Package ‘TTAinterfaceTrendAnalysis’

October 12, 2022

Type Package
Title Temporal Trend Analysis Graphical Interface
Version 1.5.8
Date 2021-10-06

Description This interface was created to develop a standard procedure to analyse temporal trend in the framework of the OSPAR convention.
The analysis process run through 4 successive steps : 1) manipulate your data, 2) select the parameters you want to analyse, 3) build your regulated time series, 4) perform diagnosis and analysis and 5) read the results.
Statistical analysis call other package function such as Kendall tests or cusum() function.

License GPL (>= 2)

Depends R (>= 3.3.0), base, stats, grDevices
Imports pastecs, reshape, e1071, relimp, multcomp, rkt, stlplus, nlme, tcltk, tcltk2, mvtnorm, zoo, methods

Description

A friendly interface to perform Temporal Trend Analyses (MannKendall tests). Just follow the successive step from the data formatting to the results sorting.

About

Display logo, version and developers name and email of the package.
Envir

Usage

about()

Details

Display logo, version and developers name of the package.

---

Envir

A temporary environment to stock data and objects

---

Description

The function creates an environment where the data, arguments, and objects that are used between the different functions of the package will be stored for better exchange processes.

Usage

Envir()

Details

Objects passed through the environment 'Envir' are called in the other function as Envir$objects

---

fixdata

Fixdata function

---

Description

Simply modify your dataset through the interface

Usage

fixdata()

Value

The edited database that is automatically read by the interface to replace former values

Note

fixdata() call the function fix() that act on the rawdata base. The fix() function itself call the function edit() from the package utils

See Also

fix edit
**FULLoption**

**Main function**

**Description**

This is the core function of the interface. It receives arguments from the interface (see the function `<TTAinterface>`) and builds regularized time series, performs diagnostics, and analyses.

**Usage**

```r
FULLoption(param, depth=NULL, sal = NULL, site=NULL, rawdata="NO", select="NO", 
resume.reg="NO", test.normality="NO", plotB = "NO", selectBox="ByYears", log.trans="NO", 
plotZ="NO", datashow="NO", help.timestep = "NO", auto.timestep = "NO", time.step = NULL, 
help.aggreg = "NO", auto.aggreg = "NO", aggreg = NULL, mix = "YES", outliers.re = "NO", 
na.replace="NO", start = NULL, end = NULL, months = c(1:12), norm = "NO", npsu = 30, 
test.on.remaider = "NO", autocorr = "NO", spectrum="NO", anomaly="NO", a.barplot="NO", 
zsmooth="NO", local.trend = "NO", test = "MK")
```

**Arguments**

- `param` The name of the parameter you want to analyze; it must be the name of the column where your data are. Must be entered like this: "yourparam".
- `depth` If existing, the depth interval where your data will be analyzed. If values are different from depth max and depth min, missing values are excluded. Depth column must be named as 'DEPTH'. Enter the value like this: c(a,b). For analysis at one specific depth, enter c(a,a).
- `sal` Same thing as for the depth Salinity column must be named as 'S'.
- `site` Labels of sampling sites as they appear in the database. Enter the value like this: c("S1", "S2").
- `rawdata` Perform descriptive statistics on raw data, can be "YES" or "NO" (the default).
- `select` Perform descriptive statistics on selected parameter and site, can be "YES" or "NO" (the default).
- `resume.reg` Perform descriptive statistics on regularized time series, can be "YES" or "NO" (the default).
- `test.normality` Perform a Shapiro-Wilk normality test on selected parameter, can be "YES" or "NO" (the default).
- `plotB` Display a boxplot of raw data with outliers identified as circle, can be "YES" or "NO" (the default).
- `selectBox` Options for plotB: allow to choose between boxplot by years or by months.
- `log.trans` This option transforms your data in \( \log(x+1) \) prior to performing analysis.
- `plotZ` Display a plot of the regularized time series, can be "YES" or "NO" (the default).
- `datashow` Show a table of the regularized data, can be "YES" or "NO" (the default).
help timestep
Display an advice for time step selection, base on the mean time that separate two successive measurements. Can be "YES" or "NO" (the default).

auto timestep
Autoexecute the advice without display it.

time step
Choice of the time step for data aggregation during the build of the time series, can be "Fortnight", "Semi-fortnight", "Mensual", "Annual" or "Mono-mensual" for an aggregation of the data of a month of all years (e.g. all January data).

help aggreg
Display an advice for method of aggregation selection, base on Wilcoxon p.value between rawdata and the different method. Can be "YES" or "NO" (the default).

auto aggreg
Autoexecute the advice without display it.

aggreg
Choice of the method of aggregation during the build of the time series, can be "Mean", "Median", "Max" for maximal value selection or "Quantile" for selection of the quantile 90

mix
Allow to mix the data of all sampling site during analysis. Permanently set to "YES" and removed from the GUI since version 1.5.

outliers.re
Remove the outliers from the rawdata, the outliers list is save in a .csv file. (for outliers visual identification see boxplot section).

na.replace
Replace missing values with median of the corresponding cycle (week, month...) for lags longer than 3 days and linear regression for shorter missed period. Can be "YES" or "NO" (the default).

start
Define the first year of data analysis (by default the first of the database).

end
Define the last year of data analysis (by default the last of the database).

months
Define the months of data analysis (by default the twelve months).

norm
Compute normalised values of nutrients at the salinity npsu for each years, can be "YES" or "NO" (the default).

npsu
Compute normalised values of nutrients at the salinity npsu for each years, 30 by default.

test.on.remaider
Extract the reminders from the data series using the stl package functions to perform statistical analysis.

autocorr
Display the autocorrelation diagramme of the regularized time series using the acf function with arguments : lag.max = ((nrow(TimeSerie))/2), na.action = na.pass. Can be "YES" or "NO" (the default)

spectrum
Display the Fourrier spectrum of the regularized time series using a Smoothened Periodogram (spec.pgram). Can be "YES" or "NO" (the default).

anomaly
Display a color box (function filled.contour) plot by year each time.step (months or weeks) minus the mean of the time.step of all years. Red colors show positive anomalies and blue colors negative anomalies. Can be "YES" or "NO" (the default).

a.barplot
Display an anomaly barplot as a function of the time.step. Red colors show positive anomalies and blue colors negative anomalies. Can be "YES" or "NO" (the default).

zsmooth
Display a detrended plot of the time series using the stl function with arguments s.window="periodic", na.action=na.fail. Can be "YES" or "NO" (the default).
Display the interactive cusum plot of the time series (local.trend of the pastecs package) that allow to manually identify the period of change in the tendency using the function identify and perform a Kendall family test on each identified period (see test section). Can be "YES" or "NO" (the default).

Perform a test to evaluate the presence and the magnitude of a temporal trend on the time series. Can be "MK" for Seasonal Mann-Kendall test (the default), "SMK" for the same test with detail for each time step, "LOESS" that fit a polynomial surface determined by one or more numerical predictors, using local fitting; a MK is perform on this fitting.

Value

Results are return as .png figures or .txt files Results are also directly readable directly in the right part of the interface.

Savepath can be choose using the option 'Select directory' (see the function selectdirectory more more informations)

Name of saved filed follow the nomenclature : Original.file.name_analysis.name_parameter.txt/png

or for multiple period analysis (see cusum for more details) : Original.file.name_analysis.name_parameter_starting.year_ending.year.txt/png

analysis.names are :

See values output of corresponding functions.

boxplot impute shapiro.test summary acf spectrum filled.contour stl local.trend mannKen seasonTrend seaKen loess

Interpolate or substitute missing time series values (code of the former wq package)

Description

Interpolates or substitutes missing data in a time series for gaps up to a specified size.
Usage

interpTs(x, type = c("linear", "series.median", "series.mean", "cycle.median", "cycle.mean"), gap = NULL)

Arguments

x: object of class "ts" or "mts"

Type: method of interpolation or substitution

gap: maximum gap to be replaced

Value

The time series with some or all missing values replaced.

Author(s)

Alan D. Jassby and James E. Cloern

mannKen

Mann-Kendall trend test and the Sen slope (code modified from the former wq package)

Description

Applies Kendall’s tau test for the significance of a monotonic time series trend. Also calculates the Sen slope as an estimate of this trend.

Usage

mannKen(x, ...)

Arguments

x: A numeric vector, matrix or data frame

...: Other arguments to pass to plotting function

Value

A list of the following if x is a vector:

- sen.slope: Sen slope
- sen.slope.rel: Relative Sen slope
- p.value: Significance of slope
- S: Kendall’s S
- varS: Variance of S
- miss: Fraction of missing slopes connecting first and last fifths of x or a matrix with corresponding columns if x is a matrix or data frame.
seaKen

seaKen seasonTrend

---

**seaKen**  
*Seasonal and Regional Kendall trend test (code modified from the former wq package)*

---

**Description**
Calculates the Seasonal or Regional Kendall test of trend significance, including an estimate of the Sen slope.

**Usage**

```r
seaKen(x, ...)  
```

**Arguments**

- `x` A numeric vector, matrix or data frame made up of seasonal time series
- `...` Other arguments to pass to plotting function

**Value**

A list of the following if `x` is a vector: `seaKen` returns a list with the following members:

- `sen.slope` Sen slope
- `sen.slope.pct` Sen slope as percent of mean
- `p.value` significance of slope
- `miss` for each season, the fraction missing of slopes connecting first and last 20 percent of the years or a matrix with corresponding columns if `x` is a matrix or data frame.

Alan D. Jassby and James E. Cloern

**See Also**
mannKen
seasonTrend

Determine seasonal trends (code modified from the former wq package)

Description
Finds the trend for each season and each variable in a time series.

Usage
seasonTrend(x, ...)

Arguments
x Time series vector, or time series matrix with column names
... Further options to pass to plotting function

Value
A data frame with the following fields:

series series names
season season number
sen.slope Sen slope in original units per year
sen.slope.rel Sen slope divided by median for that specific season and series
p p-value for the trend according to the Mann-Kendall test.
missing Proportion of slopes joining first and last fifths of the data that are missing

mannKen
selectdirectory  Saved path selection

Description

Allow to chose the directory where results (.txt and .png files) will be saved.

Usage

selectdirectory()

Details

It select the main save directory; the package will create appropriate sub-folder as function of selected parameters, statistics, methods etc. Then you will be able to perform successive analyses without overwriting the previous results.

SRNDunkerque  Coastal survey near the Gravelines power plant from 1995 to 2010

Description

Variation in temperature, salinity and chlorophyll-a concentration (microg/l) monthly measured between 1995 and 2010 at three different stations distributed onshore to offshore (North Sea) near the city of Dunkerque (north of France) for the SRN monitoring program (Ifremer). This database contain many missing values.

Format

A data.frame (TXT) containing 1561 measurements of temperature, salinity and chlorophyll-a concentration

Source

The Ifremer QUADRIGE_2 meta-database
TTAinterface

Graphic Interface For Temporal Trend Analysis

Description
A friendly user graphic interface to perform temporal trend analysis. The interface offers multiple options to select parameters and build time series that the user can follow step by step. Some options are selected by default to let the hurry user to do really quick analysis. Some diagnostic tools are also present.

Usage
TTAinterface()

Value
Results are saved in .txt files or .png figures in the desire directory (see selectdirectory). See 'FULLoption' values for more details.
