SGP-package

Description

SGP contains classes and functions to calculate student growth percentiles and percentile growth projections/trajectories following methodology found in Betebenner (2008, 2009). The package contains two primary functions, studentGrowthPercentiles and studentGrowthProjections, and numerous higher level functions that make use of them including: prepareSGP, analyzeSGP, combineSGP, summarizeSGP, visualizeSGP and outputSGP. These functions are used to calculate and visualize student growth percentiles and percentile growth projections/trajectories for students using large scale, longitudinal assessment data. These norm- and criterion-referenced growth values are currently used in a number of states for many purposes including diagnostic and accountability. The functions employ quantile regression (using the quantreg package) to estimate the conditional density for current achievement using each student's achievement history. Percentile growth projections/trajectories are calculated using the coefficient matrices derived from the student growth percentile analyses. These quantities are summarized in a variety of ways to describe student growth. Beginning with version 1.4-0.0, the SGP package also calculate time dependent SGPs (SGPt) and allows for student growth projections to be calculated across assessment transitions by equating the two tests.

Calculation of student growth percentiles and percentile growth trajectories/projections is typically performed by grade and subject. Data for growth percentile calculation must be specifically formatted. See sgpData for an example data set. Batch R syntax for performing analyses across all grades and years is provided in the examples of the studentGrowthPercentiles and studentGrowthProjections using the higher level functions prepareSGP, analyzeSGP, combineSGP, summarizeSGP, and visualizeSGP.

References

Perform 6 step sequence: prepareSGP, analyzeSGP, combineSGP, summarizeSGP, visualizeSGP, and outputSGP

Utility function to perform sequence of 6 steps going from data preparation, prepareSGP, SGP data analysis, analyzeSGP, data combining, combineSGP, data summary, summarizeSGP, data visualization visualizeSGP and data output outputSGP.

Usage

abcSGP(sgp_object, state=NULL, steps=c("prepareSGP", "analyzeSGP", "combineSGP", "summarizeSGP", "visualizeSGP", "outputSGP"), years=NULL,

Arguments

sgp_object  A list containing LONG formatted data. See sgpData_LONG for an exemplar. By including the name of the state in the object name (e.g., Idaho_SGP), the function will detect what state is associated with the data and supply that to
the 'state' argument of the function so that state meta-data located in the SGP-stateData object can be utilized. NOTE: Data preparation must be meticulous to utilize this enhanced functionality.

state
Acronym indicating state associated with the data for access to embedded knot and boundaries, cutscores, CSEMs, and other relevant state level data. This can be supplied to the function automatically by including the full state name (e.g, New_Hampshire_SGP) in the name of the object supplied to sgp_object.

steps
Vector containing all or some subset of prepareSGP, analyzeSGP, combineSGP, summarizeSGP, visualizeSGP indicating what steps the user wants accomplished. Default is to perform all steps.

years
A vector indicating year(s) in which to produce student growth percentiles and/or student growth projections/trajectories. If missing the function will use the data to infer the year(s) in which to perform growth percentile analyses based upon the assumption of having at least three years of panel data for analyses.

content_areas
A vector indicating content area(s) in which to produce student growth percentiles and/or student growth projections/trajectories. If missing the function will use the data to infer the content area(s) available for analyses.

grades
A vector indicating grades for which to calculate student growth percentiles and/or student growth projections/trajectories. If missing the function will use the data to infer all the grade progressions for student growth percentile and student growth projections/trajectories analyses.

prepareSGP.var.names
list supplied to prepareSGP mapping provided variable names to variable names required as part of the SGP package. See prepareSGP for more details. Defaults to NULL.

prepareSGP.create.additional.variables
Boolean variable indicating whether prepareSGP should create addition variables (e.g., ACHIEVEMENT_LEVEL) if they are missing.

sgp.percentiles
Boolean variable indicating whether to calculate student growth percentiles. Defaults to TRUE.

sgp.projections
Boolean variable indicating whether to calculate student growth projections. Defaults to TRUE.

sgp.projections.lagged
Boolean variable indicating whether to calculate lagged student growth projections often used for growth to standard analyses. Defaults to TRUE.

sgp.percentiles.baseline
Boolean variable indicating whether to calculate baseline student growth percentiles and/or coefficient matrices. Defaults to TRUE.

sgp.projections.baseline
Boolean variable indicating whether to calculate baseline student growth projections. Defaults to TRUE.

sgp.projections.lagged.baseline
Boolean variable indicating whether to calculate lagged baseline student growth projections. Defaults to TRUE.
sgp.use.my.coefficient.matrices
Boolean variable indicating whether to use embedded coefficient matrices to calculate SGPs. One should be careful to remove previously calculated SGPs prior to recalculating SGPs.

sgp.minimum.default.panel.years
Integer indicating the minimum number of panel years to begin with in the calculation of student growth percentiles. The default is NULL (converted to 3 years).

sgp.target.scale.scores
Boolean variable passed to combineSGP indicating whether target scale scores associated with SGP_TARGETs should be calculated as part of the combineSGP run. Defaults to FALSE.

sgp.target.scale.scores.only
Boolean variable passed to combineSGP indicating whether ONLY target scale scores associated with SGP_TARGETs should be calculated as part of the combineSGP run. Defaults to FALSE.

sgp.test.cohort.size
Integer indicating the maximum number of students sampled from the full cohort to use in the calculation of student growth percentiles. Intended to be used as a test of the desired analyses to be run. The default, NULL, uses no restrictions (no tests are performed, and analyses use the entire cohort of students).

return.sgp.test.results
Boolean variable passed to analyzeSGP and studentGrowthPercentiles indicating whether the results from the cohort sample subset (if specified using the above argument) should be returned for inspection. Defaults to FALSE. If TRUE, only the sample subset of the data used will be returned in the SGP object’s @Data slot. Alternatively, user can supply the character "ALL_DATA" to the argument to return the entire original data.

simulate.sgps
Boolean variable indicating whether to simulate SGP values for students based on test-specific Conditional Standard Errors of Measurement (CSEM). Test CSEM data must be available for simulation. Must be set to TRUE for confidence interval construction. Defaults to TRUE in abcSGP only.

calculate.simex
A character state acronym or list including state/csem variable, csem.data.vnames, csem.loss.hoss, simulation.iterations, lambda and extrapolation method. Returns both SIMEX adjusted SGP (SGP_SIMEX) as well as the percentile ranked SIMEX SGP (RANK_SIMEX) values as suggested by Castellano and McCaffrey (2017). Defaults to NULL, no simex calculations performed. Alternatively, setting the argument to TRUE sets the list up with state=state, lambda=seq(0,2,0.5), simulation.iterations=50, simex.sample.size=25000, extrapolation="linear" and save.matrices=TRUE.

calculate.simex.baseline
A character state acronym or list including state/csem variable, csem.data.vnames, csem.loss.hoss, simulation.iterations, lambda and extrapolation method. Defaults to NULL, no simex calculations performed. Alternatively, setting the argument to TRUE uses the same defaults as above along with simex.use.my.coefficient.matrices = TRUE. This argument is passed to analyzeSGP.
goodness.of.fit.print

Boolean variable passed to `analyzeSGP` indicating whether to print goodness of fit results.

parallel.config

A named list with, at a minimum, two elements indicating 1) the BACKEND package to be used for parallel computation and 2) the WORKERS list to specify the number of processors to be used in each major analysis. The BACKEND element can be set = to FOREACH or PARALLEL. Please consult the manuals and vignettes for information of these packages! The `analyzeSGP` help page contains more thorough explanation and examples of the parallel.config setup. The parallel.config list is passed to `analyzeSGP`, `combineSGP`, `summarizeSGP` and `visualizeSGP`. The WORKERS list can accordingly contain elements for PERCENTILES, PROJECTIONS, LAGGED_PROJECTIONS, BASELINE_MATRICES, BASELINE_PERCENTILES for `analyzeSGP`, SUMMARY for `summarizeSGP` and GA_PLOTS and SG_PLOTS for `visualizeSGP`. See those functions help pages for details.

save.intermediate.results

Should intermediate results of abcSGP be saved after each of `prepareSGP`, `analyzeSGP`, `combineSGP`, and `summarizeSGP`. Default is FALSE.

save.old.summaries

A Boolean argument (defaults to FALSE which will delete the @Summary slot before creating new summaries) indicating whether the call to `summarizeSGP` should save existing summaries in the @Summary slot.

sgPlot.demo.report

A Boolean variable (defaults to FALSE) indicating whether to produce only the demonstration student report catalog. Default is to produce reports for entire current year data.

sgp.config

Configuration passed to `analyzeSGP` and `combineSGP` for user specified SGP analyses. See `analyzeSGP` documentation for details on format of configuration argument.

sgp.summaries

A list giving the summaries requested for each group analyzed based upon the summary.group argument. Default is NULL allowing the `summarizeSGP` function to produce the list of summaries automatically.

summary.groups

A list consisting of 8 types of groups across which all summaries are taken: institution, content, time, institution_type, institution_level, demographic, and institution_inclusion. Summaries generated in summarizeSGP are for all possible combinations of the 8 types of group. See documentation for `summarizeSGP` for more detail.

data_supplementary

A list argument (or NULL, the default) providing additional multiple membership lookup tables for `summarizeSGP`. See `sgpData_INSTRUCTOR_NUMBER` for an example. Supplied data is embedded in the @Data_Supplementary slot.

confidence.interval.groups

A subset of the groups provided in the summary.groups argument indicating which groups to provide confidence intervals for. See documentation for `summarizeSGP` for more detail.
plot.types  A character vector passed to `visualizeSGP` indicating the types of plots to produce. Currently supported plots include `bubblePlots`, `studentGrowthPlots`, and `growthAchievementPlots`.

outputSGP.output.type  An argument passed to outputSGP indicating the output types to be produced. Defaults to `LONG_Data`, `LONG_FINAL_YEAR_Data`, `WIDE_Data`, and `INSTRUCTOR_Data`.

outputSGP.directory  A file path indicating where to save output files. Defaults to `Data`.

verbose.output  A Boolean argument indicating whether the function should output verbose diagnostic messages.

sgp.sqlite  A Boolean argument (defaults to `FALSE`) indicating whether a SQLite database file of the essential SGP data should be created from the `@Data` slot and subsequently used to extract data subsets for analyses conducted in order to reduce the amount of RAM memory required. See full argument description in `analyzeSGP`.

sgp.percentiles.equated  A Boolean argument (defaults to `NULL`, which calculates equated results if in the equating year) passed to `analyzeSGP` indicating whether equating should be used on the most recent year of test data provided. Equating allows for student growth projections to be calculated in across assessment transitions where the scale for the assessment changes.

sgp.percentiles.equating.method  Character vector argument passed to `analyzeSGP` indicating type(s) of equating method to used if `sgp.percentiles.equated=TRUE`. Default is `NULL` indicating 'equipercentile' equating. Options include 'identity', 'mean', 'linear', and 'equipercentile'.

sgp.percentiles.calculate.sgps  Boolean argument passed to `analyzeSGP` indicating whether student growth percentiles are produced as part of calls to the `studentGrowthPercentiles` function. Default is `TRUE`. Setting to `FALSE` produces only coefficient matrices.

get.cohort.data.info  Boolean argument passed to `analyzeSGP` indicating whether to create norm group cohort information based upon sgp configurations provided or calculated in `analyzeSGP`.

SGPt  Argument (defaults to `NULL`) indicating whether to perform time dependent SGP analyses (SGPt).

fix.duplicates  Argument to control how `analyzeSGP` and `combineSGP` deal with duplicate records based upon the key of `VALID_CASE`, `CONTENT_AREA`, `YEAR`, and `ID`. The function currently warns of duplicate records and doesn’t modify data. If set to 'KEEP.ALL', `analyzeSGP` tries to fix the duplicate individual records by adding a '_DUP_***' suffix to the duplicate ID before running `studentGrowthPercentiles` in order to create unique records based upon the key. If needed, the `@Data` slot will be extended as necessary to accommodate additional student records and SGP results in `combineSGP`. 
Value

Function returns a list containing the input long data set in the @Data slot as a data.table keyed using VALID_CASE, CONTENT_AREA, YEAR, ID, SGP results including student growth percentile and student growth projections/trajectories in the SGP slot, and summary results in the @Summary slot.

Examples

## Not run:
## Runs all 5 steps

Demonstration_SGP <- abcSGP(sgp_object=sgpData_LONG, state="DEMO")

## Or letting the function detect the state.

Demonstration_SGP <- abcSGP(sgpData_LONG)

###
### Example uses of the parallel.config argument
###

Demonstration_SGP <- abcSGP(sgpData_LONG,
parallel.config=list(  
  BACKEND="PARALLEL", TYPE="PSOCK",
  WORKERS=list(    
    PERCENTILES=8, BASELINE_PERCENTILES=8, PROJECTIONS=7, LAGGED_PROJECTIONS=6,
    SUMMARY=8,
    GA_PLOTS=8, SG_PLOTS=8)
  )
)}

## End(Not run)
Description

Wrapper function used to produce student growth percentiles and student growth projections (both cohort and baseline referenced) using long formatted data like that provided by `prepareSGP`.

Usage

```r
analyzeSGP(sgp_object, 
state=NULL, 
years=NULL, 
content_areas=NULL,

Arguments

sgp_object An object of class SGP containing long formatted data in the @Data slot (from prepareSGP).

state Acronym indicating state associated with the data for access to embedded knot and boundaries, cutscores, CSEMs, and other state related assessment data.

years A vector indicating year(s) in which to produce student growth percentiles and/or student growth projections/trajectories. If missing the function will use the data to infer the year(s) based upon the assumption of having at least three years of panel data for analyses.

content_areas A vector indicating content area(s) in which to produce student growth percentiles and/or student growth projections/trajectories. If left missing the function will use the data to infer the content area(s) available for analyses.

grades A vector indicating grades for which to calculate student growth percentiles and/or student growth projections/trajectories. If left missing the function will use the data to infer all the grade progressions for student growth percentile and student growth projections/trajectories analyses.

sgp.percentiles Boolean variable indicating whether to calculate student growth percentiles. Defaults to TRUE.

sgp.projections Boolean variable indicating whether to calculate student growth projections. Defaults to TRUE.

sgp.projections.lagged Boolean variable indicating whether to calculate lagged student growth projections often used for growth to standard analyses. Defaults to TRUE.

sgp.percentiles.baseline Boolean variable indicating whether to calculate baseline student growth percentiles and/or coefficient matrices. Defaults to TRUE.

sgp.projections.baseline Boolean variable indicating whether to calculate baseline student growth projections. Defaults to TRUE.

sgp.projections.lagged.baseline Boolean variable indicating whether to calculate lagged baseline student growth projections. Defaults to TRUE.

sgp.percentiles.baseline.max.order Integer indicating the maximum order to calculate baseline student growth percentiles (regardless of maximum coefficient matrix order). Also the max order of baseline coefficient matrices to be calculated if requested. Default is 3. To utilize the maximum matrix order, set to NULL.

sgp.projections.baseline.max.order Integer indicating the maximum order to calculate baseline student growth projections (regardless of maximum coefficient matrix order). Default is 3. To utilize the maximum matrix order, set to NULL.
analyzeSGP

sgp.projections.lagged.baseline.max.order
Integer indicating the maximum order to calculate lagged baseline student growth projections (regardless of maximum coefficient matrix order). Default is 3. To utilize the maximum matrix order, set to NULL.

sgp.projections.max.forward.progression.years
Integer indicating the maximum number of years forward that cohort based projections will be established for. Default is 3 years.

sgp.projections.max.forward.progression.grade
Integer indicating the maximum grade forward that cohort based projections will be established for. Default is NULL, the highest grade.

sgp.projections.use.only.complete.matrices
Boolean argument (defaults to TRUE/NULL) indicating whether to produce projections only when a complete set of coefficient matrices is available.

sgp.minimum.default.panel.years
Integer indicating the minimum number of panels years to use for default sgp analyses. Default value is NULL (converted to 3) years of data.

sgp.use.my.coefficient.matrices
Argument, defaults to NULL, indicating whether to use coefficient matrices embedded in argument supplied to 'sgp_object' to calculate student growth percentiles.

sgp.use.my.sgp_object.baseline.coefficient.matrices
Argument, defaults to NULL (FALSE), indicating whether to utilize baseline matrices embedded in supplied sgp_object and not utilize baseline matrices embedded in SGPstateData.

sgp.test.cohort.size
Integer indicating the maximum number of students sampled from the full cohort to use in the calculation of student growth percentiles. Intended to be used as a test of the desired analyses to be run. The default, NULL, uses no restrictions (no tests are performed, and analyses use the entire cohort of students).

return.sgp.test.results
Boolean variable passed to studentGrowthPercentiles indicating whether the results from the cohort sample subset (if specified using the above argument) should be returned for inspection. Defaults to FALSE. If TRUE, only the sample subset of the data used will be returned in the SGP object's @Data slot. Alternatively, user can supply the character "ALL_DATA" to the argument to return the entire original data.

simulate.sgps
Boolean variable indicating whether to simulate SGP values for students based on test-specific Conditional Standard Errors of Measurement (CSEM). Test CSEM data must be available for simulation and included in SGPstateData. This argument must be set to TRUE for confidence interval construction. Defaults to TRUE.

calculate.simex
A character state acronym or list including state/csem variable, csem.data.vnames, csem.loss.hoss, simulation.iterations, lambda and extrapolation method. Returns both SIMEX adjusted SGP (SGP_SIMEX) as well as the percentile ranked SIMEX SGP (RANK_SIMEX) values as suggested by Castellano and McCaffrey (2017). Defaults to NULL, no simex calculations performed. Alternatively, setting the argument to TRUE sets the list up with state=state, lambda=seq(0,2,0.5),
analyzeSGP

simulation.iterations=50, simex.sample.size=25000, extrapolation="linear" and save.matrices=TRUE.

calculate.simex.baseline
A character state acronym or list including state/csem variable, csem.data.vnames, csem.loss.hoss, simulation.iterations, lambda and extrapolation method. Defaults to NULL, no simex calculations performed. Alternatively, setting the argument to TRUE uses the same defaults as above along with simex.use.my.coefficient.matrices = TRUE, which assumes baseline SIMEX coefficient matrices are available.

goodness.of.fit.print
Boolean variable indicating whether to print out Goodness of Fit figures as PDF into a directory labeled Goodness of Fit. Defaults to TRUE.

sgp.config
If years, content_areas, and grades are missing, user can directly specify a list containing three vectors: baseline.content.areas, baseline.panel.years, and baseline.grade.sequences. This advanced option is helpful for analysis of non-traditional grade progressions and other special cases. See examples for use cases.

sgp.config.drop.nonsequential.grade.progression.variables
Boolean variable (defaults to TRUE) indicating whether non-sequential grade progression variables should be dropped when sgp.config is processed. For example, if a grade progression of c(3,4,6) is provided, the data configuration will assume (default is TRUE) that data for a missing year needs to be dropped prior to applying studentGrowthPercentiles or studentGrowthProjections to the data.

sgp.baseline.panel.years
A vector of years to be used for baseline coefficient matrix calculation. Default is to use most recent five years of data.

sgp.baseline.config
A list containing three vectors: sgp.content.areas, sgp.panel.years, sgp.grade.sequences indicating how baseline student growth percentile analyses are to be conducted. In almost all cases this value is calculated by default within the function but can be specified directly for advanced use cases. See source code for more detail on this configuration option.

trim.sgp.config
A Boolean variable indicating whether the arguments content_areas, years and grades should be used to 'trim' any manually supplied configuration for analysis supplied by 'sgp.config'.

parallel.config
A named list with, at a minimum, two elements indicating 1) the BACKEND package to be used for parallel computation and 2) the WORKERS list to specify the number of processors to be used in each major analysis. The BACKEND element can be set = to FOREACH or PARALLEL. Please consult the manuals and vignettes for information of these packages!

TYPE is a third element of the parallel.config list that provides necessary information when using FOREACH or PARALLEL packages as the backend. With BACKEND="FOREACH", the TYPE element specifies the flavor of 'foreach' backend. As of version 1.0-1.0, only "doParallel" is supported. If BACKEND = "PARALLEL", the parallel package will be used. This package com-
bines deprecated parallel packages snow and multicore. Using the "snow" implementation of parallel the function will create a cluster object based on the TYPE element specified and the number of workers requested (see WORKERS list description below). The TYPE element indicates the users preferred cluster type (either "PSOCK" for socket cluster or "MPI" for an OpenMPI cluster). If Windows is the operating system, this "snow" implementation must be used and the TYPE element must = "PSOCK". Defaults are assigned based on operating system if TYPE is missing based on system OS. Unix/Mac OS defaults to the "multicore" to avoid worker node pre-scheduling and appears to be more efficient in these operating systems.

The WORKERS list must contain, at a minimum, a single number of processors (nodes) desired or available. If WORKERS is specified in this manner, then the same number of processors will be used for each analysis type (sgp.percentiles, sgp.projections, ... sgp.projections.lagged.baseline). Alternatively, the user may specify the numbers of processors used for each analysis. This allows for better memory management in systems that do not have enough RAM available per core. The choice of the number of cores is a balance between the number of processors available, the amount of RAM a system has and the size of the data (sgp_object). Each system will be different and will require some tailoring. One rule of thumb used by the authors is to allow for 4GB of memory per core used for running large state data. The SGP Demonstration (and data that size) requires more like 1-2GB per core. As an example, PERCENTILES=4 and PROJECTIONS=2 might be used on a quad core machine with 4 GB of RAM. This will use all 4 cores available for the sgp.percentiles analysis and 2 cores for the sgp.projections analysis (which requires more memory than available). The WORKERS list accepts these elements: PERCENTILES, PROJECTIONS (for both cohort and baseline referenced projections), LAGGED_PROJECTIONS (for both cohort and baseline referenced lagged projections), BASELINE_MATRICES (used to produce the baseline coefficient matrices when not available in SGPstateData - very computationally intensive), BASELINE_PERCENTILES (SGP calculation only when baseline coefficient matrices have already been produced and are available - NOT very computationally intensive).

Alternatively, the name of an external CLUSTER.OBJECT (PSOCK or MPI) set up by the user outside of the function can be used.

Example use cases are provided below.

verbose.output A Boolean argument (defaults to FALSE) indicating whether the function should output verbose diagnostic messages.

print.other.gp A Boolean argument (defaults to FALSE) indicating whether the function should output SGP of all orders.

sgp.projections.projection.unit

A character vector argument indicating whether the studentGrowthProjections function should produce projections relative to future grades or future years. Options are "YEAR" and "GRADE", with default being "YEAR".

get.cohort.data.info

A Boolean argument (defaults to FALSE) indicating whether a summary of all cohorts to be submitted to the studentGrowthPercentiles and studentGrowthProjections functions should be performed prior to analysis.
sgp.sqlite  A Boolean argument (defaults to FALSE) indicating whether a SQLite database file of the essential SGP data should be created from the @Data slot and subsequently used to extract data subsets for analysis with studentGrowthPercentiles and studentGrowthProjections functions. If the size of the @Data object is greater than 1 GB sgp.sqlite is set to TRUE internally. When TRUE, this can substantially reduce the amount of RAM memory required to conduct analyses. If set to TRUE the file "TMP_SGP_Data.sqlite" will be created in the R temporary directory (see ?tempdir for information). This file is deleted by default although one may keep it if the argument is specified as the character "KEEP".

sgp.percentiles.equated  A Boolean argument (defaults to NULL/FALSE) indicating whether equating should be used on the most recent year of test data provided. Equating allows for student growth projections to be calculated in across assessment transitions where the scale for the assessment changes.

sgp.percentiles.equating.method  A character vector (defaults to NULL/'equipercentile') indicating the type of equating method to use. Options include any combination of 'identity', 'mean', 'linear', and 'equipercentile'.

sgp.percentiles.calculate.sgps  A Boolean argument (defaults to TRUE) indicating whether to calculate percentiles in calls to studentGrowthPercentiles function. Setting to FALSE would indicate desire to calculate only coefficient matrices and no percentiles.

SGPt  An argument supplied to implement time-dependent SGP analyses (SGPt). Default is NULL giving standard, non-time dependent argument. If set to TRUE, the function assumes the variables 'TIME' and 'TIME_LAG' are supplied as part of the panel.data. To specify other names, supply a list of the form: list(TIME='my_time_name', TIME_LAG='my_time_lag_name'), substituting your variable names.

fix.duplicates  Argument to control how duplicate records based upon the key of VALID_CASE, CONTENT_AREA, YEAR, and ID are dealt with. If set to 'KEEP.ALL', the function tries to fix the duplicate individual records by adding a '_DUP_***' suffix to the duplicate ID before running studentGrowthPercentiles in order to create unique records based upon the key. See combineSGP for additional info on fix.duplicates functionality.

...  Arguments to be passed to studentGrowthPercentiles or studentGrowthProjections for finer control over SGP calculations. NOTE: arguments can only be passed to one lower level function at a time, and only student growth percentiles OR projections can be created but not both at the same time.

Value  
Function returns a list containing the long data set in the @Data slot as a data.table keyed using VALID_CASE, CONTENT_AREA, YEAR, ID and the student growth percentile and/or student growth projection/trajectory results in the SGP slot.

Examples

```r
## Not run:
## analyzeSGP is Step 2 of 5 of abcSGP
Demonstration_SGP <- sgpData_LONG
Demonstration_SGP <- prepareSGP(Demonstration_SGP)
Demonstration_SGP <- analyzeSGP(Demonstration_SGP)

## Or (explicitly pass state argument)
Demonstration_SGP <- prepareSGP(sgpData_LONG)
Demonstration_SGP <- analyzeSGP(Demonstration_SGP, state="DEMO")

### Example uses of the sgp.config argument

# Use only 3 years of Data, for grades 3 to 6
# and only perform analyses for most recent year (2012)
my.custom.config <- list(
  MATHEMATICS.2013_2014 = list(
    sgp.content.areas=rep("MATHEMATICS", 3), # Note, must be same length as sgp.panel.years
    sgp.grade.sequences=list(3:4, 3:5, 4:6)),
  READING.2013_2014 = list(
    sgp.content.areas=rep("READING", 3),
    sgp.grade.sequences=list(3:4, 3:5, 4:6)))
Demonstration_SGP <- prepareSGP(sgpData_LONG)
Demonstration_SGP <- analyzeSGP(Demonstration_SGP, sgp.config=my.custom.config,
  sgp.percentiles.baseline = FALSE,
  sgp.projections.baseline = FALSE,
  sgp.projections.lagged.baseline = FALSE,
  simulate.sgps=FALSE)

# Another example sgp.config list:

# Use different CONTENT_AREA priors, and only 1 year of prior data
my.custom.config <- list(
  MATHEMATICS.2013_2014.READ_PRIOR = list(
    sgp.content.areas=c("READING", "MATHEMATICS"),
    sgp.panel.years=c('2012_2013', '2013_2014'),
    sgp.grade.sequences=list(3:4, 4:5, 5:6)),
  READING.2013_2014.MATH_PRIOR = list(
    sgp.content.areas=c("MATHEMATICS", "READING"),
```
analyzeSGP

sgp.panel.years=c('2012_2013', '2013_2014'),
sgp.grade.sequences=list(3:4, 4:5, 5:6))

## An example showing multiple priors within a single year

Demonstration_SGP <- prepareSGP(sgpData_LONG)

DEMO.config <- list(
  READING.2012_2013 = list(
    sgp.content.areas=c("MATHEMATICS", "READING", "MATHEMATICS", "READING", "READING"),
    sgp.grade.sequences=list(c(3,3,4,5), c(4,4,5,5,6), c(5,5,6,6,7), c(6,6,7,7,8))),
  MATHEMATICS.2012_2013 = list(
    sgp.content.areas=c("READING", "MATHEMATICS", "READING", "MATHEMATICS", "MATHEMATICS"),
    sgp.grade.sequences=list(c(3,3,4,5), c(4,4,5,5,6), c(5,5,6,6,7), c(6,6,7,7,8))))

Demonstration_SGP <- analyzeSGP(
  Demonstration_SGP,
  sgp.config=DEMO.config,
  sgp.projections=FALSE,
  sgp.projections.lagged=FALSE,
  sgp.percentiles.baseline=FALSE,
  sgp.projections.baseline=FALSE,
  sgp.projections.lagged.baseline=FALSE,
  sgp.config.drop.nonsequential.grade.progression.variables=FALSE)

###
### Example uses of the parallel.config argument
###

## Windows users must use a snow socket cluster:
# possibly a quad core machine with low RAM Memory
# 4 workers for percentiles, 2 workers for projections.
# Note the PSOCK type cluster is used for single machines.

Demonstration_SGP <- prepareSGP(sgpData_LONG)
Demonstration_SGP <- analyzeSGP(Demonstration_SGP,
  parallel.config=list(
    BACKEND="PARALLEL", TYPE="PSOCK",
    WORKERS=list(PERCENTILES=4,
      PROJECTIONS=2,
      LAGED_PROJECTIONS=2,
      BASELINE_PERCENTILES=4))

## New parallel package - only available with R 2.13 or newer
# Note there are up to 16 workers, and MPI is used,
# suggesting this example is for a HPC cluster, possibly Windows OS.
...

parallel.config=list(
  BACKEND="PARALLEL", TYPE="MPI",
```r
WORKERS=list(PERCENTILES=16,
              PROJECTIONS=8,
              LAGGED_PROJECTIONS=6,
              BASELINE_PERCENTILES=12))

## FOREACH use cases:
... parallel.config=list(
  BACKEND="FOREACH", TYPE="doParallel",
  WORKERS=3)
...

# NOTE: This list of parallel.config specifications is NOT exhaustive.
# See examples in analyzeSGP documentation for some others.

### Advanced Example: restrict years, recalculate baseline SGP
### coefficient matrices, and use parallel processing
###

# Remove existing DEMO baseline coefficient matrices from
# the SGPstateData object so that new ones will be computed.
SGPstateData$DEMO$Baseline_splineMatrix <- NULL

# set up a customized sgp.config list
...

# set up a customized sgp.baseline.config list
...

# to be completed

## End(Not run)
```

**baselineSGP**

Analyze student data to produce student growth percentiles and coefficient matrices from a baseline (i.e. multiple cohort) norm group

---

**Description**

Utility function/exemplar used to produce student growth percentiles using long formatted data like that provided by `prepareSGP`. Used as part of `analyzeSGP` for baseline referenced student growth percentile analyses.
Usage

baselineSGP(sgp_object, state=NULL, years=NULL, content_areas=NULL, grades=NULL, exclude.years=NULL, sgp.config=NULL, sgp.baseline.config=NULL, sgp.baseline.panel.years=NULL, sgp.percentiles.baseline.max.order=3, return.matrices.only=FALSE, calculate.baseline.sgps=TRUE, calculate.simex.baseline=NULL, goodness.of.fit.print=TRUE, parallel.config=NULL, SGPt=NULL, ...)

Arguments

sgp_object An object of class SGP containing long formatted data in the @Data (from prepareSGP) slot.
state Acronym indicating state associated with the data for access to embedded knot and boundaries.
years A vector indicating year(s) in which to produce baseline referenced student growth percentiles.
content_areas A vector indicating content area in which to produce baseline referenced student growth percentiles.
grades A vector indicating which grades to calculate baseline referenced student growth percentiles.
exclude.years A vector indicating which years to exclude from the calculations?
sgp.config If years, content_areas, and grades are missing, user can directly specify a list containing three vectors: baseline.content.areas, baseline.panel.years, and baseline.grade.sequences. This advanced option is helpful for analysis of non-traditional grade progressions and other special cases. See analyzeSGP for use cases.
sgp.baseline.config A list containing three vectors: sgp.content.areas, sgp.panel.years, sgp.grade.sequences indicating how baseline student growth percentile analyses are to be conducted. In most cases this value will be calculated by default within the function but can be specified directly for advanced use cases. See source code for more detail on this configuration option.
sgp.baseline.panel.years A character vector indicating the years to be used for the calculation of baseline SGPs. Default is to use most recent five years of data.
sgp.percentiles.baseline.max.order
   Integer indicating the maximum order to calculate baseline student growth percentiles (regardless of maximum coefficient matrix order). Default is 3. To utilize the maximum matrix order, set to NULL.

return.matrices.only
   Boolean variable indicating whether the function will only return baseline referenced coefficient matrices. Defaults to FALSE.

calculate.baseline.sgps
   Boolean variable indicating whether the function will calculate baseline referenced student growth percentiles from baseline referenced coefficient matrices. Defaults to TRUE.

calculate.simex.baseline
   A list including state/csem variable, csem.data.vnames, csem.loss.hoss, simulation.iterations, lambda and extrapolation method. Defaults to NULL, no simex calculations performed. Alternatively, setting the argument to TRUE sets the list up with state=state, lambda=seq(0,2,0.5), simulation.iterations=50, simex.sample.size=25000, extrapolation="linear" and save.matrices=TRUE.

goodness.of.fit.print
   Boolean variable indicating whether the function will export goodness of fit plots if baseline referenced student growth percentiles are calculated. Defaults to TRUE.

parallel.config
   parallel configuration argument allowing for parallel analysis by 'tau'. Defaults to NULL.

SGPt
   Argument supplied to generate time dependent SGPs. Defaults to NULL/FALSE.

... Arguments to be passed internally to studentGrowthPercentiles for finer control over SGP calculations.

Value
    If return.matrices.only is set to TRUE function returns a list containing the baseline referenced coefficient matrices. Otherwise function returns the SGP object provided with the sgp_object argument with the baseline referenced coefficient matrices, growth percentiles, etc. embedded.

**bubblePlot**

*Core bubblePlot function for SGP*

**Description**

Function to create bubble plots associated with student growth percentile and percentile growth trajectory results. The function is adaptable to many representations but is used in conjunction with results derived from `summarizeSGP` to represent summary level results of growth against achievement (usually, median student growth percentile against percentage at/above proficient). The function has MANY options and users are advised to read this documentation thoroughly as well as investigate the source code for the function itself to see what the many different representations that are possible. The function has the ability to produce interactive data tips using the pdf2 package available on R-Forge. This package is NOT installed as part of the SGP package and must be installed separately from the package to take advantage of this functionality of the bubblePlot function. To install pdf2 from the R prompt type: `install.packages("pdf2",repos="http://R-Forge.R-project.org")`. The use of the pdf2 package is scheduled to be deprecated as it is no longer maintained by the creator and requires use of a pre 2.14 version of R.

**Usage**

```
bubblePlot(bubble_plot_data.X, bubble_plot_data.Y,```
bubble_plot_data.SUBSET=NULL,
bubble_plot_data.INDICATE=NULL,
    bubble_plot_data.BUBBLE_CENTER_LABEL=NULL,

    bubble_plot_configs.BUBBLE_COLOR_GRADIENT_REVERSE=FALSE,
bubble_plot_configs.BUBBLE_TIPS=TRUE,
bubble_plot_configs.BUBBLE_PLOTDEVICE="PDF",
bubble_plot_configs.BUBBLE_PLOT_FORMAT="print",
bubble_plot_configs.BUBBLE_PLOT_LEGEND=FALSE,
bubble_plot_configs.BUBBLE_PLOT_TITLE=TRUE,
bubble_plot_configs.BUBBLE_PLOTBACKGROUND_LABELS=c("Growth", "Achievement"),
bubble_plot_configs.BUBBLE_PLOTEXTRAS=NULL,
    bubble_plot_configs.BUBBLE_PLOTDIMENSION=NULL, ## List of WIDTH and HEIGHT
bubble_plot_configs.BUBBLE_PLOTNAME="bubblePlot.pdf",
bubble_plot_configs.BUBBLE_PLOT_PATH="Figures",
bubble_plot_pdftk.CREATECATALOG=FALSE)

Arguments

bubble_plot_data.X
    A vector of X coordinates for the bubbles to be plotted.
bubble_plot_data.Y

A vector of Y coordinates for the bubbles to be plotted.

bubble_plot_data.SUBSET

A Boolean vector indicating a subset of the bubbles to be highlighted and plotted. When BUBBLE_TIPS are indicated, only subsetted bubbles will show bubble tips. To further accentuate highlight bubbles, their radius can be altered using the bubble_plot_configs.BUBBLE_SUBSET_INCREMENT argument. Default value is bubble_plot_data.SUBSET=NULL.

bubble_plot_data.INDICATE

A Boolean vector indicating whether to attached a label to to further highlight in a manner suitable for printing. Usually done for few bubbles. Default value is bubble_plot_data.INDICATE=NULL.

bubble_plot_data.BUBBLE_CENTER_LABEL

A character vector to label the interior of the bubbles with. Usually a vector of singleton characters. Default value is bubble_plot_data.BUBBLE_CENTER_LABEL=NULL.

bubble_plot_data.SIZE

A vector indicating the size of each of the bubbles plotted.

bubble_plot_data.LEVELS

A vector (usually a factor) indicating categories to which the bubbles belong. Default value is bubble_plot_data.LEVELS=NULL.

bubble_plot_data.BUBBLE_TIPS_LINES

A list of arbitrary length indicating the different values supplied when bubble tips are requested. Default value is bubble_plot_data.BUBBLE_TIPS_LINES=list(paste(MEDIAN_SGP,'MEDIAN_SGP_COUNT','PERCENT_AT_ABOVE_PROFICIENT)).

bubble_plot_labels.X

A vector of length 2 where the 1st component is, usually a one word summary for the axis (e.g., Growth) and the 2nd component of the vector is a label for the axis (e.g., Median Student Growth Percentile). Default value is bubble_plot_labels.X=c('Growth','Median Student Growth Percentile').

bubble_plot_labels.Y

A vector of length 2 where the 1st component is, usually a one word summary for the axis (e.g., Achievement) and the 2nd component of the vector is a label for the axis (e.g., Percent at/above Proficient). Default value is bubble_plot_labels.Y=c('Achievement at/above Proficient').

bubble_plot_labels.SIZE

A vector of quantities giving breaking points for the size bubbles indicated in the legend of the plot. Default value is bubble_plot_labels.SIZE=c(50,100,500,1000).

bubble_plot_labels.LEVELS

A vector of quantities giving level labels associated with bubble_plot_data.LEVELS. These labels will appear in the right legend of the plot. Default value is bubble_plot_labels.LEVELS=NULL.

bubble_plot_labels.BUBBLE_TIPS_LINES

A list of labels that appear in the mouse over data tips. Should be of same length as the list from bubble_plot_data.BUBBLE_TIPS_LINES. Default value is bubble_plot_labels.BUBBLE_TIPS_LINES=list('Median SGP (Count)','Percent at/above Proficient').
bubble_plot_labels.BUBBLE_TITLES
A character vector with of the same length as number of points plotted indicated what name should appear on each mouse over bubble tip (e.g., the school name associated with the bubble. Default value is bubble_plot_labels.BUBBLE_TITLES=SCHOOL_NAME.
bubble_plot_titles.MAIN
The main title of the bubble plot. Default value is bubble_plot_titles.MAIN='Growth and Achievement'.
bubble_plot_titles.SUB1
The right upper title of the bubble plot. Default value is bubble_plot_titles.SUB1='State School Performance'.
bubble_plot_titles.SUB2
The right lower title of the bubble plot. Default value is bubble_plot_titles.SUB2='Growth & Current Achievement'.
bubble_plot_titles.LEGEND1
The title of the upper legend to the right of the bubble plot. Default value is bubble_plot_titles.LEGEND1='School Size'.
bubble_plot_titles.LEGEND2_P1
The 1st line of the title of the lower legend of the bubble plot. Default value is bubble_plot_titles.LEGEND2_P1=NULL.
bubble_plot_titles.LEGEND2_P2
The 2nd line of the title of the lower legend of the bubble plot. Default value is bubble_plot_titles.LEGEND2_P2=NULL.
bubble_plot_titles.NOTE
A note, message, description, etc to be placed in lower half of the legend. Default value is bubble_plot_titles.NOTE=NULL. Note that this can only be used if there are not LEVELS (and therefore no second legend).
bubble_plot_configs.BUBBLE_MIN_MAX
A vector of length two indicating min and max values for the bubbles in inches. Default value is bubble_plot_configs.BUBBLE_MIN_MAX=c(0.03,0.03).
bubble_plot_configs.BUBBLE_X_TICKS
A vector indicating what x coordinates to display for the x axis of the bubble plot. Default value is bubble_plot_configs.BUBBLE_X_TICKS=seq(0,100,10).
bubble_plot_configs.BUBBLE_X_TICKS_SIZE
A vector, the same length as bubble_plot_configs.BUBBLE_X_TICKS indicating the character expansion (i.e., cex) associated with the characters. Default value is bubble_plot_configs.BUBBLE_X_TICKS_SIZE=c(rep(0.6,5),1,rep(0.6,5)).
bubble_plot_configs.BUBBLE_X_BANDS
A vector of cutpoints used to separate the plot background into horizontal rectangular regions.
bubble_plot_configs.BUBBLE_X_BAND_LABELS
A character vector of labels used to labels the rectangles produced with bubble_plot_configs.BUBBLE_X_BANDS.
bubble_plot_configs.BUBBLE_Y_TICKS
A vector indicating what x coordinates to display for the x axis of the bubble plot. Default value is bubble_plot_configs.BUBBLE_Y_TICKS=seq(0,100,10).
bubble_plot_configs.BUBBLE_Y_TICKS_SIZE
A vector, the same length as bubble_plot_configs.BUBBLE_Y_TICKS indicating the character expansion (i.e., cex) associated with the characters. Default value is bubble_plot_configs.BUBBLE_Y_TICKS_SIZE=rep(0.6,11).
bubblePlot

bubble_plot_configs.BUBBLE_Y_BANDS
A vector of cutpoints used to separate the plot background into horizontal rectangular regions.

bubble_plot_configs.BUBBLE_Y_BAND_LABELS
A character vector of labels used to labels the rectangles produced with bubble_plot_configs.BUBBLE_X_BANDS.

bubble_plot_configs.BUBBLE_SUBSET_INCREASE
Default value is bubble_plot_configs.BUBBLE_SUBSET_INCREASE=0.

bubble_plot_configs.BUBBLE_SUBSET_ALPHA
Default value is bubble_plot_configs.BUBBLE_SUBSET_ALPHA=list(Transparent=0.3,Opaque=0.9).

bubble_plot_configs.BUBBLE_COLOR
Default value is bubble_plot_configs.BUBBLE_COLOR="deeppink2".

bubble_plot_configs.BUBBLE_COLOR_GRADIENT_REVERSE
Boolean argument (defaults to FALSE) indicating whether to reverse color gradient associated with bubbles.

bubble_plot_configs.BUBBLE_TIPS
Default value is bubble_plot_configs.BUBBLE_TIPS=TRUE.

bubble_plot_configs.BUBBLE_PLOT_DEVICE
Default value is bubble_plot_configs.BUBBLE_PLOT_DEVICE='PDF'.

bubble_plot_configs.BUBBLE_PLOT_FORMAT
Default value is bubble_plot_configs.BUBBLE_PLOT_FORMAT='print'.

bubble_plot_configs.BUBBLE_PLOT_LEGEND
Default value is bubble_plot_configs.BUBBLE_PLOT_LEGEND=FALSE.

bubble_plot_configs.BUBBLE_PLOT_TITLE
Default value is bubble_plot_configs.BUBBLE_PLOT_TITLE=TRUE.

bubble_plot_configs.BUBBLE_PLOT_BACKGROUND_LABELS
Default value is bubble_plot_configs.BUBBLE_PLOT_BACKGROUND_LABELS=c('Growth', 'Achievement').

bubble_plot_configs.BUBBLE_PLOT_EXTRAS
Default value is bubble_plot_configs.BUBBLE_PLOT_EXTRAS=NULL.

bubble_plot_configs.BUBBLE_PLOT_DIMENSION
Default value is bubble_plot_configs.BUBBLE_PLOT_DIMENSION=NULL.

bubble_plot_configs.BUBBLE_PLOT_NAME
Default value is bubble_plot_configs.BUBBLE_PLOT_NAME='bubblePlot.pdf'.

bubble_plot_configs.BUBBLE_PLOT_PATH
Default value is bubble_plot_configs.BUBBLE_PLOT_PATH=paste('Figures', sep='').

bubble_plot_pdftk.CREATE_CATALOG
Default value is bubble_plot_pdftk.CREATE_CATALOG=FALSE.

Details
Typical use of the function is as part of visualizeSGP function. However, function can be used more generically for diverse plots showing many dimensions of data simultaneously.

Value
Function creates a bubble chart and writes the result as a PDF to bubble_plot_configs.BUBBLE_PATH.
bubblePlot_Styles

**Description**

Function includes a number of "styles" associated with bubblePlot to create bubble plots depicting a variety of relationships often of interest to stakeholders. The bubblePlot function itself is adaptable to many representations but is most often used in conjunction with results derived from summarizeSGP to represent summary level results of growth against achievement (usually, median student growth percentile against percentage at/above proficient).

**Usage**

```r
bubblePlot_Styles(
  sgp_object,
  state,
  bPlot.years=NULL,
  bPlot.content_areas=NULL,
  bPlot.districts=NULL,
  bPlot.schools=NULL,
  bPlot.instructors=NULL,
  bPlot.styles=c(1),
  bPlot.levels=NULL,
  bPlot.level.cuts=NULL,
  bPlot.full.academic.year=TRUE,
  bPlot.minimum.n=10,
  bPlot.anonymize=FALSE,
  bPlot.prior.achievement=TRUE,
  bPlot.draft=FALSE,
  bPlot.demo=FALSE,
  bPlot.output="PDF",
  bPlot.format="print",
  bPlot.folder="Visualizations/bubblePlots")
```

**Arguments**

- **sgp_object**: An object of class SGP containing long formatted data in the @Data slot that will be used for the production of student growth and achievement plots and system growth and achievement plots, summary data from summarizeSGP in the @Summary slot for bubble plots.

- **state**: Acronym indicating state associated with the summaries for access to assessment program information embedded in SGPstateData.
bPlot.years  A vector indicating year(s) in which to produce bubblePlots using data available in sgp_object. If missing the function will use the last year available in the data to produce bubblePlots.

bPlot.content_areas  A vector indicating content area(s) to produce bubblePlots using data available in sgp_object. If missing the function will produce plots for all available content areas provided in the data.

bPlot.districts  A vector indicating districts to produce bubblePlots using data available in sgp_object. If missing the function will produce plots for all available districts provided in the data where districts represent a relevant unit to be represented by the specific bubblePlot style.

bPlot.schools  A vector indicating schools to produce bubblePlots using data available in sgp_object. If missing the function will produce plots for all available schools provided in the data where districts represent a relevant unit to be represented by the specific bubblePlot style.

bPlot.instructors  A vector indicating instructors to produce bubblePlots using data available in sgp_object. If missing the function will produce plots for all available instructors provided in the data where schools and districts represent relevant units to be represented by the specific bubblePlot style.

bPlot.styles  A vector of positive integers indicating the types of bubblePlots to produce using data available in sgp_object. See associated documentation for example plots.

bPlot.levels  A character vector of levels to be used to color bubbles in the bubblePlot. See associated documentation for example plots.

bPlot.level.cuts  A vector of cuts to be used to distinguish levels used to color bubbles in the bubblePlot. See associated documentation for example plots.

bPlot.full.academic.year  A Boolean argument (defaults to TRUE) indicating whether bubblePlots should use full academic year results if available.

bPlot.minimum.n  A positive integer (defaults to 10) indicating the minimum size for summary values to be displayed in the bubblePlots.

bPlot.anonymize  A Boolean argument (defaults to FALSE) indicating whether to anonymize bubblePlots school and district names that appear in the plots and data tips of the plots. For student level anonymization, the function utilizes the randomNames package to produce gender and ethnic correct names based upon gender and ethnicity codes available in @Data.

bPlot.prior.achievement  A Boolean argument (defaults to TRUE) indicating whether to produce bubblePlots using prior achievement as well as current achievement as the vertical dimension of the bubblePlot.

bPlot.draft  A Boolean argument (defaults to FALSE) indicating whether to put an indicator on the chart noting that the results are draft and to not distribute.
bPlot.demo  A Boolean argument (defaults to FALSE) indicating whether to produce demo student level plots (styles 150 and/or 153) for instructors.

bPlot.output Argument indicating the desired type of output format for bubble plots. Either 'PDF' (default) or 'PNG'.

bPlot.format Either "print" or "presentation" indicating whether to optimize the plot for print form (light background) or presentation form (dark background).

bPlot.folder Character vector indicating where bubblePlots should be placed. Default folder is "Visualizations/bubblePlots".

Details

bubblePlot_Styles is an omnibus function containing a number of applications of the bubblePlot function with data output from SGP analyses. As added styles are constructed they will be added to the function allowing user to construct plots of their liking. User wishing to participate and provide or suggest specific styles of their own should contact the package maintainer. Styles representing summary level data (e.g., growth and achievement for schools) are currently assigned numbers from 1 to 99 and styles representing individual level data (e.g., growth and achievement for students within a single grade) are currently assigned numbers from 100 to 199.

1: Growth and achievement bubblePlots for the entire state with bubbles representing schools.

100: Growth and achievement bubblePlots by grade for students in selected schools and districts.

Value

Function produces numerous PDF bubble charts in the styles specified by the function.

Author(s)

Damian W. Betebenner <dbetebenner@nciea.org> and Adam Van Iwaarden <vaniwaarden@colorado.edu>

capwords Function for converting all caps to mixed case. Useful in data cleaning.

Description

The function capwords converts characters to mixed case character as intelligently as possible and leading/trailing spaces.

Usage

capwords(x,
Combine student data and SGP results

Utility function that merges student long data in the @Data slot with results from student growth percentiles and/or student growth projections calculations. Default values of this function are designed to be used following use of other utility functions: prepareSGP and analyzeSGP. Function is integrated with cutscores embedded in SGPstateData to calculate growth-to-standard SGP targets and their associated scale scores with catch-up/keep-up to proficient status and/or move-up/stay-up to advanced status as well as the scale scores associated with these targets.
Usage

```r
combineSGP(sgp_object,
  state=NULL,
  years=NULL,
  content_areas=NULL,
  sgp.percentiles=TRUE,
    sgp.percentiles.baseline=TRUE,
  sgp.projections=TRUE,
  sgp.projections.baseline=TRUE,
  sgp.projections.lagged=TRUE,
    sgp.projections.lagged.baseline=TRUE,
  sgp.target.scale.scores=FALSE,
  sgp.target.scale.scores.only=FALSE,
    sgp.target.scale.scores.merge=FALSE,
  sgp.target.content_areas=NULL,
  max.sgp.target.years.forward=3,
  update.all.years=FALSE,
  sgp.config=NULL,
  sgp.percentiles.equated=NULL,
  SGPt=NULL,
    fix.duplicates=NULL,
  parallel.config=NULL)
```

Arguments

- **sgp_object**: An object of class SGP containing slots `@Data` (from `prepareSGP`) and `@SGP` (from `analyzeSGP`).
- **state**: Acronym for which state is to be used for the lagged projections and growth to standard analyses. Function will try to guess state name from passed `sgp_object` if missing.
- **years**: A vector of years indicating years of data to merge with `@Data`. If missing, merge will use all available years of student growth percentile results.
- **content_areas**: A vector of content areas indicating content areas of student growth percentile data to merge with `@Data`. If missing, merge will use all available content areas of student growth percentile results.
- **sgp.percentiles**: A Boolean variable indicating whether to combine student growth percentiles.
- **sgp.percentiles.baseline**: A Boolean variable indicating whether to combine baseline student growth percentiles.
- **sgp.projections**: A Boolean variable indicating whether to combine current year student growth projections and calculate catch-up/keep-up and move-up/stay-up values.
- **sgp.projections.baseline**: A Boolean variable indicating whether to combine current year baseline student growth projections and calculate catch-up/keep-up and move-up/stay-up values.
combineSGP

sgp.projections.lagged
A Boolean variable indicating whether to combine lagged student growth projections and calculate catch-up/keep-up and move-up/stay-up values.

sgp.projections.lagged.baseline
A Boolean variable indicating whether to combine lagged baseline student growth projections and calculate catch-up/keep-up move-up/stay-up values.

sgp.target.scale.scores
A Boolean variable indicating whether scale scores from calculated SGP targets should be calculated.

sgp.target.scale.scores.only
A Boolean variable indicating whether combineSGP should skip merging and only calculate scale scores from calculated SGP targets. Default is FALSE.

sgp.target.scale.scores.merge
An argument (defaults to FALSE) indicating whether & how target scale scores should be merged with the LONG data in the @Data slot.

sgp.target.content_areas
A Boolean variable indicating whether content area associated with SGP targets should be calculated.

max.sgp.target.years.forward
A integer indicating the number of years forward from the lagged (last year’s) score to project forward for growth to standard calculations. Default is 3 years from the present, 4 years from the lagged year, which is the standard in most growth to standard calculations used by state departments of education.

update.all.years
A Boolean argument defaulting to FALSE indicating whether combineSGP should delete previously merged variables calculated in analyzeSGP and re-merge all available data.

sgp.config
Argument (defaults to NULL) passed utilized only for target scale score calculation. If targets for end of course tests are required, user must specify configurations directly. See code from testSGP number 3 for an example.

sgp.percentiles.equated
Boolean variable indicating whether equated percentiles are being merged (defaults to NULL which is converted to FALSE unless otherwise explicitly declared. If scale score targets are being calculated, linkages will be passed to scale score targets for calculation.

SGPt
Argument used to pass SGPt configuration to getTargetScaleScore for studentGrowthProjections calculation of scale score targets.

fix.duplicates
Argument to control how duplicate records based upon the key of VALID_CASE, CONTENT_AREA, YEAR, and ID are dealt with. If set to 'KEEP.ALL', the function tries to fix the duplicate individual records. If present and a '_DUP_***' suffix has been added to the duplicate ID before running studentGrowthPercentiles, then the @Data slot will be extended as necessary to accomodate additional student records and SGP results.

parallel.config
Parallel configuration only used when 'sgp.target.scale.scores' is set to TRUE. Default is NULL consistent with no targets being calculated. To utilize parallel processing in the calculation of SGP scale score targets user must specify a
courseProgressionSGP

list designating a backend (e.g., BACKEND='PARALLEL') and a number of workers (e.g., 'WORKERS=list(SGP_SCALE_SCORE_TARGETS=4)').

Value

Function returns a list containing the input long data set in the @Data slot as a data.table keyed using VALID_CASE, CONTENT_AREA, YEAR, ID merged with student growth percentiles and/or straight/lagged projection targets and catch-up/keep-up and move-up/stay-up status with, if requested, the scale scores associated with such targets.

courseProgressionSGP Identify potential course progressions for SGP analyses

description

Utility function used to analyze supplied long data or an existing SGP class object to identify potential course progressions suitable for analysis with analyzeSGP, studentGrowthPercentiles, etc. See examples for more information.

Usage

courseProgressionSGP(
  sgp_object,
  lag.direction=c("FORWARD", "BACKWARD"),
  year)

createKnotsBoundaries

Function to create Knots and Boundaries from supplied data in LONG format.

Description
The function createKnotsBoundaries creates Knots, Boundaries and Loss/Hoss scores for subsequent use and embedding in SGPstateData. Function can be called separately but is usually called as part of prepareSGP. See examples below.

Usage
createKnotsBoundaries(tmp.data, knot.cut.percentiles=c(0.2,0.4,0.6,0.8))
Arguments

tmp.data          Data supplied to function in LONG format. See sgpData_LONG for an exemplar. tmp.data must contain, at least, variables 'VALID_CASE', 'CONTENT_AREA', 'SCALE_SCORE', 'GRADE'.

knot.cut.percentiles
A numeric vector of quantiles of 'SCALE_SCORE' to be used as the cut points. Default is to use the 20th, 40th, 60th, and 80th percentiles (i.e., c(0.2,0.4,0.6,0.8)).

Value

Returns a list containing Knots, Boundaries and Loss/Hoss scores.

Author(s)

Damian W. Betebenner <dbetebenner@nciea.org>

Examples

## Not run:
### Run on supplied long data
DEMO_Knots_Boundaries <- createKnotsBoundaries(sgpData_LONG)

### Run as part of prepareSGP
### First NULL out knots and boundaries embedded in SGPstateData
SGPstateData[["DEMO"]][["Achievement"]][["Knots_Boundaries"] <- NULL
Demonstration_SGP <- prepareSGP(sgpData_LONG)

## End(Not run)

**getStateAbbreviation**  
*Function for converting state/organization abbreviations to long form and back.*

Description

The function getStateAbbreviation converts state/organization abbreviations to their long form and back. For example ID gets converted to Idaho.

Usage

getStateAbbreviation(
          supplied.name,
          SGPfunction=NULL,
          type="Abbreviation")
Arguments

supplied.name: A character string state/organization abbreviation or long form name.

SGPfunction: SGP package function from which getStateAbbreviation is being called. Defaults to NULL.

type: Either Abbreviation or Long indicating whether the desired output is an Abbreviation (long form name is supplied) or the long form name (abbreviation is supplied). The default is Abbreviation.

Value

Returns a character string.

Author(s)

Damian W. Betebenner <dbetebenner@nciea.org>

Examples

getStateAbbreviation("IDAHO") ## ID
getStateAbbreviation("ID", type="Long") ## Idaho

gofSGP

Function for producing goodness of fit plots using existing SGP object

Description

gofSGP creates goodness-of-fit plots in either PDF or PNG for showing SGP distribution by prior achievement level and prior scale score decile. These plots expand upon the plots currently produced with the studentGrowthPercentiles function.

Usage

gofSGP(
  sgp_object,
  state=NULL,
  years=NULL,
  content_areas=NULL,
  content_areas_prior=NULL,
  grades=NULL,
  ceiling.floor=TRUE,
  use.sgp="SGP",
  output.format="PDF",
  color.scale="reds.and.blues")
## gofSGP

### Arguments

- **sgp_object**: The SGP object from which the goodness-of-fit data will be used.
- **state**: The `state` for the sgp_object. Derive from sgp_object name if not explicitly supplied.
- **years**: The years that goodness-of-fit plots are requested. Default is to use all years available.
- **content_areas**: The content area(s) that goodness-of-fit plots are requested. Default is to use all content areas available.
- **content_areas_prior**: The content area(s) of the prior year which growth by achievement level is being produced that goodness-of-fit plots are requested. Default is to use all content areas available.
- **grades**: The grade(s) that goodness-of-fit plots are requested. Default is to use all grade available.
- **ceiling.floor**: Boolean variable to explicitly control display of ceiling/floor portion of goodness of fit plot.
- **use.sgp**: Character vectors (defaults to 'SGP') indicating what student growth percentile variable to calculate goodness-of-fit plots for.
- **output.format**: Character vectors (defaults to 'PDF') indicating what driver to use to output results. Options currently include 'PDF', 'PNG' and 'SVG'. 'SVG' is currently experimental.
- **color.scale**: Character vectors (defaults to 'red') indicating what color palette to use for creating percentile distribution table.

### Value

Returns output ('PDF', 'PNG' or 'SVG') associated with goodness-of-fit analyses.

### Author(s)

Damian W. Betebenner <dbetebenner@nciea.org>

Demonstration_SGP <- abcSGP(sgpData_LONG)

gofSGP(Demonstration_SGP)

## End(Not run)```
growthAchievementPlot

growthAchievementPlot for SGP

Description

Function to create growth and achievement plots depicting system level results associated with student growth percentile results. The charts show, simultaneously, norm- and criterion-referenced student achievement (i.e., status) as well as norm- and criterion-referenced student growth. These charts are those shown on the cover of the December 2009 Issue of Educational Measurement: Issues and Practice. See Betebenner (2009) and Betebenner (2012) for more details.

Usage

growthAchievementPlot(
  gaPlot.sgp_object,
  gaPlot.students=NULL,
  gaPlot.percentile_trajectories,
  gaPlot.achievement_percentiles=c(.01, seq(.05, .95, by=.05), .99),
  gaPlot.show.scale.transformations=TRUE,
  gaPlot.grade_range,
  gaPlot.max.order.for.progression=NULL,
  gaPlot.start.points="Achievement Level Cuts",
  gaPlot.back.extrapolated.cuts=NULL,
  gaPlot.subtitle = TRUE,
  gaPlot.SGPt=NULL,
  state,
  content_area,
  year,
  format="print",
  baseline=FALSE,
  equated=NULL,
  output.format="PDF",
  output.folder,
  assessment.name)

Arguments

gaPlot.sgp_object
  The sgp_object containing system information for constructing the growth and achievement plot. Object is calculated using abcSGP or (at least) prepareSGP followed by analyzeSGP. The function requires coefficient matrices in order to display percentile growth trajectories.

gaPlot.students
  Either NULL (the default) or a list of student IDs for whom one wishes to generate growth and achievement plots.
gaPlot.percentile_trajectories
A vector indicating the growth percentile trajectories to be depicted on the plot. If missing, the percentile trajectories will be the trajectories associated with the state supplied. If no state is supplied, the percentile trajectories will be 10, 35, 50, 65, 90.

gaPlot.achievement_percentiles
A vector of percentiles that achievement (i.e., status) percentiles will be depicted across the range of grades.

gaPlot.show.scale.transformations
A Boolean arguments (defaults to TRUE) indicating whether to show the scale as a vertical axis if a scale transformation is applied to the supplied data.

gaPlot.grade_range
The grade range for which to demonstrate plot. If missing, function uses supplied state to derive grade range.

gaPlot.max.order.for.progression
The maximum coefficient matrix order to use for each progression. Default is NULL which utilizes the maximum order available with the coefficient matrices.

gaPlot.start.points
Either 'Achievement Level Cuts' or 'Achievement Percentiles' defining where the growth percentiles trajectories will start in the growth achievement plots.

gaPlot.back.extrapolated.cuts
Scale score in final year for which nth percentile growth culminates from back-extrapolated scale scores.

gaPlot.subtitle
Boolean variable (defaults to TRUE) indicating whether subtitle is printed on the growth achievement chart indicating student starting point.

gaPlot.SGPt
A boolean variable indicating whether time dependent coefficient matrices (SGPt) are to be used in student growth projection calculation.

state
A two letter acronym for the state associated with the supplied data.

content_area
A character vector indicating the content area to produce the growth and achievement chart. Note that the supplied content area must match that used in the internal labeling of content area for the sgp_object.

year
The year for which to produce the growth and achievement plots.

format
Either "print" (the default) for light background or "presentation" for dark background slides.

baseline
Boolean variable (defaults to FALSE) indicating whether to create percentile trajectories using baseline referenced coefficient matrices.

equated
Boolean variable (defaults to FALSE) indicating whether to utilize linked matrices to generate growth and achievement plots.

output.format
A character vector indicating which output format to use. Currently support 'PDF' (the default) and 'PNG'. The call to growthAchievementPlot in visualizeSGP outputs in both formats.

output.folder
A character vector indicating where to put the produced growth and achievement plot.

assessment.name
A character vector indicating the assessment.name. If missing, the supplied state is used to determine the assessment.name.
Details

Typical use of the function is as part of visualizeSGP function. However, function can be used to produce growth and achievement charts.

Value

Function creates a growth and achievement chart and writes the result as a PDF to output.folder.

Author(s)

Damian W. Betebenner <dbetebenner@nciea.org>

References

outputSGP

**Output student data and SGP results for a variety of purposes**

Description

Utility function used to export student data and SGP results for a variety of purposes. Current functionality exports data in wide format for data visualization purposes. See source code for detailed functionality.

Usage

```r
outputSGP(sgp_object,
state=NULL,
output.type=c("LONG_Data", "LONG_FINAL_YEAR_Data", "WIDE_Data",
"INSTRUCTOR_Data"),
baseline.sgps=FALSE,
outputSGP_SUMMARY.years=NULL,
outputSGP_SUMMARY.content_areas=NULL,
outputSGP_INDIVIDUAL.years=NULL,
outputSGP_INDIVIDUAL.content_areas=NULL,
outputSGP.anonymize=FALSE,
outputSGP.student.groups=NULL,
outputSGP.directory="Data",
outputSGP.translate.names=TRUE,
outputSGP.projection.years.for.target=3,
outputSGP.pass.through.variables=NULL)
```
**Arguments**

- **sgp_object**: An object of class SGP containing data to be exported.
- **state**: Acronym for which state is to be used for the lagged projections and growth to standard analyses. Function will try to guess state name from passed `sgp_object` if missing.
- **years**: A vector indicating the years to be included in the output. Default is to use all years.
- **content_areas**: A vector indicating the content areas to be included in the output. Default is to use all content areas.
- **output.type**: A character vector indicating what output type is requested. Currently `LONG_Data`, `WIDE_Data`, `INSTRUCTOR_Data`, `SchoolView`, `RLI` are supported modes of output. `LONG_Data` exports the contents of the @Data slot in a pipe delimited format. `LONG_FINAL_YEAR_Data` exports the contents of the last year of the @Data slot in a pipe delimited format. `WIDE_Data` exports a reshaped version of the @Data slot where each row is a unique student record. `INSTRUCTOR_Data` uses the @Data_Supplementary$INSTRUCTOR_NUMBER table to export a long student by instructor number table. `SchoolView` exports tables used for representation in SchoolView. `RLI` exports used for representation by RLI. The default exports `LONG_Data`, `LONG_FINAL_YEAR_Data`, `WIDE_Data` and `INSTRUCTOR_Data`.
- **baseline.sgps**: Boolean vector indicating whether to output baseline SGPs for cohort referenced SGPs.
- **outputSGP_SUMMARY.years**: A character vector indicating the year to be used for output file construction for summary tables.
- **outputSGP_SUMMARY.content_areas**: A character vector indicating the content areas to be used for output file construction for summary tables.
- **outputSGP_INDIVIDUAL.years**: A character vector indicating the year to be used for output file construction for individual level file.
- **outputSGP_INDIVIDUAL.content_areas**: A character vector indicating the content areas to be used for output file construction for individual level file.
- **outputSGP.anonymize**: A Boolean variable indicating whether to anonymize output files.
- **outputSGP.student.groups**: A list of variables to be used for student groups in individual and summary tables.
- **outputSGP.directory**: A file path indicating where to save output files. Defaults to Data.
- **outputSGP.translate.names**: A Boolean argument, defaults to TRUE, indicating whether data output should refer to `names.provided` or `names.sgp` in @Names slot of supplied SGP object. This argument allows for the conversion of variable naming conventions from the SGP package back to that used by the state/organization.
prepareSGP

outputSGP.projection.years.for.target
An integer argument indicating what projection to supply with regard to the number of years projected forward.

outputSGP.pass.through.variables
A character vector of variables in @Data that are to be merged with output in RLI output.type. Default is NULL or no.

Value
Function writes data in multiple formats including .Rdata, .txt (pipe delimited) and zipped versions of .txt.

## Output current year
outputSGP(Demonstration_SGP, output.type="LONG_FINAL_YEAR_Data")

## End(Not run)

prepareSGP

Prepare data for SGP analyses

Description
Utility function/exemplar used to embed supplied long data into a list object as a keyed data.table. NOTE: This function also serves the purposes of running many checks on the SGP object you construct to make sure it is up to date and in the best shape possible. If you have an older object that you wish to make sure is up to date with the latest version of the SGP package, running prepareSGP on an object is never bad thing to do. See examples for more information.
Usage

prepareSGP(data,
  data_supplementary=NULL,
  state=NULL,
  var.names=NULL,
  create.additional.variables=TRUE,
  fix.duplicates=NULL)

Arguments

data A panel data set in long form or an object of class SGP. See embedded `sgpData_LONG` data set for an exemplar.

data_supplementary Supplementary data (e.g., student teacher lookup tables) to be embedded in SGP object in slot `@Data_Supplementary`. Data must be embedded in a list. Default is no data supplied.

state A two letter acronym indicating the state associated with the data. If not supplied, the function will try to infer what the state is from the data object name supplied.

var.names A list or a data.frame that includes all required columns that do not match the SGP conventions, as well as all secondary columns needed for summarizing and reporting.

create.additional.variables Boolean argument indicating whether prepareSGP should create additional variables often used in analyses. For example, the function can create a variable `HIGH_NEED_STATUS` identifying the top and bottom quartile of students in each school by year by content area by grade grouping.

fix.duplicates Argument to control how prepareSGP deals with duplicate records based upon the key of `VALID_CASE, CONTENT_AREA, YEAR, and ID`. The function currently warns of duplicate records and doesn’t modify data. If set to TRUE, prepareSGP tries to fix the duplicate individual records by adding a `_DUP_***` suffix to the duplicate ID in order to create unique records based upon the key.

Value

Function returns an object of class SGP. The long data is in the `data` slot.

## Running prepareSGP on an already create SGP object as part of a annual update
Demonstration_SGP <- prepareSGP(Demonstration_SGP)

## Running prepareSGP on a long data set without creating addition variables
Demonstration_SGP <- prepareSGP(sgpData_LONG, create.additional.variables=FALSE)

## End(Not run)
```

### Description

rliSGP is a wrapper function designed to expedite SGP analyses on Renaissance Learning Incorporated (RLI) interim STAR assessments.

### Usage

```r
rliSGP(
  sgp_object,
  additional.data=NULL,
  state=NULL,
  content_areas=c("MATHEMATICS", "READING", "READING_UNIFIED", "EARLY_LITERACY"),
  testing.window,
  eow.or.update="UPDATE",
  update.save.shell.only=FALSE,
  configuration.year,
  sgp.percentiles.baseline=TRUE,
  sgp.projections.baseline=TRUE,
  sgp.projections.lagged.baseline=FALSE,
  sgp.target.scale.scores=TRUE,
  update.ids=NULL,
  SGPt=TRUE,
  simulate.sgps=FALSE,
  save.intermediate.results=FALSE,
  coefficient.matrices=NULL,
  goodness.of.fit.print=FALSE,
  return.updated.shell=FALSE,
  fix.duplicates="KEEP.ALL",
)```
```r
eow.calculate.sgps=FALSE,
score.type="RASCH",
cutscore.file.name="Cutscores.csv",
  parallel.config=NULL)
```

**Arguments**

- **sgp_object**: An object of class SGP or a data.frame from which an SGP object can be produced. If data.frame is supplied, the current window’s data will be created from the last window present in the data.frame.

- **additional.data**: Current window’s data for UPDATE or EOW (end of window) processing. Can be NULL if new data all fed into argument ‘sgp_object’ as data.frame.

- **state**: Abbreviation for STATE/ORGANIZATION being analyzed. Currently only available for ‘RLI’ or ‘RLI_UK’.

- **content_areas**: Character vector indicating which content areas rliSGP should be run for (‘MATHEMATICS’, ‘READING’, ‘READING_UNIFIED’, and/or ‘EARLY_LITERACY’). Default is all.

- **testing.window**: Argument indicating testing window being analyzed. Either ‘FALL’, ‘WINTER’, ‘SPRING’ indicating what testing window’s data is being analyzed.

- **eow.or.update**: Argument indicating whether end-of-window or within-window updates are being done. Either ‘EOW’ (end of window) or ‘UPDATE’ (within window).

- **update.save.shell.only**: Boolean argument indicating whether End of Window processing should only produce/save RLI_SGP_UPDATE_SHELL and bypass coefficient matrix production.

- **configuration.year**: Year associated with SGP analyses (configuration year) to be used.

- **sgp.percentiles.baseline**: Boolean variable passed to updateSGP to control whether baseline student growth percentiles are calculated. Default is TRUE.

- **sgp.projections.baseline**: Boolean variable passed to updateSGP to control whether baseline student growth projections are calculated. Default is TRUE.

- **sgp.projections.lagged.baseline**: Boolean variable passed to updateSGP to control whether lagged baseline student growth projections are calculated. Default is FALSE.

- **sgp.target.scale.scores**: Boolean variable passed to updateSGP to control whether scale score targets are calculated. Default is TRUE.

- **update.ids**: Argument that allows ID to be updated based upon a supplied two column data frame where the first column represents the ORIGINAL/OLD ID and the second column the NEW ID that is to replace it. NOTE that ID needn’t be replaced in either ‘sgp_object’ nor ‘additional.data’ that are provided as part of the ‘rliSGP’ call. Substitution will occur on entire data set before analysis. Default is NULL, no ID replacement is performed.
SGPt  Argument indicating whether to perform time dependent SGP (SGPt) analyses. Current default is TRUE based upon transition to SGPt in Summer 2015.

simulate.sgsp  A Boolean argument indicating whether to calculate SGP standard errors based upon CSEMs provided by either an embedded CSEM-scale score lookup or an embedded variable. Default is FALSE.

save.intermediate.results  Boolean variable passed to updateSGP indicating whether to save intermediate results from prepareSGP, analyzeSGP, and combineSGP as part of the rliSGP analyses.

coefficient.matrices  List of baseline matrices to be used for analyses (overrides what exists in SGPstateData). Defaults to NULL (use those in SGPstateData).

goodness.of.fit.print  Boolean argument passed to updateSGP indicating whether to print goodness of fit plots associated with outcome. Default is FALSE.

return.updated.shell  Boolean argument (defaults to FALSE) indicating whether to return sgp_object as part of call to rliSGP.

fix.duplicates  Character argument (defaults to 'KEEP.ALL') indicating how to deal with duplicates submitted as part of data for analysis. Setting 'fix.duplicates' to null sets no modification of duplicates.

eow.calculate.sgsp  Boolean argument passed to updateSGP further passed to analyzeSGP indicating whether student growth percentiles are calculated as part of EOW analyses. Default is FALSE which results in just coefficient matrices being calculated.

score.type  Either RASCH (default) or STAR indicating what type of score is being supplied for analysis. The selection ensures the correct cutscores, matrices, and knots/boundaries are used for analyses.

cutscore.file.name  Cutscore file name and path for input and creation of RLI Cutscores. Default is Cutscores.csv.

parallel.config  Argument passed to abcSGP or updateSGP to activate parallel processing with an appropriate backend.

Value

Saves relevant results to disc for use in subsequent analyses.

Examples

```r
## Not run:

# For Within Window processing
```
SGP-class

### Description

The formal S4 class for SGP. This class stores the data object for use with the functions `analyzeSGP`, `combineSGP`, `summarizeSGP`, and `visualizeSGP`. The SGP class contains and organizes all the results associated with SGP analyses. `is.SGP` tests for membership for this class.

### Details

- **list.null**: combines class list and class NULL

### Usage

Objects can be created by calls of the form `new("SGP",...)`, but this is not encouraged. To instantiate a new instance of SGP class use the function `prepareSGP` instead.

### is.SGP(x)

### Slots

- **Data**: A data.table including student-level data in a (long) format. For annual testing, each VALID_CASE, CONTENT_AREA, YEAR, ID combination represents a unique case in the data. For instances with multiple tests within a year, each VALID_CASE, CONTENT_AREA, YEAR, ID, WITHINYEAR combination represents a unique case in the data. See `sgpData_LONG` for an exemplar data set

- **Data_Supplementary**: A list (possibly NULL) providing additional data.tables containing student level multiple-membership lookup tables. For example, `sgpData_INSTRUCTOR_NUMBER` provides student teacher linkages and can be embedded in this slot using a list that contains it.

- **Names**: A data.frame with five columns: ‘names.provided’, ‘names.sgp’, ‘names.type’, ‘names.info’, ‘names.output’. This data.frame is used as a lookup table to translate state specific variable names to SGP variable names as well as provide information for `summarizeSGP` on the types of summary tables to produce.

- **SGP**: A list including the output from `analyzeSGP`

- **Summary**: A list including the output from `summarizeSGP`

- **Version**: A list of meta-data including the version of the SGP package used to construct the SGP object and the date the object was created.

SGPstateData

State assessment program data from large scale state assessments for use with SGP package

Description
An environment (an object of class environment) containing information on state assessment programs, organized by state. Currently the environment contains achievement level cutscores and labels for the state assessments, assessment name and abbreviation, growth cutscores and labels, information on vertical scaling, conditional standard errors of measurement (CSEMs), knots and boundaries, and state specific configurations currently being used for SGP analyses at the agency (state, district, national) level. The cutscores, in particular, are used to calculate growth-to-standard/projection values. States currently included in the data set are Arizona (AZ), Arkansas (AR), California (CA), Colorado (CO), Connecticut (CT), Georgia (GA), Hawaii (HI), Idaho (ID), Indiana (IN), Kansas (KS), Maine (ME), Massachusetts (MA), Minnesota (MN), Mississippi (MS), Missouri (MO), Nebraska (NE), Nevada (NV), New Hampshire (NH), New Mexico (NM), New Jersey (NJ), New York (NY), Oregon (OR), Rhode Island (RI), South Dakota (SD), Utah (UT), Vermont (VT), Virginia (VA), West Virginia (WV), Wisconsin (WI), Archdioces of Baltimore (AOB), Colorado English Language Assessment (CELA), Demonstration (DEMO), Albuquerque (ABQ), Australia NAPLAN (NAPLAN), Guatemala (GUA), Renaissance Learning Incorporated (RLI), Renaissance Learning Incorporated UK (RLI_UK), and New Haven (NEW_HAVEN).

splineMatrix-class  

Class "splineMatrix"

Description

The formal S4 class for coefficient matrices produced from the studentGrowthPercentiles function. This class stores the B-spline knots and boundaries used by the coefficient matrix object for the production of student growth percentiles and projections.

Details

splineMatrix: This class contains the S3 matrix class, inheriting its methods. The slot Knots should be one or more lists of numeric vector(s) used in the internal call to bs, which generates a B-spline basis matrix from student scores. There are typically with 4 values for the knots. Similarly, Boundaries are used in bs for the Boundary.knots argument. This is always two values which are at or slightly beyond the lowest and highest observed student scores. Content_Areas and Grade_Progression provide information about the data (sub)set used to produce the matrix.

Objects from the Class

Objects can be created by calls of the form new("splineMatrix",...), but this is not encouraged. Previously produced coefficient matrices MUST be bound to the IDENTICAL knots and boundaries used to create them. Use the function studentGrowthPercentiles instead.

Slots

.Data: A coefficient matrix derived from studentGrowthPercentiles.

Knots: A list(s) of numeric values used as the knots to generate the B-spline basis matrix in studentGrowthPercentiles.

Boundaries: A list(s) of numeric values used as the Boundary.knots to generate the B-spline basis matrix in studentGrowthPercentiles.

Content_Areas: A list of time dependent content area names included in the data used to produce the coefficient matrix.

Grade_Progression: A list of the time dependent grades included in the data used to produce matrices.

Time: A list of the Times (e.g., years) measurements occurred included in the data used to produce matrices.

Time_Lags: A list of the time lags/differences between Time (e.g., years) included in the data used to produce matrices.

Version: A list including the version of the SGP package used to construct the splineMatrix object and the date the object was created.

studentGrowthPercentiles

---

**studentGrowthPercentiles**

*Student Growth Percentiles*

**Description**

Function to calculate student growth percentiles using large scale assessment data. Outputs growth percentiles for each student and supplies various options as function arguments. Results from this function are utilized to calculate percentile growth projections/trajectories using the studentGrowthProjections function.

**Usage**

```r
studentGrowthPercentiles(panel.data, sgp.labels, panel.data.vnames=NULL, additional.vnames.to.return=NULL, grade.progression, content_area.progression, year.progression, year_lags.progression, num.prior, max.order.for.percentile=NULL, return.additional.max.order.sgp=NULL, subset.grade, percentile.cuts, growth.levels, use.my.knots.boundaries, use.my.coefficient.matrices, calculate.confidence.intervals, print.other.gp=FALSE, print.sgp.order=FALSE, calculate.sgps=TRUE, rq.method="br", rq.method.for.large.n="fn", max.n.for.coefficient.matrices=NULL, knot.cut.percentiles=c(0.2,0.4,0.6,0.8), knots.boundaries.by.panel=FALSE, exact.grade.progression.sequence=FALSE,
```
Arguments

panel.data  REQUIRED. Object of class list, data.frame, or matrix containing longitudinal student data in wide format. If supplied as part of a list, data should be contained in panel.data$Panel_Data. Data must be formatted so that student ID is the first variable/column, student grade/time variables for each time period, from earliest to most recent, are the next variables/columns, and student scale score variables for each year, from earliest to latest, are the remaining variables/columns. See sgpData for an exemplar data set. NOTE: The column position of the variables IS IMPORTANT, NOT the names of the variables.

sgp.labels  REQUIRED. A list, sgp.labels, of the form list(my.year=, my.subject=) or list(my.year=,my.subject=,my.extra.label). The user-specified values are used to save the student growth percentiles, coefficient matrices, knots/boundaries, and goodness of fit results in an orderly fashion using an appropriate combination of year & subject & grade. Except in special circumstances, supplying my.year and my.subject are sufficient to uniquely label derivative output.
Panel data vnames
Vector of variables to use in student growth percentile calculations. If not specified, function attempts to use all available variables.

Additional vnames to return
A list of the form list(VARIABLE_NAME_SUPPLIED=VARIABLE_NAME_TO_BE_RETURNED) indicating data to be returned with results from studentGrowthPercentiles analyses.

Grade progression
Preferred argument to specify a student grade/time progression in the data. For example, 3:4 would indicate to subset the data where the two most recent grades for which data are available are 3 and 4, respectively. The argument allows for non-sequential grade progressions to be analyzed with automatic removal of columns where "holes" occur in the supplied grade.progression. For example, for the grade.progression c(7,8,10), the penultimate GRADE and SCALE SCORE column in the supplied panel.data would be removed. The argument can also be combined with an appropriate panel.data.vnames argument to remove a year of data would analyze students progressing from 7 to 8 to 10.

Content area progression
Character vector of content area names of same length as grade.progression to be provided if not all identical to 'my.subject' in sgp.labels list. Vector will be used to populate the @Content_Areas slot of the splineMatrix class coefficient matrices. If missing, 'sgp.labels$my.subject' is repeated in a vector length equal to grade.progression.

Year progression
Character vector of years associated with grade and content area progressions. If missing then the year.progression is assumed to end in 'my.year' provided in sgp.labels and be of the same length as grade.progression. Vector will be used to populate the @Years slot of the splineMatrix class coefficient matrices.

Year lags progression
A numeric vector indicating the time lags/span between observations in the columns supplied to studentGrowthPercentiles. The default, NULL, allows the function to calculate the lags/differences based upon the supplied years.

Num prior
Number of prior scores one wishes to use in the analysis. Defaults to num.panels-1. If num_prior=1, then only 1st order growth percentiles are computed, if num.prior=2, then 1st and 2nd order are computed, if num.prior=3, 1st, 2nd, and 3rd ...

NOTE: specifying num.prior is necessary in some situations (in early grades for example) where the number of prior data points is small compared to the number of panels of data.

Max order for percentile
A positive integer indicating the maximum order for percentiles desired. Similar limiting of number of priors used can be accomplished using the grade.progression argument.

Return additional max order sgp
A positive integer (defaults to NULL) indicating the order of an additional SGP to be returned: SGP_MAX_ORDER_N.
subset.grade  Student grade level for sub-setting. If the data fed into the function contains multiple grades, setting subset.grade=5 selects out those students in grade five in the most recent year of the data. If no sub-setting is desired, argument do not include the subset.grade argument. If grade.progression is supplied, then a subset grade is implicitly specified.

percentile.cuts  Additional percentile cuts (supplied as a vector) between 1 and 99 associated with each student’s conditional distribution. Default is to provide NO growth percentile cuts (scale scores associated with those growth percentiles) for each student.

growth.levels  A two letter state acronym or a list of the form list(my.cuts= ,my.levels= ) specifying a vector of cuts between 1 and 99 (e.g., 35, 65) and the associated qualitative levels associated with the cuts (e.g., low, typical, and high). Note that the length of my.levels should be one more than the length of my.cuts. To add your growth levels to the SGPstateData data set, please contact the package administrator.

use.my.knots.boundaries  A list of the form list(my.year= ,my.subject= ) specifying a set of pre-calculated knots and boundaries for B-spline calculations. Most often used to utilize knots and boundaries calculated from a previous analysis. Knots and boundaries are stored (and must be made available) with panel.data supplied as a list in panel.data$Knots_Boundaries$my.subject.my.year. As of SGP_0.0-6 user can also supply a two letter state acronym to utilize knots and boundaries within the SGPstateData data set supplied with the SGP package. To add your knots and boundaries to the SGPstateData data set, please contact the package administrator. If missing, function automatically calculates knots, boundaries, and loss.hoss values and stores them in panel.data$Knots_Boundaries$my.subject.my.year where my.subject and my.year are provided by sgp.labels.

use.my.coefficient.matrices  A list of the form list(my.year= ,my.subject= ) specifying a set of pre-calculated coefficient matrices to use for student growth percentile calculations. Can be used to calculate baseline referenced student growth percentiles or to calculate student growth percentiles for small groups of excluded students without recalculating an entire set of data. If missing, coefficient matrices are calculated based upon the provided data and stores them in panel.data$Coefficient_Matrices$my.subject.my.year where my.subject and my.year are provided by sgp.labels.

calculate.confidence.intervals  A character vector providing either a state acronym or a variable name from the supplied panel data. If a state acronym, CSEM tables from the embedded SGPstateData (note: CSEM data must be embedded in the SGPstateData set. To have your state CSEMs embed in the SGPstateData set, please contact the package administrator) will be used. If a variable name, the supplied panel data must contain a variable providing student level CSEMs (e.g., with adaptive testing). NOTE: If a variable name is supplied, the user must also use the argument panel.data.vnames indicating what variables in the supplied panel.data will be used for the studentGrowthPercentiles analysis. For greater control, the user can also supply a list of the form list(state= ,confidence.quantiles=,...)
specifying the state or variable to use, confidence.quantiles to report from the simulated SGPs calculated for each student, simulation.iterations indicating the number of simulated SGPs to calculate, distribution indicating whether to the the Normal or Skew-Normal to calculate SGPs, and round (defaults to 1, which is an integer - see round_any from plyr package for details) giving the level to round to. If requested, simulations are calculated and simulated SGPs are stored in panel.data$Simulated_SGPs.

print.other.gp Boolean argument (defaults to FALSE) indicating whether growth percentiles of all orders should be returned. The default returns only the highest order growth percentile for each student.

print.sgp.order Boolean argument (defaults to FALSE) indicating whether the order of the growth percentile should be provided in addition to the SGP itself.

calculate.sgps Boolean argument (defaults to TRUE) indicating whether student growth percentiles should be calculated following coefficient matrix calculation.

rq.method Argument defining the estimation method used in the quantile regression calculations. The default is the "br" method referring to the Barrodale and Robert's L1 estimation detailed in Koenker (2005) and in the help for the quantile regression (quantreg) package.

rq.method.for.large.n Argument defining the estimation method used in the quantile regression calculations when norm group cohort size exceeds 300,000 students. The default is the "fn" method referring to the Frisch-Newton estimation detailed in Koenker (2005) and in the help for the quantile regression (quantreg) package.

max.n.for.coefficient.matrices Argument the defines a size threshold above which a subset of data is taken with a number of cases equal to the sgp.subset.size.threshold argument. Default is NULL, no subset is taken.

knot.cut.percentiles Argument that specifies the quantiles to be used for calculation of B-spline knots. Default is to place knots at the 0.2, 0.4, 0.6, and 0.8 quantiles.

knots.boundaries.by.panel Boolean argument (defaults to FALSE) indicating whether knots and boundaries should be calculated by panel in supplied panel data instead of aggregating across panel. If panels are on different scales, then different knots and boundaries may be required to accommodate quantile regression analyses.

exact.grade.progression.sequence Boolean argument indicating whether the grade.progression supplied is used exactly (TRUE) as supplied or whether lower order analyses are run as part of the whole analysis (FALSE—the default).

drop.nonsequential.grade.progression.variables Boolean argument indicating whether to drop variables that do not occur with a non-sequential grade progress. For example, if the grade progression 7, 8, 10 is provided, the penultimate variable in panel.data is dropped. Default is TRUE.
studentGrowthPercentiles

convert.0and100

Boolean argument (defaults to TRUE) indicating whether conversion of growth
percentiles of 0 and 100 to growth percentiles of 1 and 99, respectively, occurs.
The default produces growth percentiles ranging from 1 to 99.

sgp.quantiles

Argument to specify quantiles for quantile regression estimation. Default is
Percentiles. User can additionally submit a vector of quantiles (between 0 and
1). Goodness of fit output only available currently for PERCENTILES.

sgp.quantiles.labels

Argument to specify integer labels associated with provided ‘sgp.quantiles’. In-
teger labels must a vector of length 1 longer than the length of ‘sgp.quantiles’.

sgp.loss.hoss.adjustment

Argument to control whether SGP is calculated using which.max for values as-
sociated with the hoss embedded in SGPstateData. Providing two letter state
acronym utilizes this adjustment whereas supply NULL (the default) uses no
adjustment.

sgp.cohort.size

Argument to control the minimum cohort size used to calculate SGPs and as-
sociated coefficient matrices. NULL (the default) uses no restriction. If not
NULL, argument should be an integer value.

sgp.less.than.sgp.cohort.size.return

If non-NULL, indicates whether a data set should be returned with the indi-
cated character string in place of the SGP that would be calculated. If set
to TRUE, then character string: < sgp.cohort.size students in cohort. No
SGP Calculated.

sgp.test.cohort.size

Integer indicating the maximum number of students sampled from the full cohort
to use in the calculation of student growth percentiles. Intended to be used as a
test of the desired analyses to be run. The default, NULL, uses no restrictions
(no tests are performed, and analyses use the entire cohort of students).

percuts.digits

Argument specifying how many digits (defaults to 2) to print percentile cuts (if
asked for) with.

isotonize

Boolean argument (defaults to TRUE) indicating whether quantile regression
results are isotonized to prevent quantile crossing following the methods derived
by Chernozhukov, Fernandez-Val and Glischon (2010).

convert.using.loss.hoss

Boolean argument (defaults to TRUE) indicating whether requested percentile
cuts are adjusted using the lowest obtainable scale score (LOSS) and highest ob-
tainable scale score (HOSS). Those percentile cuts above the HOSS are replaced
with the HOSS and those percentile cuts below the LOSS are replaced with the
LOSS. The LOSS and HOSS are obtained from the loss and hoss calculated with
the knots and boundaries used for spline calculations.

goodness.of.fit

Boolean argument (defaults to TRUE) indicating whether to produce goodness
of fit results associated with produced student growth percentiles. Goodness of
fit results are grid.grobs stored in panel.data$Goodness_of_Fit
$my.subject.my.year where my.subject and my.year are provided by sgp.labels.
studentGrowthPercentiles

goodness.of.fit.minimum.n
   Integer argument (defaults to 250) indicating the minimum number of observations necessary before goodness of fit plots are constructed.

goodness.of.fit.output.format
   Character argument (defaults to graphical object 'GROB') indicating output format for goodness of fit plots. Options include: 'GROB', 'PDF', 'PNG', 'SVG'.

return.prior.scale.score
   Boolean argument (defaults to TRUE) indicating whether to include the prior scale score in the SGP data output. Useful for examining relationship between prior achievement and student growth.

return.prior.scale.score.standardized
   Boolean argument (defaults to TRUE) indicating whether to include the standardized prior scale score in the SGP data output. Useful for examining relationship between prior achievement and student growth.

return.norm.group.identifier
   Boolean argument (defaults to TRUE) indicating whether to include the content areas and years that form students' specific norm group in the SGP data output.

return.norm.group.scale.scores
   Boolean argument (defaults to NULL) indicating whether to return a semi-colon separated character vector of the scores associated with the SGP_NORM_GROUP to which the student belongs.

return.norm.group.dates
   Boolean argument or character string (defaults to NULL) indicating whether to return a semi-colon separated character vector of the dates associated with time dependent SGPt calculations. If 'TRUE' is supplied, 'DATE' is the assumed name for the date variable.

return.norm.group.preference
   A single numeric value (defaults to NULL). When multiple SGPs will be produced for some students and a system is required to identify the preferred SGP that will be matched with the student in the combineSGP function. This argument provides a ranking that specifies how preferable SGPs produced from the analysis in question is relative to other possible analyses. LOWER NUMBERS CORRESPOND WITH HIGHER PREFERENCE.

return.panel.data
   Boolean argument indicating whether to return the original data provided in panel.data$Panel_Data in the SGP list of results. Defaults to 'identical(parent.frame(), .GlobalEnv)': If the parent environment from which the function is called is .GlobalEnv, then FALSE, otherwise TRUE.

print.time.taken
   Boolean argument (defaults to TRUE) indicating whether to print message indicating information on studentGrowthPercentiles analysis and time taken.

parallel.config
   parallel configuration argument allowing for parallel analysis by 'tau'. Defaults to NULL.

calculate.simex
   A character state acronym or list including state/csem variable, csem.data.vnames, csem.loss.hoss, simulation.iterations, simulation.sample.size, lambda and extrapolation method. Returns both SIMEX adjusted SGP (SGP_SIMEX) as well
as the percentile ranked SIMEX SGP (\texttt{RANK\_SIMEX}) values as suggested by Castellano and McCaffrey (2017). Defaults to NULL, no simex calculations performed.

\texttt{sgp.percentiles.set.seed}

An integer (or NULL) argument indicating whether to set.seed to make analyses fully reproducible. To turn off, set argument to NULL. Default is 314159.

\texttt{sgp.percentiles.equated}

An object containing information (linkages, year, ...) on equating done for calculating student growth percentiles.

\texttt{SGPt}

An argument supplied to implement time-dependent SGP analyses (SGPt). Default is NULL giving standard, non-time dependent argument. If set to TRUE, the function assumes the variables 'TIME' and 'TIME\_LAG' are supplied as part of the panel.data. To specify other names, supply a list of the form: list\((TIME='my\_time\_name', TIME\_LAG='my\_time\_lag\_name')\), substituting your variable names.

\texttt{SGPt.max.time}

Boolean argument (defaults to NULL/\texttt{FALSE}) indicating whether cuts/trajectories should be calculated based upon the maximum Time value in the matrices. Such cuts are sometimes used to provide within window trajectories.

\texttt{verbose.output}

A Boolean argument indicating whether the function should output verbose diagnostic messages.

Details

Typical use of the function is to submit a data frame to the function containing records of all students across all grades, allowing the function to subset out specific grade progressions using \texttt{grade.progression}. Additional uses include using pre-calculated results to recalculate SGPs for baseline referencing. \texttt{studentGrowthPercentiles} examples provide code for use in analyzing assessment data across multiple grades.

Value

Function returns an object of class list containing objects: \texttt{Coefficient\_Matrices}, \texttt{Goodness\_of\_Fit}, \texttt{Knots\_Boundaries}, \texttt{Panel\_Data}, \texttt{SGPercentiles}, \texttt{Simulated\_SGPs}.

  my.sgpData <- studentGrowthPercentiles(panel.data=my.sgpData,
sgp.labels=list(my.year=2015, my.subject="Reading"),

### Example showing how to use pre-calculated coefficient matrices to calculate student growth percentiles

```r
my.grade.sequences <- list(3:4, 3:5, 3:6, 3:7, 4:8)
my.sgpData <- list(Panel_Data=sgpData) ### Put sgpData into Panel_Data slot

for (i in seq_along(my.grade.sequences)) {
  my.sgpData <- studentGrowthPercentiles(panel.data=my.sgpData, 
    sgp.labels=list(my.year=2015, my.subject="Reading"), 
    growth.levels="DEMO", 
    grade.progression=my.grade.sequences[[i]])
}

percentiles.1st.run <- my.sgpData$SGPercentiles$READING.2015

my.sgpData$SGPercentiles$READING.2015 <- NULL

for (i in seq_along(my.grade.sequences)) {
  my.sgpData <- studentGrowthPercentiles(panel.data=my.sgpData, 
    sgp.labels=list(my.year=2015, my.subject="Reading"), 
    use.my.knots.boundaries=list(my.year=2015, my.subject="Reading"), 
    use.my.coefficient.matrices=list(my.year=2015, my.subject="Reading"), 
    growth.levels="DEMO", 
    grade.progression=my.grade.sequences[[i]])
}

percentiles.2nd.run <- my.sgpData$SGPercentiles$READING.2015

identical(percentiles.1st.run, percentiles.2nd.run)
```

### End(Not run)

---

`studentGrowthPlot`  
Create a student growth and achievement chart
**Description**

Function used to produce individual student growth and achievement chart (an achievement time lines indicating student growth) based upon output from student growth percentile and student growth projection analyses. Function is integrated with SGPstateData to accommodate state specific scales and nomenclature including performance level names. See Betebenner (2012) for discussion.

**Usage**

```r
studentGrowthPlot(Scale_Scores, Plotting_Scale_Scores, Achievement_Levels, SGP, SGP_Levels, Grades, Content_Areas, Cuts, Plotting_Cuts, SGP_Targets, SGP_Scale_Score_Targets, Cutscores, Years, Report_Parameters)
```

**Arguments**

- `Scale_Scores`: A vector of historical scale scores.
- `Plotting_Scale_Scores`: A vector of scale scores used as the vertical coordinates for plotting. If supplied, `Scale_Scores` are used for text and `Plotting_Scale_Scores` are used for the actual coordinates.
- `Achievement_Levels`: A vector of historical performance levels.
- `SGP`: A vector of historical student growth percentiles.
- `SGP_Levels`: A vector of historical growth (SGP) levels (e.g., low, typical, high).
- `Grades`: A vector of historical grades student was tested in.
- `Content_Areas`: A vector of historical content areas student was tested in.
- `Cuts`: A list of cuts scores for NY1, NY2, and NY3.
- `Plotting_Cuts`: A list of plotting cuts scores for NY1, NY2, and NY3. Plotting cuts are identical to `Cuts` for states with a vertical scale and are transformed for non-vertical scale states.
- `SGP_Targets`: A list of CUKU, CUKU_Current, MUSU, MUSU_Current targets.
- `SGP_Scale_Score_Targets`: A list of CUKU, CUKU_Current, MUSU, MUSU_Current scale score targets.
studentGrowthPlot_Styles

Plotting_SGP_Scale_Score_Targets
A list of CUKU, CUKU_Current, MUSU, MUSU_Current scale score targets for plotting that are transformed when no vertical scale exists.

Cutscores
A data.frame of long formatted achievement level cutscores.

Years
A vector of years corresponding to supplied scale scores.

Report_Parameters
A list containing arguments: Current_Year, Content_Area, State, Denote_Content_Area, SGP_Targets, and Configuration.

Details
Function currently used as part of SGP package to produce student growth charts for states. Function is usually called from the higher level function visualizeSGP which allows for the creation of a student growth plot catalog for each school with student reports organized by grade and student name.

Value
Returns a student growth plot graphical object that is usually exported in either PDF or PNG format.

Author(s)
Damian W. Betebenner <dbetebenner@nciea.org>

References

Description
Function includes five "styles" associated with studentGrowthPlot to create PDF student growth plots depicting the growth and achievement for an individual student over time. The five styles display one to five content area student growth plots on a single page. The one, two, and three content area plots are rendered on 8.5 by 11 PDFs and the four and five content area plots are rendered on 11 by 17 PDFs. These charts are currently being used in multiple states to report student growth results. This function is called by visualizeSGP to generate individual student reports. This function may expand in the future to incorporate other possible individual student reports.
Usage

studentGrowthPlot_Styles(
    sgPlot.data,
    sgPlot.sgp_object,
    sgPlot.cutscores,
    state,
    last.year,
    content_areas,
    districts,
    schools,
    reports.by.student,
    reports.by.instructor,
    reports.by.school,
    sgPlot.years,
    sgPlot.demo.report,
    sgPlot.folder,
    sgPlot.folder.names,
    sgPlot.anonymize,
    sgPlot.front.page,
    sgPlot.header.footer.color,
    sgPlot.fan,
    sgPlot.sgp.targets,
    sgPlot.cleanup,
    sgPlot.baseline,
    sgPlot.sgp.targets.timeframe,
    sgPlot.zip,
    sgPlot.output.format,
    sgPlot.linkages)

Arguments

sgPlot.data Wide formatted individual student report data used to produce student growth plots. To view structure of wide formatted data, utilize the sgPlot.save.sgPlot.data option with visualizeSGP to save wide formatted student growth plot data.

sgPlot.sgp_object SGP object containing coefficient matrices and knots and boundaries for percentile trajectory calculations associated with JSON output.

sgPlot.cutscores List of cutscores, possibly transformed, for plotting studentGrowthPlots

state Acronym indicating state associated with the summaries for access to assessment program information embedded in SGPstateData.

last.year Argument indicating the final year represented in the student growth plots.

content_areas Argument providing the content areas depicted in the student growth plots.

districts A vector of district numbers indicating which districts student growth plots should be produced for.

schools A vector of school numbers indicating which schools student growth plots should be produce for.
reports.by.student
A Boolean variable passed to \texttt{studentGrowthPlot\_Styles} indicating whether separate individual plots will be produced or separate reports and a summary catalog containing those reports will be produced.

reports.by.instructor
A Boolean variable passed to \texttt{studentGrowthPlot\_Styles} indicating whether individual plots will be collated and bundled as a summary catalog by instructor.

reports.by.school
A Boolean variable passed to \texttt{studentGrowthPlot\_Styles} indicating whether individual plots will be collated and bundled as a summary catalog by school. Prior to version 0.9-9.7, this was the only way of bundling reports and was thus the default.

\texttt{sgPlot.years}
A vector of all years over which student growth plots are being produced.

\texttt{sgPlot.demo.report}
A Boolean argument indicating whether a demonstration report catalog (with anonymized individual, school, and district names) is to be produced.

\texttt{sgPlot.folder}
A character argument specifying the folder into which the student growth reports will be placed.

\texttt{sgPlot.folder.names}
Either \texttt{names} or \texttt{number} indicating whether names or numbers should be used as folder names.

\texttt{sgPlot.anonymize}
A Boolean argument indicating whether individual, school, and district names should be anonymized.

\texttt{sgPlot.front.page}
A character vector indicating the file, the the base directory, that should be used as the front page for the student growth plots.

\texttt{sgPlot.header.footer.color}
A color (as a character) specifying the header/footer color of the report.

\texttt{sgPlot.fan}
A Boolean argument indicating whether the projection fan indicating growth rates necessary to reach 1 years targets be displayed.

\texttt{sgPlot.sgp.targets}
A Boolean argument indicating whether the sgp targets are to be displayed.

\texttt{sgPlot.cleanup}
A Boolean argument indicating whether to cleanup/remove files produced as part of pdfLaTeX build.

\texttt{sgPlot.baseline}
A Boolean argument indicating whether to use baseline referenced student growth percentiles in student growth plots.

\texttt{sgPlot.sgp.targets.timeframe}
An integer argument indicating the number of years forward associated with SGP targets.

\texttt{sgPlot.zip}
A Boolean argument indicating whether to school folders.

\texttt{sgPlot.output.format}
Argument indicating the desired type of output format for student growth plots. Either \texttt{‘PDF’}, \texttt{‘PNG’}, or \texttt{‘PDF\_PIECES’}.
studentGrowthProjections

sgPlot.linkages

Argument passing linkage information (defaults to NULL) associated with assessment scale transition.

Details

studentGrowthPlot_Styles is a utility function containing five templates for displaying studentGrowthPlots. The templates display two or three content areas depending upon the availability of test data for the state. This function will expand in the future to allow for other types of individual growth and achievement reports.

Value

Function produces numerous (potentially hundreds of thousands of) PDF/PNG student growth plots.

Author(s)

Damian W. Betebenner <dbetebenner@nciea.org> and Adam Van Iwaarden <vaniwaarden@colorado.edu>

studentGrowthProjections

Student Growth Projections

Description

Function to calculate percentile growth projections/trajectories using large scale assessment data and results derived from student growth percentile calculation. Function can produce percentile growth trajectories, as well as growth percentiles, sufficient for each student to reach a set of predefined scale score cut.

Usage

studentGrowthProjections(panel.data,
            sgp.labels,
            grade.progression,
            content_area.progression=NULL,
            year_lags.progression=NULL,
            grade.projection.sequence=NULL,
            content_area.projection.sequence=NULL,
            year_lags.projection.sequence=NULL,
            max.forward.progression.years=NULL,
            max.forward.progression.grade=NULL,
max.order.for.progression,
use.my.knots.boundaries,
use.my.coefficient.matrices,
panel.data.vnames,
achievement.level.prior.vname=NULL,
performance.level.cutscores,
calculate.sgps=TRUE,
convert.0and100=TRUE,
trajectories.chunk.size=50000L,
sgp.projections.equated=NULL,
projection.unit="YEAR",
projection.unit.label=NULL,
percentile.trajectory.values=NULL,
return.percentile.trajectory.values=NULL,
return.projection.group.identifier=NULL,
return.projection.group.scale.scores=NULL,
return.projection.group.dates=NULL,
isotonize=TRUE,
lag.increment=0L,
sgp.exact.grade.progression=FALSE,
projcuts.digits=NULL,
sgp.projections.use.only.complete.matrices=NULL,
SGPt=NULL,
print.time.taken=TRUE)

Arguments

panel.data Object of class list containing longitudinal student data in wide format in
panel.data$Panel_Data. See studentGrowthPercentiles for data require-
ments. List object must also contain panel.data$Knots_Boundaries and panel.data$Coefficient_Matrices.
See sgpData for an exemplar data set. NOTE: The column position of the vari-
ables IS IMPORTANT, NOT the names of the variables.

sgp.labels REQUIRED. A list, sgp.labels, of the form list(my.year= ,
my.subject= ). The user-specified values are used to save the percentile growth
projections/trajectories and identify coefficient matrices and knots & boundaries
for calculation if use.my.coefficient.matrices or
use.my.knots.boundaries is missing. Partly replaces previous argument proj.function.labels.

grade.progression REQUIRED. Argument to specify a student grade/time progression in the data
to be used for percentile growth projection/trajectory calculation. This argument helps in replacing previous arguments num.panels, max.num.scores, and
num.prior.scores.

content_area.progression Argument to specify a student content area progression in the data supplied for
percentile growth projection/trajectory calculation. Defaults to NULL and is
calculated from supplied argument 'sgp.labels'.

year.lags.progression Argument to specify a student year progression lags in the data supplied for per-
centile growth projection/trajectory calculation. Defaults to NULL assuming annual increment calculated from supplied argument 'sgp.labels' and 'grade.progression'.

**grade.projection.sequence**
Argument to manually supply grade sequence over which projection is made. Defaults to NULL and is calculated from available data.

**content_area.projection.sequence**
Argument to manually supply content area sequence over which projection is made. Defaults to NULL and assumes current year content area is repeated going forward.

**year_lags.projection.sequence**
Argument to manually supply year lags sequence over which projection is made. Length of supplied sequence should be 1 less than length of supplied 'grade.projection.sequence' and 'content_area.projection.sequence'. Defaults to NULL and assumes annual (1 year lags).

**max.forward.progression.years**
The MAXIMUM number of years/grades/time periods to project forward conditional upon available coefficient matrices. If missing/NULL (the default), function will project forward as far as allowed by available coefficient matrices.

**max.forward.progression.grade**
The MAXIMUM grade to project forward based upon available coefficient matrices. If missing/NULL (the default), function will project forward as far as allowed by available coefficient matrices.

**max.order.for.progression**
Argument to specify the maximum coefficient matrix order to be used for percentile growth projection/trajectory calculation. If missing, the function utilizes the highest matrix order available.

**use.my.knots.boundaries**
A list of the form `list(my.year= ,my.subject=)` specifying the set of pre-calculated knots and boundaries for B-spline calculations. Knot and boundaries are stored (and must be made available) with `panel.data` supplied as a list in `panel.data$Knots_Boundaries$my.year.my.subject`. As of SGP_0.0-6.9 user can also supply a two letter state acronym to utilize knots and boundaries within the `SGPstateData` data set supplied with the SGP package. If missing, function tries to retrieve knots and boundaries from `panel.data$Knots_Boundaries$my.year.my.subject` where `my.year` and `my.subject` are provided by `sgp.labels`.

**use.my.coefficient.matrices**
A list of the form `list(my.year= ,my.subject=)` specifying the set of pre-calculated coefficient matrices to use for percentile growth projection/trajectory calculations. Coefficient matrices are stores (and must be available) with `panel.data` supplied as a list in `panel.data$Coefficient_Matrices$my.year.my.subject`. If missing, function tries to retrieve coefficient matrices from `panel.data$Coefficient_Matrices$my.year.my.subject` where `my.year` and `my.subject` are provided by `sgp.labels`.

**panel.data.vnames**
Vector of variables to use in percentile growth projection/trajectory calculations. If not specified, function attempts to use all available variables.
achievement.level.prior.vname
Character vector indicating variable is supplied panel data corresponding to the prior achievement level to be added to the output. Used in the production of growth to standard analyses.

performance.level.cutscores
Argument for supplying performance level cutscores to be used for determining growth-to-standard percentile growth trajectory calculations. Argument accepts a two letter state acronym (e.g., "CO") that retrieves cutscores that are automatically embedded in a data set contained in the SGP package. Argument also accepts a subject specific list of the form:

```r
performance.level.cutscores <- list(
  Reading=list(GRADE_3=c(cut1, cut2, cut3),
                     GRADE_4=c(cut1, cut2, cut3),
                     ...,
                     GRADE_8=c(cut1, cut2, cut3)),
  Math=list(GRADE_3=c(cut1, cut2, cut3),
                        ...,
                     GRADE_7=c(cut1, cut2, cut3),
                     GRADE_8=c(cut1, cut2, cut3)))
```

Note that the subject name must match that provided by sgp.labels. If cuts are not desired leave the cutscore unspecified, which is the default. If your state's cutscores are not included in the SGPstateData data set or are incorrect, please contact <dbetebenner@nciea.org> to have them added or corrected!

calculate.sgps
Boolean argument (defaults to TRUE) indicating whether to calculate student growth projections. Currently used to bypass calculations in analyzeSGP when scale changes occur.

convert.0and100
Boolean argument (defaults to TRUE) indicating whether conversion of growth percentiles of 0 and 100 to growth percentiles of 1 and 99, respectively, occurs. The default produces growth percentiles ranging from 1 to 99.

trajectories.chunk.size
To enhance speed, large data sets are broken up into smaller data sets before trajectories and cuts are calculated. The default chunk.size is 50,000 and is utilized when data sets of over 150 percent of the trajectory.chunk.size are passed to .get.percentile.trajectories and .get.trajectories.and.cuts.

sgp.projections.equated
A list (defaults to NULL) specifying the Year and Linkages associated with the equating used for projection purposes.

projection.unit
Argument specifying the units in which the projections/trajectories and cuts are reported. Either "GRADE", the default, or "YEAR".

projection.unit.label
Argument specifying the label associated with the units in which the projections/trajectories and cuts are reported. Defaults to NULL utilizing the value associated with the argument supplied to projection.unit.
**studentGrowthProjections**

**percentile.trajectory.values**
An integer argument with values ranging from 1 to 100 that returns a vector of percentile trajectory cuts (default is NULL, no percentile trajectory values returned). The returned values are the lower bound for the interval associated with the percentile(s) requested. For example, by specifying `percentile.trajectory.values=1` the user would receive the conditional .005 quantile associated with each student's distribution. Supplied values can also be a vector of targets that will return Scale Scores associated with those targets.

**return.percentile.trajectory.values**
A Boolean variable indicating whether to return the percentile trajectory values when they are supplied as targets via panel.data. Default is NULL/FALSE.

**return.projection.group.identifier**
A Boolean variable indicating whether to return the projection group identifier to distinguish different projection trajectories. Defaults to NULL/FALSE.

**return.projection.group.scale.scores**
A Boolean variable indicating whether to return the projection group scale scores for each student. Defaults to NULL/FALSE.

**return.projection.group.dates**
A Boolean variable indicating whether to return the projection group dates associated with the students' scale scores. Defaults to NULL/FALSE.

**isotonize**
Boolean argument (defaults to TRUE) indicating whether quantile regression results are isotonized to prevent quantile crossing following the methods derived by Chernozhukov, Fernandez-Val and Glichon (2010).

**lag.increment**
A non-negative integer (defaults to 0) indicating the lag associated with the data supplied for projections. Only relevant if Cutscores or Knots and Boundaries are year dependent.

**sgp.exact.grade.progression**
A Boolean argument (defaults to FALSE) indicating whether to use the exact grade progression supplied or all orders up to the grade progression supplied.

**projcuts.digits**
The number of digits (defaults to NULL/0) percentile trajectories (if requested) are formatted.

**sgp.projections.use.only.complete.matrices**
A Boolean argument (defaults to TRUE) indicating whether projections should be calculated even when all matrices are not available for the given content_area.projection.sequence and grade.projection.sequence.

**SGPt**
Character vector indicating the name of the 'DATE' variable to be used for time dependent student growth projection calculations. Defaults to NULL, non-time-dependent SGP calculations.

**print.time.taken**
Boolean argument (defaults to TRUE) indicating whether to print message indicating information on studentGrowthProjections analysis and time taken.

**Value**
Function returns the input panel.data list object with the additional percentile growth trajectories/percentiles stored in panel.data$SGProjections$my.year.my.subject consisting of student IDs and the associated percentile growth projections/trajectories and cuts. The data frame
contains projections/trajectories for each performance level cut-point supplied and each percentile cut the user specifies.

Note

Use of this function assumes prior calculation of student growth percentiles, making the coefficient matrices available within the panel.data$Coefficient_Matrices list object. Additionally, if cutscores are desired they must be supplied explicitly by the user (as detailed above in performance.level.cutscores) or included in the SGPstateData data set. If your state's cutscores are not included or are incorrect, please contact <dbetebenner@nciea.org> to have cutscores added or corrected!

Examples

```r
## Not run:
## First calculate SGPs for 2014
my.grade.sequences <- list(3:4, 3:5, 3:6, 3:7, 4:8)
my.sgpData <- list(Panell_Data = sgpData)
for (i in seq_along(my.grade.sequences)) {
  my.sgpData <- studentGrowthPercentiles(panel.data=my.sgpData,
  sgp.labels=list(year=2014, subject="Reading"),
  use.my.knots.boundaries="DEMO",
  grade.progression=my.grade.sequences[[i]])
}

## Calculate Growth Projections
my.grade.progressions <- list(3, 3:4, 3:5, 3:6, 4:7)
```
for (i in seq_along(my.grade.progressions)) {
  my.sgpData <- studentGrowthProjections(panel.data=my.sgpData,
    sgp.labels=list(my.year=2014, my.subject="Reading"),
    project.cuts.digits=0,
    projection.unit="GRADE",
    performance.level.cutpoints="DEMO",
    percentile.trajectory.values=c(25, 50, 75),
    grade.progression=my.grade.progressions[[i]])
}

## Save the Student Growth Projections Results to a .csv file:
write.csv(my.sgpData$SGProjections$READING.2014,
  file="2014_Reading_SGProjections.csv", row.names=FALSE, quote=FALSE)

## End(Not run)

summarizeSGP
summarize student scale scores, proficiency levels and student growth percentiles according to user specified summary group variables

Description
Utility function used to produce summary tables using long formatted data that contain student growth percentiles. An exemplar is provided from the successive execution of prepareSGP, analyzeSGP and combineSGP.

Usage
summarizeSGP(sgp.object, state, years, content_areas, sgp.summaries=NULL, summary.groups=NULL, confidence.interval.groups=NULL, produce.all.summary.tables=FALSE, summarizeSGP.baseline=NULL, projection.years.for.target=NULL, save.old.summaries=FALSE, highest.level.summary.grouping="STATE", parallel.config=NULL)

Arguments
sgp.object An object of class SGP containing long formatted data in the @Data slot. If summaries of student growth percentiles are requested, those quantities must first be produced (possibly by first using analyzeSGP) and subsequently combined with the @Data data (possibly with combineSGP).
state

Acronym indicating state associated with the summaries for access to assessment program information embedded in SGPstateData.

years

A character vector indicating year(s) in which to produce summary tables associated with student growth percentile and percentile growth trajectory/projection analyses. If missing the function will use the data to calculate years and produce summaries for the most recent three years.

content_areas

A character vector indicating content area(s) in which to produce student growth percentiles and/or student growth projections/trajectories. If missing the function will use the data to infer the content area(s) available for analyses.

sgpsummaries

A list giving the summaries requested for each group analyzed based upon the summary_group argument. The default (produced internal to summarizeSGP) summaries include:

- MEDIAN_SGP: The group level median student growth percentile.
- MEDIAN_SGP_COUNT: The number of students used to compute the median.
- PERCENT_AT_ABOVE_PROFICIENT: The percentage of students at or above proficient.
- PERCENT_AT_ABOVE_PROFICIENT_COUNT: The number of students used to compute the percentage at/above proficient.
- PERCENT_AT_ABOVE_PROFICIENT_PRIOR: The percentage of students at or above proficient in the prior year.
- PERCENT_AT_ABOVE_PROFICIENT_PRIOR_COUNT: The number of students used to compute the percentage at/above proficient in the prior year.

NOTE: The internal function percent_in_category() summary function requires a variable that MUST be a factor with proficiency categories as levels. The function utilizes the SGPstateData with the provided state name in an attempt to identify achievement levels and whether or not they are considered proficient.

summary.groups

A list consisting of 8 elements indicating the types of groups across which all summaries are taken (Inclusion means that summaries will be calculated for levels of the associated variable). For state data, if the list is not explicitly provided, the function will attempt to determine levels based upon meta data supplied in the @Names slot of the provided SGP object. See prepareSGP for more information on supplied meta-data.

institution:

State, District and/or School.

content area:

Variable indicating content area (default is CONTENT_AREA) if content area summaries are of interest.

time:

Variable indicating time (default is YEAR) if time summaries are of interest. NOTE: Cross year (i.e., multi-year) summaries default to 3 years.

institution_type:

Variable(s) indicating the type of institution (default EMH_LEVEL) if summaries by institution type is of interest.

institution_level:

Variable(s) indicating levels within the institution (default GRADE) if summaries by institution level is of interest.

demographic:

Demographics variables if summaries by demographic subgroup are of interest.

institution_inclusion:

Variables indicating inclusion for institutional calculations.

growth_only_summary:

Variables indicating whether to calculate summaries only for those students with growth in addition to other analyses.

All group slots MUST be included in the list, although NULL can be provided if a grouping subset is not desired. All possible combinations of the group variables are produced.
summarizeSGP

confidence.interval.groups

A list consisting of information used to calculate group confidence intervals:

TYPE:

VARIABLES:

QUANTILES

GROUP

category

time

institution_type

institution_level

demographic

institution_inclusion

growth_only_summary The growth only summary variables if confidence intervals by growth only summary group are desired.

For CSEM analysis this argument requires that simulated SGPs have been produced (see analyzeSGP for more information). List slots set to NULL will not produce confidence intervals. NOTE: This is currently an experimental functionality and is very memory intensive. Groups to be included should be identified selectively! The default 95% confidence intervals are provided in the selected summary tables as two additional columns named LOWER_MEDIAN_SGP_95_CONF_BOUND and UPPER_MEDIAN_SGP_95_CONF_BOUND.

produce.all.summary.tables

A Boolean variable, defaults to FALSE, indicating whether the function should produce ALL possible summary table. By default, a set of approximately 70 tables are produced that are used in other parts of the packages (e.g., bubblePlots).

summarizeSGP.baseline

A Boolean variable, defaults to FALSE, indicating whether the function should utilize baseline sgp for summary table production. By default, a set of approximately 100 tables are produced that are used in other parts of the packages (e.g., bubblePlots).

projection.years.for.target

An integer/NULL argument (defaults to NULL) indicating SGP_TARGET variables to summarize based upon years projected forward. Default is years for projections used by state (or 3 years) which is what is generally used by most states.

save.old.summaries

A Boolean argument, defaults to FALSE, indicating whether to save the @Summary slot (if not NULL) prior to calculating new summaries. By defaulting to FALSE, the function overwrites previous (e.g., last year’s summaries) summaries.

highest.level.summary.grouping

A character vector indicating the highest level for summary groups, defaults to 'STATE'.

parallel.config

A named list with, at a minimum, two elements indicating 1) the BACKEND package to be used for parallel computation and 2) the WORKERS list to specify the number of processors to be used in each major analysis. The BACKEND
element can be set = to FOREACH or PARALLEL. Please consult the manuals and vignettes for information of these packages! The analyzeSGP help page contains more thorough explanation and examples of the parallel.config setup.

TYPE is a third element of the parallel.config list that provides necessary information when using FOREACH or PARALLEL packages as the backend. With BACKEND="FOREACH", the TYPE element specifies the flavor of 'foreach' backend. As of version 1.0-1.0, only "doParallel" is supported. TYPE=NA (default) produces summaries sequentially. If BACKEND = "PARALLEL", the parallel package will be used. This package combines deprecated parallel packages snow and multicore. Using the "snow" implementation of parallel the function will create a cluster object based on the TYPE element specified and the number of workers requested (see WORKERS list description below). The TYPE element indicates the users preferred cluster type (either "PSOCK" for socket cluster of "MPI" for an OpenMPI cluster). If Windows is the operating system, this "snow" implementation must be used and the TYPE element must = "PSOCK". Defaults are assigned based on operating system if TYPE is missing based on system OS. Unix/Mac OS defaults to the "multicore" to avoid worker node pre-scheduling and appears to be more efficient in these operating systems.

The WORKERS element is a list with SUMMARY specifying the number of processors (nodes) desired or available. For example, SUMMARY=2 may be used on a dual core machine to use both cores available. (NOTE: choice of the number of cores is a balance between the number of processors available and the amount of RAM a system has; each system will be different and may require some adjustment).

Default is FOREACH as the back end, TYPE=NA and WORKERS=1, which produces summary tables sequentially: 'list(BACKEND="FOREACH", TYPE=NA, WORKERS=list(SUMMARY=1))'

Example parallel use cases are provided below.

Details

Function makes use of the foreach package to parallel process summary tables of student data. The proper choice of parallel backend is dependent upon the user's operating system, software and system memory capacity. Please see the foreach documentation for details. By default, the function will process the summary tables sequentially.

Value

Function returns lists containing the summary tables as data.table objects in the @Summary slot of the SGP data object. Each institution has a slot in the @Summary list.

Examples

```r
## Not run:
## summarizeSGP is Step 4 of 5 of abcSGP
Demonstration_SGP <- sgpData_LONG
Demonstration_SGP <- prepareSGP(Demonstration_SGP)
Demonstration_SGP <- analyzeSGP(Demonstration_SGP)
Demonstration_SGP <- combineSGP(Demonstration_SGP)
Demonstration_SGP <- summarizeSGP(Demonstration_SGP)

### Example uses of the parallel.config argument

## Windows users must use the parallel package and R version >= 2.13:
# Note the number of workers is 8, and PSOCK type cluster is used.
# This example is would be good for a single workstation with 8 cores.
... parallel.config=list(
  BACKEND="PARALLEL", TYPE="PSOCK",
  WORKERS=list(SUMMARY=2))
...

# doParallel package - only available with R 2.13 or newer
... parallel.config=list(
  BACKEND="FOREACH", TYPE="doParallel",
  WORKERS=list(SUMMARY=6))
...

## parallel package - only available with R 2.13 or newer
# Note the number of workers is 50, and MPI is used,
# suggesting this example is for a HPC cluster usage.
... parallel.config=list(
  BACKEND="PARALLEL", TYPE="MPI"),
  WORKERS=list(SUMMARY=50))
...

# NOTE: This list of parallel.config specifications is NOT exhaustive.
# See examples in analyzeSGP documentation for some others.

## End(Not run)
```

---

testSGP  

Test SGP Package functions

description

testSGP runs large scale tests of the SGP package to test for consistent performance across releases.
Usage

```r
testSGP(TEST_NUMBER,
save.results=TRUE,
test.option=list(),
memory.profile=FALSE)
```

Arguments

- **TEST_NUMBER**: An integer indicating the test to be run. Type `testSGP()` to see list and description of available tests.
- **save.results**: A Boolean variable, defaulting to FALSE, indicating whether the results of the analysis is saved to the working directory.
- **test.option**: A character string (defaults to NULL) supplying a test option to the given test specified by TEST_NUMBER. Argument is test specific. See source code for testSGP for possible arguments.
- **memory.profile**: A Boolean variable indicating whether to use memory profiling via `Rprof`. Experimental. Defaults to FALSE.

Value

Returns output associated with functions being run.

```
updateSGP

Function to update SGP object with additional year's analyses

Description

updateSGP takes an object of class SGP and adds in additional data (usually an additional year's data) and runs analyses on that additional year's data including the results in the supplied SGP object.

Usage

```r
updateSGP(
  what_sgp_object=NULL,
  with_sgp_data_LONG=NULL,
  with_sgp_data_INSTRUCTOR_NUMBER=NULL,
  state=NULL,
  steps=c("prepareSGP",
           "analyzeSGP",
           "combineSGP",
           "summarizeSGP",
           "visualizeSGP",
           "outputSGP"),
  years=NULL,
  content_areas=NULL,
  grades=NULL,
  sgp.percentiles=TRUE,
  overwrite.existing.data=FALSE,
  sgp.use.my.coefficient.matrices=TRUE
)
```
sgp.projections=TRUE,
sgp.projections.lagged=TRUE,
sgp.percentiles.baseline=TRUE,
sgp.projections.baseline=TRUE,
sgp.projections.lagged.baseline=TRUE,
sgp.test.cohort.size=NULL,
return.sgp.test.results=FALSE,
simulate.sgps=TRUE,
save.old.summaries=NULL,
save.intermediate.results=TRUE,
calculate.simex=NULL,
calculate.simex.baseline=NULL,
sgp.use.my.coefficient.matrices=NULL,
sgp.target.scale.scores=FALSE,
sgp.target.scale.scores.only=FALSE,
overwrite.existing.data=TRUE,
update.old.data.with.new=TRUE,
output.updated.data=TRUE,
sgPlot.demo.report=TRUE,
plot.types=c("bubblePlot", "studentGrowthPlot", "growthAchievementPlot"),
outputSGP.output.type=c("LONG_Data",
"LONG_FINAL_YEAR_Data",
"WIDE_Data",
"INSTRUCTOR_Data"),
outputSGP.directory="Data",
sgp.config=NULL,
goodness.of.fit.print=TRUE,
parallel.config=NULL,
sgp.sqlite=FALSE,
SGPt=NULL,
sgp.percentiles.equated=NULL,
sgp.percentiles.equating.method=NULL,
sgp.percentiles.calculate.sgps=TRUE,
fix.duplicates=NULL,
...)

Arguments

what_sgp_object
The SGP object to which the additional data will be added and analyzed. This object must be specified.

with_sgp_data_LONG
The additional data in LONG format to be added to the supplied SGP object. The additional data must be in the same form as the data in the @Data slot. If with_sgp_data_LONG is not supplied, the function with update the sgp_object supplied in 'what_sgp_object' using the embedded coefficient matrices, essentially re-doing the analyses.

with_sgp_data_INSTRUCTOR_NUMBER
The addition INSTRUCTOR_NUMBER data in LONG format to be added to
`updateSGP`

the supplied SGP object. The additional data must be in the same format as the
data in the `@Data_Supplementary[['INSTRUCTOR_NUMBER']]` slot. Default is NULL, no INSTRUCTOR_NUMBER data is supplied.

**state**
The 'state' for the sgp_object. Derived from sgp_object name if not explicitly supplied.

**steps**
A vector indicting the steps abcSGP will perform as part of the update. Defaults to all steps: `prepareSGP, analyzeSGP, combineSGP, summarizeSGP, visualizeSGP, outputSGP`.

**years**
If only 'what_sgp_object' is supplied, years specifies the years to be run among those in the provided sgp_object.

**content_areas**
If only 'what_sgp_object' is supplied, content_areas specifies the content areas to be run among those provided by the coefficient matrices in the sgp_object. Default is to run all analyses associated with the coefficient matrices.

**grades**
A vector indicating grades for which to calculate student growth percentiles and/or student growth projections/trajectories. If missing the function will use the data to infer all the grade progressions for student growth percentile and student growth projections/trajectories analyses. This argument is passed to either abcSGP or analyzeSGP depending on the update context.

**sgp.percentiles**
Boolean variable indicating whether to calculate student growth percentiles (if analyzeSGP is included in the 'steps' argument). Defaults to TRUE.

**sgp.projections**
Boolean variable indicating whether to calculate student growth projections (if analyzeSGP is included in the 'steps' argument). Defaults to TRUE.

**sgp.projections.lagged**
Boolean variable indicating whether to calculate lagged student growth projections often used for growth to standard analyses (if analyzeSGP is included in the 'steps' argument). Defaults to TRUE.

**sgp.percentiles.baseline**
Boolean variable indicating whether to calculate baseline student growth percentiles and/or coefficient matrices (if analyzeSGP is included in the 'steps' argument). Defaults to TRUE.

**sgp.projections.baseline**
Boolean variable indicating whether to calculate baseline student growth projections (if analyzeSGP is included in the 'steps' argument). Defaults to TRUE.

**sgp.projections.lagged.baseline**
Boolean variable indicating whether to calculate lagged baseline student growth projections (if analyzeSGP is included in the 'steps' argument). Defaults to TRUE.

**sgp.test.cohort.size**
Integer indicating the maximum number of students sampled from the full cohort to use in the calculation of student growth percentiles. Intended to be used as a test of the desired analyses to be run. The default, NULL, uses no restrictions (no tests are performed, and analyses use the entire cohort of students).
return.sgp.test.results

Boolean variable passed to `analyzeSGP` and `studentGrowthPercentiles` indicating whether the results from the cohort sample subset (if specified using the above argument) should be returned for inspection. Defaults to FALSE. If TRUE, only the sample subset of the data used will be returned in the SGP object’s @Data slot. Alternatively, user can supply the character “ALL_DATA” to the argument to return the entire original data.

simulate.sgps

Boolean variable indicating whether to simulate SGP values for students based on test-specific Conditional Standard Errors of Measurement (CSEM). Test CSEM data must be available for simulation and included in `SGPstateData`. This argument must be set to TRUE for confidence interval construction. Defaults to TRUE. This argument is passed to `analyzeSGP`.

save.old.summaries

A Boolean argument (defaults to NULL/TRUE which will save the @Summary slot before creating new summaries) indicating whether the call to `summarizeSGP` should save existing summaries in the @Summary slot. If `overwrite.existing.data` is TRUE, save.old.summaries will default to FALSE unless explicitly set to TRUE.

save.intermediate.results

A Boolean argument (defaults to FALSE) indicating whether results should be saved to the current directory after each step of the analysis.

calculate.simex

A character state acronym or list including state/csem variable, csem.data.vnames, csem.loss.hoss, simulation.iterations, lambda and extrapolation method. Returns both SIMEX adjusted SGP (SGP_SIMEX) as well as the percentile ranked SIMEX SGP (RANK_SIMEX) values as suggested by Castellano and McCaffrey (2017). Defaults to NULL, no simex calculations performed. Alternatively, setting the argument to TRUE sets the list up with state=state, lambda=seq(0,2,0.5), simulation.iterations=50, simex.sample.size=25000, extrapolation="linear" and save.matrices=TRUE.

calculate.simex.baseline

A character state acronym or list including state/csem variable, csem.data.vnames, csem.loss.hoss, simulation.iterations, lambda and extrapolation method. Defaults to NULL, no simex calculations performed. Alternatively, setting the argument to TRUE uses the same defaults as above along with simex.use.my.coefficient.matrices = TRUE. This argument is passed to `analyzeSGP`.

gp.use.my.coefficient.matrices

A Boolean argument (defaults to FALSE/NULL) passed to `analyzeSGP` indicating whether previous coefficient matrices should be used as part of the analyses.

ggp.target.scale.scores

A Boolean argument (defaults to FALSE/NULL) passed to `combineSGP` indicating whether to calculate scale scores associated with SGP targets as part of the analyses.

ggp.target.scale.scores.only

A Boolean argument (defaults to FALSE/NULL) passed to `combineSGP` indicating whether ONLY to calculate scale scores associated with SGP targets as part of the `combineSGP`. 
**updateSGP**

overwrite.existing.data
A Boolean argument (defaults to TRUE) indicating whether updateSGP should overwrite existing data/results from an earlier run as part of updateSGP.

update.old.data.with.new
A Boolean argument (defaults to TRUE) indicating whether updateSGP should add new data supplied in argument with_SGP_Data_LONG to existing longitudinal data or reduce data set to run analyses on only that which is provided.

output.updated.data
A Boolean argument (defaults to TRUE) indicating whether updateSGP should use outputSGP to save the new data added in with_sgp_data_LONG separately in a new directory called "Updated_Data". Only relevant when overwrite.existing.data is FALSE and sgp.use.my.coefficient.matrices is TRUE. Output type controlled by the outputSGP.output.type argument.

sgPlot.demo.report
A Boolean argument (defaults to TRUE) indicating whether updateSGP should produce just the demo student growth plots or those associated with all students in the last year.

plot.types
A character vector (defaults to 'c('bubblePlot, studentGrowthPlot, growthAchievementPlot')') indicating what plot types to export from visualizeSGP.

outputSGP.output.type
Specifies the type of output generated as part of intermediate step when adding addition data and using old coefficient matrices. Defaults are the defaults of outputSGP, LONG_Data, LONG_FINAL_YEAR_Data, WIDE_Data, and INSTRUCTOR_Data.

outputSGP.directory
A a file path indicating where to save output files. Defaults to Data.

sgp.config
List of analysis control parameters passed to analyzeSGP. For details on this argument see document for that function.

goodness.of.fit.print
A Boolean variable passed to analyzeSGP indicating whether to print goodness of fit plots.

parallel.config
Parallel computation configuration passed to abcSGP, analyzeSGP, combineSGP, and summarizeSGP. See documentation under those functions for details.

sgp.sqlite
A Boolean argument (defaults to FALSE) indicating whether a SQLite database file of the essential SGP data should be created from the @Data slot and subsequently used to extract data subsets for analyses conducted in order to reduce the amount of RAM memory required. See full argument description in analyzeSGP.

SGPt
Argument (defaults to NULL) indicating whether time dependent student growth percentile (SGPt) are calculate.

sgp.percentiles.equated
Argument (defaults to NULL) passed to abcSGP and analyzeSGP indicating whether equated SGP are to be calculated.

sgp.percentiles.equating.method
Character vector argument passed to analyzeSGP indicating type(s) of equating method to used if sgp.percentiles.equated=TRUE. Default is NULL indicat-
updateSGP

ing 'equipercentile' equating. Options include 'identity', 'mean', 'linear', and 'equipercentile'.

sgp.percentiles.calculate.sgps

Boolean argument passed to abcSGP and analyzeSGP indicating whether to produce student growth percentiles as part of call to studentGrowthPercentiles. Default is TRUE. Setting to FALSE produces only coefficient matrices.

fix.duplicates

Argument to control how analyzeSGP and combineSGP deal with duplicate records based upon the key of VALID_CASE, CONTENT_AREA, YEAR, and ID. The function currently warns of duplicate records and doesn’t modify data. If set to 'KEEP.ALL', analyzeSGP tries to fix the duplicate individual records by adding a '_DUP_***' suffix to the duplicate ID before running studentGrowthPercentiles in order to create unique records based upon the key. If needed, the @Data slot will be extended as necessary to accomodate additional student records and SGP results in combineSGP.

... Arguments to be passed to abcSGP for finer control over SGP calculations. For example, 'parallel.config' can be supplied to abcSGP for parallel computation.

Value

Returns and object of class SGP including additional analyses.

Examples

## Not run:
### Run analyses on all but final year's of data

Demonstration_Data_LONG <- subset(sgpData_LONG, YEAR

Demonstration_Data_LONG_2013_2014 <- subset(sgpData_LONG, YEAR

Demonstration_SGP <- abcSGP(
  sgp_object=Demonstration_Data_LONG,
  sgPlot.demo.report=TRUE)

### Run updateSGP on Demonstration_SGP and the 2013_2014 data

Demonstration_SGP <- updateSGP(
  what_sgp_object=Demonstration_SGP,
  with_sgp_data_LONG=Demonstration_Data_LONG_2013_2014)

## End(Not run)
visualizeSGP

Visualize data from SGP analyses

Description

Utility function to produce a variety of graphical displays associated with student growth percentile/percentile growth trajectory results. Function currently includes facility to produce individual student growth and achievement plots, interactive bubble plots depicting summary growth and achievement data, and growth and achievement charts showing system level growth and achievement data as shown on the cover of *Educational Measurement: Issues and Practice* as part of Betebenner (2009) and Betebenner (2012).

Usage

```r
visualizeSGP(
    sgp_object,
    plot.types=c("bubblePlot", "studentGrowthPlot", "growthAchievementPlot"),
    state,
    bPlot.years=NULL,
    bPlot.content_areas=NULL,
    bPlot.districts=NULL,
    bPlot.schools=NULL,
    bPlot.instructors=NULL,
    bPlot.styles=c(1),
    bPlot.levels=NULL,
    bPlot.level.cuts=NULL,
    bPlot.full.academic.year=TRUE,
    bPlot.minimum.n=10,
    bPlot.anonymize=FALSE,
    bPlot.prior.achievement=TRUE,
    bPlot.draft=FALSE,
    bPlot.demo=FALSE,
    bPlot.output="PDF",
    bPlot.format="print",
    bPlot.folder="Visualizations/bubblePlots",
    sgPlot.save.sgPlot.data=FALSE,
    sgPlot.years=NULL,
    sgPlot.content_areas=NULL,
    sgPlot.districts=NULL,
    sgPlot.schools=NULL,
    sgPlot.reports.by.school=TRUE,
    sgPlot.instructors=NULL,
    sgPlot.reports.by.instructor=FALSE,
    sgPlot.students=NULL,
    sgPlot.reports.by.student=FALSE,
    sgPlot.reports.group.vars=
        list(DISTRICT_NUMBER="DISTRICT_NUMBER", SCHOOL_NUMBER="SCHOOL_NUMBER"),
)```
Arguments

sgp_object
An object of class SGP containing long formatted data in the @Data slot that will be used for the production of student growth and achievement plots and system growth and achievement plots, summary data from summarizeSGP in the Summary slot for bubble plots. Alternatively, a properly formatted WIDE data set can be provided for production of student growth plots. Such data sets are produced from an SGP object when the sgPlot.save.sgPlot.data argument is set to TRUE.

plot.types
A character vector indicating what types of plots to construct. Currently available plots include bubblePlot, studentGrowthPlot, and growthAchievementPlot.

state
Acronym indicating state associated with the summaries for access to assessment program information embedded in SGPSstateData.

bPlot.years
A vector indicating year(s) in which to produce bubblePlots using data available in sgp_object. If missing the function will use the last year available in the data to produce bubblePlots.

bPlot.content_areas
A vector indicating content area(s) to produce bubblePlots using data available in sgp_object. If missing the function will produce plots for all available content areas provided in the data.
bPlot.districts
A vector indicating districts to produce bubblePlots using data available in sgp_object. Consult bubblePlot styles to determine which bubblePlots styles accept specification for districts. Default is to produce plots for all available districts in the data.

bPlot.schools
A vector indicating schools to produce bubblePlots using data available in sgp_object. Consult bubblePlot styles to determine which bubblePlot styles accept specification for schools. Default is to produce plots for all available schools in the data.

bPlot.instructors
A vector indicating instructors to produce bubblePlots using data available in sgp_object. If missing the function will produce plots for all available instructors provided in the data where schools and districts represent relevant units to be represented by the specific bubblePlot style.

bPlot.styles
A vector of positive integers indicating the types of bubblePlots to produce using data available in sgp_object. See associated documentation for example plots.

bPlot.levels
A character vector of levels to be used to color bubbles in the bubblePlot. See associated documentation for example plots.

bPlot.level.cuts
A vector of cuts to be used to distinguish levels used to color bubbles in the bubblePlot. See associated documentation for example plots.

bPlot.full.academic.year
A Boolean argument (defaults to TRUE) indicating whether bubblePlots should use full academic year results if available.

bPlot.minimum.n
A positive integer (defaults to 10) indicating the minimum size for summary values to be displayed in the bubblePlots.

bPlot.anonymize
A Boolean argument (defaults to FALSE) indicating whether to anonymize bubblePlots school and district names that appear in the plots and data tips of the plots. For student level anonymization, the function utilizes the randomNames package to produce gender and ethnic correct names based upon gender and ethnicity codes available in sgp_object@Data.

bPlot.prior.achievement
A Boolean argument (defaults to TRUE) indicating whether to produce bubblePlots using prior achievement as well as current achievement as the vertical dimension of the bubblePlot.

bPlot.draft
A Boolean argument (defaults to FALSE) indicating whether to put an indicator on the chart noting that the results are draft and to not distribute.

bPlot.demo
A Boolean argument (defaults to FALSE) indicating whether to produce demo student level plots (styles 150 and/or 153) for instructors.

bPlot.output
Argument indicating the desired type of output format for bubble plots. Either 'PDF' (default) or 'PNG'.

bPlot.format
Either "print" or "presentation" indicating whether to optimize the plot for print form (light background) or presentation form (dark background).
bPlot.folder  Character vector indicating where bubblePlots should be placed. Default folder is "Visualizations/bubblePlots".

sgPlot.save.sgPlot.data  A Boolean argument indicating whether wide formatted data should be save as part of individual student report production. For operational student report production construction, using a wide formatted file for a large state can save in having to reshape the same long file multiple times.

sgPlot.years  A vector indicating year for which to produce studentGrowthPlots. The supplied year indicates the final year associated with each student's studentGrowthPlot. If missing the function will use the last year available in the data to produce studentGrowthPlots.

sgPlot.content_areas  A vector indicating the content areas for which to produce studentGrowthPlots. If missing, the function will utilize all available content areas.

sgPlot.districts  A vector indicating which districts to produce studentGrowthPlots for. If missing the function will use all available districts in the data to produce studentGrowthPlots.

sgPlot.schools  A vector indicating which schools to produce studentGrowthPlots for. If missing the function will use all available schools in the data to produce studentGrowthPlots. If both sgPlot.districts and sgPlot.schools are provided the function produces studentGrowthPlots for ALL students in the districts and schools provided.

sgPlot.reports.by.school  A Boolean variable indicating whether the reports should be collated as single reports in a single folder by school and deposited into a district/school/grade folder hierarchy. The default is TRUE which puts the reports into their appropriate district/school/grade folder.

sgPlot.instructors  A vector indicating which instructors to produce studentGrowthPlots for. If NULL and the argument sgPlot.reports.by.instructor is TRUE, the argument function will use all available instructors in the data to produce studentGrowthPlots. If sgPlot.districts and/or sgPlot.schools are provided the function produces studentGrowthPlots for ALL students in the districts and/or schools provided.

sgPlot.reports.by.instructor  A Boolean variable indicating whether the reports should be collated as single reports in a single folder or deposited into a district/school/grade folder.

sgPlot.students  A vector of student IDs indicating which students to produce studentGrowthPlots for. If missing the function will use all available students in the data to produce studentGrowthPlots.

sgPlot.reports.group.vars  A list of variables used to group student reports. Default is list(DISTRICT_NUMBER='DISTRICT_NUMBER',SCHOOL_NUMBER='SCHOOL_NUMBER').

sgPlot.reports.by.student  A Boolean variable indicating whether the reports should be collated as single reports in a single folder or deposited into a district/school/grade folder.
hierarchy. The default is FALSE which puts the reports into their appropriate
district/school/grade slot.

sgPlot.header.footer.color
Character vector (default is blue) indicating the color of the header/footer associated with the studentGrowthPlot. Another good color is goldenrod2.

sgPlot.front.page
A path to a PDF to be used as the front page to the studentGrowthPlot. The default is missing so that no front page is attached to the studentGrowthPlot.

sgPlot.folder
Character vector indicating where studentGrowthPlots should be placed. Note that studentGrowthPlots are placed within nested folders within this folder. Default folder is "Visualizations/studentGrowthPlots".

sgPlot.folder.names
Either "name" or "number" (the default) indicating how the nested folder structure will be labeled that holds the studentGrowthPlots.

sgPlot.fan
A Boolean argument (defaults to TRUE) indicating whether to produce projection fan on studentGrowthPlots.

sgPlot.sgp.targets
A Boolean argument (defaults to TRUE) indicating whether to indicate SGP growth targets on studentGrowthPlots.

sgPlot.sgp.targets.timeframe
An integer argument specifying the number of years forward associated with targets to be added to the student growth plots.

sgPlot.anonymize
A Boolean argument (defaults to FALSE) indicating whether to anonymize student, school and district names. For student level anonymization, the function utilizes the randomNames package to produce gender and ethnicity based names based upon gender and ethnicity codes available in sgp_object@Data.

sgPlot.cleanup
A Boolean argument (defaults to TRUE) indicating whether to remove files produced by pdfLaTeX to produce studentGrowthPlot catalogs.

sgPlot.demo.report
A Boolean argument (defaults to TRUE) indicating whether to just produce a sample studentGrowthPlot catalogs. Note: When producing studentGrowthPlots for an entire state, considerable resources are required to produce this many reports. We are actively working on parallelizing this functionality to reduce report production time by two orders of magnitude.

sgPlot.produce.plots
A Boolean argument (defaults to TRUE) indicating whether to produce studentGrowthPlots. Useful when one just wants to produce wide formatted data without the actual student growth plots.

sgPlot.baseline
Argument (defaults to NULL) indicating whether to use baseline referenced SGP's for student growth plot construction. If not set by user, argument will be set using SGPstateData which contains information on whether state is a cohort or baseline referenced system.

sgPlot.zip
A Boolean argument (defaults to TRUE) indicating whether to zip school folders containing studentGrowthPlots.
sgPlot.output.format
Argument indicating the desired type of output format for student growth plots. Either 'PDF' (default), 'PNG', 'PDF_PIECES', or 'JSON'.

sgPlot.year.span
Integer argument (defaults to 5) indicating the number of years to display for the pdf student growth plot.

sgPlot.plot.test.transition
Boolean argument (defaults to TRUE) indicating whether test transition data will be used IF it’s available. Setting to FALSE ignore previous test transition data, which would indicate a desire to ‘forget the past’.

gaPlot.years
A vector indicating the year(s) for which to produce growthAchievementPlots. If missing the function will use the last year available in the data to produce the growthAchievementPlots.

gaPlot.content_areas
A vector indicating content area(s) to produce growthAchievementPlots using data available in sgp_object. If missing the function will produce plots for all available content areas provided in the data.

gaPlot.students
A vector of student IDs indicating which students to produce growthAchievementPlots for. If missing the function will use all available students in the data to produce growthAchievementPlots.

gaPlot.format
Either ’print’ or ’presentation’ indicating whether to optimize the plot for print form (light background) or presentation form (dark background).

gaPlot.baseline
Argument (defaults to NULL) indicating whether to calculate growth and achievement plots using percentile trajectories derived from baseline referenced coefficient matrices. If not set by user, argument will be set using SGPstateData which contains information on whether state is a cohort or baseline referenced system.

gaPlot.max.order.for.progression
The maximum coefficient matrix order to use for each progression. Default is NULL which utilizes the maximum order available with the coefficient matrices.

gaPlot.start.points
Either ’Achievement Level Cuts’ or ’Achievement Percentiles’ defining where the percentile trajectories of the growth achievement plot will start from.

gaPlot.folder
Character vector indicating where growthAchievementPlots should be placed. The default folder is 'Visualizations/growthAchievementPlots'.

gaPlot.back.extrapolated.cuts
A numeric value or Boolean vector indicating whether to create back extrapolated cutscores based upon nth percentile growth.

gaPlot.SGPt
Boolean indicator for growth achievement plot indicating whether time dependent SGPs are to be used for student growth projections SGPt

parallel.config
A named list with, at a minimum, two elements indicating 1) the BACKEND package to be used for parallel computation and 2) the WORKERS list to specify the number of processors to be used in each major analysis. The BACKEND
element can be set = to FOREACH or PARALLEL. Please consult the manuals and vignettes for information of these packages! The `analyzeSGP` help page contains more thorough explanation and examples of the `parallel.config` setup.

TYPE is a third element of the `parallel.config` list that provides necessary information when using FOREACH or PARALLEL packages as the backend. With `BACKEND="FOREACH"`, the TYPE element specifies the flavor of 'foreach' backend. As of version 1.0-1.0, only "doParallel" is supported. TYPE=NA (default) produces summaries sequentially. If `BACKEND = "PARALLEL"`, the parallel package will be used. This package combines deprecated parallel packages snow and multicore. Using the "snow" implementation of parallel the function will create a cluster object based on the TYPE element specified and the number of workers requested (see WORKERS list description below). The TYPE element indicates the users preferred cluster type (either "PSOCK" for socket cluster of "MPI" for an OpenMPI cluster). If Windows is the operating system, this "snow" implementation must be used and the TYPE element must = "PSOCK". Defaults are assigned based on operating system if TYPE is missing based on system OS. Unix/Mac OS defaults to the "multicore" to avoid worker node pre-scheduling and appears to be more efficient in these operating systems.

The WORKERS element is a list with GA_PLOTS (growth achievement plots) and SG_PLOTS (student growth plots) specifying the number of processors to be used. NOTE: choice of the number of cores is a balance between the number of processors available and the amount of RAM a system has; each system will be different and may require some adjustment.

Default is FOREACH as the back end, TYPE=NA and both plot WORKERS=1, which produces plots sequentially: 'list(BACKEND="FOREACH", TYPE=NA, WORKERS=list(GA_PLOTS=1, SG_PLOTS=1))'

Examples of various parallel configurations can be found in the examples for `analyzeSGP` and `summarizeSGP`.

Value

Function produces numerous (potentially hundreds of thousands) of pdf files in a folder structure specified by the user and supplied through arguments to the function.

Author(s)

Damian W. Betebenner <dbetebenner@nciea.org> and Adam Van Iwaarden <vaniwaarden@colorado.edu>

Examples

```r
## Not run:
## visualizeSGP is Step 5 of 5 of abcSGP
Demonstration_SGP <- sgpData_LONG
Demonstration_SGP <- prepareSGP(Demonstration_SGP)
Demonstration_SGP <- analyzeSGP(Demonstration_SGP)
Demonstration_SGP <- combineSGP(Demonstration_SGP)
Demonstration_SGP <- summarizeSGP(Demonstration_SGP)
visualizeSGP(Demonstration_SGP)

## Produce a DEMO catalog of student growth plots
visualizeSGP(
  sgp_object=Demonstration_SGP,
  plot.types="studentGrowthPlot",
  state="DEMO",
  sgPlot.demo.report=TRUE)

## Production of sample student growth and achievement plots
visualizeSGP(
  sgp_object=Demonstration_SGP,
  plot.types="studentGrowthPlot",
  state="DEMO",
  sgPlot.districts=470,
  sgPlot.schools=c(6418, 8008),
  sgPlot.header.footer.color="#4CB9CC")

## End(Not run)
```
