

# Package ‘TidyDensity’

June 8, 2022

**Title** Functions for Tidy Analysis and Generation of Random Data

**Version** 1.2.0

**Description** To make it easy to generate random numbers based upon the underlying stats distribution functions. All data is returned in a tidy and structured format making working with the data simple and straight forward. Given that the data is returned in a tidy 'tibble' it lends itself to working with the rest of the 'tidyverse'.

**License** MIT + file LICENSE

**Encoding** UTF-8

**RoxygenNote** 7.2.0

**URL** <https://github.com/spsanderson/TidyDensity>

**BugReports** <https://github.com/spsanderson/TidyDensity/issues>

**Imports** magrittr, rlang (>= 0.4.11), dplyr, ggplot2, plotly, tidyr, purrr, stringr, actuar, methods, stats, patchwork, survival, nloptr

**Suggests** rmarkdown, knitr, roxygen2, EnvStats

**VignetteBuilder** knitr

**NeedsCompilation** no

**Author** Steven Sanderson [aut, cre],  
Steven Sanderson [cph]

**Maintainer** Steven Sanderson <spsanderson@gmail.com>

**Repository** CRAN

**Date/Publication** 2022-06-08 13:50:02 UTC

bootstrap\_unnest\_tbl    *Unnest Tidy Bootstrap Tibble*

---

**Description**

Unnest the data output from tidy\_bootstrap().

**Usage**

```
bootstrap_unnest_tbl(.data)
```

**Arguments**

`.data` The data that is passed from the `tidy_bootstrap()` function.

**Details**

This function takes as input the output of the `tidy_bootstrap()` function and returns a two column tibble. The columns are `sim_number` and `y`

It looks for an attribute that comes from using `tidy_bootstrap()` so it will not work unless the data comes from that function.

**Value**

A tibble

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Bootstrap: [tidy\\_bootstrap\(\)](#)

**Examples**

```
tb <- tidy_bootstrap(.x = mtcars$mpg)
bootstrap_unnest_tbl(tb)

bootstrap_unnest_tbl(tb) %>%
  tidy_distribution_summary_tbl(sim_number)
```

---

ci\_hi

*Confidence Interval Generic*

---

**Description**

Gets the upper 97.5% quantile of a numeric vector.

**Usage**

```
ci_hi(.x, .na_rm = FALSE)
```

**Arguments**

`.x` A vector of numeric values  
`.na_rm` A Boolean, defaults to FALSE. Passed to the quantile function.

**Details**

Gets the upper 97.5% quantile of a numeric vector.

**Value**

A numeric value.

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Statistic: [ci\\_lo\(\)](#), [tidy\\_kurtosis\\_vec\(\)](#), [tidy\\_range\\_statistic\(\)](#), [tidy\\_skewness\\_vec\(\)](#)

**Examples**

```
x <- mtcars$mpg
ci_hi(x)
```

---

`ci_lo`*Confidence Interval Generic*

---

**Description**

Gets the lower 2.5% quantile of a numeric vector.

**Usage**

```
ci_lo(.x, .na_rm = FALSE)
```

**Arguments**

`.x` A vector of numeric values  
`.na_rm` A Boolean, defaults to FALSE. Passed to the quantile function.

**Details**

Gets the lower 2.5% quantile of a numeric vector.

**Value**

A numeric value.

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Statistic: [ci\\_hi\(\)](#), [tidy\\_kurtosis\\_vec\(\)](#), [tidy\\_range\\_statistic\(\)](#), [tidy\\_skewness\\_vec\(\)](#)

x <- mtcars$mpg
ci_lo(x)
```

---

color\_blind

*Provide Colorblind Compliant Colors*

---

**Description**

8 Hex RGB color definitions suitable for charts for colorblind people.

**Usage**

```
color_blind()
```

---

td\_scale\_color\_colorblind

*Provide Colorblind Compliant Colors*

---

**Description**

Provide Colorblind Compliant Colors

**Usage**

```
td_scale_color_colorblind(..., theme = "td")
```

**Arguments**

...	Data passed to the function
theme	This defaults to td and that is the only allowed value

---

*Provide Colorblind Compliant Colors*

---

### Description

Provide Colorblind Compliant Colors

### Usage

```
td_scale_fill_colorblind(..., theme = "td")
```

### Arguments

...	Data passed to the function
theme	This defaults to td and that is the only allowed value

---

*Automatic Plot of Density Data*

---

### Description

This is an auto plotting function that will take in a tidy\_ distribution function and a few arguments, one being the plot type, which is a quoted string of one of the following:

- density
- quantile
- probability
- qq
- mcmc

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

### Usage

```
tidy_autoplot(
  .data,
  .plot_type = "density",
  .line_size = 0.5,
  .geom_point = FALSE,
  .point_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .geom_jitter = FALSE,
  .interactive = FALSE
)
```

**Arguments**

<code>.data</code>	The data passed in from a tidy_distribution function like tidy_normal()
<code>.plot_type</code>	This is a quoted string like 'density'
<code>.line_size</code>	The size param ggplot
<code>.geom_point</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return a plot with ggplot2::geom_point()
<code>.point_size</code>	The point size param for ggplot
<code>.geom_rug</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_rug()
<code>.geom_smooth</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_smooth() The aes parameter of group is set to FALSE. This ensures a single smoothing band returned with SE also set to FALSE. Color is set to 'black' and linetype is 'dashed'.
<code>.geom_jitter</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_jitter()
<code>.interactive</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.

**Details**

This function will spit out one of the following plots:

- density
- quantile
- probability
- qq
- mcmc

**Value**

A ggplot or a plotly plot.

**Author(s)**

Steven P. Sanderson II, MPH

**Examples**

```
tidy_normal(.num_sims = 5) %>%
  tidyautoplot()

tidy_normal(.num_sims = 20) %>%
  tidyautoplot(.plot_type = "qq")
```

---

`tidy_beta`*Tidy Randomly Generated Beta Distribution Tibble*

---

## Description

This function will generate `n` random points from a beta distribution with a user provided, `.shape1`, `.shape2`, `.ncp` or non-centrality parameter, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_beta(.n = 50, .shape1 = 1, .shape2 = 1, .ncp = 0, .num_sims = 1)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.shape1</code>	A non-negative parameter of the Beta distribution.
<code>.shape2</code>	A non-negative parameter of the Beta distribution.
<code>.ncp</code>	The non-centrality parameter of the Beta distribution.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `stats::rbeta()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rbeta\(\)](#)

## Value

A tibble of randomly generated data.

tidy_binomial	<i>Tidy Randomly Generated Binomial Distribution Tibble</i>
---------------	---

---

**Description**

This function will generate `n` random points from a binomial distribution with a user provided, `.size`, `.prob`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_binomial(.n = 50, .size = 0, .prob = 1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.size</code>	Number of trials, zero or more.
<code>.prob</code>	Probability of success on each trial.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rbinom()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rbinom()`

**Value**

A tibble of randomly generated data.

Other Discrete Distribution: `tidy_hypergeometric()`, `tidy_negative_binomial()`, `tidy_poisson()`, `tidy_zero_truncated_binomial()`, `tidy_zero_truncated_negative_binomial()`, `tidy_zero_truncated_poisson()`

Other Binomial: `tidy_negative_binomial()`, `tidy_zero_truncated_binomial()`, `tidy_zero_truncated_negative_binomial()`, `util_binomial_param_estimate()`, `util_binomial_stats_tbl()`, `util_negative_binomial_param_estimate()`

**Examples**

```
tidy_binomial()
```

---

tidy\_bootstrap

*Bootstrap Empirical Data*

---

**Description**

Takes an input vector of numeric data and produces a bootstrapped nested tibble by simulation number.

**Usage**

```
tidy_bootstrap(  
  .x,  
  .num_sims = 2000,  
  .proportion = 0.8,  
  .distribution_type = "continuous"  
)
```

**Arguments**

<code>.x</code>	The vector of data being passed to the function. Must be a numeric vector.
<code>.num_sims</code>	The default is 2000, can be set to anything desired. A warning will pass to the console if the value is less than 2000.
<code>.proportion</code>	How much of the original data do you want to pass through to the sampling function. The default is 0.80 (80%)
<code>.distribution_type</code>	This can either be 'continuous' or 'discrete'

**Details**

This function will take in a numeric input vector and produce a tibble of bootstrapped values in a list. The table that is output will have two columns: `sim_number` and `bootstrap_samples`

The `sim_number` corresponds to how many times you want the data to be resampled, and the `bootstrap_samples` column contains a list of the bootstrapped resampled data.

**Value**

A nested tibble

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Bootstrap: [bootstrap\\_unnest\\_tbl\(\)](#)

**Examples**

```
x <- mtcars$mpg
tidy_bootstrap(x)
```

---

tidy\_burr

*Tidy Randomly Generated Burr Distribution Tibble*

---

**Description**

This function will generate `n` random points from a Burr distribution with a user provided, `.shape1`, `.shape2`, `.scale`, `.rate`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_burr(  
  .n = 50,  
  .shape1 = 1,  
  .shape2 = 1,  
  .rate = 1,  
  .scale = 1/.rate,  
  .num_sims = 1  
)
```

### Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.shape1</code>	Must be strictly positive.
<code>.shape2</code>	Must be strictly positive.
<code>.rate</code>	An alternative way to specify the <code>.scale</code> .
<code>.scale</code>	Must be strictly positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

### Details

This function uses the underlying `actuar::rburr()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rburr\(\)](#)

### Value

A tibble of randomly generated data.

### Author(s)

Steven P. Sanderson II, MPH

```

```
Tidy Randomly Generated Cauchy Distribution Tibble
```

---

**Description**

This function will generate `n` random points from a cauchy distribution with a user provided, `.location`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_cauchy(.n = 50, .location = 0, .scale = 1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.location</code>	The location parameter.
<code>.scale</code>	The scale parameter, must be greater than or equal to 0.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rcauchy()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rcauchy()`

**Value**

A tibble of randomly generated data.

<code>tidy_chisquare</code>	<i>Tidy Randomly Generated Chisquare (Non-Central) Distribution Tibble</i>
-----------------------------	--

---

**Description**

This function will generate `n` random points from a chisquare distribution with a user provided, `.df`, `.ncp`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_chisquare(.n = 50, .df = 1, .ncp = 1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.df</code>	Degrees of freedom (non-negative but can be non-integer)
<code>.ncp</code>	Non-centrality parameter, must be non-negative.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rchisq()`, and its underlying p, d, and q functions. For more information please see [stats::rchisq\(\)](#)

**Value**

A tibble of randomly generated data.

tidy\_combinedautoplot

*Automatic Plot of Combined Multi Dist Data*

---

## Description

This is an auto plotting function that will take in a tidy\_ distribution function and a few arguments, one being the plot type, which is a quoted string of one of the following:

- density
- quantile
- probablity
- qq

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

## Usage

```
tidy_combinedautoplot(
  .data,
  .plot_type = "density",
  .line_size = 0.5,
  .geom_point = FALSE,
  .point_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .geom_jitter = FALSE,
  .interactive = FALSE
)
```

## Arguments

.data	The data passed in from a the function tidy_multi_dist()
.plot_type	This is a quoted string like 'density'
.line_size	The size param ggplot
.geom_point	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return a plot with ggplot2::ggeom_point()
.point_size	The point size param for ggplot
.geom_rug	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_rug()
.geom_smooth	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_smooth() The aes parameter of group is set to FALSE. This ensures a single smoothing band returned with SE also set to FALSE. Color is set to 'black' and linetype is 'dashed'.

- `.geom_jitter` A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of `ggplot2::geom_jitter()`
- `.interactive` A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.

## Details

This function will spit out one of the following plots:

- density
- quantile
- probability
- qq

## Value

A ggplot or a plotly plot.

`tidy_combine_distributions`*Combine Multiple Tidy Distributions of Different Types*

---

**Description**

This allows a user to specify any n number of tidy\_ distributions that can be combined into a single tibble. This is the preferred method for combining multiple distributions of different types, for example a Gaussian distribution and a Beta distribution.

This generates a single tibble with an added column of dist\_type that will give the distribution family name and its associated parameters.

**Usage**

```
tidy_combine_distributions(...)
```

**Arguments**

...                   The ... is where you can place your different distributions

**Details**

Allows a user to generate a tibble of different tidy\_ distributions

**Value**

A tibble

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Multiple Distribution: [tidy\\_multi\\_single\\_dist\(\)](#)

**Examples**

```
tn <- tidy_normal()
tb <- tidy_beta()
tc <- tidy_cauchy()

tidy_combine_distributions(tn, tb, tc)

## OR

tidy_combine_distributions(
```

```
tidy_normal(),
tidy_beta(),
tidy_cauchy(),
tidy_logistic()
)
```

---

tidy\_distribution\_comparison

*Compare Empirical Data to Distributions*

---

### Description

Compare some empirical data set against different distributions to help find the distribution that could be the best fit.

### Usage

```
tidy_distribution_comparison(.x, .distribution_type = "continuous")
```

### Arguments

`.x` The data set being passed to the function  
`.distribution_type` What kind of data is it, can be one of continuous or discrete

### Details

The purpose of this function is to take some data set provided and to try to find a distribution that may fit the best. A parameter of `.distribution_type` must be set to either continuous or discrete in order for this the function to try the appropriate types of distributions.

The following distributions are used:

Continuous:

- tidy\_beta
- tidy\_cauchy
- tidy\_exponential
- tidy\_gamma
- tidy\_logistic
- tidy\_lognormal
- tidy\_pareto
- tidy\_uniform
- tidy\_weibull

Discrete:

- tidy\_binomial
- tidy\_geometric
- tidy\_hypergeometric
- tidy\_poisson

**Value**

An invisible list object. A tibble is printed.

**Author(s)**

Steven P. Sanderson II, MPH

**Examples**

```
xc <- mtcars$mpg
tidy_distribution_comparison(xc, "continuous")

xd <- trunc(xc)
tidy_distribution_comparison(xd, "discrete")
```

---

tidy\_distribution\_summary\_tbl

*Tidy Distribution Summary Statistics Tibble*

---

**Description**

This function returns a summary statistics tibble. It will use the y column from the tidy\_distribution function.

**Usage**

```
tidy_distribution_summary_tbl(.data, ...)
```

**Arguments**

.data            The data that is going to be passed from a a tidy\_distribution function.

...             This is the grouping variable that gets passed to `dplyr::group_by()` and `dplyr::select()`.

**Details**

This function takes in a tidy\_distribution table and will return a tibble of the following information:

- sim\_number
- mean\_val
- median\_val
- std\_val
- min\_val
- max\_val
- skewness
- kurtosis
- range
- iqr
- variance

The kurtosis and skewness come from the package `healthyR.ai`

**Value**

A summary stats tibble

**Author(s)**

Steven P. Sanderson II, MPH

**Examples**

```
library(dplyr)

tn <- tidy_normal(.num_sims = 5)
tb <- tidy_beta(.num_sims = 5)

tidy_distribution_summary_tbl(tn)
tidy_distribution_summary_tbl(tn, sim_number)

data_tbl <- tidy_combine_distributions(tn, tb)

tidy_distribution_summary_tbl(data_tbl)
tidy_distribution_summary_tbl(data_tbl, dist_type)
```

---

tidy_empirical	<i>Tidy Empirical</i>
----------------	-----------------------

---

## Description

This function takes in a single argument of `.x` a vector and will return a tibble of information similar to the `tidy_` distribution functions. The `y` column is set equal to `dy` from the density function.

## Usage

```
tidy_empirical(.x, .num_sims = 1, .distribution_type = "continuous")
```

## Arguments

<code>.x</code>	A vector of numbers
<code>.num_sims</code>	How many simulations should be run, defaults to 1.
<code>.distribution_type</code>	A string of either "continuous" or "discrete". The function will default to "continuous"

## Details

This function takes in a single argument of `.x` a vector

## Value

A tibble

## Author(s)

Steven P. Sanderson II, MPH

## Examples

```
x <- mtcars$mpg
tidy_empirical(.x = x, .distribution_type = "continuous")
tidy_empirical(.x = x, .num_sims = 10, .distribution_type = "continuous")
```

---

`tidy_exponential`*Tidy Randomly Generated Exponential Distribution Tibble*

---

### Description

This function will generate `n` random points from a exponential distribution with a user provided, `.rate`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_exponential(.n = 50, .rate = 1, .num_sims = 1)
```

### Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.rate</code>	A vector of rates
<code>.num_sims</code>	The number of randomly generated simulations you want.

### Details

This function uses the underlying `stats::rexp()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rexp()`

### Value

A tibble of randomly generated data.

### Author(s)

Steven P. Sanderson II, MPH

tidy_f	<i>Tidy Randomly Generated F Distribution Tibble</i>
--------	--

---

**Description**

This function will generate `n` random points from a `rf` distribution with a user provided, `df1`, `df2`, and `ncp`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_f(.n = 50, .df1 = 1, .df2 = 1, .ncp = 0, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.df1</code>	Degrees of freedom, Inf is allowed.
<code>.df2</code>	Degrees of freedom, Inf is allowed.
<code>.ncp</code>	Non-centrality parameter.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `stats::rf()`, and its underlying p, d, and q functions. For more information please see [stats::rf\(\)](#)

## Value

A tibble of randomly generated data.

---

`tidy_four_autoplot`      *Automatic Plot of Density Data*

---

## Description

This is an auto plotting function that will take in a `tidy_` distribution function and a few arguments, one being the plot type, which is a quoted string of one of the following:

- density
- quantile
- probability
- qq

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

**Usage**

```
tidy_fourautoplot(
  .data,
  .line_size = 0.5,
  .geom_point = FALSE,
  .point_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .geom_jitter = FALSE,
  .interactive = FALSE
)
```

**Arguments**

<code>.data</code>	The data passed in from a tidy_distribution function like tidy_normal()
<code>.line_size</code>	The size param ggplot
<code>.geom_point</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return a plot with ggplot2::geom_point()
<code>.point_size</code>	The point size param for ggplot
<code>.geom_rug</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_rug()
<code>.geom_smooth</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_smooth() The aes parameter of group is set to FALSE. This ensures a single smoothing band returned with SE also set to FALSE. Color is set to 'black' and linetype is 'dashed'.
<code>.geom_jitter</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_jitter()
<code>.interactive</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.

**Details**

This function will spit out one of the following plots:

- density
- quantile
- probability
- qq

**Value**

A ggplot or a plotly plot.

---

tidy\_gamma

*Tidy Randomly Generated Gamma Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a gamma distribution with a user provided, `.shape`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_gamma(.n = 50, .shape = 1, .scale = 0.3, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.shape</code>	This is strictly 0 to infinity.
<code>.scale</code>	The standard deviation of the randomly generated data. This is strictly from 0 to infinity.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rgamma()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rgamma\(\)](#)

**Value**

A tibble of randomly generated data.

tidy\_generalized\_beta *Tidy Randomly Generated Generalized Beta Distribution Tibble*

---

**Description**

This function will generate `n` random points from a generalized beta distribution with a user provided, `.shape1`, `.shape2`, `.shape3`, `.rate`, and/or `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the [stats::density\(\)](#) function.
- `dy` The `y` value from the [stats::density\(\)](#) function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_generalized_beta(
  .n = 50,
  .shape1 = 1,
  .shape2 = 1,
  .shape3 = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.shape1</code>	A non-negative parameter of the Beta distribution.
<code>.shape2</code>	A non-negative parameter of the Beta distribution.
<code>.shape3</code>	A non-negative parameter of the Beta distribution.
<code>.rate</code>	An alternative way to specify the <code>.scale</code> parameter.
<code>.scale</code>	Must be strictly positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rbeta()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rbeta\(\)](#)

**Value**

A tibble of randomly generated data.

*Tidy Randomly Generated Generalized Pareto Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a generalized Pareto distribution with a user provided, `.shape1`, `.shape2`, `.rate` or `.scale` and number of `#` random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_generalized_pareto(
  .n = 50,
  .shape1 = 1,
  .shape2 = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.shape1</code>	Must be positive.
<code>.shape2</code>	Must be positive.
<code>.rate</code>	An alternative way to specify the <code>.scale</code> argument
<code>.scale</code>	Must be positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `actuar::rgepareto()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rgepareto\(\)](#)

tidy\_geometric

*Tidy Randomly Generated Geometric Distribution Tibble*

---

**Description**

This function will generate `n` random points from a geometric distribution with a user provided, `.prob`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the [stats::density\(\)](#) function.
- `dy` The `y` value from the [stats::density\(\)](#) function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_geometric(.n = 50, .prob = 1, .num_sims = 1)
```

**Arguments**

.n                    The number of randomly generated points you want.

.prob                 A probability of success in each trial  $0 < \text{prob} \leq 1$ .

.num\_sims             The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rgeom()`, and its underlying p, d, and q functions. For more information please see [stats::rgeom\(\)](#)

tidy\_hypergeometric *Tidy Randomly Generated Hypergeometric Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a hypergeometric distribution with a user provided,  $m, nn$ , and  $k$ , and number of random simulations to be produced. The function returns a tibble with the simulation number column the  $x$  column which corresponds to the  $n$  randomly generated points, the  $d_$ ,  $p_$  and  $q_$  data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting  $p_$  function of the distribution family.
- `q` The values from the resulting  $q_$  function of the distribution family.

## Usage

```
tidy_hypergeometric(.n = 50, .m = 0, .nn = 0, .k = 0, .num_sims = 1)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.m</code>	The number of white balls in the urn
<code>.nn</code>	The number of black balls in the urn
<code>.k</code>	The number of balls drawn fro the urn.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `stats::rhyper()`, and its underlying  $p$ ,  $d$ , and  $q$  functions. For more information please see [stats::rhyper\(\)](#)

## Value

A tibble of randomly generated data.

tidy_inverse_burr	<i>Tidy Randomly Generated Inverse Burr Distribution Tibble</i>
-------------------	---

---

**Description**

This function will generate n random points from an Inverse Burr distribution with a user provided, `.shape1`, `.shape2`, `.scale`, `.rate`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the x column which corresponds to the n randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of n for the current simulation.
- `y` The randomly generated data point.
- `dx` The x value from the `stats::density()` function.
- `dy` The y value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_inverse_burr(
  .n = 50,
  .shape1 = 1,
  .shape2 = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.shape1</code>	Must be strictly positive.
<code>.shape2</code>	Must be strictly positive.
<code>.rate</code>	An alternative way to specify the <code>.scale</code> .
<code>.scale</code>	Must be strictly positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `actuar::rinvburr()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rinvburr\(\)](#)

**Value**

A tibble of randomly generated data.

`tidy_inverse_exponential`*Tidy Randomly Generated Inverse Exponential Distribution Tibble*

---

## Description

This function will generate  $n$  random points from an inverse exponential distribution with a user provided, `.rate` or `.scale` and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_inverse_exponential(.n = 50, .rate = 1, .scale = 1/.rate, .num_sims = 1)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.rate</code>	An alternative way to specify the <code>.scale</code>
<code>.scale</code>	Must be strictly positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `actuar::rinvexp()`, and its underlying `p`, `d`, and `q` functions. For more information please see `actuar::rinvexp()`

## Value

A tibble of randomly generated data.

tidy_inverse_gamma	<i>Tidy Randomly Generated Inverse Gamma Distribution Tibble</i>
--------------------	--

---

**Description**

This function will generate  $n$  random points from an inverse gamma distribution with a user provided, `.shape`, `.rate`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_inverse_gamma(
  .n = 50,
  .shape = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

### Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.shape</code>	Must be strictly positive.

tidy\_inverse\_normal *Tidy Randomly Generated Inverse Gaussian Distribution Tibble*

---

## Description

This function will generate `n` random points from an Inverse Gaussian distribution with a user provided, `.mean`, `.shape`, `.dispersion`. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_inverse_normal(
  .n = 50,
  .mean = 1,
  .shape = 1,
  .dispersion = 1/.shape,
  .num_sims = 1
)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.mean</code>	Must be strictly positive.
<code>.shape</code>	Must be strictly positive.
<code>.dispersion</code>	An alternative way to specify the <code>.shape</code> .
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `actuar::rinvgauss()`. For more information please see [rinvgauss\(\)](#)

## Value

A tibble of randomly generated data.

tidy\_inverse\_pareto     *Tidy Randomly Generated Inverse Pareto Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from an inverse pareto distribution with a user provided, `.shape`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the [stats::density\(\)](#) function.
- `dy` The  $y$  value from the [stats::density\(\)](#) function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_inverse_pareto(.n = 50, .shape = 1, .scale = 1, .num_sims = 1)
```

### Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.shape</code>	Must be positive.
<code>.scale</code>	Must be positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

tidy\_inverse\_weibull *Tidy Randomly Generated Inverse Weibull Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a weibull distribution with a user provided, `.shape`, `.scale`, `.rate`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_inverse_weibull(  
  .n = 50,  
  .shape = 1,  
  .rate = 1,  
  .scale = 1/.rate,  
  .num_sims = 1  
)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.shape</code>	Must be strictly positive.
<code>.rate</code>	An alternative way to specify the <code>.scale</code> .
<code>.scale</code>	Must be strictly positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `actuar::rinweibull()`, and its underlying `p`, `d`, and `q` functions. For more information please see `actuar::rinweibull()`

<code>tidy_kurtosis_vec</code>	<i>Compute Kurtosis of a Vector</i>
--------------------------------	-------------------------------------

---

**Description**

This function takes in a vector as it's input and will return the kurtosis of that vector. The length of this vector must be at least four numbers. The kurtosis explains the sharpness of the peak of a distribution of data.

$$\left(\frac{1}{n} * \sum(x - \mu)^4\right) / \left(\left(\frac{1}{n} * \sum(x - \mu)^2\right)^2\right)$$
**Usage**

```
tidy_kurtosis_vec(.x)
```

**Arguments**

`.x`                    A numeric vector of length four or more.

**Details**

A function to return the kurtosis of a vector.

**Value**

The kurtosis of a vector

**Author(s)**

Steven P. Sanderson II, MPH

tidy\_logistic

*Tidy Randomly Generated Logistic Distribution Tibble*

---

**Description**

This function will generate `n` random points from a logistic distribution with a user provided, `.location`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_logistic(.n = 50, .location = 0, .scale = 1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.location</code>	The location parameter
<code>.scale</code>	The scale parameter
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rlogis()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rlogis\(\)](#)

**Value**

A tibble of randomly generated data.

tidy_logistic()
```

---

```
tidy_lognormal
```

```
Tidy Randomly Generated Lognormal Distribution Tibble
```

---

**Description**

This function will generate `n` random points from a lognormal distribution with a user provided, `.meanlog`, `.sdlog`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_lognormal(.n = 50, .meanlog = 0, .sdlog = 1, .num_sims = 1)
```

### Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.meanlog</code>	Mean of the distribution on the log scale with default 0
<code>.sdlog</code>	Standard deviation of the distribution on the log scale with default 1
<code>.num_sims</code>	The number of randomly generated simulations you want.

### Details

This function uses the underlying `stats::rlnorm()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rlnorm()`

### Value

A tibble of randomly generated data.

### Author(s)

Steven P. Sanderson II, MPH

---

tidy\_mixture\_density *Tidy Mixture Data*

---

## Description

Create mixture model data and resulting density and line plots.

## Usage

```
tidy_mixture_density(...)
```

## Arguments

... The random data you want to pass. Example `rnorm(50,0,1)` or something like `tidy_normal(.mean = 5, .sd = 1)`

## Details

This function allows you to make mixture model data. It allows you to produce density data and plots for data that is not strictly of one family or of one single type of distribution with a given set of parameters.

For example this function will allow you to mix say `tidy_normal(.mean = 0, .sd = 1)` and `tidy_normal(.mean = 5, .sd = 1)` or you can mix and match distributions.

The output is a list object with three components.

### 1. Data

- `input_data` (The random data passed)
- `dist_tbl` (A tibble of the passed random data)
- `density_tbl` (A tibble of the x and y data from `stats::density()`)

### 1. Plots

- `line_plot` - Plots the `dist_tbl`
- `dens_plot` - Plots the `density_tbl`

### 1. Input Functions

- `input_fns` - A list of the functions and their parameters passed to the function itself

## Value

A list object

## Author(s)

Steven P. Sanderson II, MPH

## Examples

```
output <- tidy_mixture_density(rnorm(100, 0, 1), tidy_normal(.mean = 5, .sd = 1))

output$data

output$plots

output$input_fns
```

---

```
tidy_multi_dist_autoplot
```

*Automatic Plot of Multi Dist Data*

---

## Description

This is an auto plotting function that will take in a tidy\_ distribution function and a few arguments, one being the plot type, which is a quoted string of one of the following:

- density
- quantile
- probability
- qq

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

## Usage

```
tidy_multi_dist_autoplot(
  .data,
  .plot_type = "density",
  .line_size = 0.5,
  .geom_point = FALSE,
  .point_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .geom_jitter = FALSE,
  .interactive = FALSE
)
```

## Arguments

.data	The data passed in from a the function tidy_multi_dist()
.plot_type	This is a quoted string like 'density'
.line_size	The size param ggplot

<code>.geom_point</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return a plot with <code>ggplot2::geom_point()</code>
<code>.point_size</code>	The point size param for <code>ggplot</code>
<code>.geom_rug</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_rug()</code>
<code>.geom_smooth</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_smooth()</code> The <code>aes</code> parameter of <code>group</code> is set to FALSE. This ensures a single smoothing band returned with SE also set to FALSE. Color is set to 'black' and <code>linetype</code> is 'dashed'.
<code>.geom_jitter</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_jitter()</code>
<code>.interactive</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.

### Details

This function will spit out one of the following plots:

- density
- quantile
- probability
- qq

### Value

A `ggplot` or a `plotly` plot.

### Author(s)

Steven P. Sanderson II, MPH

### Examples

```
tn <- tidy_multi_single_dist(
  .tidy_dist = "tidy_normal",
  .param_list = list(
    .n = 500,
    .mean = c(-2, 0, 2),
    .sd = 1,
    .num_sims = 5
  )
)

tn %>%
```

```
tidy_multi_distautoplot()  
  
tn %>%  
  tidy_multi_distautoplot(.plot_type = "qq")
```

---

tidy\_multi\_single\_dist

*Generate Multiple Tidy Distributions of a single type*

---

## Description

Generate multiple distributions of data from the same tidy\_ distribution function.

## Usage

```
tidy_multi_single_dist(.tidy_dist = NULL, .param_list = list())
```

## Arguments

`.tidy_dist` The type of tidy\_ distribution that you want to run. You can only choose one.

`.param_list` This must be a `list()` object of the parameters that you want to pass through to the TidyDensity tidy\_ distribution function.

## Details

Generate multiple distributions of data from the same tidy\_ distribution function. This allows you to simulate multiple distributions of the same family in order to view how shapes change with parameter changes. You can then visualize the differences however you choose.

## Value

A tibble

## Author(s)

Steven P. Sanderson II, MPH

## See Also

Other Multiple Distribution: [tidy\\_combine\\_distributions\(\)](#)

**Examples**

```
tidy_multi_single_dist(
  .tidy_dist = "tidy_normal",
  .param_list = list(
    .n = 50,
    .mean = c(-1, 0, 1),
    .sd = 1,
    .num_sims = 3
  )
)
```

---

tidy\_negative\_binomial

*Tidy Randomly Generated Negative Binomial Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a negative binomial distribution with a user provided, `.size`, `.prob`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_negative_binomial(.n = 50, .size = 1, .prob = 0.1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.size</code>	target for number of successful trials, or dispersion parameter (the shape parameter of the gamma mixing distribution). Must be strictly positive, need not be integer.
<code>.prob</code>	Probability of success on each trial where $0 < .prob \leq 1$ .
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rbinom()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rbinom()`

**Value**

A tibble of randomly generated data.

tidy\_normal

*Tidy Randomly Generated Gaussian Distribution Tibble*

---

**Description**

This function will generate `n` random points from a Gaussian distribution with a user provided, `.mean`, `.sd` - standard deviation and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `dnorm`, `pnorm` and `qnorm` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_normal(.n = 50, .mean = 0, .sd = 1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.mean</code>	The mean of the randomly generated data.
<code>.sd</code>	The standard deviation of the randomly generated data.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rnorm()`, `stats::pnorm()`, and `stats::qnorm()` functions to generate data from the given parameters. For more information please see [stats::rnorm\(\)](#)

**Value**

A tibble of randomly generated data.

tidy\_paralogistic      *Tidy Randomly Generated Paralogistic Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a paralogistic distribution with a user provided, `.shape`, `.rate`, `.scale` and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_paralogistic(
  .n = 50,
  .shape = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.shape</code>	Must be strictly positive.
<code>.rate</code>	An alternative way to specify the <code>.scale</code>
<code>.scale</code>	Must be strictly positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `actuar::rparalogis()`, and its underlying `p`, `d`, and `q` functions. For more information please see `actuar::rparalogis()`

**Value**

A tibble of randomly generated data.

tidy\_pareto

*Tidy Randomly Generated Pareto Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a pareto distribution with a user provided, `.shape`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_pareto(.n = 50, .shape = 10, .scale = 0.1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.shape</code>	Must be positive.
<code>.scale</code>	Must be positive.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `actuar::rpareto()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rpareto\(\)](#)

tidy_pareto1	<i>Tidy Randomly Generated Pareto Single Parameter Distribution Tib- ble</i>
--------------	--

---

## Description

This function will generate  $n$  random points from a single parameter pareto distribution with a user provided, `.shape`, `.min`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_pareto1(.n = 50, .shape = 1, .min = 1, .num_sims = 1)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.shape</code>	Must be positive.
<code>.min</code>	The lower bound of the support of the distribution.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `actuar::rpareto1()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rpareto1\(\)](#)

## Value

A tibble of randomly generated data.

tidy_poisson	<i>Tidy Randomly Generated Poisson Distribution Tibble</i>
--------------	--

---

**Description**

This function will generate  $n$  random points from a Poisson distribution with a user provided, `.lambda`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_poisson(.n = 50, .lambda = 1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.lambda</code>	A vector of non-negative means.
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::rpois()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rpois()`

**Value**

A tibble of randomly generated data.

**Author(s)**

Steven P. Sanderson II, MPH

Other Discrete Distribution: `tidy_binomial()`, `tidy_hypergeometric()`, `tidy_negative_binomial()`, `tidy_zero_truncated_binomial()`, `tidy_zero_truncated_negative_binomial()`, `tidy_zero_truncated_poisson()`

**Examples**

```
tidy_poisson()
```

---

tidy_random_walk	<i>Tidy Random Walk</i>
------------------	-------------------------

---

**Description**

Takes in the data from a `tidy_` distribution function and applies a random walk calculation of either `cum_prod` or `cum_sum` to `y`.

**Usage**

```
tidy_random_walk(  
  .data,  
  .initial_value = 0,  
  .sample = FALSE,  
  .replace = FALSE,  
  .value_type = "cum_prod"  
)
```

## Arguments

- `.data` The data that is being passed from a `tidy_` distribution function.
- `.initial_value` The default is 0, this can be set to whatever you want.
- `.sample` This is a boolean value TRUE/FALSE. The default is FALSE. If set to TRUE then the y value from the `tidy_` distribution function is sampled.
- `.replace` This is a boolean value TRUE/FALSE. The default is FALSE. If set to TRUE AND `.sample` is set to TRUE then the replace parameter of the sample function will be set to TRUE.
- `.value_type` This can take one of three different values for now. These are the following:
- "cum\_prod" - This will take the cumprod of y
  - "cum\_sum" - This will take the cumsum of y

## Details

Monte Carlo simulations were first formally designed in the 1940's while developing nuclear weapons, and since have been heavily used in various fields to use randomness solve problems that are potentially deterministic in nature. In finance, Monte Carlo simulations can be a useful tool to give a sense of how assets with certain characteristics might behave in the future. While there are more complex and sophisticated financial forecasting methods such as ARIMA (Auto-Regressive Integrated Moving Average) and GARCH (Generalised Auto-Regressive Conditional Heteroskedasticity) which attempt to model not only the randomness but underlying macro factors such as seasonality and volatility clustering, Monte Carlo random walks work surprisingly well in illustrating market volatility as long as the results are not taken too seriously.

## Value

An ungrouped tibble.

## Author(s)

Steven P. Sanderson II, MPH

## Examples

```
tidy_normal(.sd = .1, .num_sims = 25) %>%  
  tidy_random_walk()
```

---

tidy\_random\_walk\_autoplot

*Automatic Plot of Random Walk Data*

---

**Description**

This is an auto-plotting function that will take in a tidy\_ distribution function and a few arguments with regard to the output of the visualization.

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

**Usage**

```
tidy_random_walk_autoplot(
  .data,
  .line_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .interactive = FALSE
)
```

**Arguments**

<code>.data</code>	The data passed in from a tidy_distribution function like tidy_normal()
<code>.line_size</code>	The size param ggplot
<code>.geom_rug</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_rug()
<code>.geom_smooth</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_smooth() The aes parameter of group is set to FALSE. This ensures a single smoothing band returned with SE also set to FALSE. Color is set to 'black' and linetype is 'dashed'.
<code>.interactive</code>	A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.

**Details**

This function will produce a simple random walk plot from a tidy\_ distribution function.

**Value**

A ggplot or a plotly plot.

---

tidy\_range\_statistic *Get the range statistic*

---

**Description**

Takes in a numeric vector and returns back the range of that vector

**Usage**

```
tidy_range_statistic(.x)
```

**Arguments**

.x                    A numeric vector

**Details**

Takes in a numeric vector and returns the range of that vector using the diff and range functions.

**Value**

A single number, the range statistic

**Author(s)**

Steven P. Sandeson II, MPH

**See Also**

Other Statistic: [ci\\_hi\(\)](#), [ci\\_lo\(\)](#), [tidy\\_kurtosis\\_vec\(\)](#), [tidy\\_skewness\\_vec\(\)](#)

**Examples**

tidy_range_statistic(seq(1:10))
```

---

`tidy_scale_zero_one_vec`*Vector Function Scale to Zero and One*

---

**Description**

Takes a numeric vector and will return a vector that has been scaled from  $[0, 1]$

**Usage**

```
tidy_scale_zero_one_vec(.x)
```

**Arguments**

`.x` A numeric vector to be scaled from  $[0, 1]$  inclusive.

**Details**

Takes a numeric vector and will return a vector that has been scaled from  $[0, 1]$  The input vector must be numeric. The computation is fairly straightforward. This may be helpful when trying to compare the distributions of data where a distribution like beta which requires data to be between 0 and 1

$$y[h] = (x - \min(x)) / (\max(x) - \min(x))$$

**Value**

A numeric vector

dens_1 <- density(vec_1)
dens_2 <- density(vec_2)
max_x <- max(dens_1$x, dens_2$x)
max_y <- max(dens_1$y, dens_2$y)
plot(dens_1, asp = max_y/max_x, main = "Density vec_1 (Red) and vec_2 (Blue)",
     col = "red", xlab = "", ylab = "Density of Vec 1 and Vec 2")
lines(dens_2, col = "blue")
```

---

tidy\_skewness\_vec      *Compute Skewness of a Vector*

---

### Description

This function takes in a vector as it's input and will return the skewness of that vector. The length of this vector must be at least four numbers. The skewness explains the 'tailedness' of the distribution of data.

$$\frac{((1/n) * \sum(x - \mu)^3)}{(((1/n) * \sum(x - \mu)^2)^{3/2})}$$

### Usage

```
tidy_skewness_vec(.x)
```

### Arguments

.x                      A numeric vector of length four or more.

### Details

A function to return the skewness of a vector.

### Value

The skewness of a vector

### Author(s)

Steven P. Sanderson II, MPH

### See Also

tidy_skewness_vec(rnorm(100, 3, 2))
```

---

`tidy_t`*Tidy Randomly Generated T Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a  $rt$  distribution with a user provided,  $df$ ,  $ncp$ , and number of random simulations to be produced. The function returns a tibble with the simulation number column the  $x$  column which corresponds to the  $n$  randomly generated points, the  $d_$ ,  $p_$  and  $q_$  data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting  $p_$  function of the distribution family.
- `q` The values from the resulting  $q_$  function of the distribution family.

## Usage

```
tidy_t(.n = 50, .df = 1, .ncp = 0, .num_sims = 1)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.df</code>	Degrees of freedom, Inf is allowed.
<code>.ncp</code>	Non-centrality parameter.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `stats::rt()`, and its underlying  $p$ ,  $d$ , and  $q$  functions. For more information please see `stats::rt()`

## Value

A tibble of randomly generated data.

```

```
Tidy Randomly Generated Uniform Distribution Tibble
```

---

**Description**

This function will generate `n` random points from a uniform distribution with a user provided, `.min` and `.max` values, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_uniform(.n = 50, .min = 0, .max = 1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.min</code>	A lower limit of the distribution.
<code>.max</code>	An upper limit of the distribution
<code>.num_sims</code>	The number of randomly generated simulations you want.

**Details**

This function uses the underlying `stats::runif()`, and its underlying p, d, and q functions. For more information please see [stats::runif\(\)](#)

**Value**

A tibble of randomly generated data.

*Tidy Randomly Generated Weibull Distribution Tibble*

---

**Description**

This function will generate n random points from a weibull distribution with a user provided, `.shape`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the x column which corresponds to the n randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of n for the current simulation.
- `y` The randomly generated data point.
- `dx` The x value from the `stats::density()` function.
- `dy` The y value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_weibull(.n = 50, .shape = 1, .scale = 1, .num_sims = 1)
```

**Arguments**

<code>.n</code>	The number of randomly generated points you want.
<code>.shape</code>	Shape parameter defaults to 0.
<code>.scale</code>	Scale parameter defaults to 1.
<code>.num_sims</code>	The number of randomly generated simulations you want.

`tidy_zero_truncated_binomial`*Tidy Randomly Generated Binomial Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a zero truncated binomial distribution with a user provided, `.size`, `.prob`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_zero_truncated_binomial(.n = 50, .size = 0, .prob = 1, .num_sims = 1)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.size</code>	Number of trials, zero or more.
<code>.prob</code>	Probability of success on each trial $0 \leq \text{prob} \leq 1$ .
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `actuar::rztbinom()`, and its underlying `p`, `d`, and `q` functions. For more information please see `actuar::rztbinom()`

## Value

A tibble of randomly generated data.

`tidy_zero_truncated_poisson`*Tidy Randomly Generated Zero Truncated Poisson Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a Zero Truncated Poisson distribution with a user provided, `.lambda`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_zero_truncated_poisson(.n = 50, .lambda = 1, .num_sims = 1)
```

## Arguments

<code>.n</code>	The number of randomly generated points you want.
<code>.lambda</code>	A vector of non-negative means.
<code>.num_sims</code>	The number of randomly generated simulations you want.

## Details

This function uses the underlying `actuar::rztpois()`, and its underlying `p`, `d`, and `q` functions. For more information please see `actuar::rztpois()`

## Value

A tibble of randomly generated data.

**Examples**

```
tidy_zero_truncated_poisson()
```

---

```
util_beta_param_estimate
```

*Estimate Beta Parameters*

---

**Description**

This function will automatically scale the data from 0 to 1 if it is not already. This means you can pass a vector like `mtcars$mpg` and not worry about it.

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated beta data.

Three different methods of shape parameters are supplied:

- Bayes
- NIST mme
- EnvStats mme, see [EnvStats::ebeta\(\)](#)

**Usage**

```
util_beta_param_estimate(.x, .auto_gen_empirical = TRUE)
```

**Arguments**

`.x` The vector of data to be passed to the function. Must be numeric, and all values must be  $0 \leq x \leq 1$

`.auto_gen_empirical`

This is a boolean value of `TRUE/FALSE` with default set to `TRUE`. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will attempt to estimate the beta `shape1` and `shape2` parameters given some vector of values.

**Value**

A tibble/list

---

util\_binomial\_param\_estimate

*Estimate Binomial Parameters*

---

## Description

This function will check to see if some given vector `.x` is either a numeric vector or a factor vector with at least two levels then it will cause an error and the function will abort. The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated binomial data.

## Usage

```
util_binomial_param_estimate(.x, .size = NULL, .auto_gen_empirical = TRUE)
```

**Arguments**

- `.x`                    The vector of data to be passed to the function. Must be numeric, and all values must be  $0 \leq x \leq 1$
- `.size`                Number of trials, zero or more.
- `.auto_gen_empirical`  
This is a boolean value of TRUE/FALSE with default set to TRUE. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will attempt to estimate the binomial  $p_{\text{hat}}$  and size parameters given some vector of values.

**Value**

A tibble/list

---

`util_cauchy_param_estimate`*Estimate Cauchy Parameters*

---

## Description

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated cauchy data.

## Usage

```
util_cauchy_param_estimate(.x, .auto_gen_empirical = TRUE)
```

## Arguments

`.x` The vector of data to be passed to the function.

`.auto_gen_empirical` This is a boolean value of `TRUE/FALSE` with default set to `TRUE`. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

## Details

This function will attempt to estimate the cauchy location and scale parameters given some vector of values.

## Value

A tibble/list

util\_cauchy\_stats\_tbl *Distribution Statistics*

---

## Description

Returns distribution statistics in a tibble.

## Usage

```
util_cauchy_stats_tbl(.data)
```

## Arguments

`.data` The data being passed from a `tidy_` distribution function.

## Details

This function will take in a tibble and returns the statistics of the given type of `tidy_` distribution. It is required that data be passed from a `tidy_` distribution function.

## Value

A tibble

---

util\_exponential\_param\_estimate

*Estimate Exponential Parameters*

---

## Description

This function will attempt to estimate the exponential rate parameter given some vector of values. The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated exponential data.

## Usage

```
util_exponential_param_estimate(.x, .auto_gen_empirical = TRUE)
```

## Arguments

`.x` The vector of data to be passed to the function. Must be numeric.

`.auto_gen_empirical` This is a boolean value of `TRUE/FALSE` with default set to `TRUE`. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

## Details

This function will see if the given vector `.x` is a numeric vector.

## Value

A tibble/list

---

util\_hypergeometric\_param\_estimate

*Estimate Hypergeometric Parameters*

---

**Description**

This function will attempt to estimate the geometric prob parameter given some vector of values `.x`. Estimate `m`, the number of white balls in the urn, or `m+n`, the total number of balls in the urn, for a hypergeometric distribution.

**Usage**

```
util_hypergeometric_param_estimate(
  .x,
  .m = NULL,
  .total = NULL,
  .k,
  .auto_gen_empirical = TRUE
)
```

**Arguments**

- `.x` A non-negative integer indicating the number of white balls out of a sample of size `.k` drawn without replacement from the urn. You cannot have missing, undefined or infinite values.
- `.m` Non-negative integer indicating the number of white balls in the urn. You must supply `.m` or `.total`, but not both. You cannot have missing values.
- `.total` A positive integer indicating the total number of balls in the urn (i.e.,  $m+n$ ). You must supply `.m` or `.total`, but not both. You cannot have missing values.
- `.k` A positive integer indicating the number of balls drawn without replacement from the urn. You cannot have missing values.
- `.auto_gen_empirical`  
This is a boolean value of TRUE/FALSE with default set to TRUE. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will see if the given vector `.x` is a numeric integer. It will attempt to estimate the prob parameter of a geometric distribution. Missing (NA), undefined (NaN), and infinite (Inf, -Inf) values are not allowed. Let `.x` be an observation from a hypergeometric distribution with parameters `.m = M`, `.n = N`, and `.k = K`. In R nomenclature, `.x` represents the number of white balls drawn out of a sample of `.k` balls drawn without replacement from an urn containing `.m` white balls and `.n` black balls. The total number of balls in the urn is thus `.m + .n`. Denote the total number of balls by  $T = .m + .n$

util\_logistic\_param\_estimate

*Estimate Logistic Parameters*

---

## Description

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to TRUE then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated logistic data.

Three different methods of shape parameters are supplied:

- MLE
- MME
- MMUE

## Usage

```
util_logistic_param_estimate(.x, .auto_gen_empirical = TRUE)
```

## Arguments

`.x` The vector of data to be passed to the function.

`.auto_gen_empirical`

This is a boolean value of TRUE/FALSE with default set to TRUE. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will attempt to estimate the logistic location and scale parameters given some vector of values.

`util_lognormal_stats_tbl`*Distribution Statistics*

---

**Description**

Returns distribution statistics in a tibble.

**Usage**

```
util_lognormal_stats_tbl(.data)
```

**Arguments**

`.data`            The data being passed from a `tidy_` distribution function.

**Details**

This function will take in a tibble and returns the statistics of the given type of `tidy_` distribution. It is required that data be passed from a `tidy_` distribution function.

**Value**

A tibble

---

`util_negative_binomial_param_estimate`*Estimate Negative Binomial Parameters*

---

## Description

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated negative binomial data.

Two different methods of shape parameters are supplied:

- MLE/MME
- MMUE

## Usage

```
util_negative_binomial_param_estimate(.x, .size, .auto_gen_empirical = TRUE)
```

## Arguments

`.x` The vector of data to be passed to the function.

`.size` The size parameter.

`.auto_gen_empirical`

This is a boolean value of `TRUE/FALSE` with default set to `TRUE`. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

## Details

This function will attempt to estimate the negative binomial size and prob parameters given some vector of values.

## Value

A tibble/list

util\_normal\_param\_estimate

*Estimate Normal Gaussian Parameters*

---

**Description**

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated normal data.

Three different methods of shape parameters are supplied:

- MLE/MME
- MVUE

**Usage**

```
util_normal_param_estimate(.x, .auto_gen_empirical = TRUE)
```

## Arguments

- `.x` The vector of data to be passed to the function.
- `.auto_gen_empirical`  
This is a boolean value of TRUE/FALSE with default set to TRUE. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

## Details

This function will attempt to estimate the normal gaussian mean and standard deviation parameters given some vector of values.
