text{logOR}\)  
  log(odds ratios).
- \(\text{OR}\)  
  odds ratios.

\textbf{Details}

All transformations are based on (Borenstein et al. 2011). In case that a direct transformation is not available, the transformations are chained to provide the effect size of interest.

---

**forest**

*Forest plot for a RoBMA object*

**Description**

*forest* creates a forest plot for a "RoBMA" object.

**Usage**

```r
forest(
  x,
  conditional = FALSE,
  plot_type = "base",
  output_scale = NULL,
  order = NULL,
  ...
)
```

**Arguments**

- `x`: a fitted RoBMA object
- `conditional`: whether conditional estimates should be plotted. Defaults to `FALSE` which plots the model-averaged estimates. Note that both "weightfunction" and "PET-PEESE" are always ignoring the other type of publication bias adjustment.
- `plot_type`: whether to use a base plot "base" or ggplot2 "ggplot" for plotting. Defaults to "base".
- `output_scale`: transform the effect sizes and the meta-analytic effect size estimate to a different scale. Defaults to `NULL` which returns the same scale as the model was estimated on.
- `order`: order of the studies. Defaults to `NULL` - ordering as supplied to the fitting function. Studies can be ordered either "increasing" or "decreasing" by effect size, or by labels "alphabetical".
- `...`: list of additional graphical arguments to be passed to the plotting function. Supported arguments are `lwd`, `lty`, `col`, `col.fill`, `xlim`, `ylab`, `main`, `xlim`, `ylim` to adjust the line thickness, line type, line color, fill color, x-label, y-label, title, x-axis range, and y-axis range respectively.
**interpret**

Interpret results of a RoBMA model.

**Description**

*interpret* creates a brief textual summary of a fitted RoBMA object.

**Usage**

```
interpret(object, output_scale = NULL)
```

**Arguments**

- `object`: a fitted RoBMA object
- `output_scale`: transform the meta-analytic estimates to a different scale. Defaults to `NULL` which returns the same scale as the model was estimated on.

**Value**

*interpret* returns a character.
is.RoBMA

Reports whether x is a RoBMA object

Description

Reports whether x is a RoBMA object

Usage

is.RoBMA(x)

Arguments

x

an object to test

Value

is.RoBMA returns a boolean.

plot.RoBMA

Plots a fitted RoBMA object

Description

plot.RoBMA allows to visualize different "RoBMA" object parameters in various ways. See type for the different model types.

Usage

## S3 method for class 'RoBMA'
plot(
  x,
  parameter = "mu",
  conditional = FALSE,
  plot_type = "base",
  prior = FALSE,
  output_scale = NULL,
  rescale_x = FALSE,
  show_data = TRUE,
  dots_prior = NULL,
  ...
)
Arguments

- **x**: a fitted RoBMA object
- **parameter**: a parameter to be plotted. Defaults to "mu" (for the effect size). The additional options are "tau" (for the heterogeneity), "weightfunction" (for the estimated weightfunction), or "PET-PEESE" (for the PET-PEESE regression).
- **conditional**: whether conditional estimates should be plotted. Defaults to FALSE which plots the model-averaged estimates. Note that both "weightfunction" and "PET-PEESE" are always ignoring the other type of publication bias adjustment.
- **plot_type**: whether to use a base plot "base" or ggplot2 "ggplot" for plotting. Defaults to "base".
- **prior**: whether prior distribution should be added to figure. Defaults to FALSE.
- **output_scale**: transform the effect sizes and the meta-analytic effect size estimate to a different scale. Defaults to NULL which returns the same scale as the model was estimated on.
- **rescale_x**: whether the x-axis of the "weightfunction" should be re-scaled to make the x-ticks equally spaced. Defaults to FALSE.
- **show_data**: whether the study estimates and standard errors should be show in the "PET-PEESE" plot. Defaults to TRUE.
- **dots_prior**: list of additional graphical arguments to be passed to the plotting function of the prior distribution. Supported arguments are lwd, lty, col, and col.fill, to adjust the line thickness, line type, line color, and fill color of the prior distribution respectively.

... list of additional graphical arguments to be passed to the plotting function. Supported arguments are lwd, lty, col, col.fill, xlab, ylab, main, xlim, ylim to adjust the line thickness, line type, line color, fill color, x-label, y-label, title, x-axis range, and y-axis range respectively.

Value

plot.RoBMA returns either NULL if plot_type = "base" or an object object of class 'ggplot2' if plot_type = "ggplot2".

See Also

RoBMA()

Examples

```r
## Not run:
# using the example data from Anderson et al. 2010 and fitting the default model
# (note that the model can take a while to fit)
fit <- RoBMA(r = Anderson2010$r, n = Anderson2010$n, study_names = Anderson2010$labels)

### ggplot2 version of all of the plots can be obtained by adding 'model_type = "ggplot"
# the 'plot' function allows to visualize the results of a fitted RoBMA object, for example;
# the model-averaged effect size estimate
plot(fit, parameter = "mu")
```

# and show both the prior and posterior distribution
plot(fit, parameter = "mu", prior = TRUE)

# conditional plots can be obtained by specifying
plot(fit, parameter = "mu", conditional = TRUE)

# plotting function also allows to visualize the weight function
plot(fit, parameter = "weightfunction")

# re-scale the x-axis
plot(fit, parameter = "weightfunction", rescale_x = TRUE)

# or visualize the PET-PEESE regression line
plot(fit, parameter = "PET-PEESE")

## End(Not run)

---

**plot_models**

*Models plot for a RoBMA object*

**Description**

*plot_models* plots individual models’ estimates for a "RoBMA" object.

**Usage**

```r
plot_models(
  x,
  parameter = "mu",
  conditional = FALSE,
  output_scale = NULL,
  plot_type = "base",
  order = "decreasing",
  order_by = "model",
  ...
)
```

**Arguments**

- `x`: a fitted RoBMA object
- `parameter`: a parameter to be plotted. Defaults to "mu" (for the effect size). The additional option is "tau" (for the heterogeneity).
- `conditional`: whether conditional estimates should be plotted. Defaults to FALSE which plots the model-averaged estimates. Note that both "weightfunction" and "PET-PEESE" are always ignoring the other type of publication bias adjustment.
output_scale: transform the effect sizes and the meta-analytic effect size estimate to a different scale. Defaults to NULL which returns the same scale as the model was estimated on.

plot_type: whether to use a base plot "base" or ggplot2 "ggplot" for plotting. Defaults to "base".

order: how the models should be ordered. Defaults to "decreasing" which orders them in decreasing order in accordance to order_by argument. The alternative is "increasing".

order_by: what feature should be use to order the models. Defaults to "model" which orders the models according to their number. The alternatives are "estimate" (for the effect size estimates), "probability" (for the posterior model probability), and "BF" (for the inclusion Bayes factor).

... list of additional graphical arguments to be passed to the plotting function. Supported arguments are lwd, lty, col, col.fill, xlab, ylab, main, xlim, ylim to adjust the line thickness, line type, line color, fill color, x-label, y-label, title, x-axis range, and y-axis range respectively.

Value

plot_models returns either NULL if plot_type = "base" or an object object of class 'ggplot2' if plot_type = "ggplot2".

Examples

## Not run:
# using the example data from Anderson et al. 2010 and fitting the default model
# (note that the model can take a while to fit)
fit <- RoBMA(r = Anderson2010$r, n = Anderson2010$n, study_names = Anderson2010$labels)

### ggplot2 version of all of the plots can be obtained by adding
# the plot_models function creates a plot for of the individual models' estimates, for example,
# the effect size estimates from the individual models can be obtained with
# and effect size estimates from only the conditional models
plot_models(fit, conditional = TRUE)

## End(Not run)
Description
The data set contains Cohen’s d effect sizes, standard errors, and labels for 5 studies assessing the tactile outcome from a meta-analysis of the effect of potassium-containing toothpaste on dentine hypersensitivity (Poulsen et al. 2006) which was used as an example in Bartoš et al. (2021).

Usage
Poulsen2006

Format
A data.frame with 3 columns and 5 observations.

Value
a data.frame.

References

print.RoBMA
Prints a fitted RoBMA object

Description
Prints a fitted RoBMA object

Usage
## S3 method for class 'RoBMA'
print(x, ...)

Arguments
x a fitted RoBMA object.
... additional arguments.

Value
print.RoBMA invisibly returns the print statement.

See Also
RoBMA()
print.summary.RoBMA  

Prints summary object for RoBMA method

Description
Prints summary object for RoBMA method

Usage
## S3 method for class 'summary.RoBMA'

RoBMA()

prior  

Creates a prior distribution

Description
prior creates a prior distribution. The prior can be visualized by the plot function.

Usage
prior(
  distribution,
  parameters,
  truncation = list(lower = -Inf, upper = Inf),
  prior_weights = 1
)
Arguments

distribution  name of the prior distribution. The possible options are
  "point" for a point density characterized by a location parameter.
  "normal" for a normal distribution characterized by a mean and sd parameters.
  "lognormal" for a lognormal distribution characterized by a meanlog and sdlog parameters.
  "cauchy" for a Cauchy distribution characterized by a location and scale parameters. Internally converted into a generalized t-distribution with df = 1.
  "t" for a generalized t-distribution characterized by a location, scale, and df parameters.
  "gamma" for a gamma distribution characterized by either shape and rate, or shape and scale parameters. The later is internally converted to the shape and rate parametrization
  "invgamma" for an inverse-gamma distribution characterized by a shape and scale parameters. The JAGS part uses a 1/gamma distribution with a shape and rate parameter.
  "beta" for a beta distribution characterized by an alpha and beta parameters.
  "exp" for an exponential distribution characterized by either rate or scale parameter. The later is internally converted to rate.
  "uniform" for a uniform distribution defined on a range from a to b

parameters  list of appropriate parameters for a given distribution.

truncation  list with two elements, lower and upper, that define the lower and upper truncation of the distribution. Defaults to list(lower = -Inf, upper = Inf). The truncation is automatically set to the bounds of the support.

prior_weights  prior odds associated with a given distribution. The value is passed into the model fitting function, which creates models corresponding to all combinations of prior distributions for each of the model parameters and sets the model priors odds to the product of its prior distributions.

Value

prior and prior_none return an object of class 'prior'. A named list containing the distribution name, parameters, and prior weights.

See Also

plot.prior(), Normal, Lognormal, Cauchy, Beta, Exponential, LocationScaleT, InvGamma.

Examples

# create a standard normal prior distribution
p1 <- prior(distribution = "normal", parameters = list(mean = 1, sd = 1))

# create a half-normal standard normal prior distribution
p2 <- prior(distribution = "normal", parameters = list(mean = 1, sd = 1),
truncation = list(lower = 0, upper = Inf))

# the prior distribution can be visualized using the plot function
# (see ?plot.prior for all options)
plot(p1)

prior_informed

*Creates an informed prior distribution based on research*

**Description**

`prior_informed` creates an informed prior distribution based on past research. The prior can be visualized by the `plot` function.

**Usage**

```r
prior_informed(name, parameter = NULL, type = "smd")
```

**Arguments**

- `name` name of the prior distribution. There are many options based on prior psychological or medical research. For psychology, the possible options are
  - "van Erp" for an informed prior distribution for the heterogeneity parameter `tau` of meta-analytic effect size estimates based on standardized mean differences (van Erp et al. 2017),
  - "Oosterwijk" for an informed prior distribution for the effect sizes expected in social psychology based on prior elicitation with dr. Oosterwijk (Gronau et al. 2017).

For medicine, the possible options are based on Bartoš et al. (2021) who developed empirical prior distributions for the effect size and heterogeneity parameters of the continuous standardized outcomes based on the Cochrane database of systematic reviews. Use "Cochrane" for a prior distribution based on the whole database or call `print(prior_informed_medicine_names)` to inspect the names of all 46 subfields and set the appropriate parameter and type.

- `parameter` parameter name describing what prior distribution is supposed to be produced in cases where the name corresponds to multiple prior distributions. Relevant only for the empirical medical prior distributions.

- `type` prior type describing what prior distribution is supposed to be produced in cases where the name and parameter correspond to multiple prior distributions. Relevant only for the empirical medical prior distributions.

**Details**

Further details can be found in van Erp et al. (2017), Gronau et al. (2017), and Bartoš et al. (2021).
prior_none

Value

prior_informed returns an object of class 'prior'.

prior_none

Creates a prior distribution

Description

prior creates a prior distribution. The prior can be visualized by the plot function.

Usage

prior_none(prior_weights = 1)
prior_PEESE

Arguments

prior_weights  prior odds associated with a given distribution. The value is passed into the model fitting function, which creates models corresponding to all combinations of prior distributions for each of the model parameters and sets the model priors odds to the product of its prior distributions.

Value

prior and prior_none return an object of class 'prior'. A named list containing the distribution name, parameters, and prior weights.

See Also

plot.prior(), Normal, Lognormal, Cauchy, Beta, Exponential, LocationScaleT, InvGamma.

Examples

# create a standard normal prior distribution
p1 <- prior(distribution = "normal", parameters = list(mean = 1, sd = 1))

# create a half-normal standard normal prior distribution
p2 <- prior(distribution = "normal", parameters = list(mean = 1, sd = 1),
             truncation = list(lower = 0, upper = Inf))

# the prior distribution can be visualized using the plot function
# (see ?plot.prior for all options)
plot(p1)
Arguments

- **distribution**: name of the prior distribution. The possible options are
  - "point" for a point density characterized by a location parameter.
  - "normal" for a normal distribution characterized by a mean and sd parameters.
  - "lognormal" for a lognormal distribution characterized by a meanlog and sdlog parameters.
  - "cauchy" for a Cauchy distribution characterized by a location and scale parameters. Internally converted into a generalized t-distribution with df = 1.
  - "t" for a generalized t-distribution characterized by a location, scale, and df parameters.
  - "gamma" for a gamma distribution characterized by either shape and rate, or shape and scale parameters. The later is internally converted to the shape and rate parametrization
  - "invgamma" for an inverse-gamma distribution characterized by a shape and scale parameters. The JAGS part uses a 1/gamma distribution with a shape and rate parameter.
  - "beta" for a beta distribution characterized by an alpha and beta parameters.
  - "exp" for an exponential distribution characterized by either rate or scale parameter. The later is internally converted to rate.
  - "uniform" for a uniform distribution defined on a range from a to b

- **parameters**: list of appropriate parameters for a given distribution.

- **truncation**: list with two elements, lower and upper, that define the lower and upper truncation of the distribution. Defaults to list(lower = -Inf, upper = Inf). The truncation is automatically set to the bounds of the support.

- **prior_weights**: prior odds associated with a given distribution. The value is passed into the model fitting function, which creates models corresponding to all combinations of prior distributions for each of the model parameters and sets the model priors odds to the product of its prior distributions.

Value

prior_PET and prior_PEESE return an object of class 'prior'.

See Also

plot.prior(), prior()

Examples

# create a half-Cauchy prior distribution
# (PET and PEESE specific functions automatically set lower truncation at 0)
p1 <- prior_PET(distribution = "Cauchy", parameters = list(location = 0, scale = 1))
plot(p1)
prior_PET

*Creates a prior distribution for PET or PEESE models*

**Description**

prior creates a prior distribution for fitting a PET or PEESE style models in RoBMA. The prior distribution can be visualized by the plot function.

**Usage**

```r
prior_PET(
  distribution,
  parameters,
  truncation = list(lower = 0, upper = Inf),
  prior_weights = 1
)
```

**Arguments**

- **distribution**
  name of the prior distribution. The possible options are
  - "point" for a point density characterized by a location parameter.
  - "normal" for a normal distribution characterized by a mean and sd parameters.
  - "lognormal" for a lognormal distribution characterized by a meanlog and sdlog parameters.
  - "cauchy" for a Cauchy distribution characterized by a location and scale parameters. Internally converted into a generalized t-distribution with df = 1.
  - "t" for a generalized t-distribution characterized by a location, scale, and df parameters.
  - "gamma" for a gamma distribution characterized by either shape and rate, or shape and scale parameters. The later is internally converted to the shape and rate parametrization.
  - "invgamma" for an inverse-gamma distribution characterized by a shape and scale parameters. The JAGS part uses a 1/gamma distribution with a shape and rate parameter.
  - "beta" for a beta distribution characterized by an alpha and beta parameters.
  - "exp" for an exponential distribution characterized by either rate or scale parameter. The later is internally converted to rate.
  - "uniform" for a uniform distribution defined on a range from a to b

- **parameters**
  list of appropriate parameters for a given distribution.

- **truncation**
  list with two elements, lower and upper, that define the lower and upper truncation of the distribution. Defaults to `list(lower = -Inf, upper = Inf)`. The truncation is automatically set to the bounds of the support.
prior_weightfunction

prior_weights  prior odds associated with a given distribution. The value is passed into the model fitting function, which creates models corresponding to all combinations of prior distributions for each of the model parameters and sets the model priors odds to the product of its prior distributions.

Value

prior_PET and prior_PEESE return an object of class 'prior'.

See Also

plot.prior(), prior()

Examples

# create a half-Cauchy prior distribution
# (PET and PEESE specific functions automatically set lower truncation at 0)
p1 <- prior_PET(distribution = "Cauchy", parameters = list(location = 0, scale = 1))

plot(p1)

prior_weightfunction  Creates a prior distribution for a weight function

Description

prior_weightfunction creates a prior distribution for fitting a RoBMA selection model. The prior can be visualized by the plot function.

Usage

prior_weightfunction(distribution, parameters, prior_weights = 1)

Arguments

distribution  name of the prior distribution. The possible options are
  "two.sided" for a two-sided weight function characterized by a vector steps and vector alpha parameters. The alpha parameter determines an alpha parameter of Dirichlet distribution which cumulative sum is used for the weights omega.
  "one.sided" for a one-sided weight function characterized by either a vector steps and vector alpha parameter, leading to a monotonic one-sided function, or by a vector steps, vector alpha1, and vector alpha2 parameters leading non-monotonic one-sided weight function. The alpha / alpha1 and alpha2 parameters determine an alpha parameter of Dirichlet distribution which cumulative sum is used for the weights omega.

parameters  list of appropriate parameters for a given distribution.
prior_weights  prior odds associated with a given distribution. The model fitting function usually creates models corresponding to all combinations of prior distributions for each of the model parameters, and sets the model priors odds to the product of its prior distributions.

Value

prior_weightfunction returns an object of class `prior`.

See Also

plot.prior()

Examples

p1 <- prior_weightfunction("one-sided", parameters = list(steps = c(.05, .10), alpha = c(1, 1, 1)))

# the prior distribution can be visualized using the plot function
# (see ?plot.prior for all options)
plot(p1)

RoBMA                  Estimate a Robust Bayesian Meta-Analysis

Description

RoBMA is used to estimate a Robust Bayesian Meta-Analysis. The interface allows a complete customization of the ensemble with different prior (or list of prior) distributions for each component.

Usage

RoBMA(
  d = NULL,  
  r = NULL,  
  logOR = NULL,  
  z = NULL,  
  y = NULL,  
  se = NULL,  
  v = NULL,  
  n = NULL,  
  lCI = NULL,  
  uCI = NULL,  
  t = NULL,  
  study_names = NULL,  
  study_ids = NULL,  
  data = NULL,  
  transformation = if (is.null(y)) "fishers_z" else "none",  
  prior_scale = if (is.null(y)) "cohens_d" else "none",  
  ...)
effect_direction = "positive",
model_type = NULL,
priors_effect = prior(distribution = "normal", parameters = list(mean = 0, sd = 1)),
priors_heterogeneity = prior(distribution = "invgamma", parameters = list(shape = 1,
  scale = 0.15)),
priors_bias = list(prior_weightfunction(distribution = "two.sided", parameters =
  list(alpha = c(1, 1), steps = c(0.05)), prior_weights = 1/12),
prior_weightfunction(distribution = "two.sided", parameters = list(alpha = c(1, 1,
  1), steps = c(0.05, 0.1)), prior_weights = 1/12), prior_weightfunction(distribution =
  "one.sided", parameters = list(alpha = c(1, 1), steps = c(0.05)), prior_weights =
  1/12), prior_weightfunction(distribution = "one.sided", parameters = list(alpha =
  c(1, 1, 1), steps = c(0.05, 0.5)), prior_weights = 1/12), prior_weightfunction(distribution =
  "one.sided", parameters = list(alpha = c(1, 1, 1, 1), steps = c(0.025, 0.05, 0.5)),
prior_weights = 1/12), prior_PET(distribution = "Cauchy", parameters = list(0, 1),
  truncation = list(0, Inf), prior_weights = 1/4), prior_PEESE(distribution = "Cauchy",
  parameters = list(0, 5), truncation = list(0, Inf), prior_weights = 1/4)),
priors_effect_null = prior(distribution = "point", parameters = list(alpha = 1,
  location = 0)),
priors_heterogeneity_null = prior(distribution = "point", parameters = list(alpha =
  1, 1, location = 0)),
priors_bias_null = prior_none(),
priors_rho = prior("beta", parameters = list(alpha = 1, beta = 1)),
priors_rho_null = NULL,
chains = 3,
sample = 5000,
burnin = 2000,
adapt = 500,
thin = 1,
parallel = FALSE,
autofit = TRUE,
autofit_control = set_autofit_control(),
convergence_checks = set_convergence_checks(),
save = "all",
seed = NULL,
silent = TRUE,
...)

Arguments

d         a vector of effect sizes measured as Cohen’s d
r         a vector of effect sizes measured as correlations
logOR     a vector of effect sizes measured as log odds ratios
z         a vector of effect sizes measured as Fisher’s z
y         a vector of unspecified effect sizes (note that effect size transformations are un-
available with this type of input)
se  a vector of standard errors of the effect sizes
v  a vector of variances of the effect sizes
n  a vector of overall sample sizes
lCI a vector of lower bounds of confidence intervals
uCI a vector of upper bounds of confidence intervals
t  a vector of t/z-statistics
study_names  an optional argument with the names of the studies
study_ids  an optional argument specifying dependency between the studies (for using a multilevel model). Defaults to NULL for studies being independent.
data  a data object created by the combine_data function. This is an alternative input entry to specifying the d, r, y, etc... directly. I.e., you cannot pass the a data.frame and reference to the columns.
transformation  transformation to be applied to the supplied effect sizes before fitting the individual models. Defaults to "fishers_z". We highly recommend using "fishers_z" transformation since it is the only variance stabilizing measure and does not bias PET and PEESE style models. The other options are "cohens_d", correlation coefficient "r" and "logOR". Supplying "none" will treat the effect sizes as unstandardized and refrain from any transformations.
prior_scale  a scale used to define priors. Defaults to "cohens_d". Other options are "fishers_z", correlation coefficient "r", and "logOR". The prior scale does not need to match the effect sizes measure - the samples from prior distributions are internally transformed to match the transformation of the data. The prior_scale corresponds to the scale of default output, but can be changed within the summary function.
effect_direction  the expected direction of the effect. The one-sided selection sets the weights omega to 1 to significant results in the expected direction. Defaults to "positive" (another option is "negative").
model_type  string specifying the RoBMA ensemble. Defaults to NULL. The other options are "PSMA", "PP", and "2w" which override settings passed to the priors_effect, priors_heterogeneity, priors_effect, priors_effect_null, priors_heterogeneity_null, priors_bias_null, and priors_effect. See details for more information about the different model types.
priors_effect  list of prior distributions for the effect size (mu) parameter that will be treated as belonging to the alternative hypothesis. Defaults to a standard normal distribution prior(distribution = "normal", parameters = list(mean = 0, sd = 1)).
priors_heterogeneity  list of prior distributions for the heterogeneity tau parameter that will be treated as belonging to the alternative hypothesis. Defaults to prior(distribution = "invgamma", parameters = list(shape = 1, scale = .15)) that is based on heterogeneities estimates from psychology (van Erp et al. 2017).
priors_bias  list of prior distributions for the publication bias adjustment component that will be treated as belonging to the alternative hypothesis. Defaults to list(prior_weightfunction(distribution = "two.sided", parameters = list(alpha
priors_effect_null
  list of prior distributions for the effect size (mu) parameter that will be treated as belonging to the null hypothesis. Defaults to a point null hypotheses at zero, prior(distribution = "point", parameters = list(location = 0)).

priors_heterogeneity_null
  list of prior distributions for the heterogeneity tau parameter that will be treated as belonging to the null hypothesis. Defaults to a point null hypotheses at zero (a fixed effect meta-analytic models), prior(distribution = "point", parameters = list(location = 0)).

priors_bias_null
  list of prior weight functions for the omega parameter that will be treated as belonging to the null hypothesis. Defaults no publication bias adjustment, prior_none().

priors_rho
  list of prior distributions for the variance allocation (rho) parameter that will be treated as belonging to the alternative hypothesis. This setting allows users to fit a three-level meta-analysis when study_ids are supplied. Note that this is an experimental feature and see News for more details. Defaults to a beta distribution prior(distribution = "beta", parameters = list(alpha = 1, beta = 1)).

priors_rho_null
  list of prior distributions for the variance allocation (rho) parameter that will be treated as belonging to the null hypothesis. Defaults to NULL.

chains
  a number of chains of the MCMC algorithm.

sample
  a number of sampling iterations of the MCMC algorithm. Defaults to 5000.

burnin
  a number of burnin iterations of the MCMC algorithm. Defaults to 2000.

adapt
  a number of adaptation iterations of the MCMC algorithm. Defaults to 500.

thin
  a thinning of the chains of the MCMC algorithm. Defaults to 1.

parallel
  whether the individual models should be fitted in parallel. Defaults to FALSE. The implementation is not completely stable and might cause a connection error.

autofit
  whether the model should be fitted until the convergence criteria (specified in autofit_control) are satisfied. Defaults to TRUE.

autofit_control
  allows to pass autofit control settings with the set_autofit_control() function. See ?set_autofit_control for options and default settings.
convergence_checks

automatic convergence checks to assess the fitted models, passed with set_convergence_checks() function. See ?set_convergence_checks for options and default settings.

save

whether all models posterior distributions should be kept after obtaining a model-averaged result. Defaults to "all" which does not remove anything. Set to "min" to significantly reduce the size of final object, however, some model diagnostics and further manipulation with the object will not be possible.

seed

a seed to be set before model fitting, marginal likelihood computation, and posterior mixing for reproducibility of results. Defaults to NULL - no seed is set.

silent

whether all print messages regarding the fitting process should be suppressed. Defaults to TRUE. Note that parallel = TRUE also suppresses all messages.

... additional arguments.

Details

The default settings of the RoBMA 2.0 package corresponds to the RoBMA-PSMA ensemble proposed by Bartoš et al. (2021). The previous versions of the package (i.e., RoBMA < 2.0) used specifications proposed by Maier et al. (in press) (this specification can be easily obtained by setting model_type = "2w". The RoBMA-PP specification from Bartoš et al. (2021) can be obtained by setting model_type = "PP".

The vignette("CustomEnsembles", package = "RoBMA") and vignette("ReproducingBMA", package = "RoBMA") vignettes describe how to use RoBMA() to fit custom meta-analytic ensembles (see prior(), prior_weightfunction(), prior_PET(), and prior_PEESE() for more information about prior distributions).

The RoBMA function first generates models from a combination of the provided priors for each of the model parameters. Then, the individual models are fitted using autorun.jags function. A marginal likelihood is computed using bridge_sampler function. The individual models are then combined into an ensemble using the posterior model probabilities using BayesTools package.

Generic summary.RoBMA(), print.RoBMA(), and plot.RoBMA() functions are provided to facilitate manipulation with the ensemble. A visual check of the individual model diagnostics can be obtained using the diagnostics() function. The fitted model can be further updated or modified by update.RoBMA() function.

Value

RoBMA returns an object of class 'RoBMA'.

                        truncation = list(0, Inf)))
```

## End(Not run)
RoBMA_control

Control MCMC fitting process

Description

Controls settings for the autofit process of the MCMC JAGS sampler (specifies termination criteria), and values for the convergence checks.

Usage

set_autofit_control(
  max_Rhat = 1.05,
  min_ESS = 500,
  max_error = NULL,
  max_SD_error = NULL,
  max_time = list(time = 60, unit = "mins"),
  sample_extend = 1000
)

set_convergence_checks(
  max_Rhat = 1.05,
  min_ESS = 500,
  max_error = NULL,
  max_SD_error = NULL,
  remove_failed = FALSE,
  balance_probability = TRUE
)

Arguments

- **max_Rhat**: maximum value of the R-hat diagnostic. Defaults to 1.05.
- **min_ESS**: minimum estimated sample size. Defaults to 500.
- **max_error**: maximum value of the MCMC error. Defaults to NULL. Be aware that PEESE publication bias adjustment can have estimates on different scale than the rest of the output, resulting in relatively large max MCMC error.
- **max_SD_error**: maximum value of the proportion of MCMC error of the estimated SD of the parameter. Defaults to NULL.
- **max_time**: list with the time and unit specifying the maximum autofitting process per model. Passed to `difftime` function (possible units are "secs", "mins", "hours", "days", "weeks", "years"). Defaults to `list(time = 60, unit = "mins")`.
- **sample_extend**: number of samples to extend the fitting process if the criteria are not satisfied. Defaults to 1000.
- **remove_failed**: whether models not satisfying the convergence checks should be removed from the inference. Defaults to FALSE - only a warning is raised.
**RoBMA_options**

balance_probability

whether prior model probability should be balanced across the combinations of models with the same H0/H1 for effect / heterogeneity / bias in the case of non-convergence. Defaults to TRUE.

**Value**

set_autofit_control returns a list of autofit control settings and set_convergence_checks returns a list of convergence checks settings.

**See Also**

RoBMA, update.RoBMA

---

**RoBMA_options**

*Options for the RoBMA package*

---

**Description**

A placeholder object and functions for the RoBMA package. (adapted from the runjags R package).

**Usage**

RoBMA.options(...)

RoBMA.get_option(name)

**Arguments**

... named option(s) to change - for a list of available options, see details below.

name the name of the option to get the current value of - for a list of available options, see details below.

**Value**

The current value of all available RoBMA options (after applying any changes specified) is returned invisibly as a named list.
Description

Functions for transforming between standard errors and sample sizes (assuming equal sample sizes per group).

Usage

\[
\begin{align*}
\text{se}_d(d, n) \\
n_d(d, se) \\
\text{se}_r(r, n) \\
n_r(r, se) \\
\text{se}_z(n) \\
n_z(se)
\end{align*}
\]

Arguments

- \( d \): Cohen’s d
- \( n \): sample size of the corresponding effect size
- \( se \): standard error of the corresponding effect size
- \( r \): correlation coefficient

Details

Calculations for Cohen’s d, Fisher’s z, and log(OR) are based on (Borenstein et al. 2011). Calculations for correlation coefficient were modified to make the standard error corresponding to the computed on Fisher’s z scale under the same sample size (in order to make all other transformations consistent). In case that a direct transformation is not available, the transformations are chained to provide the effect size of interest.

Note that sample size and standard error calculation for log(OR) is not available. The standard error is highly dependent on the odds within the groups and sample sizes for individual events are required. Theoretically, the sample size could be obtained by transforming the effect size and standard error to a different measure and obtaining the sample size using corresponding function, however, it leads to a very poor approximation and it is not recommended.

References

standard_errors

See Also

effect_sizes(), standard_errors()

standard_errors Standard errors transformations

Description

Functions for transforming between standard errors of different effect size measures.

Usage

se_d2se_logOR(se_d, logOR)
se_d2se_r(se_d, d)
se_r2se_d(se_r, r)
se_logOR2se_d(se_logOR, logOR)
se_d2se_z(se_d, d)
se_r2se_z(se_r, r)
se_r2se_logOR(se_r, r)
se_logOR2se_r(se_logOR, logOR)
se_logOR2se_z(se_logOR, logOR)
se_z2se_d(se_z, z)
se_z2se_r(se_z, z)
se_z2se_logOR(se_z, z)

Arguments

se_d standard error of Cohen’s d
logOR log(odds ratios)
d Cohen’s d
se_r standard error of correlation coefficient
r correlation coefficient
se_logOR standard error of log(odds ratios)
se_z standard error of Fisher’s z
z Fisher’s z
Details

Transformations for Cohen’s d, Fisher’s z, and log(OR) are based on (Borenstein et al. 2011). Calculations for correlation coefficient were modified to make the standard error corresponding to the computed on Fisher’s z scale under the same sample size (in order to make all other transformations consistent). In case that a direct transformation is not available, the transformations are chained to provide the effect size of interest.

It is important to keep in mind that the transformations are only approximations to the true values. From our experience, se_d2se_z works well for values of se(Cohen’s d) < 0.5. Do not forget that the effect sizes are standardized and variance of Cohen’s d = 1. Therefore, a standard error of study cannot be larger unless the participants provided negative information (of course, the variance is dependent on the effect size as well, and, can therefore be larger).

When setting prior distributions, do NOT attempt to transform a standard normal distribution on Cohen’s d (mean = 0, sd = 1) to a normal distribution on Fisher’s z with mean 0 and sd = se_d2se_z(0, 1). The approximation does NOT work well in this range of values. Instead, approximate the sd of distribution on Fisher’s z using samples in this way: sd(d2z(rnorm(10000, 0, 1))) or, specify the distribution on Cohen’s d directly.

summary.RoBMA

Summarize fitted RoBMA object

Description

summary.RoBMA creates summary tables for a RoBMA object.

Usage

# S3 method for class 'RoBMA'
summary(
  object,
  type = "ensemble",
  conditional = FALSE,
  output_scale = NULL,
  probs = c(0.025, 0.975),
  logBF = FALSE,
  BF01 = FALSE,
  short_name = FALSE,
  remove_spike_0 = FALSE,
  ...
)

Arguments

object | a fitted RoBMA object

type | whether to show the overall RoBMA results ("ensemble"), an overview of the individual models ("models"), an overview of the individual models MCMC diagnostics ("diagnostics"), or a detailed summary of the individual models ("individual"). Can be abbreviated to first letters.

conditional | show the conditional estimates (assuming that the alternative is true). Defaults to FALSE. Only available for type == "conditional".

output_scale | transform the meta-analytic estimates to a different scale. Defaults to NULL which returns the same scale as the model was estimated on.

probs | quantiles of the posterior samples to be displayed. Defaults to c(.025, .975)

logBF | show log of Bayes factors. Defaults to FALSE.

BF01 | show Bayes factors in support of the null hypotheses. Defaults to FALSE.

short_name | whether priors names should be shortened to the first (couple) of letters. Defaults to FALSE.

remove_spike_0 | whether spike prior distributions with location at zero should be omitted from the summary. Defaults to FALSE.

... | additional arguments

Value

summary.RoBMA returns a list of tables of class 'BayesTools_table'.

Note

See diagnostics() for visual convergence checks of the individual models.

See Also

RoBMA(), diagnostics(), check_RoBMA()

Examples

```r
# Not run:
# using the example data from Anderson et al. 2010 and fitting the default model
# (note that the model can take a while to fit)
fit <- RoBMA(r = Anderson2010$r, n = Anderson2010$n, study_names = Anderson2010$labels)

# summary can provide many details about the model
summary(fit)

# estimates from the conditional models can be obtained with
summary(fit, conditional = TRUE)

# overview of the models and their prior and posterior probability, marginal likelihood,
# and inclusion Bayes factor can be obtained with
summary(fit, type = "models")
```
# diagnostics overview, containing the maximum R-hat, minimum ESS, maximum MCMC error, and
# maximum MCMC error / sd across parameters for each individual model can be obtained with
# summary(fit, type = "diagnostics")

# summary of individual models and their parameters can be further obtained by
# summary(fit, type = "individual")

## End(Not run)

---

**update.RoBMA**

*Updates a fitted RoBMA object*

**Description**

`update.RoBMA` can be used to

1. add an additional model to an existing "RoBMA" object by specifying either a null or alternative prior for each parameter and the prior odds of the model (`prior_weights`), see the vignette("CustomEnsembles") vignette,
2. change the prior odds of fitted models by specifying a vector `prior_weights` of the same length as the fitted models,
3. refitting models that failed to converge with updated settings of control parameters,
4. or changing the convergence criteria and recalculating the ensemble results by specifying new control argument and setting `refit_failed == FALSE`.

**Usage**

```r
## S3 method for class 'RoBMA'
update(
  object,
  refit_failed = TRUE,
  prior_effect = NULL,
  prior_heterogeneity = NULL,
  prior_bias = NULL,
  prior_rho = NULL,
  prior_weights = NULL,
  prior_effect_null = NULL,
  prior_heterogeneity_null = NULL,
  prior_bias_null = NULL,
  prior_rho_null = NULL,
  study_names = NULL,
  chains = NULL,
  adapt = NULL,
  burnin = NULL,
  sample = NULL,
)```

Arguments

object a fitted RoBMA object
refit_failed whether failed models should be refitted. Relevant only if new priors or prior_weights are not supplied. Defaults to TRUE.
prior_effect prior distribution for the effect size ($\mu$) parameter that will be treated as belonging to the alternative hypothesis. Defaults to NULL.
prior_heterogeneity prior distribution for the heterogeneity $\tau$ parameter that will be treated as belonging to the alternative hypothesis. Defaults to NULL.
prior_bias prior distribution for the publication bias adjustment component that will be treated as belonging to the alternative hypothesis. Defaults to NULL.
prior_rho prior distributions for the variance allocation ($\rho$) parameter that will be treated as belonging to the alternative hypothesis. This setting allows users to fit a three-level meta-analysis when study_ids are supplied. Note that this is an experimental feature and see News for more details. Defaults to a beta distribution \text{prior}(\text{distribution} = \text{"beta"}, \text{parameters} = \text{list(alpha = 1, beta = 1)}).
prior_weights either a single value specifying prior model weight of a newly specified model using priors argument, or a vector of the same length as already fitted models to update their prior weights.
prior_effect_null prior distribution for the effect size ($\mu$) parameter that will be treated as belonging to the null hypothesis. Defaults to NULL.

prior_heterogeneity_null prior distribution for the heterogeneity $\tau$ parameter that will be treated as belonging to the null hypothesis. Defaults to NULL.
prior_bias_null prior distribution for the publication bias adjustment component that will be treated as belonging to the null hypothesis. Defaults to NULL.
prior_rho_null prior distributions for the variance allocation ($\rho$) parameter that will be treated as belonging to the null hypothesis. Defaults to NULL.
study_names an optional argument with the names of the studies
chains a number of chains of the MCMC algorithm.
adapt a number of adaptation iterations of the MCMC algorithm. Defaults to 500.
update.RoBMA

burnin a number of burnin iterations of the MCMC algorithm. Defaults to 2000.
sample a number of sampling iterations of the MCMC algorithm. Defaults to 5000.
thin a thinning of the chains of the MCMC algorithm. Defaults to 1.
autofit whether the model should be fitted until the convergence criteria (specified in autofit_control) are satisfied. Defaults to TRUE.
parallel whether the individual models should be fitted in parallel. Defaults to FALSE. The implementation is not completely stable and might cause a connection error.
autofit_control allows to pass autofit control settings with the set_autofit_control() function. See ?set_autofit_control for options and default settings.
convergence_checks automatic convergence checks to assess the fitted models, passed with set_convergence_checks() function. See ?set_convergence_checks for options and default settings.
save whether all models posterior distributions should be kept after obtaining a model-averaged result. Defaults to "all" which does not remove anything. Set to "min" to significantly reduce the size of final object, however, some model diagnostics and further manipulation with the object will not be possible.
seed a seed to be set before model fitting, marginal likelihood computation, and posterior mixing for reproducibility of results. Defaults to NULL - no seed is set.
silent whether all print messages regarding the fitting process should be suppressed. Defaults to TRUE. Note that parallel = TRUE also suppresses all messages.

Details
See RoBMA() for more details.

Value
RoBMA returns an object of class 'RoBMA'.

See Also

Examples
## Not run:
# using the example data from Bem 2011 and fitting the default (RoBMA-PSMA) model
fit <- RoBMA(d = Bem2011$d, se = Bem2011$se, study_names = Bem2011$study)

# the update function allows us to change the prior model weights of each model
fit1 <- update(fit, prior_weights = c(0, rep(1, 35)))

# add an additional model with different priors specification
# (see '?prior' for more information)
fit2 <- update(fit,
priors_effect_null = prior("point", parameters = list(location = 0)),
priors_heterogeneity = prior("normal",
  parameters = list(mean = 0, sd = 1),
  truncation = list(lower = 0, upper = Inf)),
priors_bias = prior_weightfunction("one-sided",
  parameters = list(cuts = c(.05, .10, .20),
  alpha = c(1, 1, 1, 1))))

# refit the models with an increased number of sample iterations
fit3 <- update(fit, sample = 10000)

## End(Not run)

---

**weighted_multivariate_normal**

*Weighted multivariate normal distribution*

**Description**

Density function for the weighted multivariate normal distribution with mean, covariance matrix sigma, critical values crit_x, and weights omega.

**Arguments**

- **x**
  - quantiles.
- **p**
  - vector of probabilities.
- **mean**
  - mean.
- **sigma**
  - covariance matrix.
- **crit_x**
  - vector of critical values defining steps.
- **omega**
  - vector of weights defining the probability of observing a t-statistics between each of the two steps.
- **type**
  - type of weight function (defaults to "two.sided").
- **log, log.p**
  - logical; if TRUE, probabilities p are given as log(p).

**Value**

`.dwmnorm_fast` returns a density of the multivariate weighted normal distribution.

**See Also**

*Normal, weighted_normal*
### weighted_normal

**Weighted normal distribution**

**Description**

Density, distribution function, quantile function and random generation for the weighted normal distribution with mean, standard deviation sd, steps steps (or critical values) crit_x), and weights omega.

**Usage**

```r
dwnorm(
  x,
  mean,
  sd,
  steps = if (!is.null(crit_x)) NULL,
  omega,
  crit_x = if (!is.null(steps)) NULL,
  type = "two.sided",
  log = FALSE
)

pwnorm(
  q,
  mean,
  sd,
  steps = if (!is.null(crit_x)) NULL,
  omega,
  crit_x = if (!is.null(steps)) NULL,
  type = "two.sided",
  lower.tail = TRUE,
  log.p = FALSE
)

qwnorm(
  p,
  mean,
  sd,
  steps = if (!is.null(crit_x)) NULL,
  omega,
  crit_x = if (!is.null(steps)) NULL,
  type = "two.sided",
  lower.tail = TRUE,
  log.p = FALSE
)

rwnorm(
```

weighted_normal

n,
mean,
sd,
steps = if (!is.null(crit_x)) NULL,
omega,
crit_x = if (!is.null(steps)) NULL,
type = "two.sided"
)

Arguments

x, q vector of quantiles.
mean mean
sd standard deviation.
steps vector of steps for the weight function.
omega vector of weights defining the probability of observing a t-statistics between each of the two steps.
crit_x vector of critical values defining steps (if steps are not supplied).
type type of weight function (defaults to "two.sided").
log, log.p logical; if TRUE, probabilities p are given as log(p).
lower.tail logical; if TRUE (default), probabilities are \( P[X \leq x] \), otherwise, \( P[X \geq x] \).
p vector of probabilities.
n number of observations. If length(n) > 1, the length is taken to be the number required.

Details

The mean, sd, steps, omega can be supplied as a vectors (mean, sd) or matrices (steps, omega) with length / number of rows equal to x/q/p. Otherwise, they are recycled to the length of the result.

Value

dwnorm gives the density, dwnorm gives the distribution function, qwnorm gives the quantile function, and rwnorm generates random deviates.
