Package ‘ShinyItemAnalysis’

September 27, 2021

Type Package
Title Test and Item Analysis via Shiny
Version 1.4.0
Date 2021-09-24
Description Package including functions and interactive shiny application for the psychometric analysis of educational tests, psychological assessments, health-related and other types of multi-item measurements, or ratings from multiple raters.
License GPL-3
URL http://www.ShinyItemAnalysis.org,
https://CRAN.R-project.org/package=ShinyItemAnalysis
BugReports https://github.com/patriciamar/ShinyItemAnalysis/issues
Depends R (>= 3.5.0)
Imports difR (>= 5.0), dplyr, ggplot2, lme4, magrittr, mirt (>= 1.24), nnet, psych, rlang, rstudioapi, tibble, tidy
Suggests data.table, deltaPlotR, difNLR (>= 1.3.2), DT, ggdendro, gridExtra, knitr, latticeExtra, ltm, msm, purr, rmarkdown, shiny (>= 1.0.3), shinyBS, shinydashboard, shinyjs, stringr, VGAM, xtable
Encoding UTF-8
LazyData TRUE
RoxygenNote 7.1.2
NeedsCompilation no

Description

The ShinyItemAnalysis package contains an interactive shiny application for the psychometric analysis of educational tests, psychological assessments, health-related and other types of multi-item measurements, or ratings from multiple raters, which can be accessed using function `startShinyItemAnalysis()`. The shiny application covers a broad range of psychometric methods and offers data examples, model equations, parameter estimates, interpretation of results, together with a selected R code, and is therefore suitable for teaching psychometric concepts with R. It also allows the users to upload and analyze their own data and to automatically generate analysis reports in PDF or HTML.

Besides, the package provides its own functions for test and item analysis within classical test theory framework (e.g., functions `gDiscrim()`, `ItemAnalysis()`, `DistractorAnalysis()`, or `DDplot()`), using various regression models (e.g., `plotCumulative()`, `plotAdjacent()`, `plotMultinomial()`, or `plotDIFlogistic()`), and under IRT framework (e.g., `ggWrightMap()`, or `plotDIFirt()`).

Package also contains several demonstration datasets including the HCI dataset from the reference paper by Martinkova and Drabinova (2018).

Details

Package: ShinyItemAnalysis
Type: Package
Version: 1.4.0
Date: 2021-09-24
Depends: R (>= 3.5.0)
Imports: cowplot, data.table, deltaPlotR, difNLR (>= 1.3.2), difR (>= 5.0), dplyr, DT, gg dendro, ggplot2, gridExtra, knitr, latticeExtra, lme4, ltm, magrittr, mirt (>= 1.24), msm, nnet, plotly, psychometric, purrr, rlang, rmarkdown, scales, shiny (>= 1.0.3), shinyBS, shinydashboard, shinyjs (>= 0.9), stringr, tibble, tidyR, VGAM, xtable License: GPL-3
BugReports: https://github.com/patriciamar/ShinyItemAnalysis/issues
Website: http://www.ShinyItemAnalysis.org/
Encoding: UTF-8

Functions

- `startShinyItemAnalysis`
- `DDplot`
- `DistractorAnalysis`
ShinyItemAnalysis-package

- plotDistractorAnalysis
- gDiscrim
- ggWrightMap
- ItemAnalysis
- plotAdjacent, plotCumulative, plotMultinomial
- plotDIFirt, plotDIFLogistic
- plot_corr
- recode_nr
- ICCrestricted
- fa_parallel

Description

The AIBS dataset (Gallo, 2020) comes from the scientific peer review facilitated by the American Institute of Biological Sciences (AIBS) of biomedical applications from and intramural collaborative biomedical research program for 2014–2017. For each proposal, three assigned individual reviewers were asked to provide scores and commentary for the following application criteria: Innovation, Approach/Feasibility, Investigator, and Significance (Impact added as scored criterion in 2014). Each of these criteria is scored on a scale from 1.0 (best) to 5.0 (worst) with a 0.1 gradation, as well as an overall score (1.0–5.0 with a 0.1 gradation). Asynchronous discussion was allowed, although few scores changed post-discussion. The data includes reviewers’ self-reported expertise scores (1/2/3, 1 is high expertise) relative to each proposal reviewed, and reviewer / principal investigator demographics. A total of 72 applications ("Standard" or "Pilot") were reviewed in 3 review cycles. The success rate was 34–38%. Application scores indicate where each application falls among all practically possible applications in comparison with the ideal standard of quality from a perfect application. The dataset was used by Erosheva et al. (2021a) to demonstrate issues of inter-rater reliability in case of restricted samples. For details, see Erosheva et al. (2021b).

Usage

data(AIBS)

Format

AIBS is a data.frame consisting of 216 observations on 25 variables. Data describes 72 proposals with 3 ratings each.

ID Proposal ID.
Year Year of the review.
PropType Proposal type; "Standard" or "Pilot".
PIIID Anonymized ID of principal investigator (PI).
PIOrgType PI's organization type.
PIGender PI's gender membership; "1" females, "2" males.
PIRank PI's rank; "3" full professor, "1" assistant professor.
PIDegree PI's degree; "1" PhD, "2" MD, "3" PhD/MD.
Innovation  Innovation score.
Approach  Approach score.
Investig  Investigator score.
Signif  Significance score.
Impact  Impact score.
Score  Scientific merit (overall) score.
ScoreAvg  Average of the three overall scores from three different reviewers.
ScoreAvgAdj  Average of the three overall scores from three different reviewers, increased by multiple of 0.001 of the worst score.
ScoreRank  Project rank calculated based on ScoreAvg.
ScoreRankAdj  Project rank calculated based on ScoreAvgAdj.
RevID  Reviewer’s ID.
RevExp  Reviewer’s experience.
RevInst  Reviewer’s institution; "1" academia, "2" government.
RevGender  Reviewer’s gender; "1" females, "2" males.
RevRank  Reviewer’s rank; "3" full professor, "1" assistant professor.
RevDegree  Reviewer’s degree; "1" PhD, "2" MD, "3" PhD/MD.
RevCode  Reviewer code ("A", "B", "C") in the original wide dataset.

**Description**

Dataset from Kolek et al. (2021) study investigating a video game’s effects on implicit and explicit attitudes towards depicted historical events in the short- and long-term. As an intervention tool, a serious game *Czechoslovakia 38–89: Borderlands* was utilized that deals with the expulsion of the Sudeten Germans from the former Czechoslovakia after the WWII. Data consists responses from 145 adults from two groups (experimental and control group) on number of multi-item measurements.

**Usage**

AttitudesExpulsion

**Format**

A `data.frame` with 145 rows and 239 variables:

- **ID** anonymous identifier
- **Group** C = control or E = experimental group
- **Gender** factor, male or female
- **GenderF** integer, 1 = female
- **Merkel** effect of Merkel speech between the posttest and the delayed posttest, range 0–5, where 0 stands for no effect, 5 for very significant effect
- **Sudety** factor, N = not originally from Czech Borderlands; Y = originally from Czech Borderlands
- **Education** factor, V = university; S = high school; Z = elementary school
- **Education123** integer, same as above, but coded as 3= university; 2= high school; 1= elementary school, meaning higher the number, higher the education
- **PANASpn** total PANAS score of positive and negative affect scales
- **PANASp** total PANAS score of positive affect scale
- **PANASN** total PANAS score of negative affect scale
- **Macro** Macro attitude measurement
- **Micro** Micro attitude measurement
- **IATeffect** Single-Category Implicit association test score

Items beginning with an asterisk have following prefixes in the actual dataset:

- **pre** pretest
- **post** immediate posttest
- **del** one month delayed posttest
- **Post_Pre** difference between posttest_pretest
- **Del_Post** difference between delayed posttest and posttest
Source

**BFI2 Dataset**

**Description**
BFI2 dataset (Hřebíčková et al., 2020) consists of responses of 1,733 respondents (1,003 females, 730 males) to Big Five Inventory 2 (BFI-2). It contains 60 ordinal items, vector of age, education, and vector of gender membership.

**Usage**
data(BFI2)

**Format**
BFI2 is a data.frame consisting of 1,733 observations on 64 variables.

**i1–i60** The BFI items, scored on Likert scale where 1 = Disagree strongly, 2 = Disagree a little, 3 = Neutral; no opinion, 4 = Agree a little, and 5 = Agree strongly. Some items were recoded so that all items are scored in the same direction, see Details.

**Gender** Gender membership, 0 = females, 1 = males.

**Age** Age in years.

**Educ** Education, 1 = Basic school, 2 = Secondary technical school, 3 = Secondary general school, 4 = Other secondary school, 5 = Tertiary professional school, 6 = Bachelor degree, 7 = Masters degree, 8 = PhD

**Details**
The items prefixed with i are item scores. Items are indicators of 5 latent personality factors/dimensions/domains, which are further broken down into so-called facets. The 5 personality domains are: N = Negative Emotionality, E = Extraversion, O = Open-Mindedness, C = Consciousness and A = Agreeability. These are further broken down into so-called facets, as shown in the following table:

<table>
<thead>
<tr>
<th>Domain</th>
<th>Facet</th>
<th>Item numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>E</td>
<td>Sociability (scb)</td>
<td>1, 16, 31, 46</td>
</tr>
<tr>
<td>E</td>
<td>Assertiveness (asr)</td>
<td>6, 21, 36, 51</td>
</tr>
<tr>
<td>E</td>
<td>Energy Level (enl)</td>
<td>11, 26, 41, 56</td>
</tr>
<tr>
<td>A</td>
<td>Compassion (cmp)</td>
<td>2, 17, 32, 47</td>
</tr>
<tr>
<td>A</td>
<td>Respectfulness (rsp)</td>
<td>7, 22, 37, 52</td>
</tr>
<tr>
<td>A</td>
<td>Trust (trs)</td>
<td>12, 27, 42, 57</td>
</tr>
<tr>
<td>C</td>
<td>Organization (org)</td>
<td>3, 18, 33, 48</td>
</tr>
<tr>
<td>C</td>
<td>Productiveness (prd)</td>
<td>8, 23, 38, 53</td>
</tr>
</tbody>
</table>
In the original instrument, some items are inversely oriented, i.e., the higher score means the lower latent trait. This was the case of items number 3, 4, 5, 8, 9, 11, 12, 16, 17, 22, 23, 24, 25, 26, 28, 29, 30, 31, 36, 37, 42, 44, 45, 47, 48, 49, 50, 51, 55, and 58. These items have been recoded for you, i.e., displayed is value of 6 - original score.

In the sample code, alternative item names are provided. These item names can be used to decode the item domain, facet, item number, and whether it was recoded or not. For example, iCorg03r stands for recoded 3rd item (out of 60) from Consciousness domain and Organization facet.

Note

Thanks to Martina Hřebíčková for sharing this dataset.

CZmatura

**Description**

The CZmatura dataset comes from matura exam in mathematics. The exam was assigned in 2019 to students from Grade 13, at the end of their secondary education. Original data available from https://cermat.cz/.

**Usage**

data(CZmatura)

**Format**

CZmatura is a data.frame consisting of 15,702 observations on 75 variables.

- **SchType** School type code.
- **FirstAtt** First attempt; "1" yes, "0" no.
- **SchTypeGY** School type gymnasium; "1" yes, "0" no.
- **o1 – o26.2** Item answers.
- **b1 – b26** Scored item answers.
- **Total** Total score, calculated as sum of item scores (0 - 50).
- **IRTscore** Score estimated from GPCM/2PL model.
- **IRTscoreSE** SE of score estimated from GPCM/2PL model.

**See Also**

<table>
<thead>
<tr>
<th>dataMedical</th>
<th>Dichotomous dataset of admission test to medical school</th>
</tr>
</thead>
</table>

Description

The dataMedical dataset consists of the responses of 2,392 subjects (750 males, 1,633 females and 9 subjects without gender specification) to admission test to a medical school. It contains 100 items. A correct answer is coded as "1" and incorrect answer as "0". Missing answers were evaluated as incorrect, i.e. "0".

Usage

data(dataMedical)

Format

A dataMedical is a data.frame consisting of 2,392 observations on the following 102 variables.

X  The first 100 columns represent dichotomously scored items of the test.

gender  Variable describing gender; values "0" and "1" refer to males and females.

StudySuccess  Criterion variable; value "1" means that student studies standardly, "0" otherwise (e.g., leaving or interrupting studies).

dataMedicalgraded  Graded dataset of admission test to medical school

Description
The dataMedicalgraded dataset consists of the responses of 2,392 subjects (750 males, 1,633 females and 9 subjects without gender specification) to multiple-choice admission test to a medical school. It contains 100 items. Each item is graded with 0 to 4 points. Maximum of 4 points were set if all correct answers and none of incorrect answers were selected.

Usage
data(dataMedicalgraded)

Format
A dataMedicalgraded is a data.frame consisting of 2,392 observations on the following 102 variables.

X  The first 100 columns represent ordinal item scores of the test.
gender  Variable describing gender; values "0" and "1" refer to males and females.
StudySuccess  Criterion variable; value "1" means that student studies standardly, "0" otherwise (e.g., leaving or interrupting studies).

Description

Plots difficulty and (generalized) discrimination or criterion validity for items of the multi-item measurement test using the ggplot2 package. Difficulty and discrimination-validity indices are plotted for each item, items are ordered by their difficulty.

Usage

DDplot(
  Data,
  item.names,
  discrim = "ULI",
  k = 3,
  l = 1,
  u = 3,
  maxscore,
  minscore,
  bin = FALSE,
  cutscore,
```r
average.score = FALSE,
thr = 0.2,
criterion = "none",
val_type = "simple",
data)
```

### Arguments

- **Data**
  numeric: binary or ordinal data matrix or data.frame which rows represent examinee answers (1 correct, 0 incorrect, or ordinal item scores) and columns correspond to the items.

- **item.names**
  character: the names of items. If not specified, the names of Data columns are used.

- **discrim**
  character: type of discrimination index to be calculated. Possible values are "ULI" (default), "RIT", "RIR", and "none". See Details.

- **k**
  numeric: number of groups to which data may be divided by the total score to estimate discrimination using discrim = "ULI". Default value is 3. See Details.

- **l**
  numeric: lower group. Default value is 1. See Details.

- **u**
  numeric: upper group. Default value is 3. See Details.

- **maxscore**
  numeric: maximal scores of items. If single number is provided, the same maximal score is used for all items. If missing, vector of achieved maximal scores is calculated and used in calculations.

- **minscore**
  numeric: minimal scores of items. If single number is provided, the same maximal score is used for all items. If missing, vector of achieved maximal scores is calculated and used in calculations.

- **bin**
  logical: should the ordinal data be binarized? Default value is FALSE. In case that bin = TRUE, all values of Data equal or greater than cutscore are marked as 1 and all values lower than cutscore are marked as 0.

- **cutscore**
  numeric: cut-score used to binarize Data. If numeric, the same cut-score is used for all items. If missing, vector of maximal scores is used in calculations.

- **average.score**
  logical: should average score of the item be displayed instead of difficulty? Default value is FALSE. See Details.

- **thr**
  numeric: value of discrimination threshold. Default value is 0.2. With thr = NULL, no horizontal line is displayed in the plot.

- **criterion**
  numeric or logical vector: values of criterion. If supplied, discrim argument is ignored and item-criterion correlation (validity) is displayed instead. Default value is "none".

- **val_type**
  character: criterion validity measure. Possible values are "simple" (correlation between item score and validity criterion; default) and "index" (item validity index calculated as cor(item,criterion) * sqrt(((N -1) / N) * var(item)), where N is number of respondents, see Allen & Yen, 1979, Ch. 6.4, for details). The argument is ignored if user does not supply any criterion.

- **data**
  deprecated. Use argument Data instead.
Details

Discrimination is calculated using method specified in `discrim`. Default option "ULI" calculates difference in ratio of correct answers in upper and lower third of students. "RIT" index calculates correlation between item score and test total score. "RIR" index calculates correlation between item score and total score for the rest of the items. With option "none", only difficulty is displayed.

"ULI" index can be generalized using arguments k, l and u. Generalized ULI discrimination is then computed as follows: The function takes data on individuals, computes their total test score and then divides individuals into k groups. The lower and upper group are determined by l and u parameters, i.e. l-th and u-th group where the ordering is defined by increasing total score.

For ordinal data, difficulty is defined as relative score (achieved - minimal)/(maximal - minimal). Minimal score can be specified by `minscore`, maximal score can be specified by `maxscore`. Average score of items can be displayed with argument `average.score = TRUE`. Note that for binary data difficulty estimate is the same as average score of the item.

Note that all correlations are estimated using Pearson correlation coefficient.

# item difficulty / criterion validity plot for data with criterion
data(GMAT, package = "difNLR")
DDplot(GMAT[, 1:20], criterion = GMAT$criterion, val_type = "simple")

## End(Not run)
Description

Performs distractor analysis for each item and optional number of groups.

Usage

DistractorAnalysis(
  Data,
  key,
  p.table = FALSE,
  num.groups = 3,
  criterion = NULL,
  crit.discrete = FALSE,
  cut.points,
  data,
  matching,
  match.discrete
)

Arguments

Data character: data matrix or data.frame with rows representing unscored item responses from a multiple-choice test and columns corresponding to the items.

key character: answer key for the items. The key must be a vector of the same length as ncol(Data). In case it is not provided, criterion needs to be specified.

p.table logical: should the function return the proportions? If FALSE (default), the counts are returned.

num.groups numeric: number of groups to which are the respondents split.

criterion numeric: numeric vector. If not provided, total score is calculated and distractor analysis is performed based on it.

crit.discrete logical: is criterion discrete? Default value is FALSE. See details.

cut.points numeric: numeric vector specifying cut points of criterion. See details.

data deprecated. Use argument Data instead.

matching deprecated. Use argument criterion instead.

match.discrete deprecated. Use argument crit.discrete instead.

Details

This function is an adapted version of the distractor.analysis function from CTT package. In case that no criterion is provided, the scores are calculated using the item Data and key. The respondents are by default split into the num.groups-quantiles and the number (or proportion) of respondents in each quantile is reported with respect to their answers. In case that criterion is discrete (crit.discrete = TRUE), criterion is split based on its unique levels. Other cut points can be specified via cut.points argument.
Examples

# loading 100-item medical admission test dataset
data(dataMedicaltest, dataMedicalkey)
data <- dataMedicaltest[, 1:100]
databin <- dataMedical[, 1:100]
key <- unlist(dataMedicalkey)

fa_parallel  

Conduct Parallel Analysis

Description

Computes the eigenvalues of the sample correlation matrix and the eigenvalues obtained from a random correlation matrix for which no factors/components are assumed. By default, the function utilizes a modified Horn’s (1965) method, which – instead of mean – uses 95th percentile of each item eigenvalues sampling distribution as a threshold to find the optimal number of factors/components.
Usage

fa_parallel(
  Data,
  cor = "pearson",
  n_obs = NULL,
  method = "pca",
  threshold = "quantile",
  p = 0.95,
  n_iter = 20,
  plot = TRUE,
  show_kaiser = TRUE,
  fm = "minres",
  use = "pairwise",
  ...
)

Arguments

Data  
data.frame or matrix, dataset (where rows are observations and columns items) or correlation matrix (recognized automatically).

cor  
character, how to calculate the correlation matrix of the real data. Can be either pearson (default), tetrachoric or polychoric. Unambiguous abbreviations accepted.

n_obs  
integer, in case you provided the correlation matrix directly as the input, you have to provide the number of observations in the original dataset.

method  
character, either fa, pca, or both (the default). Which method to use for the eigenvalues simulation and computation.

threshold  
character, whether to use traditionall Horn’s method or more recent and well-performing quantile one. Either mean or quantile (default). Can be abbreviated.

p  
numeric (0–1), probability for which the sample quantile is produced. Defaults to .95. Ignored if threshold = "mean".

n_iter  
integer, number of iterations, i.e. the number of zero-factor multivariate normal distributions to sample. Defaults to 20.

plot  
logical, if TRUE (the default), show the plot along with the function results. To create the plot from the resulting object afterwards, call plot().

show_kaiser  
logical, whether to show Kaiser boundary in the plot (the default) or not.

fm  
character, factoring method. See fa from the package psych.

use  
an optional character string giving a method for computing covariances in the presence of missing values. This must be an abbreviation of one of the strings "everything", "all.obs", "complete.obs", "na.or.complete", or "pairwise.complete.obs".

...  
Arguments passed on to psych::polychoric

correct  
Correction value to use to correct for continuity in the case of zero entry cell for tetrachoric, polychoric, polybi, and mixed.cor. See the examples for the effect of correcting versus not correcting for continuity.
smooth  if TRUE and if the tetrachoric/polychoric matrix is not positive definite,
then apply a simple smoothing algorithm using cor.smooth

smooth  if TRUE and if the tetrachoric/polychoric matrix is not positive definite,
then apply a simple smoothing algorithm using cor.smooth

global  When finding pairwise correlations, should we use the global values of
the tau parameter (which is somewhat faster), or the local values (global=FALSE)?
The local option is equivalent to the polycor solution, or to doing one corre-
lation at a time. global=TRUE borrows information for one item pair from
the other pairs using those item’s frequencies. This will make a difference
in the presence of lots of missing data. With very small sample sizes with
global=FALSE and correct=TRUE, the function will fail (for as yet under-
determined reasons.

weight  A vector of length of the number of observations that specifies the
weights to apply to each case. The NULL case is equivalent of weights
of 1 for all cases.

progress  Show the progress bar (if not doing multicores)

ML  ML=FALSE do a quick two step procedure, ML=TRUE, do longer maxi-
mum likelihood — very slow! Deprecated

delete  Cases with no variance are deleted with a warning before proceeding.

max. cat  The maximum number of categories to bother with for polychoric.

Details

Horn proposed a solution to the problem of optimal factor number identification using an approach
based on a Monte Carlo simulation.

First, several (20 by default) zero-factor $p$-variate normal distributions (where $p$ is the number of
columns) are obtained, and $p \times p$ correlation matrices are computed for them. Eigenvalues of each
matrix is then calculated in order to get an eigenvalues sampling distribution for each simulated
variable.

Traditionally, Horn obtains an average of each sampling distribution and these averages are used as
a threshold which is compared with eigenvalues of the original, real data. However, usage of the
mean was later disputed by Buja & Eyuboglu (1992), and 95th percentile of eigenvalues sampling
distribution was suggested as a more accurate threshold. This, more recent method is used by
default in the function.

Value

An object of class data.frame and sia_parallel. Can be plotted using plot().

## End(Not run)

gDiscrim

Compute generalized item discrimination

Description

gDiscrim function computes various generalizations of discrimination index ULI. It enumerates the ability of item to distinguish between individuals from upper (U) vs. lower (L) ability groups, i.e. between respondents with high vs. low overall score on the test. Number of groups, as well as upper and lower groups can be specified by user. Maximal and minimal score in ordinal datasets can be specified by user.

Usage

gDiscrim(Data, k = 3, l = 1, u = 3, maxscore, minscore, x)

Arguments

Data matrix or data.frame of items to be examined. Rows represent respondents, columns represent items.

k numeric: number of groups to which may be Data divided by the total score. Default value is 3. See Details.

l numeric: lower group. Default value is 1. See Details.

u numeric: upper group. Default value is 3. See Details.

maxscore numeric: maximal score in ordinal items. If missing, vector of obtained maximal scores is imputed. See Details.
Discrim

minscore numeric: minimal score in ordinal items. If missing, vector of obtained minimal scores is imputed. See Details.

x deprecated. Use argument Data instead.

Details

The function computes total test scores for all respondents and then divides the respondents into k groups. The lower and upper groups are determined by l and u parameters, i.e., l-th and u-th group where the ordering is defined by increasing total score.

In ordinal items, difficulty is calculated as difference of average score divided by range (maximal possible score maxscore minus minimal possible score minscore for given item).

Discrimination is calculated as difference in difficulty between upper and lower group.

Note

gDiscrim is used by DDplot function.

## ggWrightMap

### Plot Wright map using ggplot2

**Description**

This function allows to generate Wright map (also called item-person map) using ggplot() function from the ggplot2 package. Wright map is used to display histogram of factor scores and the item difficulty parameters estimated by the Rasch IRT model.

**Usage**

```r
ggWrightMap(
  theta, 
  b, 
  binwidth = 0.5, 
  color = "blue", 
  size = 15, 
  item.names, 
  ylab.theta = "Respondent latent trait", 
  ylab.b = "Item difficulty", 
  rel_widths = c(1, 1)
)
```

**Arguments**

- `theta`: numeric: vector of ability estimates.
- `b`: numeric: vector of difficulty estimates.
- `binwidth`: numeric: the width of the bins of histogram.
- `color`: character: color of histogram.
- `size`: text size in pts.
- `item.names`: names of items to be displayed.
**ggWrightMap**

- `ylab.theta` character: description of y-axis for the histogram.
- `ylab.b` character: description of y-axis for the plot of difficulty estimates.
- `rel_widths` numeric: vector of length 2 specifying ratio of "facet’s" widths.

Description

HCIdata dataset consists of the responses of 669 students (405 males, 246 females, 18 without gender specification) to Homeostasis Concept Inventory (HCI) multiple-choice test. It contains answers to 20 multiple-choice items, scored items, total score, gender membership, identifier whether students plan to major in science, study year, minority membership, identifier whether English is the student’s first language, and type of school.

Usage

data(HCIdata)

Format

HCIdata is a data.frame consisting of 669 observations on the 47 variables.

A1-A20 Multiple-choice items of the HCI test.
QR1-QR20 Scored items of the HCI test, "0" incorrect, "1" correct.
total Total test score.
gender Gender membership, "M" males, "F" females, "none" undisclosed.
major Identifier whether students plans to major in the life sciences.
yearc5 Study year.
minority Minority membership, "maj" majority, "min" Black/Hispanic minority, "none" undisclosed.
EnglishF Identifier whether English is the student’s first language.
typeS Course type, "allied" allied health, "majors" physiology courses for science majors, "mixed majors" courses for non-majors.
typeSCH Type of school, "AC" associate’s college, "BCAS" baccalaureate college: arts and sciences focus, "R1" research university, "MCU" master’s college and university.

Description

HeightInventory dataset consists of the responses of 4,885 respondents (1479 males, 3406 females) to a Height Inventory (Rečka, 2018). It contains 26 ordinal items of self-perceived height rated on a scale "1" strongly disagree, "2" disagree, "3" agree, "4" strongly agree, vector of self-reported heights (in centimeters), and vector of gender membership.

Usage

data(HeightInventory)
HeightInventory

Format

HeightInventory is a data.frame consisting of 4,885 observations on the 28 variables. First 26 variables are responses on scale "1" strongly disagree, "2" disagree, "3" agree, "4" strongly agree. Items 14 - 26 were reverse-coded, so that all items are scored in the same direction. Names of these items start with "Not". Original item number and English wording is provided below.

ShortTrousers  1. A lot of trousers are too short for me.
TallerThanM  2. I am taller than men of my age.
TallerThanF  3. I am taller than women of my age.
HeightForBasketball  4. I have an appropriate height for playing basketball or volleyball.
AskMeToReach  5. Other people sometimes ask me to reach something for them.
CommentsTall  6. I am used to hearing comments about how tall I am.
ConcertObstructs  7. At concerts, my stature usually obstructs other people’s views.
ShortBed  8. Ordinary beds are too short for me.
TopShelfEasy  9. I can easily take wares from top shelves at a store.
CrowdViewComf  10. In a crowd of people, I still have a comfortable view.
ShortBlanket  11. Blankets and bedspreads rarely cover me completely.
BendToHug  12. When I want to hug someone, I usually need to bend over.
CarefullHead  13. I must often be careful to avoid bumping my head against a doorjamb or a low ceiling.
NotStoolNeeded  15. I often need a stool to reach something other people could reach without one.
NotPlayDwarf  16. I could play a dwarf.
NotSmallerThanW  17. I am smaller than women of my age.
NotNoticeSmall  18. One of the first things people notice about me is how small I am.
NotOnTipToes  19. I often need to stand on the tip of my toes to get a better view.
NotClothChildSize  20. When I buy clothes, children’s sizes often fit me well.
NotBusLegsEnoughSpace  21. I have enough room for my legs when traveling by bus.
NotFasterWalk  22. I often need to walk faster than I’m used to in order to keep pace with taller people.
NotAgeUnderestim  23. Because of my smaller stature, people underestimate my age.
NotWishLowerChair  24. It would be more comfortable for me if chairs were made lower.
NotUpwardLook  25. When talking to other adults, I have to look upwards if I want to meet their eyes.
NotMirrorTooHigh  26. Some mirrors are placed so high up that I have to crane my neck to use them.

gender  Gender membership, "M" males, "F" females.
HeightCM  Self-reported height in centimeters.
Note

Thanks to Karel Rečka and Hynek Cígler for sharing this dataset.

Description

Function estimating reliability with intra-class correlation for the complete or for the range-restricted sample.

Usage

```
ICCrestricted(
  Data,  # matrix or data.frame which includes variables describing ID of ratees (specified in case), ratings (specified in var), and (optionally) rank of ratees (specified in rank).
  case,  # character: name of the variable in Data with ID of the ratee (subject or object being evaluated, such as a respondent, proposal, patient, applicant etc.)
  var,   # character: name of the variable in Data with the ratings/scores.
  rank = NULL,  # numeric: vector of ranks of ratees. If not provided, rank of ratee is calculated based on average rating based on var variable.
  dir = "top",  # character: direction of range-restriction, available options are "top" (default) or "bottom". Can be an unambiguous abbreviation (i.e., "t" or "b").
  sel = 1,  # numeric: selected number (given > 1) or percentage (given <= 1) of ratees. Default value is 1 (complete dataset).
  nsim = 100,  # numeric: number of simulations. Default value is 100.
  ci = 0.95,  # numeric: confidence level. Default value is 0.95.
  seed = NULL)  # numeric: seed for random number generation. Default value is NULL.
```

Arguments

- **Data**: matrix or data.frame which includes variables describing ID of ratees (specified in case), ratings (specified in var), and (optionally) rank of ratees (specified in rank).
- **case**: character: name of the variable in Data with ID of the ratee (subject or object being evaluated, such as a respondent, proposal, patient, applicant etc.)
- **var**: character: name of the variable in Data with the ratings/scores.
- **rank**: numeric: vector of ranks of ratees. If not provided, rank of ratee is calculated based on average rating based on var variable.
- **dir**: character: direction of range-restriction, available options are "top" (default) or "bottom". Can be an unambiguous abbreviation (i.e., "t" or "b").
- **sel**: numeric: selected number (given > 1) or percentage (given <= 1) of ratees. Default value is 1 (complete dataset).
`ICCrestricted`

**nsim**
numeric: number of simulations for bootstrap confidence interval. Default value is 100.

**ci**
numeric: confidence interval. Default value is 0.95.

**seed**
seed for simulations. Default value is `NULL`, random seed. See `lme4::bootMer` for more detail.

**Value**
A data frame with the following columns:

- **n_sel**: number of ratees selected/subsetted.
- **prop_sel**: proportion of ratees selected.
- **dir**: direction of range-restriction. NA if range is effectively not restricted (100 ratee, "true variance", between-group variance).
- **VarResid**: residual variance.
- **VarTotal**: total variance.
- **ICC1**: single-rater inter-rater reliability.
- **ICC1_LCI**: lower bound of the confidence interval for ICC1.
- **ICC1_UCI**: upper bound of the confidence interval for ICC1.
- **ICC3**: multiple-rater inter-rater reliability.
- **ICC3_LCI**: lower bound of the confidence interval for ICC3.
- **ICC3_UCI**: upper bound of the confidence interval for ICC3.

**ItemAnalysis**

*Compute traditional item analysis indices*

**Description**

The `ItemAnalysis` function computes various traditional item analysis indices including difficulty, discrimination and item validity. For ordinal items, the difficulty and discrimination indices take into account minimal item score as well as range.

**Usage**

```r
ItemAnalysis(
    Data,
    criterion = "none",
    k = 3,
    l = 1,
    u = 3,
    maxscore = NULL,
    minscore = NULL,
    cutscore = NULL,
    bin = FALSE,
    data,
    y,
    add.bin
)
```

**Arguments**

- **Data**
  matrix or data.frame of items to be examined. Rows represent respondents, columns represent items.

- **criterion**
  vector of criterion values.

- **k**
  numeric: number of groups to which may be data.frame x divided by the total score. Default value is 3. See Details.

- **l**
  numeric: lower group. Default value is 1. See Details.
ItemAnalysis

u numeric: upper group. Default value is 3. See Details.
maxscore numeric or vector: maximal score in ordinal items. If missing, vector of obtained
maximal scores is imputed. See Details.
minsore numeric or vector: minimal score in ordinal items. If missing, vector of obtained
minimal scores is imputed. See Details.
cutscore numeric or vector: cut-score used for binarization of ordinal data. If missing,
vector of maximal scores is imputed. See Details.
bin logical: If TRUE, indices are printed also for binarized data. See Details.
data deprecated. Use argument Data instead.
y deprecated. Use argument criterion instead.
add.bin deprecated. Use argument bin instead.

Details

For ordinal items the difficulty and discrimination indices take into account minimal item score as well as range.

For calculation of discrimination ULI index, it is possible to specify the number of groups k, and which two groups 1 and u are to be compared.

In ordinal items, difficulty is calculated as difference of average score divided by range (maximal possible score maxscore minus minimal possible score minscore).

If bin is set to TRUE, item analysis of binarized data is included in the output table. In such a case, cutscore is used for binarization. When binarizing the Data, values greater or equal to cut-score are set to 1, other values are set to 0.

Value

ItemAnalysis function computes various traditional item analysis indices. Output is a data.frame with following columns:

Difficulty average score of the item divided by its range.
Mean average item score.
SD standard deviation of the item score.
SD.bin standard deviation of the item score for binarized data.
Prop.max.score proportion of maximal scores.
Min.score minimal score specified in minscore; if not provided, observed minimal score.
Max.score maximal score specified in maxscore; if not provided, observed maximal score.
obs.min observed minimal score.
obs.max observed maximal score.
Cut.Score cut-score specified in cutscore.
gULI generalized ULI.
gULI.bin generalized ULI for binarized data.
ULI discrimination with ULI using the usual parameters (3 groups, comparing 1st and 3rd).
ULI.bin  discrimination with ULI using the usual parameters for binarized data (3 groups, comparing 1st and 3rd).
RIT  item-total correlation (correlation between item score and overall test score).
RIT.bin  item-total correlation for binarized data.
RIR  item-rest correlation (correlation between item score and overall test score without the given item).
RIR.bin  item-rest correlation for binarized data.
Corr.criterion  correlation between item score and criterion criterion.
Corr.criterion.bin  correlation between item score and criterion criterion for binarized data.
Index.val  item validity index calculated as cor(item,criterion) * sqrt(((N -1) / N) * var(item)), see Allen and Yen (1979, Ch.6.4).
Index.val.bin  item validity index for binarized data.
Index.rel  item reliability index calculated as cor(item,test) * sqrt(((N -1) / N) * var(item)), see Allen and Yen (1979, Ch.6.4).
Index.rel.bin  item reliability index for binarized data.
Index.rel.drop  item reliability index 'drop' (scored without item).
Index.rel.drop.bin  item reliability index 'drop' (scored without item) for binarized data.
Alpha.drop  Cronbach’s alpha without given item. In case of two-item dataset, NAs are returned.
Alpha.drop.bin  Cronbach’s alpha without given item, for binarized data. In case of two-item dataset, NAs are returned.
Perc.miss  Percentage of missed responses on the particular item.
Perc.nr  Percentage of respondents that did not reached the item nor the subsequent ones, see recode_nr function for further details.

With bin = TRUE, indices based on binarized dataset are also provided and marked with bin suffix.

LearningToLearn

Dichotomous dataset of learning to learn test

Description

LearningToLearn is a real longitudinal dataset used in Martinkova et al (2020) study, demonstrating differential item functioning in change (DIF-C) on Learning to Learn (LtL) test. Among other variables, it primarily contains binary-coded responses of 782 subjects to (mostly) multiple-choice test consisting of 41 items within 7 subscales (see Format for details). Each respondent was tested
twice in total – the first time in Grade 6 and the second time in Grade 9. Most importantly, school track (variable `track_01` or `track`) is available, with 391 students attending basic school (BS) and 391 pursuing selective academic school (AS). This dataset was created using propensity score matching algorithm to achieve similar characteristics in both tracks (see References for details). To further simplify the work with `LtL` dataset, we provide computed total scores as well as 7 subscores, both for Grade 6 and Grade 9. The dataset also includes change variables for each item (see Format for details) for more detailed DIF-C analysis using multinomial regression model.

Usage

```R
data(LearningToLearn)
```

Format

A `LearningToLearn` data frame consists of 782 observations on the following 141 variables:

- `track_01` Dichotomously scored school track, where "1" denotes the selective academic school one.
- `track` School track, where "AS" represents the selective academic school track, and "BS" stands for basic school track.
- `score_6` & `score_9` Total test score value obtained by summing all 41 items of LtL, the number denotes the Grade which the respondent was taking at the time of testing.
- `score_6_subtest1`–`score_6_subtest7` Scores of respective cognitive subtest (1–7) of LtL in Grade 6.
- `score_9_subtest1`–`score_9_subtest7` Scores of respective cognitive subtest (1–7) of LtL in Grade 9.
- `Item1A_6`–`Item7F_6` Dichotomously coded 41 individual items obtained at Grade 6, "1" represents the correct answer to the particular item.
- `Item1A_9`–`Item7F_9` Dichotomously coded 41 individual items obtained at Grade 9, "1" represents the correct answer to the particular item.
- `Item1A_changes`–`Item7F_changes` Change patterns with those possible values:
  - a student responded correctly in neither Grade 6 nor in Grade 9 (did not improve, "00")
  - a student responded correctly in Grade 6 but not in Grade 9 (deteriorated, "10")
  - a student did not respond correctly in Grade 6 but responded correctly in Grade 9 (improved, "01"), and
  - a student responded correctly in both grades (did not deteriorate, "11")

**MSclinical**

*Clinical outcomes in multiple sclerosis patients dataset*

**Description**

The **MSclinical** dataset contains clinical measures on multiple sclerosis patients.

**Usage**

```r
data(MSclinical)
```

**Format**

**MSclinical** is a data.frame consisting of 17 observations on 13 variables.

- **LCLA** Low-Contrast Letter Acuity test.
- **MI** Motricity Index.
- **MAS** Modified Ashworth Scale.
- **BBS** Berg Balance Scale.
- **T** Tremor.
- **DD** Dysdiadochokinesia.
- **DM** Dysmetria.
- **PRs** Postural reactions.
- **KH** Knee Hyperextension.
- **NHPT** Nine-Hole Peg Test.
- **T25FW** Timed 25-Foot Walk.
- **PASAT3** 3-minute version of the Paced Auditory Serial Addition Test.
- **EDSS** Kurtzke Expanded Disability Status Scale.

**References**

Description

The NIH dataset (Erosheva et al., 2020a) was sampled from a full set of 54,740 R01 applications submitted by black and white principal investigators (PIs) and reviewed by NIH’s Center for Scientific Review (CSR) during council years 2014–2016.

It contains the original random sample of white applicants as generated by Erosheva et al. (2020b) and a sample of 46 black applicants generated to obtain the same ratio of white and black applicants as in the original sample (for details, see Erosheva et al., 2021a). The dataset was used by Erosheva et al. (2021b) to demonstrate issues of inter-rater reliability in case of restricted samples.

The available variables include preliminary criterion scores on Significance, Investigator, Innovation, Approach, Environment and a preliminary Overall Impact Score. Each of these criteria and the overall score is scored on an integer scale from 1 (best) to 9 (worst). Besides the preliminary criteria and Overall Impact Scores, the data include applicant race, the structural covariates (PI ID, application ID, reviewer ID, administering institute, IRG, and SRG), the matching variables – gender, ethnicity (Hispanic/Latino or not), career stage, type of academic degree, institution prestige (as reflected by the NIH funding bin), area of science (as reflected by the IRG handling the application), application type (new or renewal) and status (amended or not) – as well as the final overall score. In addition, the file includes a study group ID variable that refers to the Matched and Random subsets used in the original study.

Usage

data(NIH)

Format

NIH is a data.frame consisting of 5802 observations on 27 variables.

ID Proposal ID.
Score Preliminary Overall Impact score (1-9 integer scale, 1 best).
PIRace Principal investigator’s self-identified race; "White" or "Black".
PIID Anonymized ID of principal investigator (PI).
PGender PI’s gender membership; "Male" or "Female".
PIEthn PI’s ethnicity; "Hispanic/Latino" or "Non-Hispanic".
PICareerStage PI’s career stage; "ESI" Early Stage Investigator, "Experienced" Experienced Investigator, or "Non-ES NI" Non-Early Stage New Investigator.
PIDegree PI’s degree; "PhD", "MD", "MD/PhD", or "Others".
PIInst Lead PI’s institution’s FY 2014 total institution NIH funding; 5 bins with 1 being most-funded.
**plot.sia_parallel**  

**Description**  

You can call this method to plot an existing object resulting from `fa_parallel()` function, which behaves as a standard `data.frame`, but can be automatically recognized and processed with a dedicated plot method. Also, you can *post-hoc* disable the Kaiser boundaries shown by default.

---

**GroupID** Group ID.  
**RevID** Reviewer's ID.  
**IRG** IRG (Integrated Research Group) id.  
**AdminOrg** Administering Organization id.  
**SRG** SRG (Scientific Research Group) id.  
**PropType** Application type, "New" or "Renewal".  
**Amend** Amend. Logical.  
**ScoreAvg** Average of the three overall scores from different reviewers.  
**ScoreAvgAdj** Average of the three overall scores from different reviewers, increased by multiple of 0.001 of the worst score.  
**ScoreRank** Project rank calculated based on `ScoreAvg`.  
**ScoreRankAdj** Project rank calculated based on `ScoreAvgAdj`.  
**ScoreFinalChar** Final Overall Impact score (1-9 integer scale, 1 best; "ND" refers to "not discussed")  
**ScoreFinal** Final Overall Impact score (1-9 integer scale, 1 best).  

**References**  

**See Also**  

- ICCrestricted
plotAdjacent

Usage

```r
## S3 method for class 'sia_parallel'
plot(x, y, ...)
```

Arguments

- `x`: object of class `sia_parallel` to plot.
- `y`: ignored
- `...`: additional argument:
  - `show_kaiser`: logical, whether to show horizontal lines denoting Kaiser boundaries (eigenvalue 0 and/or 1 for FA and/or PCA, respectively). Defaults to `TRUE`.

Examples

```r
## Not run:
fa_parallel_result <- BFI2[, 1:60] %>% fa_parallel(plot = FALSE) # without plot
fa_parallel_result %>% plot # generate plot from "fitted" object
fa_parallel_result %>% plot(show_kaiser = FALSE) # hide Kaiser boundaries
## End(Not run)
```

---

**plotAdjacent**  
*Plot category probabilities of adjacent category logit model*

Description

Function for plotting category probabilities function estimated by `vglm()` function from the `VGAM` package using the `ggplot2` package.

Usage

```r
plotAdjacent(x, matching.name = "matching")
```

Arguments

- `x`: object of class `vglm`
- `matching.name`: character: name of matching criterion used for estimation in `x`.

Value

An object of class `ggplot` and/or `gg`.

plotCumulative  
Plot cumulative and category probabilities of cumulative logit model

Description

Function for plotting cumulative and category probabilities function estimated by vglm() function from the VGAM package using the ggplot2 package.

Usage

plotCumulative(x, type = "cumulative", matching.name = "matching")
plotCumulative

Arguments

\textit{x} object of class \texttt{vglm}

\texttt{type} character: type of plot to be displayed. Options are “cumulative” (default) for cumulative probabilities and “category” for category probabilities.

\texttt{matching.name} character: name of matching criterion used for estimation in \texttt{x}.

Value

An object of class \texttt{ggplot} and/or \texttt{gg}.

plotCumulative(fit, type = "category", matching.name = "Total score")
plotDIFirt

Description

Plots characteristic curve of IRT model.

Usage

plotDIFirt(
  parameters,
  test = "Lord",
  item = "all",
  item.name,
  same.scale = FALSE
)

Arguments

parameters numeric: data matrix or data frame. See Details.
test character: type of statistic to be shown. See Details.
item either character ("all"), or numeric vector, or single number corresponding to column indicators. See Details.
item.name character: the name of item.
same.scale logical: are the item parameters on the same scale? (default is "FALSE"). See Details.

Details

This function plots characteristic curve of DIF IRT model.

The parameters matrix has a number of rows equal to twice the number of items in the data set. The first J rows refer to the item parameter estimates in the reference group, while the last J ones correspond to the same items in the focal group. The number of columns depends on the selected IRT model: 2 for the 1PL model, 5 for the 2PL model, 6 for the constrained 3PL model and 9 for the unconstrained 3PL model. The columns of irtParam() have to follow the same structure as the output of itemParEst(), difLord() or difRaju() command from the difR package.

Two possible type of test statistics can be visualized - "Lord" gives only characteristic curves, "Raju" also highlights area between these curves.

For default option "all", all characteristic curves are plotted.

Author(s)

Adela Hladka
Institute of Computer Science of the Czech Academy of Sciences
plotDIFLogistic

Function for characteristic curve of 2PL logistic DIF model

Description

Plots characteristic curve of 2PL logistic DIF model

Usage

```r
plotDIFLogistic(x, item = 1, item.name, group.names = c("Reference", "Focal"), Data, group, match, draw.empirical = TRUE)
```
plotDIFLogistic

Arguments

x an object of "Logistic" class. See Details.
item numeric: number of item to be plotted
item.name character: the name of item to be used as title of plot.
group.names character: names of reference and focal group.
Data numeric: the data matrix. See Details.
group numeric: the vector of group membership. See Details.
match character or numeric: specifies observed score used for matching. Can be either "score", or numeric vector of the same length as number of observations in Data. See Details.
draw.empirical logical: whether empirical probabilities should be calculated and plotted. Default value is TRUE.

Details

This function plots characteristic curves of 2PL logistic DIF model fitted by difLogistic() function from difR package using ggplot2.

Data and group are used to calculate empirical probabilities for reference and focal group. match should be the same as in x$match. In case that an observed score is used as a matching variable instead of the total score or the standardized score, match needs to be a numeric vector of the same the same length as the number of observations in Data.

```

---

**plotDistractorAnalysis**

*Plot item distractor analysis*

---

**Description**

Plots graphical representation of item distractor analysis with proportions and optional number of groups.

**Usage**

```r
plotDistractorAnalysis(
  Data,
  key,
  num.groups = 3,
  item = 1,
  item.name,
  multiple.answers = TRUE,
  criterion = NULL,
  crit.discrete = FALSE,
  cut.points,
  data,
  matching,
  match.discrete
)
```

**Arguments**

- **Data** character: data matrix or data.frame with rows representing unscored item response from a multiple-choice test and columns corresponding to the items.
- **key** character: answer key for the items. The key must be a vector of the same length as `ncol(Data)`. In case it is not provided, `criterion` needs to be specified.
- **num.groups** numeric: number of groups to which are the respondents splitted.
- **item** numeric: the number of the item to be plotted.
plotDistractorAnalysis

item.name character: the name of the item.
multiple.answers logical: should be all combinations plotted (default) or should be answers split-
ted into distractors. See Details.
criterion numeric: numeric vector. If not provided, total score is calculated and distractor
analysis is performed based on it.
crit.discrete logical: is criterion discrete? Default value is FALSE.
cut.points numeric: numeric vector specifying cut points of criterion.
data deprecated. Use argument Data instead.
matching deprecated. Use argument criterion instead.
match.discrete deprecated. Use argument crit.discrete instead.

Details

This function is a graphical representation of the DistractorAnalysis function. In case that no
criterion is provided, the scores are calculated using the item Data and key. The respondents are
by default split into the num.groups-quantiles and the proportions of respondents in each quantile
are displayed with respect to their answers. In case that criterion is discrete (crit.discrete
= TRUE), criterion is split based on its unique levels. Other cut points can be specified via
cut.points argument.

If multiple.answers = TRUE (default) all reported combinations of answers are plotted. If multiple.answers
= FALSE all combinations are split into distractors and only these are then plotted with correct com-

# plotting category probabilities
plotMultinomial(fit, matching, matching.name = "Z-score")

plot_corr

Compute and plot an item correlation matrix

Description

Computes and visualizes an item correlation matrix (also known as a heatmap), offering several correlation "types" and optional clustering (with possible cluster outlining). The function relies on ggplot2 package, providing a high customisability using "the grammar of graphics" (see the examples below).
plot_corr(
    Data,
    cor = "pearson",
    clust_method = "none",
    n_clust = 0,
    shape = "circle",
    labels = FALSE,
    labels_size = 3,
    line_size = 0.5,
    line_col = "black",
    line_alpha = 1,
    fill = NA,
    fill_alpha = NA,
    ...
)

Arguments

Data matrix, data.frame or tibble: either a data.frame with scored items (as columns, one observation per row), or a correlation matrix.
cor character: correlation "type" used to correlation matrix computation; available options are "poly", "tetra", "pearson", "spearman", or "none" (in case you provide the correlation matrix directly instead). You can use an unambiguous abbreviation.
clust_method character: optional clustering method, available options are: "ward.D", "ward.D2", "single", "complete", "average" (= UPGMA), "mcquitty" (= WPGMA), "median" (= WPGMC), "centroid" (= UPGMC) or "none" (clustering disabled). See hclust for a detailed description of available options.
n_clust integer: the number of clusters you want to be outlined. When set to zero, clustering is disabled, ignoring the clust_method argument.
shape character: tile appearance; either circle (default) to map the correlation coefficient to circle size and color, or square to draw square-shaped tiles with only shade denoting the coefficient magnitude. You can use an unambiguous abbreviation of the two.
labels logical: when TRUE, the correlation coefficients are plotted onto tiles.
labels_size numeric: label size in points (pts).
line_size numeric: cluster outline width.
line_col character: color of the outline, either a HEX code (e.g. "#123456"), or one of R's standard colors (see the colors).
line_alpha numeric 0-1: the opacity of the outline.
fill character: the color used to fill the outlined clusters.
fill_alpha numeric 0-1: the opacity of the fill color.
... Arguments passed on to psych::polychoric
correct Correction value to use to correct for continuity in the case of zero entry cell for tetrachoric, polychoric, polybi, and mixed.cor. See the examples for the effect of correcting versus not correcting for continuity.

smooth if TRUE and if the tetrachoric/polychoric matrix is not positive definite, then apply a simple smoothing algorithm using cor.smooth

global When finding pairwise correlations, should we use the global values of the tau parameter (which is somewhat faster), or the local values (global=FALSE)? The local option is equivalent to the polycor solution, or to doing one correlation at a time. global=TRUE borrows information for one item pair from the other pairs using those item’s frequencies. This will make a difference in the presence of lots of missing data. With very small sample sizes with global=FALSE and correct=TRUE, the function will fail (for as yet under-determined reasons.

polycor A no longer used option, kept to stop other packages from breaking.

weight A vector of length of the number of observations that specifies the weights to apply to each case. The NULL case is equivalent of weights of 1 for all cases.

std.err std.err=FALSE does not report the standard errors (faster) deprecated

progress Show the progress bar (if not doing multicores)

ML ML=FALSE do a quick two step procedure, ML=TRUE, do longer maximum likelihood — very slow! Deprecated

delete Cases with no variance are deleted with a warning before proceeding.

max.cat The maximum number of categories to bother with for polychoric.

Details
Correlation heatmap displays selected type of correlations between items. The color of tiles indicates how much and in which way the items are correlated - red color means positive correlation and blue color means negative correlation. Correlation heatmap can be reordered using hierarchical clustering method specified with clust_method argument. When the desired number of clusters (argument n_clust) is not zero and some clustering is demanded, the rectangles outlining the found clusters are drawn.

Value
An object of class ggplot and/or gg.

```r
# use first 20 columns from HCI dataset (the remainder are not items)
HCI <- HCI[, 1:20]

# use Pearson product-moment correlation coefficient for matrix computation
plot_corr(HCI, cor = "pearson")
## Not run:
# use tetrachoric correlation and reorder the resulting heatmap
# using Ward's method
HCI %>% plot_corr(cor = "tetra", clust_method = "ward.D")

# outline 3 Ward's clusters with bold yellow line and add labels
HCI %>%
  plot_corr(
    n_clust = 3, clust_method = "ward.D", line_col = "yellow",
    line_size = 1.5, labels = TRUE
  )

# add title and position the legend below the plot
library(ggplot2)
HCI %>% plot_corr(n_clust = 3) +
  ggtitle("HCI heatmap") +
  theme(legend.position = "bottom")

# mimic the look of corrplot package
plot_corr(HCI, cor = "poly", clust_method = "complete", shape = "sq") +
  scale_fill_gradient2(
    limits = c(-.1, 1),
    breaks = seq(-.1, 1, length.out = 12),
    guide = guide_colorbar(
      barheight = .8, barwidth = .0275,
      default.unit = "npc",
      title = NULL, frame.colour = "black", ticks.colour = "black"
    )
  ) + theme(axis.text = element_text(colour = "red", size = 12))
## End(Not run)
```

---

**recode_nr**

`recode_nr()` function recognizes and recodes not-reached responses, i.e., missing responses to items such that all subsequent items are missed as well by the respondent.

**Description**

`recode_nr()` function recognizes and recodes not-reached responses, i.e., missing responses to items such that all subsequent items are missed as well by the respondent.

**Usage**

`recode_nr(Data, nr_code = 99, df)`
recode_nr

Arguments

Data matrix or data.frame: object to be recoded, must include only items columns and no additional information

nr_code single character, integer or numeric: specifying how should be recognized not-reached responses coded (default is 99)

df deprecated. Use argument Data instead.

Value

A data.frame object.

ItemAnalysis

Examples

data(HCI, package = "ShinyItemAnalysis")
HCImissed <- HCI[, 1:20]

# simulate skipped (missed) and not-reached items in HCI dataset
set.seed(4211)
for (i in 1:150) {
  # not-reached (minimum at 10th item, maximum at 20th)
  HCImissed[sample(1:nrow(HCImissed), 1), seq(sample(10:20, 1), 20)] <- NA

  # missed with random location
  HCImissed[sample(1:nrow(HCImissed), 1), sample(1:20, 1)] <- NA
}

summary(HCImissed)

HCImissedNR <- recode_nr(HCImissed, nr_code = 99)
head(HCImissedNR)
summary(HCImissedNR)
startShinyItemAnalysis

Start ShinyItemAnalysis application

Description

An interactive shiny application to run test and item analysis. By default, the function runs the application as a background process ("Jobs" tab in the "RStudio" IDE). User is then free to use the R Console for other work and to try the sample R code examples. You can still run the app the usual way in the console by specifying background = FALSE.

Usage

startShinyItemAnalysis(background = TRUE, ...)

run_app(background = TRUE, ...)

Arguments

background logical, should the application be run as a background process (in the 'RStudio')?

... Arguments passed on to utils::install.packages

lib character vector giving the library directories where to install the packages. Recycled as needed. If missing, defaults to the first element of .libPaths().

repos character vector, the base URL(s) of the repositories to use, e.g., the URL of a CRAN mirror such as "https://cloud.r-project.org". For more details on supported URL schemes see url. Can be NULL to install from local files, directories or URLs: this will be inferred by extension from pkgs if of length one.

critur1 URL(s) of the contrib sections of the repositories. Use this argument if your repository mirror is incomplete, e.g., because you burned only the ‘contrib’ section on a CD, or only have binary packages. Overrides argument repos. Incompatible with type = "both".

method download method, see download.file. Unused if a non-NULL available is supplied.

available a matrix as returned by available.packages listing packages available at the repositories, or NULL when the function makes an internal call to available.packages. Incompatible with type = "both".

destdir directory where downloaded packages are stored. If it is NULL (the default) a subdirectory downloaded_packages of the session temporary directory will be used (and the files will be deleted at the end of the session).

dependencies logical indicating whether to also install uninstalled packages which these packages depend on/link to/import/suggest (and so on recursively). Not used if repos = NULL. Can also be a character vector, a subset of c("Depends","Imports","LinkingTo","Suggests","Enhances").
Only supported if `lib` is of length one (or missing), so it is unambiguous where to install the dependent packages. If this is not the case it is ignored, with a warning.

The default, `NA`, means `c("Depends","Imports","LinkingTo")`.

`TRUE` means to use `c("Depends","Imports","LinkingTo","Suggests")` for `pkgs` and `c("Depends","Imports","LinkingTo")` for added dependencies: this installs all the packages needed to run `pkgs`, their examples, tests and vignettes (if the package author specified them correctly).

In all of these, "LinkingTo" is omitted for binary packages.

`type` character, indicating the type of package to download and install. Will be "source" except on Windows and some macOS builds: see the section on ‘Binary packages’ for those.

`configure.args` (Used only for source installs.) A character vector or a named list. If a character vector with no names is supplied, the elements are concatenated into a single string (separated by a space) and used as the value for the `--configure-args` flag in the call to `R CMD INSTALL`. If the character vector has names these are assumed to identify values for `--configure-args` for individual packages. This allows one to specify settings for an entire collection of packages which will be used if any of those packages are to be installed. (These settings can therefore be re-used and act as default settings.)

A named list can be used also to the same effect, and that allows multi-element character strings for each package which are concatenated to a single string to be used as the value for `--configure-args`.

`configure.vars` (Used only for source installs.) Analogous to `configure.args` for flag `--configure-vars`, which is used to set environment variables for the `configure` run.

`clean` a logical value indicating whether to add the `--clean` flag to the call to `R CMD INSTALL`. This is sometimes used to perform additional operations at the end of the package installation in addition to removing intermediate files.

`Ncpus` the number of parallel processes to use for a parallel install of more than one source package. Values greater than one are supported if the `make` command specified by `Sys.getenv("MAKE","make")` accepts argument `-k` `-j` `Ncpus`.

`verbose` a logical indicating if some “progress report” should be given.

`INSTALL_opts` an optional character vector of additional option(s) to be passed to `R CMD INSTALL` for a source package install. E.g., `c("--html","--no-multiarch","--no-test-...` Can also be a named list of character vectors to be used as additional options, with names the respective package names.

`quiet` logical: if true, reduce the amount of output. This is not passed to `available.packages()` in case that is called, on purpose.

`keep_outputs` a logical: if true, keep the outputs from installing source packages in the current working directory, with the names of the output files the package names with ".out" appended. Alternatively, a character string giving the directory in which to save the outputs. Ignored when installing from local files.
Value

No return value. Called for side effects.

Examples

```r
## Not run:
startShinyItemAnalysis()
startShinyItemAnalysis(background = FALSE)
## End(Not run)
```

---

**TestAnxietyCor**

*Correlation matrix for the test anxiety dataset*

Description

The TestAnxietyCor dataset contains between-item correlations for 20 items of the Test Anxiety dataset.

Usage

data(TestAnxietyCor)

Format

TestAnxietyCor is a data.frame consisting of between-item correlations for 20 items.

i1 Lack of confidence during tests.
i2 Uneasy, upset feeling.
i3 Thinking about grades.
i4 Freeze up.
i5 Thinking about getting through school.
i6 The harder I work, the more confused I get.
Thoughts interfere with concentration.
Jittery when taking tests.
Even when prepared, get nervous.
Uneasy before getting the test back.
Tense during test.
Exams bother me.
Tense/ stomach upset.
Defeat myself during tests.
Panicky during tests.
Worry before important tests.
Think about failing.
Heart beating fast during tests.
Can’t stop worrying.
Nervous during test, forget facts.

**theme_app**

*Complete theme for ShinyItemAnalysis graphics*

**Description**
This complete theme is based on `theme_bw` and it was modified for purposes of ShinyItemAnalysis.

**Usage**
```r
theme_app(base_size = 15, base_family = "")
```

**Arguments**
- `base_size`  base font size
- `base_family`  base font family

**See Also**
- `ggtheme`
Examples

```r
library(ggplot2)
data(GMAT, package = "difNLR")
data <- GMAT[, 1:20]
# total score calculation
df <- data.frame(score = apply(data, 1, sum))
# histogram
g <- ggplot(df, aes(score)) +
  geom_histogram(binwidth = 1) +
  xlab("Total score") +
  ylab("Number of respondents")
g

g + theme_app()
```
