XiMpLe-package  A Simple XML Tree Parser and Generator

Description

Provides a simple XML tree parser/generator. It includes functions to read XML files into R objects, get information out of and into nodes, and write R objects back to XML code. It’s not as powerful as the ‘XML’ package and doesn’t aim to be, but for simple XML handling it could be useful. It was originally developed for the R GUI and IDE ‘RKWard’ <https://rkward.kde.org>, to make plugin development easier.

**gen_tag_functions**

License: GPL (>= 3)
LazyLoad: yes
URL: https://reaktanz.de/?c=hacking&s=XiMpLe

**Author(s)**

NA
Maintainer: NA

**See Also**

Useful links:
- https://reaktanz.de/?c=hacking&s=XiMpLe
- Report bugs at https://github.com/rkward-community/XiMpLe/issues

---

**Description**

Takes a vector of character strings and turns them into functions in the defined environment which in turn will generate XiMpLe_node objects with the string values as tag names.

**Usage**

```r
gen_tag_functions(
  tags,
  func_names = paste0(tags, " "),
  envir = .GlobalEnv,
  replace = FALSE,
  func_rename = c("\"xml\" = "xml",
                  \"!--\" = "comment",
                  \"![CDATA[\" = "CDATA",
                  \"!DOCTYPE\" = "DOCTYPE")
)
```

**Arguments**

- **tags** A character vector defining the tags the generated functions should produce.
- **func_names** A character vector the same length as tags, defining the names of the functions to generate.
- **envir** The environment where all generated functions should appear.
- **replace** Logical, whether objects by the same name already present in envir should be preserved or replaced/overwritten.
- **func_rename** Named character vector defining which tags’ functions should get a different name. This makes it easier to get functions with valid names that generate special tag nodes.
node

Details

The generated functions will be named according to `func_names` and only have a dots argument that is given to `XMLNode`. See the examples to understand how it’s supposed to work.

Value

As many functions as specified by `tags/func_names`.

See Also

`XMLNode`,

Examples

# Say we would like to generate an HTML website and want to use
# <a>, <div> and <p> tags.
# The standard way of creating a <div> node would be this:
(my_node <- XMLNode("div", "some content", class="important"))

# By using `gen_tag_functions()`, we can create some shortcut functions
# to get better readability for our code and save some typing:
gen_tag_functions(tags=c("a", "div", "p"))
# We can now use `div_.()` instead of `XMLNode("div")`:
(my_node2 <- div_.("some content", class="important"))

# It also works for nested tags:
(my_node3 <- div_.(a_.(href="foo", "some content")))

# If you don’t want these functions filling up your .GlobalEnv,
# you can also put them in an attached environment, e.g.
attach(list(), name="XiMpLe_wrappers")
gen_tag_functions(tags=c("head", "body"), envir=as.environment("XiMpLe_wrappers"))

node

Extract/manipulate a node or parts of it from an XML tree

Description

This method can be used to get parts of a parsed XML tree object, or to fill it with new values.

`XiMpLe.XML` is a class union for objects of classes `XiMpLe_node` and `XiMpLe_doc`.

Usage

```r
node(
  obj,
  node = list(),
  what = NULL,
  cond.attr = NULL,
  ...
)```
node

cond.value = NULL,
element = NULL
)

## S4 method for signature 'XiMpLe.XML'
node(
  obj,
  node = list(),
  what = NULL,
  cond.attr = NULL,
  cond.value = NULL,
  element = NULL
)

node(
  obj,
  node = list(),
  what = NULL,
  cond.attr = NULL,
  cond.value = NULL,
  element = NULL
)
<- value

## S4 replacement method for signature 'XiMpLe.XML'
node(
  obj,
  node = list(),
  what = NULL,
  cond.attr = NULL,
  cond.value = NULL,
  element = NULL
)
<- value

Arguments

obj  An object of class XiMpLe_doc or XiMpLe_node.
node  A list of node names (or their numeric values), where each element is the child of its previous element. Duplicate matches will be returned as a list.
what  A character string, must be a valid slot name of class XiMpLe_node, like "attributes" or "value". If not NULL, only that part of a node will be returned. There's also two special properties for this option: what="@path" will not return the node or it's contents, but a character string with the "path" to it in the object; what="obj@path" is the same but won't have obj substituted with the object's name.
cond.attr  A named character string, to further filter the returned results. If not NULL, only nodes with fully matching attributes will be considered.
cond.value  A character string, similar to cond.attr, but is matched against the value between a pair of tags.
parseXMLTree

Read an XML file into an R object

Description

Read an XML file into an R object

Usage

parseXMLTree(file, drop = NULL, object = FALSE)

Arguments

file Character string, valid path to the XML file which should be parsed.
drop Character vector with the possible values "comments", "cdata", "declarations", and "doctype", defining element classes to be dropped from the resulting object, or "empty_attributes", in case you would like to omit empty attributes (as used in HTML).
object Logical, if TRUE, file will not be treated as a path name but as a character vector to be parsed as XML directly.

Value

An object of class XiMpLe_doc with four slots:

file: Full path to the parsed file, or "object" if object=TRUE.
xml: XML declaration, if found.
dtd: Doctype definition, if found.
children: A list of objects of class XiMpLe_node, with the elements "name" (the node name), "attributes" (list of attributes, if found), "children" (list of XiMpLe_node object, if found) and "value" (text value between a pair of start/end tags, if found).

See Also

XiMpLe_node, XiMpLe_doc

Examples

## Not run:
node(my.xml.tree, node=list("html","body"), what="attributes")
node(my.xml.tree, node=list("html","head","title"), what="value") <- "foobar"

## End(Not run)
Examples

```r
## Not run:
sample.XML.object <- parseXMLTree("~/data/sample_file.xml")
## End(Not run)
```

### PasteXML

#### Paste methods for XiMpLe XML objects

**Description**

These methods can be used to paste objects if class `XiMpLe_node` or `XiMpLe_doc`.

**Usage**

```r
pasteXML(obj, ...)  
```

#### S4 method for signature 'XiMpLe_node'

```r
pasteXML(
  obj,
  level = 1,
  shine = 1,
  indent.by = getOption("XiMpLe_indent", "\t"),
  tidy = TRUE,
  tidy.omit = c("![CDATA[", "*![CDATA["),
  as_script = FALSE,
  func_rename = c("\<?xml_\" = "xml_", '\|--' = "comment_", '\![CDATA[\" = "CDATA_",
    '![DOCTYPE_' = "DOCTYPE_")
)
```

#### S4 method for signature 'XiMpLe_doc'

```r
pasteXML(
  obj,
  shine = 1,
  indent.by = getOption("XiMpLe_indent", "\t"),
  tidy = TRUE,
  tidy.omit = c("![CDATA[", "*![CDATA["),
  as_script = FALSE,
  func_rename = c("\<?xml_\" = "xml_", '\|--' = "comment_", '\![CDATA[\" = "CDATA_",
    '![DOCTYPE_' = "DOCTYPE_")
)
```

**Arguments**

- `obj`: An object of class `XiMpLe_node` or `XiMpLe_doc`.
- `...`: Additional options for the generic method, see options for a specific method, respectively.
pasteXMLTag

level

Indentation level.

shine

Integer, controlling if the output should be formatted for better readability. Possible values:

0  No formatting.
1  Nodes will be indented.
2  Nodes will be indented and each attribute gets a new line.

indent.by

A character string defining how indentation should be done. Defaults to tab.

tidy

Logical, if TRUE the special characters "<" and ">" will be replaced with the entities "&lt;" and "&gt;" in attributes and text values.

tidy.omit

A character vector with node names that should be excluded from tidy.

as_script

Logical, if TRUE, tags will be pasted as a sketch for a script to be run in conjunction with functions generated by gen_tag_functions. This script code will most likely not run without adjustments, but is perhaps a good start anyway.

func_rename

Named character vector defining which tags’ functions should get a different name. This makes it easier to get functions with valid names that generate special tag nodes. Only used when as_script=TRUE. Use the same names and values as you used in gen_tag_functions.

Note

The functions pasteXMLNode() and pasteXMLTree() have been replaced by the pasteXML methods. They should no longer be used.

See Also

XiMpLe_node, XiMpLe_doc

pasteXMLTag  Write an XML tag

Description

Creates a whole XML tag with attributes and, if it is a pair of start and end tags, also one object as child. This can be used recursively to create whole XML tree structures with this one function.

Usage

pasteXMLTag(
  tag,
  attr = NULL,
  child = NULL,
  empty = TRUE,
  level = 1,
  allow.empty = FALSE,
  rename = NULL,
pasteXMLTag

shine = 2,
indent.by = getOption("XmlMe_indent", "\t"),
tidy = TRUE,
as_script = FALSE,
func_name = paste0(tag, "_")
func_rename = c(`?xml_` = "xml_", `!--_` = "comment_", `![CDATA[_` = "CDATA_",
`!DOCTYPE_` = "DOCTYPE_")
)

Arguments

tag Character string, name of the XML tag.
attr A list of attributes for the tag.
child If empty=FALSE, a character string to be pasted as a child node between start and end tag.
empty Logical, <true /> or <false></false>
level Indentation level.
allow.empty Logical, if FALSE, tags without attributes will not be returned.
rename An optional named list if the attributes in XML need to be renamed from their list names in attr. This list must in turn have a list element named after tag, containing named character elements, where the names represent the element names in attr and their values the names the XML attribute should get.
shine Integer, controlling if the output should be formatted for better readability. Possible values:
0 No formatting.
1 Nodes will be indented.
2 Nodes will be indented and each attribute gets a new line.
indent.by A character string defining how indentation should be done. Defaults to tab.
tidy Logical, if TRUE the special characters "<", ">" and "&" will be replaced with the entities "&lt;", "&gt;" and "&amp;" in attribute values. For comment or CDATA tags, if the text includes newline characters they will also be indented.
as_script Logical, if TRUE, tags will be pasted as a sketch for a script to be run in conjunction with functions generated by gen_tag_functions. This script code will most likely not run without adjustments, but is perhaps a good start anyway.
func_name A character string, defining a function name for tag. Only used when as_script=TRUE.
func_rename Named character vector defining which tags’ functions should get a different name. This makes it easier to get functions with valid names that generate special tag nodes. Only used when as_script=TRUE. Use the same names and values as you used in gen_tag_functions.

Value

A character string.
Note

However, you will probably not want to use this function at all, as it is much more comfortable to create XML nodes or even nested trees with XMLNode and XMLTree, and then feed the result to pasteXML.

See Also

XMLNode, XMLTree, pasteXML

Examples

```r
sample.XML.tag <- pasteXMLTag("a",
attr=list(href="http://example.com", target="_blank"),
child="klick here!",
empty=FALSE)
```

### Description

Copies or overwrites files from a source directory to your project directory. Can be used to make sure that files you are referencing in your generated XML code are present and up to date.

### Usage

```r
provide_file(rel, to, from, overwrite = TRUE, mode = "0777", quiet = FALSE)
```

### Arguments

- `rel` Relative path of file as to be used in HTML.
- `to` Full path to the project directory where files should be copied to.
- `from` Full path to the directory where the file can be found under its rel_path.
- `overwrite` Logical, whether existing files should be re-written or kept in place.
- `mode` Permissions for newly created directories below to.
- `quiet` Logical, whether you would like to see a message when files are copied or already exist.

### Details

The function returns the relative path that was given as its first argument, e.g. it can be used inside XMLNode to add relative paths to arguments while also copying the referenced file to the given output directory, keeping the relative path.

It can be useful to write a simple wrapper around this function to set the relevant from and to paths for a project (see examples).
show,XiMpLe.XML-method

Value

When called, the file is copied from the `from` to the `to` directory, including the relative path given by `rel`. Missing target directories below `to` are created on-the-fly. If successful, the function finally returns an invisible character string identical to `rel`.

Examples

```r
## Not run:
# a direct call that would copy the file ~/webpage/v1/static/css/bootstrap.min.css
# to the project directory as /tmp/static/css/bootstrap.min.css
# and include "static/css/bootstrap.min.css" in the <link> tag
my_HTML <- XMLNode(
  "link",
  rel="stylesheet",
  type="text/css",
  href=provide_file(
    rel="static/css/bootstrap.min.css",
    to="/tmp",
    from="~/webpage/v1"
  )
)

# for larger projects, a wrapper function might become handy
prov <- function(
  rel,
  to="/tmp",
  from="~/webpage/v1",
  overwrite=TRUE,
  mode="0777"
){
  provide_file(rel=rel, to=to, from=from, overwrite=overwrite, mode=mode)
}
# let's combine it with a shortcut function for <link>
gen_tag_functions("link")
# now this code produces the same result as the direct call above
my_HTML2 <- link_(
  rel="stylesheet",
  type="text/css",
  href=prov("static/css/bootstrap.min.css")
)
## End(Not run)
```

---

show,XiMpLe.XML-method

Show method for S4 objects of XiMpLe XML classes

Description

Used to display objects of class `XiMpLe_doc` and `XiMpLe_node`
Usage

```r
## S4 method for signature 'XiMpLe.XML'
show(object)
```

Arguments

- `object`: An object of class `XiMpLe_doc` or `XiMpLe_node`

See Also

- `XiMpLe_doc`  
  - `XiMpLe_node`

validXML

Validate S4 objects of XiMpLe XML classes

Description

Checks whether objects of class `XiMpLe_doc` or `XiMpLe_node` have valid child nodes.

Usage

```r
validXML(
  obj,
  validity = XMLValidity(),
  parent = NULL,
  children = TRUE,
  attributes = TRUE,
  warn = FALSE,
  section = parent,
  caseSens = TRUE
)
```

```r
## S4 method for signature 'XiMpLe.XML'
validXML(
  obj,
  validity = XMLValidity(),
  parent = NULL,
  children = TRUE,
  attributes = TRUE,
  warn = FALSE,
  section = parent,
  caseSens = TRUE
)
```
Arguments

obj: An object of class XiMpLe_doc or XiMpLe_node. If parent=NULL, this object will be checked for validity, including its child nodes. If parent is either a character string or another XiMpLe node, it will be checked whether obj is a valid child node of parent.

validity: An object of class XiMpLe.validity, see XMLValidity.

parent: Either a character string (name of the parent node) or a XiMpLe node, whose name will be used as name of the parent node.

children: Logical, whether child node names should be checked for validity.

attributes: Logical, whether attributes should be checked for validity.

warn: Logical, whether invalid objects should cause a warning or stop with an error.

section: Either a character string (name of the section) or a XiMpLe node, whose name will be used as name of the XML section this check refers to. This is only relevant for warnings and error messages, in case you want to use something different than the actual parent node name.

caseSens: Logical, whether checks should be case sensitive or not.

Details

XiMpLe can’t handle DOM specifications yet, but this method can be used to construct validation schemes.

Value

Returns TRUE if tests pass, and depending on the setting of warn either FALSE or an error if a test fails.

Note

: If no parent is specified, obj will be checked recursively.

validXML, XMLValidity, XiMpLe_doc, and XiMpLe_node

Examples

HTMLish <- XMLValidity(
  children=list(
    body=c("a", "p", "ol", "ul", "strong"),
    head=c("title"),
    html=c("head", "body"),
    li=c("a", "br", "strong"),
    ol=c("li"),
    p=c("a", "br", "ol", "ul", "strong"),
    ul=c("li")
  ),
  attrs=list(
    c("a", "p", ...)}
)
a=c("href", "name"),
    p=c("align")
),
    allChildren=c("!--"),
    allAttrs=c("id", "class"),
    empty=c("br")
)
# make XML object
validChildNodes <- XMLNode("html",
    XMLNode("head",
        XMLNode("!--", "comment always passes"),
        XMLNode("title", "test")
    ),
    XMLNode("body",
        XMLNode("p",
            XMLNode("a", "my link"),
            XMLNode("br"),
            "text goes on"
        )
    )
)

invalidChildNodes <- XMLNode("html",
    XMLNode("head",
        XMLNode("title",
            XMLNode("body", "test")
        )
    )
)

# do validity checks
# the first should pass
validXML(    validChildNodes, validity=HTMLish
)

# now this one should cause a warning and return FALSE
validXML(    invalidChildNodes, validity=HTMLish, warn=TRUE
)

---

**XiMpLe.validity,-class**

*Class XiMpLe.validity*

**Description**

Used for objects that describe valid child nodes and attributes of XiMpLe_nodes.
Usage

is.XiMpLe.validity(x)

Arguments

x An arbitrary R object.

Details

A constructor function XMLValidity(...) is available to be used instead of new("XiMpLe.validity", ...).

Slots

children Named list of vectors or XiMpLe.validity objects. The element name defines the parent node name and each character string a valid child node name. If a value is in turn of class XiMpLe.validity, this object will be used for recursive validation of deeper nodes.

attrs Named list of character vectors. The element name defines the parent node name and each character string a valid attribute name.

allChildren Character vector, names of globally valid child nodes for all nodes, if any.

allAttrs Character vector, names of globally valid attributes for all nodes, if any.

empty Character vector, names of nodes that must be empty nodes (i.e., no closing tag), if any.

ignore Character vector, names of nodes that should be ignored, if any.

See Also

validXML

Examples

HTMLish <- XMLValidity(
  children=list(
    body=c("a", "p", "ol", "ul", "strong"),
    head=c("title"),
    html=c("head", "body"),
    li=c("a", "br", "strong"),
    ol=c("li"),
    p=c("a", "br", "ol", "ul", "strong"),
    ul=c("li")
  ),
  attrs=list(
    a=c("href", "name"),
    p=c("align")
  ),
  allChildren=c("!--"),
  allAttrs=c("id", "class"),
  empty=c("br")
)
# this example uses recursion: the <b> node can have the "foo"
# attribute only below an <a> node; the <d> node is also only valid
# in an <a> node
XMLRecursion <- XMLValidity(
  children=list(
    a=XMLValidity(
      children=list(
        b=c("c")
      ),
      attrs=list(
        b=c("foo")
      ),
      allChildren=c("d")
    ),
    attrs=list(
      b=c("bar")
    )
  ),
  attrs=list(
    b=c("bar")
  )
)

---

**XiMpLe_doc,-class**  
*Classes XiMpLe_doc and XiMpLe.doc (old)*

### Description

This class is used for objects that are returned by `parseXMLTree`.

### Usage

- `is.XiMpLe.doc(x)`
- `as_XiMpLe_doc(obj, extra = list(), version = 2)`

```
## S4 method for signature 'XiMpLe.doc'
as_XiMpLe_doc(obj, extra = list(), version = 2)
```

### Arguments

- **x**  
  An arbitrary R object.

- **obj**  
  An object of old class `XiMpLe.doc`.

- **extra**  
  A list of values to set the `extra` slot. Note that this will be applied recursively on child nodes also.

- **version**  
  Integer numeric, to set the `version` slot. Note that this will be applied recursively on child nodes also.
Details

Class `XiMpLe.doc` is the older one, `XiMpLe_doc` was introduced with `XiMpLe 0.11-1`. It has two new slots (`extra` and `version`) that would have made it impossible to load old objects without issues. `XiMpLe.doc` inherits from `XiMpLe.doc`. You can convert old objects into valid new ones using the `as_XiMpLe_doc` method and are also advised to do so, as the `XiMpLe.doc` class might become deprecated in future releases.

A constructor function `XiMpLe_doc(...)` is available to be used instead of `new("XiMpLe.doc", ...)`. There’s also `XiMpLe_doc_old(...)` to be used instead of `new("XiMpLe.doc", ...)`, but you should not use that any longer.

Slots

- `file` Character string, Name of the file.
- `xml` Either a named list of character values (attributes for the XML declaration of the file), or a list of `XiMpLe_node` with tags whose names must start with a "?".
- `dtd` A named list, attributes for the doctype definition of the file.
- `children` A list of objects of class `XiMpLe_node` (`XiMpLe_doc` only), or `XiMpLe.node` (old, `XiMpLe.doc` only), representing the DOM structure of the XML document.
- `extra` A named list that can be used to store additional information on a document (`XiMpLe_doc` only).
- `version` A numeric integer, currently defaults to 2 (`XiMpLe_doc` only). This is a version number that can be used in the future in combination with the added extra slot. Should that get some supported values that are interpreted by package methods, the version number will be increased and the differences documented here. You shouldn’t set it manually.

Description

These classes are used to create DOM trees of XML documents, like objects that are returned by `parseXMLTree`.

Usage

```r
is.XiMpLe.node(x)

is.XiMpLe_node(x)

as_XiMpLe_node(obj, extra = list(), version = 2)
```

```r
## S4 method for signature 'XiMpLe.node'
as_XiMpLe_node(obj, extra = list(), version = 2)
```
Arguments

- **x**: An arbitrary R object.
- **obj**: An object of old class `XiMpLe.node`.
- **extra**: A list of values to set the `extra` slot. Note that this will be applied recursively on child nodes also.
- **version**: Integer numeric, to set the `version` slot. Note that this will be applied recursively on child nodes also.

Details

Class `XiMpLe.node` is the older one, `XiMpLe_node` was introduced with `XiMpLe 0.11-1`. It has two new slots (`extra` and `version`) that would have made it impossible to load old objects without issues. `XiMpLe_node` inherits from `XiMpLe.node`. You can convert old objects into valid new ones using the `as_XiMpLe_node` method and are also advised to do so, as the `XiMpLe.node` class might become deprecated in future releases.

There are certain special values predefined for the `name` slot to easily create special XML elements:

- **name=""**: If the name is an empty character string, a pseudo node is created, `pasteXMLNode` will paste its value as plain text.
- **name="!--"**: Creates a comment tag, i.e., this will comment out all its children.
- **name="![CDATA["**: Creates a CDATA section and places all its children in it.
- **name="*![CDATA["**: Creates a CDATA section and places all its children in it, where the CDATA markers are commented out by /* */, as is used for JavaScript in XHTML.

A constructor function `XiMpLe_node(...)` is available to be used instead of `new("XiMpLe_node", ...)`.

There’s also `XiMpLe_node_old(...)` to be used instead of `new("XiMpLe.node", ...)`, but you should not use that any longer.

Slots

- **name**: Name of the node (i.e., the XML tag identifier). For special names see details.
- **attributes**: A list of named character values, representing the attributes of this node. Use `character()` as value for empty attributes.
- **children**: A list of further objects of class `XiMpLe.node`, representing child nodes of this node.
- **value**: Plain text to be used as the enclosed value of this node. Set to `value=""` if you want a childless node to be forced into an non-empty pair of start and end tags by `pasteXMLNode`.
- **extra**: A named list that can be used to store additional information on a node (`XiMpLe_node` only). The only value with a noticeable effect as of now (version 2) is:
  - **shine**: A numeric integer value between 0 and 2, overwriting the `shine` value of, e.g., `pasteXML` for this particular node.
- **version**: A numeric integer, currently defaults to 2 (`XiMpLe_node` only). This is a version number that can be used in the future in combination with the added `extra` slot. Should that get more supported values like `shine` that are interpreted by package methods, the version number will be increased and the differences documented here. You shouldn’t set it manually.
**XMLgenerators**

Generate XML generator functions from XiMpLe.validity object

**Description**

Takes an object of class `XiMpLe.validity` and turns it into a character vector of generator functions for each XML node that was defined.

**Usage**

```r
XMLgenerators(
  validity,
  prefix = "XML",
  checkValidity = TRUE,
  indent.by = getOption("XiMpLe_indent", "\t"),
  roxygenDocs = FALSE,
  valParam = "validity",
  replaceChar = "_",
  dir = NULL,
  overwrite = FALSE,
  oneFile = NULL
)
```

```r
## S4 method for signature 'XiMpLe.validity'
XMLgenerators(
  validity,
  prefix = "XML",
  checkValidity = TRUE,
  indent.by = "\t",
  roxygenDocs = FALSE,
  valParam = "validity",
  replaceChar = "_",
  dir = NULL,
  overwrite = FALSE,
  oneFile = NULL
)
```

**Arguments**

- **validity**: An object of class `XiMpLe.validity`.
- **prefix**: A character string to be used as a prefix for the resulting function names.
- **checkValidity**: Logical, whether all functions should include a check for valid XML.
- **indent.by**: A character string defining how indentation should be done.
- **roxygenDocs**: Logical, whether a skeleton for roxygen2-ish documentation should be added.
- **valParam**: A character string, name of the additional parameter to use for validation if `checkValidity=TRUE`.
- **replaceChar**: A character string, used to replace certain characters in the function names.
- **dir**: A character string, directory where the generated files should be written.
- **overwrite**: Logical, whether existing files should be overwritten.
- **oneFile**: Logical, whether all functions should be written to a single file.
replaceChar  A (single) character to be used as an replacement for invalid characters for R parameter names.

dir  A character string, path to write files to. If dir=NULL, no files are being written, but the results returned in form of a character vector. If dir is set and the directory does not yet exist, it will be created.

overwrite  Logical, whether existing files should be replaced when dir is set.

oneFile  A character string. If set, all functions are to be documented in one single *.Rd file, named like the string.

Details

The resulting code follows these rules:

- Each child node gets its own argument, except if there is only one valid child node. It will use the dots element instead then.
- Each attribute will also get its own argument.
- If CheckValidity=TRUE, one extra argument named after the value of valParam will be added.
- All arguments are set to NULL by default.
- Only the main level of "allAttrs" will be taken into account, there's no recursion for this slot.

Value

If dir=NULL a named vector of character strings. Otherwise one or more files are written do the location specified via dir.

XMLValidity and XiMple.validity

Examples

```r
HTMLish <- XMLValidity(
  children=list(
    body=c("a", "p", "ol", "ul", "strong"),
    head=c("title"),
    html=c("head", "body"),
    li=c("a", "br", "strong"),
    ol=c("li"),
    p=c("a", "br", "ol", "ul", "strong"),
    ul=c("li")
  ),
  attrs=list(
    a=c("href", "name"),
    p=c("align")
  ),
  allChildren=c("!--"),
  allAttrs=c("id", "class")
)
```
XMLName

empty=c("br")
)
XMLgenerators(HTMLish)

---

### Description

Used to get/set certain slots from objects of class `XiMpLe_doc` and `XiMpLe_node`.

### Usage

XMLName(obj)

```r
## S4 method for signature 'XiMpLe_node'
XMLName(obj)

XMLName(obj) <- value

## S4 replacement method for signature 'XiMpLe_node'
XMLName(obj) <- value

XMLAttrs(obj)

## S4 method for signature 'XiMpLe_node'
XMLAttrs(obj)

XMLAttrs(obj) <- value

## S4 replacement method for signature 'XiMpLe_node'
XMLAttrs(obj) <- value

XMLChildren(obj)

## S4 method for signature 'XiMpLe_node'
XMLChildren(obj)

## S4 method for signature 'XiMpLe_doc'
XMLChildren(obj)

XMLChildren(obj) <- value

## S4 replacement method for signature 'XiMpLe_node'
XMLChildren(obj) <- value

## S4 replacement method for signature 'XiMpLe_doc'
```
XMLChildren(obj) <- value
XMLValue(obj)

## S4 method for signature 'XiMpLe_node'
XMLValue(obj)
XMLValue(obj) <- value

## S4 replacement method for signature 'XiMpLe_node'
XMLValue(obj) <- value

XMLFile(obj)

## S4 method for signature 'XiMpLe_doc'
XMLFile(obj)
XMLFile(obj) <- value

## S4 replacement method for signature 'XiMpLe_doc'
XMLFile(obj) <- value

XMLDecl(obj)

## S4 method for signature 'XiMpLe_doc'
XMLDecl(obj)
XMLDecl(obj) <- value

## S4 replacement method for signature 'XiMpLe_doc'
XMLDecl(obj) <- value

XMLDTD(obj)

## S4 method for signature 'XiMpLe_doc'
XMLDTD(obj)
XMLDTD(obj) <- value

## S4 replacement method for signature 'XiMpLe_doc'
XMLDTD(obj) <- value

XMLScan(obj, name, as.list = FALSE)

## S4 method for signature 'XiMpLe_node'
XMLScan(obj, name, as.list = FALSE)

## S4 method for signature 'XiMpLe_doc'
XMLName

XMLScan(obj, name, as.list = FALSE)

XMLScan(obj, name) <- value

## S4 replacement method for signature 'XiMpLe_node'
XMLScan(obj, name) <- value

## S4 replacement method for signature 'XiMpLe_doc'
XMLScan(obj, name) <- value

XMLScanDeep(obj, find = NULL, search = "attributes")

## S4 method for signature 'XiMpLe_node'
XMLScanDeep(obj, find = NULL, search = "attributes")

## S4 method for signature 'XiMpLe_doc'
XMLScanDeep(obj, find = NULL, search = "attributes")

Arguments

- **obj**: An object of class XiMpLe_node or XiMpLe_doc
- **value**: The new value to set.
- **name**: Character, name of nodes to scan for.
- **as.list**: Logical, if TRUE always returns a list (or NULL), otherwise if exactly one result is found, it will be returned as a single XiMpLe_node.
- **find**: Character, name of element to scan for.
- **search**: Character, name of the slot to scan, one of "attributes", "name", or "value" for nodes.

Details

These are convenience methods to get or set slots from XML objects without using the @ operator.

- **XMLName()**: get/set the XML node name (slot name of class XiMpLe_node)
- **XMLAttrs()**: get/set the XML node attributes (slot attrs of class XiMpLe_node)
- **XMLValue()**: get/set the XML node value (slot value of class XiMpLe_node)
- **XMLChildren()**: get/set the XML child nodes (slot children of both classes XiMpLe_node and XiMpLe_doc)
- **XMLFile()**: get/set the XML document file name (slot file of class XiMpLe_doc)
- **XMLDecl()**: get/set the XML document declaration (slot xml of class XiMpLe_doc)
- **XMLDTD()**: get/set the XML document doctype definition (slot dtd of class XiMpLe_doc)

Another special method can scan a node/document tree object for appearances of nodes with a particular name:
XMLName, XiMpLe.node-method

- **XMLScan(obj, name, as.list=FALSE)**: get/set the XML nodes by name (recursively searches slot name of both classes XiMpLe_node and XiMpLe_doc). If as.list=TRUE always returns a list (or NULL), otherwise if exactly one result is found, it will be returned as a single XiMpLe_node.

Finally, there is a method to scan for certain values in XiMpLe objects and just list them. For instance, it can be used to list all instances of a certain attribute type in a document tree:

- **XMLScanDeep(obj, find, search="attributes")**: returns all found instances of find in all slots defined by search.

**See Also**

node, XiMpLe_doc, XiMpLe_node

**Examples**

```r
xmlTestNode <- XMLNode("foo", XMLNode("testchild"))
XMLName(xmlTestNode) # returns "foo"
XMLName(xmlTestNode) <- "bar"
XMLName(xmlTestNode) # now returns "bar"

# search for a child node
XMLScan(xmlTestNode, "testchild")
# remove nodes of that name
XMLScan(xmlTestNode, "testchild") <- NULL
```

**Description**

These functions were used in earlier versions of the package but are now either replaced or removed.

**Usage**

```r
## S4 method for signature 'XiMpLe.node'
XMLName(obj)

## S4 replacement method for signature 'XiMpLe.node'
XMLName(obj) <- value

## S4 method for signature 'XiMpLe.node'
XMLAttrs(obj)

## S4 replacement method for signature 'XiMpLe.node'
XMLAttrs(obj) <- value
```
## S4 method for signature 'XiMpLe.node'
XMLChildren(obj)

## S4 method for signature 'XiMpLe.doc'
XMLChildren(obj)

## S4 replacement method for signature 'XiMpLe.node'
XMLChildren(obj) <- value

## S4 replacement method for signature 'XiMpLe.doc'
XMLChildren(obj) <- value

## S4 method for signature 'XiMpLe.node'
XMLValue(obj)

## S4 replacement method for signature 'XiMpLe.node'
XMLValue(obj) <- value

## S4 method for signature 'XiMpLe.doc'
XMLFile(obj)

## S4 replacement method for signature 'XiMpLe.doc'
XMLFile(obj) <- value

## S4 method for signature 'XiMpLe.doc'
XMLDecl(obj)

## S4 replacement method for signature 'XiMpLe.doc'
XMLDecl(obj) <- value

## S4 method for signature 'XiMpLe.doc'
XMLDTD(obj)

## S4 replacement method for signature 'XiMpLe.doc'
XMLDTD(obj) <- value

## S4 method for signature 'XiMpLe.node'
XMLScan(obj, name, as.list = FALSE)

## S4 method for signature 'XiMpLe.doc'
XMLScan(obj, name, as.list = FALSE)

## S4 replacement method for signature 'XiMpLe.node'
XMLScan(obj, name) <- value

## S4 replacement method for signature 'XiMpLe.doc'
XMLScan(obj, name) <- value
## S4 method for signature 'XiMpLe.node'
XMLScanDeep(obj, find = NULL, search = "attributes")

## S4 method for signature 'XiMpLe.doc'
XMLScanDeep(obj, find = NULL, search = "attributes")

## S4 method for signature 'XiMpLe.node'
pasteXML(obj, ...)

## S4 method for signature 'XiMpLe.doc'
pasteXML(obj, ...)

### Arguments

- **obj**: An object of deprecated classes XiMpLe.node or XiMpLe.doc.
- **value**: No longer used.
- **name**: No longer used.
- **as.list**: No longer used.
- **find**: No longer used.
- **search**: No longer used.
- **...**: No longer used.

### Details

For methods this can also mean that the object class is deprecated and you are asked to update old objects via `as_XiMpLe_node` or `as_XiMpLe_doc`.

---

**XMLNode**

*Constructor function for XiMpLe_node objects*

**Description**

Can be used to create XML nodes.

**Usage**

```r
XMLNode(
  tag_name,
  ..., 
  attrs, 
  shine, 
  namespace, 
  namespaceDefinitions, 
  .children = list(...) 
)
```
**XMLNode**

**Arguments**

- **tag_name**
  - Character string, the tag name.
  - Optional children for the tag. Must be either objects of class `XiMpLe_node` or character strings, which are treated as attributes if they are named, and as simple text values otherwise. Use a named character() value for empty attributes. If this argument is empty, the tag will be treated as an empty tag. To force a closing tag, supply an empty string, i.e. "".

- **attrs**
  - An optional named list of attributes. Will be appended to attributes already defined in the ... argument.

- **shine**
  - A numeric integer value between 0 and 2, overwriting the shine value of, e.g., `pasteXML` for this particular node.

- **namespace**
  - Currently ignored.

- **namespaceDefinitions**
  - Currently ignored.

- **.children**
  - Alternative way of specifying children, if you have them already as a list. This argument completely replaces values defined in the ... argument.

**Details**

To generate a CDATA node, set `tag_name="![CDATA["`, to create a comment, set `tag_name="!--"`. Note that all defined attributes will silently be dropped if a text node, CDATA node or comment is generated.

**Value**

An object of class `XiMpLe_node`.

**See Also**

`XMLTree, pasteXML`

**Examples**

```r
(sample.XML.node <- XMLNode("a",
    attrs=list(
      href="http://example.com",
      target="_blank"
    ),
    .children="klick here!"
  ))
# This is equivalent
(sample.XML.node2 <- XMLNode("a",
    "klick here!",
    href="http://example.com",
    target="_blank"
  ))
# As is this
(sample.XML.node3 <- XMLNode("a",
```
XMLTree

Constructor function for XiMpLe.doc objects

Description
Can be used to create full XML trees.

Usage
XMLTree(..., xml = NULL, dtd = NULL, .children = list(...))

Arguments
...
Optional children for the XML tree. Must be either objects of class XiMpLe_node or character strings, which are treated as simple text values.

xml
A named list, XML declaration of the XML tree. Currently just pasted, no checking is done.

dtd
A named list, doctype definition of the XML tree. Valid elements are doctype (root element), decl ("PUBLIC" or "SYSTEM"), id (the identifier) and refer (URI to .dtd). Currently just pasted, no checking is done.

.children
Alternative way of specifying children, if you have them already as a list.

Value
An object of class XiMpLe_doc

See Also
XMLElement, pasteXML

Examples
sample.XML.a <- XMLNode("a",
  attrs=list(href="http://example.com", target="_blank"),
  .children="klick here!")
sample.XML.body <- XMLNode("body", .children=list(sample.XML.a))
sample.XML.html <- XMLNode("html", .children=list(XMLElement("head", ""),
  sample.XML.body))
sample.XML.tree <- XMLTree(sample.XML.html,
  xml=list(version="1.0", encoding="UTF-8"),
  dtd=list(doctype="html", decl="PUBLIC",
    id="-//W3C//DTD XHTML 1.0 Transitional//EN",
    refer="http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd"))
