Package ‘airGR’

January 24, 2017

Type Package
Title Suite of GR Hydrological Models for Precipitation-Runoff Modelling
Version 1.0.5.12
Date 2017-01-23
Depends R (>= 3.0.1)
Description Hydrological modelling tools developed at Irstea-Antony (HBAN Research Unit, France). The package includes several conceptual rainfall-runoff models (GR4H, GR4J, GR5J, GR6J, GR2M, GR1A), a snowmelt module (CemaNeige) and the associated functions for their calibration and evaluation. Use help(airGR) for package description.

Description

This package brings into R the hydrological modelling tools used at Irstea-Antony (HBAN Research Unit, France), including rainfall-runoff models (GR4H, GR4J, GR5J, GR6J, GR2M, GR1A) and a snowmelt module (CemaNeige). Each model core is coded in FORTRAN to ensure low computational time. The other package functions (i.e. mainly the calibration algorithm and the computation of the efficiency criteria) are coded in R.

##### Functions and objects #####

The airGR package has been designed to fulfil two major requirements: facilitate the use by non-expert users and allow flexibility regarding the addition of external criteria, models or calibration algorithms. The names of the functions and their arguments were chosen to this end.

The package is mostly based on three families of functions:
- the functions belonging to the `runmodel` family require three arguments: `InputsModel`, `RunOptions` and `Param`; please refer to help pages `createinputsmodel` and `createrunoptions` for further details and examples;
- the functions belonging to the `errorcrit` family require two arguments: `InputsCrit` and `OutputsModel`; please refer to help pages `createinputscrit` and `runmodel` for further details and examples;
- the functions belonging to the `calibration` family require four arguments: `InputsModel`, `RunOptions`, `InputsCrit` and `CalibOptions`; please refer to help pages `createinputsmodel`, `createrunoptions`, `createinputscrit` and `createcaliboptions` for further details and examples.

In order to limit the risk of mis-use and increase the flexibility of these main functions, we imposed the structure of their arguments and defined their class. Most users will not need to worry about these imposed structures since functions are provided to prepare these arguments for them: `createinputsmodel`, `createrunoptions`, `createinputscrit`, `createcaliboptions`. However, advanced users wishing to supplement the package with their own models will need to comply with these imposed structures and refer to the package source codes to get all the specification requirements.

##### Models #####

Six hydrological models and one snow melt and accumulation module are implemented in airGR. The snow module can also be used alone or with the daily hydrological models, and each hydrological model can either be used alone or together with the snow module.

These models can be called within airGR using the following functions:
- `runmodel_grTh`: four-parameter hourly lumped hydrological model (Mathevet, 2005)
- `runmodel_grTj`: four-parameter daily lumped hydrological model (Perrin et al., 2003)
- `runmodel_grUj`: five-parameter daily lumped hydrological model (Le Moine, 2008)
- `runmodel_grVj`: six-parameter daily lumped hydrological model (Pushpalatha et al., 2011)
- `runmodel_grRm`: two-parameter monthly lumped hydrological model (Mouelhi, 2003; Mouelhi et al., 2006a)
- `runmodel_grQa`: one-parameter yearly lumped hydrological model (Mouelhi, 2003; Mouelhi et
- RunModel_CemaNeige: two-parameter degree-day snow melt and accumulation daily module
  (Valéry et al., 2014)
- RunModel_CemaNeigeGR4J: combined use of GR4J and CemaNeige
- RunModel_CemaNeigeGR5J: combined use of GR5J and CemaNeige
- RunModel_CemaNeigeGR6J: combined use of GR6J and CemaNeige

##### How to get started #####

To learn how to use the functions from the airGR package, it is recommended to follow the five steps described below:

1. refer to the help for RunModel_GR4H then run the provided example to assess how to make a simulation;
2. refer to the help for CreateInputsModel to understand how the inputs of a model are prepared/organised;
3. refer to the help for CreateRunOptions to understand how the run options of a model are parametrised/organised;
4. refer to the help for ErrorCritNSE and CreateInputsCrit to understand how the computation of an error criterion is prepared/made;
5. refer to the help for CalibrationMichel, run the provided example and then refer to the help for CreateCalibOptions to understand how a model calibration is prepared/made;

##### References #####

**BasinInfo**

Data sample: characteristics of a fictional catchment (L0123001, L0123002 or L0123003)

Description

R-object containing the code, station’s name, area and hypsometric curve of the catchment.

Format

List named 'BasinInfo' containing

- two strings: catchment’s code and station’s name
- one float: catchment’s area in km²
- one numeric vector: catchment’s hypsometric curve (min, quantiles 01 to 99 and max) in metres

Examples

```r
library(airGR)
data(L0123001)
str(BasinInfo)
```

**BasinObs**

Data sample: time series of observations of a fictional catchment (L0123001, L0123002 or L0123003)

Description

R-object containing the times series of precipitation, temperature, potential evapotranspiration and discharges.

Times series for L0123001 or L0123002 are at the daily time step for use with daily models such as GR4J, GR5J, GR6J, CemaNeigeGR4J, CemaNeigeGR5J and CemaNeigeGR6J. Times series for L0123003 are at the hourly time step for use with hourly models such as GR4H.

Format

Data frame named 'BasinObs' containing

- one POSIXct vector: time series dates in the POSIXct format
- five numeric vectors: time series of catchment average precipitation [mm/time step], catchment average air temperature [°C], catchment average potential evapotranspiration [mm/time step], outlet discharge [l/s], outlet discharge [mm/time step]
Calibration

Calibration algorithm which optimises the error criterion selected as objective function using the provided functions.

Description

Calibration algorithm which optimises the error criterion selected as objective function using the provided functions.

Usage

Calibration(InputsModel, RunOptions, InputsCrit, CalibOptions, FUN_MOD, FUN_CRIT, FUN_CALIB = Calibration_Michel, FUN_TRANSFO = NULL, verbose = TRUE)

Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
InputsCrit [object of class InputsCrit] see CreateInputsCrit for details
CalibOptions [object of class CalibOptions] see CreateCalibOptions for details
FUN_MOD [function] hydrological model function (e.g. RunModel_GR4J, RunModel_CemaNeigeGR4J)
FUN_CRIT [function] error criterion function (e.g. ErrorCrit_RMSE, ErrorCrit_NSE)
FUN_CALIB (optional) [function] calibration algorithm function (e.g. Calibration_Michel), default=Calibration_Michel
FUN_TRANSFO (optional) [function] model parameters transformation function, if the FUN_MOD used is native in the package FUN_TRANSFO is automatically defined
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default=TRUE

Value

list see Calibration_Michel

Calibration algorithm optimises the error criterion selected as objective function using the Irstea-HBAN procedure described by C. Michel

**Description**

Calibration algorithm optimises the error criterion selected as objective function.

The algorithm is based on a local search procedure. First, a screening is performed using either a rough predefined grid or a list of parameter sets and then a simple steepest descent local search algorithm is performed.

**Usage**

```r
Calibration_Michel(InputsModel, RunOptions, InputsCrit, CalibOptions, 
                   FUN_MOD, FUN_CRIT, FUN_TRANSFO = NULL, verbose = TRUE)
```

**Arguments**

- **InputsModel** [object of class `InputsModel`]: see `CreateInputsModel` for details
- **RunOptions** [object of class `RunOptions`]: see `CreateRunOptions` for details
- **InputsCrit** [object of class `InputsCrit`]: see `CreateInputsCrit` for details
- **CalibOptions** [object of class `CalibOptions`]: see `CreateCalibOptions` for details
- **FUN_MOD** [function]: hydrological model function (e.g. `RunModel_GR4J`, `RunModel_CemaNeigeGR4J`)
- **FUN_CRIT** [function]: error criterion function (e.g. `ErrorCrit_RMSE`, `ErrorCrit_NSE`)
- **FUN_TRANSFO** (optional) [function]: model parameters transformation function, if the `FUN_MOD` used is native in the package `FUN_TRANSFO` is automatically defined
- **verbose** (optional) [boolean]: boolean indicating if the function is run in verbose mode or not, default=TRUE

**Details**

A screening is first performed either based on a rough predefined grid (considering various initial values for each parameter) or from a list of initial parameter sets. The best set identified in this screening is then used as a starting point for the steepest descent local search algorithm.

For this search, since the ranges of parameter values can be quite different, simple mathematical transformations are applied to parameters to make them vary in a similar range and get a similar sensitivity to a predefined search step. This is done using the `TransfoParam` functions.

During the steepest descent method, at each iteration, we start from a parameter set of NParam values (NParam being the number of free parameters of the chosen hydrological model) and we determine the 2*NParam-1 new candidates by changing one by one the different parameters (+/- search step).
All these candidates are tested and the best one kept to be the starting point for the next iteration. At the end of each iteration, the search step is either increased or decreased to adapt the progression speed. A composite step can occasionally be done. The calibration algorithm stops when the search step becomes smaller than a predefined threshold.

Value

list  list containing the function outputs organised as follows:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ParamFinalR</td>
<td>[numeric] parameter set obtained at the end of the calibration</td>
</tr>
<tr>
<td>$CritFinal</td>
<td>[numeric] error criterion selected as objective function obtained at the end of the calibration</td>
</tr>
<tr>
<td>$NIter</td>
<td>[numeric] number of iterations during the calibration</td>
</tr>
<tr>
<td>$NRuns</td>
<td>[numeric] number of model runs done during the calibration</td>
</tr>
<tr>
<td>$HistParamR</td>
<td>[numeric] table showing the progression steps in the search for optimal set: parameter values</td>
</tr>
<tr>
<td>$HistCrit</td>
<td>[numeric] table showing the progression steps in the search for optimal set: criterion values</td>
</tr>
<tr>
<td>$MatBoolCrit</td>
<td>[boolean] table giving the requested and actual time steps over which the model is calibrated</td>
</tr>
<tr>
<td>$CritName</td>
<td>[character] name of the calibration criterion used as objective function</td>
</tr>
<tr>
<td>$CritBestValue</td>
<td>[numeric] theoretical best criterion value</td>
</tr>
</tbody>
</table>

Details

Users wanting to use FUN_MOD, FUN_CALIB or FUN_TRANSFO functions that are not included in the package must create their own CalibOptions object accordingly.

Value

list object of class CalibOptions containing the data required to evaluate the model outputs; it can include the following:

- `$FixedParam` [numeric] vector giving the values to allocate to non-optimised parameter values
- `$SearchRanges` [numeric] matrix giving the ranges of raw parameters
- `$StartParamList` [numeric] matrix of parameter sets used for grid-screening calibration procedure
- `$StartParamDistrib` [numeric] matrix of parameter values used for grid-screening calibration procedure

### CreateInputsCrit

**Creation of the InputsCrit object required to the ErrorCrit functions**

**Description**

Creation of the InputsCrit object required to the ErrorCrit functions.

**Usage**

CreateInputsCrit(FUN_CRIT, InputsModel, RunOptions, Qobs, BoolCrit = NULL,
transfo = "", Ind_zeroes = NULL, epsilon = NULL)

**Arguments**

- **FUN_CRIT** [function] error criterion function (e.g. ErrorCrit_RMSE, ErrorCrit_NSE)
- **InputsModel** [object of class InputsModel] see CreateInputsModel for details
- **RunOptions** [object of class RunOptions] see CreateRunOptions for details
- **Qobs** [numeric] series of observed discharges [mm/time step]
- **BoolCrit** (optional) [boolean] boolean giving the time steps to consider in the computation (all time steps are consider by default)
- **transfo** (optional) [character] name of the transformation (e.g. "", "sqrt", "log", "inv", "sort")
- **Ind_zeroes** (optional) [numeric] indices of the time steps where zeroes are observed
- **epsilon** (optional) [numeric] epsilon to add to all Qobs and Qsim if $Ind_zeroes is not empty
Details

Users wanting to use FUN_CRIT functions that are not included in the package must create their own InputsCrit object accordingly.

Value

list object of class InputsCrit containing the data required to evaluate the model outputs; it can include the following:

$BoolCrit [boolean] boolean giving the time steps considered in the computation
$Qobs [numeric] series of observed discharges [mm/time step]
$transfo [character] name of the transformation (e.g. "", "sqrt", "log", "inv", "sort")
$Ind_zeroes [numeric] indices of the time steps where zeroes are observed
$epsilon [numeric] epsilon to add to all Qobs and Qsim if $Ind_zeroes is not empty

## efficiency criterion: Nash-Sutcliffe Efficiency
InputsCrit <- CreateInputsCrit(FUN_CRIT = ErrorCrit_NSE, InputsModel = InputsModel, RunOptions = RunOptions, Qobs = BasinObs$Qmm[Ind_Run])
CreateInputsModel

Creation of the InputsModel object required to the RunModel functions.

Description

Creation of the InputsModel object required to the RunModel functions.

Usage

CreateInputsModel(FUN_MOD, DatesR, Precip, PrecipScale = TRUE, PotEvap = NULL, TempMean = NULL, TempMin = NULL, TempMax = NULL, ZInputs = NULL, HypsoData = NULL, NLayers = 5, verbose = TRUE)

Arguments

FUN_MOD [function] hydrological model function (e.g. RunModel_GR4J, RunModel_CemaNeigeGR4J)
DatesR [POSIXt] vector of dates required to create the GR model and CemaNeige module inputs
Precip [numeric] time series of total precipitation (catchment average) [mm], required to create the GR model and CemaNeige module inputs

PrecipScale (optional) [boolean] indicating if the mean of the precipitation interpolated on the elevation layers must be kept or not, required to create CemaNeige module inputs, default = TRUE (the mean of the precipitation is kept to the original value)

PotEvap [numeric] time series of potential evapotranspiration (catchment average) [mm], required to create the GR model inputs

TempMean (optional) [numeric] time series of mean air temperature [°C], required to create the CemaNeige module inputs

TempMin (optional) [numeric] time series of min air temperature [°C], possibly used to create the CemaNeige module inputs

TempMax (optional) [numeric] time series of max air temperature [°C], possibly used to create the CemaNeige module inputs

ZInputs (optional) [numeric] real giving the mean elevation of the Precip and Temp series (before extrapolation) [m], possibly used to create the CemaNeige module inputs

HypsoData (optional) [numeric] vector of 101 reals: min, q01 to q99 and max of catchment elevation distribution [m], if not defined a single elevation is used for CemaNeige

NLayers (optional) [numeric] integer giving the number of elevation layers requested [-], required to create CemaNeige module inputs, default=5

verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default= TRUE

Details

Users wanting to use FUN_MOD functions that are not included in the package must create their own InputsModel object accordingly.

Value

object of class InputsModel containing the data required to evaluate the model outputs; it can include the following:

$DatesR [POSIXlt] vector of dates
$Precip [numeric] time series of total precipitation (catchment average) [mm]
$PotEvap [numeric] time series of potential evapotranspiration (catchment average) [mm], defined if FUN_MOD includes GR4H, GR4J, GR5J, GR6J, GR2M or GR1A

$LayerPrecip [list] list of time series of precipitation (layer average) [mm], defined if FUN_MOD includes CemaNeige

$LayerTempMean [list] list of time series of mean air temperature (layer average) [°C], defined if FUN_MOD includes CemaNeige

$LayerFracSolidPrecip [list] list of time series of solid precipitation fraction (layer average) [-],
CreateRunOptions

defined if FUN_MOD includes CemaNeige

## efficiency criterion: Nash-Sutcliffe Efficiency
InputsCrit <- CreateInputsCrit(FUN_CRIT = ErrorCrit_NSE, InputsModel = InputsModel,
                                RunOptions = RunOptions, Qobs = BasinObs$Qmm[Ind_run])
OutputsCrit <- ErrorCrit_NSE(InputsCrit = InputsCrit, OutputsModel = OutputsModel)
CreateRunOptions

Description
Creation of the RunOptions object required to the RunModel functions.

Usage
CreateRunOptions(FUN_MOD, InputsModel, IndPeriod_WarmUp = NULL, IndPeriod_Run, 
IniStates = NULL, IniResLevels = NULL, Outputs_Cal = NULL, 
Outputs_Sim = "all", RunSnowModule = TRUE, MeanAnSolidPrecip = NULL, 
verbose = TRUE)

Arguments
FUN_MOD [function] hydrological model function (e.g. RunModel_GR4J, RunModel_CemaNeigeGR4J)
InputsModel [object of class InputsModel] see CreateInputsModel for details
IndPeriod_WarmUp (optional) [numeric] index of period to be used for the model warm-up [-]
IndPeriod_Run [numeric] index of period to be used for the model run [-]
IniStates (optional) [numeric] vector of initial model internal states [mm]
IniResLevels (optional) [numeric] vector of initial filling rates for production and routing 
stores (2 values between 0 and 1) [-]
Outputs_Cal (optional) [character] vector giving the outputs needed for the calibration 
(e.g. c("Qsim"), the fewer outputs the faster the calibration
Outputs_Sim (optional) [character] vector giving the requested outputs 
(e.g. c("DatesR","Qsim","SnowPack")), default="all"
RunSnowModule (optional) [boolean] option indicating whether CemaNeige should be activated, 
default=TRUE
MeanAnSolidPrecip (optional) [numeric] vector giving the annual mean of average solid precipitation 
for each layer (computed from InputsModel if not defined) [mm/y]
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or 
not, default=TRUE

Details
Users wanting to use FUN_MOD functions that are not included in the package must create their 
own RunOptions object accordingly.

##### Initialisation options #####
The model initialisation options can either be set to a default configuration or be defined by the user. 
This is done via three vectors: 
IndPeriod_WarmUp, IniStates, IniResLevels.
A default configuration is used for initialisation if these vectors are not defined.

1) Default initialisation options:

- IndPeriod_WarmUp default setting ensures a one-year warm-up using the time steps preceding 
the IndPeriod_Run. The actual length of this warm-up might be shorter depending on data 
availability (no missing value of climate inputs being allowed in model input series).
- **IniStates** and **IniResLevels** are automatically set to initialise all the model states at 0, except for the production and routing stores which are initialised at 50% of their capacity. This initialisation is made at the very beginning of the model call (i.e. at the beginning of **IndPeriod_WarmUp** or at the beginning of **IndPeriod_Run** if the warm-up period is disabled).

(2) Customisation of initialisation options:

- **IndPeriod_WarmUp** can be used to specify the indices of the warm-up period (within the time-series prepared in InputsModel).
  - remark 1: for most common cases, indices corresponding to one or several years preceding **IndPeriod_Run** are used (e.g. **IndPeriod_WarmUp** = 1000:1365 and **IndPeriod_Run** = 1366:5000).
  
  However, it is also possible to perform a long-term initialisation if other indices than the warm-up ones are set in **IndPeriod_WarmUp** (e.g. **IndPeriod_WarmUp** <- c(1:5000, 1:5000, 1:1000:1365)).
  
  - remark 2: it is also possible to completely disable the warm-up period when using **IndPeriod_WarmUp** = 0L.

- **IniStates** and **IniResLevels** can be used to specify the initial model states.
  - remark 1: if **IniStates** is used, all model states must be provided (e.g. 60 floats [mm] are required for GR4J, GR5J and GR6J; 60+2*NLayers floats [mm] are required for CemaNeigeGR4J, CemaNeigeGR5J and CemaNeigeGR6J; see fortran source code for details).
  
  - remark 2: in addition to **IniStates**, **IniResLevels** allows to set the filling rate of the production and routing stores for the GR models. For instance for GR4J, GR5J and GR6J: **IniResLevels** <- c(0.3,0.5) should be used to obtain initial fillings of 30% and 50% for the production and routing stores, respectively. **IniResLevels** is optional and can only be used if **IniStates** is also defined (the state values corresponding to these two stores in **IniStates** are not used in such case).

**Value**

list object of class **RunOptions** containing the data required to evaluate the model outputs; it can include the following:

- **IndPeriod_WarmUp** [numeric] index of period to be used for the model warm-up [-]
- **IndPeriod_Run** [numeric] index of period to be used for the model run [-]
- **IniStates** [numeric] vector of initial model states [mm]
- **IniResLevels** [numeric] vector of initial filling rates for production and routing stores [-]
- **Outputs_Cal** [character] character vector giving only the outputs needed for the calibration
- **Outputs_Sim** [character] character vector giving the requested outputs
- **RunSnowModule** [boolean] option indicating whether CemaNeige should be activated
- **MeanAnSolidPrecip** [numeric] vector giving the annual mean of average solid precipitation for each layer [mm/y]

DataAltiExtrapolation_Valery

Altitudinal extrapolation of precipitation and temperature series described by A. Valéry

Description

Function which extrapolates the precipitation and air temperature series for different elevation layers
(method from Valéry, 2010).

Usage

DataAltiExtrapolation_Valery(DatesR, Precip, PrecipScale = TRUE,
                          TempMean, TempMin = NULL, TempMax = NULL,
                          ZInputs, HypsoData, NLayers, verbose = TRUE)
Arguments

DatesR [POSIXt] vector of dates
Precip [numeric] time series of daily total precipitation (catchment average) [mm]
PrecipScale (optional) [boolean] indicating if the mean of the precipitation interpolated on the elevation layers must be kept or not, required to create CemaNeige module inputs, default = TRUE (the mean of the precipitation is kept to the original value)
TempMean [numeric] time series of daily mean air temperature [°C]
TempMin (optional) [numeric] time series of daily min air temperature [°C]
TempMax (optional) [numeric] time series of daily max air temperature [°C]
ZInputs [numeric] real giving the mean elevation of the Precip and Temp series (before extrapolation) [m]
HypsoData [numeric] vector of 101 reals: min, q01 to q99 and max of catchment elevation distribution [m]
NLayers [numeric] integer giving the number of elevation layers requested [-]
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default=TRUE

Details

Elevation layers of equal surface are created the 101 elevation quantiles (HypsoData) and the number requested elevation layers (NLayers).
Forcing data (precipitation and air temperature) are extrapolated using gradients from Valery (2010). (e.g. gradP=0.0004 [m-1] for France and gradT=0.434 [°C/100m] for January, 1st).
This function is used by the CreateInputsModel function.

Value

list containing the extrapolated series of precip. and air temp. on each elevation layer

$LayerPrecip [list] list of time series of daily precipitation (layer average) [mm]
$LayerTempMean [list] list of time series of daily mean air temperature (layer average) [°C]
$LayerTempMin [list] list of time series of daily min air temperature (layer average) [°C]
$LayerTempMax [list] list of time series of daily max air temperature (layer average) [°C]
$LayerFracSolidPrecip [list] list of time series of daily solid precip. fract. (layer average) [-]
$ZLayers [numeric] vector of median elevation for each layer

ErrorCrit  Error criterion using the provided function

Description

Function which computes an error criterion with the provided function.

Usage

ErrorCrit(InputsCrit, OutputsModel, FUN_CRIT, warnings = TRUE, verbose = TRUE)

Arguments

InputsCrit  [object of class InputsCrit] see CreateInputsCrit for details
OutputsModel  [object of class OutputsModel] see RunModel_GR4J or RunModel_CemaNeigeGR4J for details
FUN_CRIT  [function] error criterion function (e.g. ErrorCrit_RMSE, ErrorCrit_NSE)
warnings  (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE
verbose  (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Value

list  list containing the function outputs, see ErrorCrit_RMSE or ErrorCrit_NSE for details

ErrorCrit_KGE

**Error criterion based on the KGE formula**

**Description**

Function which computes an error criterion based on the KGE formula proposed by Gupta et al. (2009).

**Usage**

ErrorCrit_KGE(InputsCrit, OutputsModel, warnings = TRUE, verbose = TRUE)

**Arguments**

- **InputsCrit** [object of class `InputsCrit`]: see `CreateInputsCrit` for details
- **OutputsModel** [object of class `OutputsModel`]: see `RunModel_GR4J` or `RunModel_CemaNeigeGR4J` for details
- **warnings** (optional) [boolean]: boolean indicating if the warning messages are shown, default = TRUE
- **verbose** (optional) [boolean]: boolean indicating if the function is run in verbose mode or not, default = TRUE

**Details**

In addition to the criterion value, the function outputs include a multiplier (-1 or +1) which allows the use of the function for model calibration: the product CritValue*Multiplier is the criterion to be minimised (Multiplier=-1 for KGE).

**Value**

list list containing the function outputs organised as follows:

- **$CritValue** [numeric]: value of the criterion
- **$CritName** [character]: name of the criterion
- **$SubCritValues** [numeric]: values of the sub-criteria
- **$SubCritNames** [character]: names of the components of the criterion
- **$CritBestValue** [numeric]: theoretical best criterion value
- **$Multiplier** [numeric]: integer indicating whether the criterion is indeed an error (+1) or an efficiency (-1)
- **$Ind_notcomputed** [numeric]: indices of the time steps where InputsCrit$BoolCrit=FALSE or no data is available

### ErrorCrit_KGE2

#### Error criterion based on the KGE' formula

**Description**
Function which computes an error criterion based on the KGE' formula proposed by Kling et al. (2012).

**Usage**

```r
ErrorCrit_KGE2(InputsCrit, OutputsModel, warnings = TRUE, verbose = TRUE)
```

**Arguments**
- **InputsCrit** [object of class InputsCrit] see CreateInputsCrit for details
- **OutputsModel** [object of class OutputsModel] see RunModel_GR4J or RunModel_CemaNeigeGR4J for details
- **warnings** (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE
- **verbose** (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

**Details**
In addition to the criterion value, the function outputs include a multiplier (-1 or +1) which allows the use of the function for model calibration: the product CritValue*Multiplier is the criterion to be minimised (Multiplier=-1 for KGE2).
Value

list  list containing the function outputs organised as follows:
$CritValue [numeric] value of the criterion
$CritName [character] name of the criterion
$SubCritValues [numeric] values of the sub-criteria
$SubCritNames [character] names of the components of the criterion
$CritBestValue [numeric] theoretical best criterion value
$Multiplier [numeric] integer indicating whether the criterion is indeed an error (+1) or an efficiency (-1)
$Ind_notcomputed [numeric] indices of the time steps where InputsCrit$BoolCrit=FALSE or no data is available

Examples
## see example of the ErrorCrit function

### ErrorCrit_NSE
Error criterion based on the NSE formula

Description
Function which computes an error criterion based on the NSE formula proposed by Nash & Sutcliffe (1970).

Usage
ErrorCrit_NSE(InputsCrit, OutputsModel, warnings = TRUE, verbose = TRUE)

Arguments
InputsCrit [object of class InputsCrit] see CreateInputsCrit for details
OutputsModel [object of class OutputsModel] see RunModel_GR4J or RunModel_CemaNeigeGR4J for details
warnings (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Details

In addition to the criterion value, the function outputs include a multiplier (-1 or +1) which allows the use of the function for model calibration: the product CritValue*Multiplier is the criterion to be minimised (Multiplier=-1 for NSE).

Value

list list containing the function outputs organised as follows:

- **$CritValue** [numeric] value of the criterion
- **$CritName** [character] name of the criterion
- **$CritBestValue** [numeric] theoretical best criterion value
- **$Multiplier** [numeric] integer indicating whether the criterion is indeed an error (+1) or an efficiency (-1)
- **$Ind_notcomputed** [numeric] indices of the time steps where InputsCrit$BoolCrit=FALSE or no data is available

**ErrorCrit_RMSE** *Error criterion based on the RMSE*

Description

Function which computes an error criterion based on the root mean square error (RMSE).

Usage

```
ErrorCrit_RMSE(InputsCrit, OutputsModel, warnings = TRUE, verbose = TRUE)
```
Arguments

InputsCrit [object of class InputsCrit] see CreateInputsCrit for details
OutputsModel [object of class OutputsModel] see RunModel_GR4J or RunModel_CemaNeigeGR4J for details
warnings (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Details

In addition to the criterion value, the function outputs include a multiplier (-1 or +1) which allows the use of the function for model calibration: the product CritValue*Multiplier is the criterion to be minimised (Multiplier=+1 for RMSE).

Value

list list containing the function outputs organised as follows:

$CritValue [numeric] value of the criterion
$CritName [character] name of the criterion
$CritBestValue [numeric] theoretical best criterion value
$Multiplier [numeric] integer indicating whether the criterion is indeed an error (+1) or an efficiency (-1)
$Ind_notcomputed [numeric] indices of the time steps where InputsCrit$BoolCrit=FALSE or no data is available

**PEdaily_Oudin**

Computation of daily series of potential evapotranspiration with Oudin’s formula

Description

Function which computes daily PE using the formula from Oudin et al. (2005).
plot.OutputsModel

Usage

PEdaily_Oudin(JD, Temp, LatRad)

Arguments

JD [numeric] time series of julian day [-]
Temp [numeric] time series of daily mean air temperature [°C]
LatRad [numeric] latitude of measurement for the temperature series [rad]

Value

time series of daily potential evapotranspiration [mm/d]

Author(s)

Laurent Coron, Ludovic Oudin (December 2013)

References

Examples

library(airGR)
data(L0123001)
PotEvap <- PEdaily_Oudin(JD = as.POSIXlt(BasinObs$DatesR)$yday, Temp = BasinObs$T, LatRad = 0.8)

plot.OutputsModel Default preview of model outputs

Description

Function which creates a screen plot giving an overview of the model outputs

Usage

# S3 method for class 'OutputsModel'
plot(x, Qobs = NULL, IndPeriod_Plot = NULL,
     BasinArea = NULL, which = "all", log_scale = FALSE, verbose = TRUE, ...)

Arguments

- `x` [object of class `OutputsModel` list of model outputs (which must at least include DatesR, Precip and Qsim) [POSIXlt, mm, mm]
- `qobs` (optional) [numeric] time series of observed flow (for the same time steps than simulated) [mm/time step]
- `IndPeriod_Plot` (optional) [numeric] indices of the time steps to be plotted (among the OutputsModel series)
- `BasinArea` (optional) [numeric] basin area [km²], used to plot flow axes in m³/s
- `which` (optional) [character] choice of plots (e.g. `c("Precip", "Temp", "SnowPack", "Flows", "Regime", "CumFreq", "CorQQ")`), default = "all"
- `log_scale` (optional) [boolean] boolean indicating if the flow axis is to be logarithmic, default = FALSE
- `verbose` (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE
- `...` other parameters to be passed through to plotting functions

Details

Dashboard of results including various graphs (depending on the model):
1. time series of total precipitation
2. time series of temperature (plotted only if CemaNeige is used)
3. time series of snow pack (plotted only if CemaNeige is used)
4. time series of simulated flows (and observed flows if provided)
5. interannual median monthly simulated flow (and observed flows if provided)
6. correlation plot between simulated and observed flows (if observed flows provided)
7. cumulative frequency plot for simulated flows (and observed flows if provided)

Value

screen plot window

Author(s)

Laurent Coron (June 2014), Olivier Delaigue, Guillaume Thirel

Description

Function which performs a single model run with the provided function over the selected period.

Usage

`RunModel( InputsModel, RunOptions, Param, FUN_MOD)`
Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of model parameters
FUN_MOD [function] hydrological model function (e.g. RunModel_GR4J, RunModel_CemaNeigeGR4J)

Value

list see RunModel_GR4J or RunModel_CemaNeigeGR4J for details

InputsCrit <- CreateInputsCrit(FUN_CRIT = ErrorCrit_NSE, InputsModel = InputsModel,
                                RunOptions = RunOptions, Qobs = BasinObs$Qmm[Ind_Run])
OutputsCrit <- ErrorCrit_NSE(InputsCrit = InputsCrit, OutputsModel = OutputsModel)
Description

Function which performs a single run for the CemaNeige daily snow module.

Usage

RunModel_CemaNeige(InputsModel, RunOptions, Param)

Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 2 parameters

CemaNeige X1 weighting coefficient for snow pack thermal state [-]
CemaNeige X2 degree-day melt coefficient [mm/°C/d]

Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list list containing the function outputs organised as follows:

$DatesR [POSIXlt] series of dates
$CemaNeigeLayers[ilayer]$Pliq [numeric] series of liquid precip. [mm/d]
$CemaNeigeLayers[ilayer]$Psol [numeric] series of solid precip. [mm/d]
$CemaNeigeLayers[ilayer]$PotMelt [numeric] series of potential snow melt [mm]
$CemaNeigeLayers[ilayer]$PliqAndMelt [numeric] series of liquid precip. + actual snow melt [mm]
$StateEnd [numeric] states at the end of the run: CemaNeige states [mm & °C]

(refer to the provided references or to the package source code for further details on these model outputs)

Run with the CemaNeigeGR4J hydrological model

Description

Function which performs a single run for the CemaNeige-GR4J daily lumped model over the test period.

Usage

RunModel_CemaNeigeGR4J(InputsModel, RunOptions, Param)

Arguments

InputsModel  [object of class InputsModel] see CreateInputsModel for details
RunOptions    [object of class RunOptions] see CreateRunOptions for details
Param         [numeric] vector of 6 parameters

GR4J X1        production store capacity [mm]
GR4J X2        intercatchment exchange coefficient [mm/d]
GR4J X3        routing store capacity [mm]
GR4J X4        unit hydrograph time constant [d]
CemaNeige X1   weighting coefficient for snow pack thermal state [-]
CemaNeige X2   degree-day melt coefficient [mm/°C/d]

Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list list containing the function outputs organised as follows:

$DatesR        [POSIXlt] series of dates
$PotEvap       [numeric] series of input potential evapotranspiration [mm/d]
$Precip        [numeric] series of input total precipitation [mm/d]
$Prod          [numeric] series of production store level [mm]
$AE            [numeric] series of actual evapotranspiration [mm/d]
$Perc          [numeric] series of percolation (PERC) [mm/d]
$PR            [numeric] series of PR=PN-PS+PERC [mm/d]
$Q9            [numeric] series of UH1 outflow (Q9) [mm/d]
$Q1            [numeric] series of UH2 outflow (Q1) [mm/d]
$Rout          [numeric] series of routing store level [mm]
$Exch          [numeric] series of potential semi-exchange between catchments [mm/d]
$\text{SAExch}$ [numeric] series of actual exchange between catchments (1+2) [mm/d]
$\text{QR}$ [numeric] series of routing store outflow (QR) [mm/d]
$\text{QD}$ [numeric] series of direct flow from UH2 after exchange (QD) [mm/d]
$\text{Qsim}$ [numeric] series of Qsim [mm/d]
$\text{CemaNeigeLayers}$ [list] list of CemaNeige outputs (1 list per layer)
$\text{CemaNeigeLayers[[iLayer]]}$\$\text{Pliq}$ [numeric] series of liquid precip. [mm/d]

RunModel_CemaNeigeGR5J

*Run with the CemaNeigeGR5J hydrological model*

**Description**

Function which performs a single run for the CemaNeige-GR5J daily lumped model.

**Usage**

RunModel_CemaNeigeGR5J(InputsModel, RunOptions, Param)

**Arguments**

InputsModel [object of class *InputsModel*] see CreateInputsModel for details
RunOptions [object of class *RunOptions*] see CreateRunOptions for details
Param [numeric] vector of 7 parameters

- **GR5J X1** production store capacity [mm]
- **GR5J X2** intercatchment exchange coefficient [mm/d]
- **GR5J X3** routing store capacity [mm]
- **GR5J X4** unit hydrograph time constant [d]
- **GR5J X5** intercatchment exchange threshold [-]
CemaNeige X1  weighting coefficient for snow pack thermal state [-]
CemaNeige X2  degree-day melt coefficient [mm/°C/d]

Details
For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.

Value
list list containing the function outputs organised as follows:

$DatesR  [POSIXlt] series of dates
$PotEvap  [numeric] series of input potential evapotranspiration [mm/d]
$Precip  [numeric] series of input total precipitation [mm/d]
$Prod  [numeric] series of production store level [mm]
$AE  [numeric] series of actual evapotranspiration [mm/d]
$Perc  [numeric] series of percolation (PERC) [mm/d]
$PR  [numeric] series of PR=PN-PS+PERC [mm/d]
$Q9  [numeric] series of UH1 outflow (Q9) [mm/d]
$Q1  [numeric] series of UH2 outflow (Q1) [mm/d]
$Rout  [numeric] series of routing store level [mm]
$Exch  [numeric] series of potential semi-exchange between catchments [mm/d]
$AEExch  [numeric] series of actual exchange between catchments (1+2) [mm/d]
$QR  [numeric] series of routing store outflow (QR) [mm/d]
$QD  [numeric] series of direct flow from UH2 after exchange (QD) [mm/d]
$Qsim  [numeric] series of Qsim [mm/d]
$CemaNeigeLayers  [list] list of CemaNeige outputs (1 list per layer)
$CemaNeigeLayers[[iLayer]]$Pliq  [numeric] series of liquid precip. [mm/d]
$CemaNeigeLayers[[iLayer]]$Psol  [numeric] series of solid precip. [mm/d]
$CemaNeigeLayers[[iLayer]]$SnowPack  [numeric] series of snow pack [mm]
$CemaNeigeLayers[[iLayer]]$ThermalState  [numeric] series of snow pack thermal state [°C]
$CemaNeigeLayers[[iLayer]]$Gratio  [numeric] series of Gratio [0-1]
$CemaNeigeLayers[[iLayer]]$PotMelt  [numeric] series of potential snow melt [mm/d]
$CemaNeigeLayers[[iLayer]]$Melt  [numeric] series of actual snow melt [mm/d]
$CemaNeigeLayers[[iLayer]]$PliqAndMelt  [numeric] series of liquid precip. + actual snow melt [mm/d]
$CemaNeigeLayers[[iLayer]]$Temp  [numeric] series of air temperature [°C]
$StateEnd  [numeric] states at the end of the run:
store & unit hydrographs levels [mm], CemaNeige states [mm & °C]

Run with the CemaNeigeGR6J hydrological model

Description
Function which performs a single run for the CemaNeige-GR6J daily lumped model.

Usage
RunModel_CemaNeigeGR6J(InputsModel, RunOptions, Param)

Arguments
InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 8 parameters

- GR6J X1 production store capacity [mm]
- GR6J X2 intercatchment exchange coefficient [mm/d]
- GR6J X3 routing store capacity [mm]
- GR6J X4 unit hydrograph time constant [d]
- GR6J X5 intercatchment exchange threshold [-]
- GR6J X6 coefficient for emptying exponential store [mm]
- CemaNeige X1 weighting coefficient for snow pack thermal state [-]
- CemaNeige X2 degree-day melt coefficient [mm/°C/d]

Details
For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.

Value
list list containing the function outputs organised as follows:

- $DatesR [POSIXlt] series of dates
- $PotEvap [numeric] series of input potential evapotranspiration [mm/d]
- $Precip [numeric] series of input total precipitation [mm/d]

RunModel_GR1A

Description

Function which performs a single run for the GR1A annual lumped model over the test period.

Usage

RunModel_GR1A(InputsModel, RunOptions, Param)

Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 1 parameter

GR1A X1 model parameter [-]
Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see `CreateRunOptions`.

Value

list list containing the function outputs organised as follows:

- `$DatesR` [POSIXlt] series of dates
- `$PotEvap` numeric series of input potential evapotranspiration [mm/y]
- `$Precip` numeric series of input total precipitation [mm/y]
- `$Qsim` numeric series of Qsim [mm/y]
- `$StateEnd` numeric states at the end of the run (NULL) [-]

(refer to the provided references or to the package source code for further details on these model outputs)

## Run with the GR4H hydrological model

**Description**

Function which performs a single run for the GR4H hourly lumped model.

**Usage**

```r
RunModel_GR4H(InputsModel, RunOptions, Param)
```

**Arguments**

- `InputsModel` [object of class `InputsModel`] see `CreateInputsModel` for details
- `RunOptions` [object of class `RunOptions`] see `CreateRunOptions` for details
- `Param` [numeric] vector of 4 parameters
  - GR4H X1  
    production store capacity [mm]
  - GR4H X2  
    groundwater exchange coefficient [mm/h]
  - GR4H X3  
    routing store capacity [mm]
  - GR4H X4  
    unit hydrograph time constant [h]

**Details**

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see `CreateRunOptions`.

**Value**

list list containing the function outputs organised as follows:
$DatesR$ [POSIXlt] series of dates
$PotEvap$ [numeric] series of input potential evapotranspiration [mm/h]
$Precip$ [numeric] series of input total precipitation [mm/h]

RunModel_GR4J

Run with the GR4J hydrological model

Description

Function which performs a single run for the GR4J daily lumped model over the test period.

Usage

RunModel_GR4J(InputsModel, RunOptions, Param)

Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 4 parameters
  GR4J X1 production store capacity [mm]
  GR4J X2 intercatchment exchange coefficient [mm/d]
  GR4J X3 routing store capacity [mm]
  GR4J X4 unit hydrograph time constant [d]

Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.
Value

list containing the function outputs organised as follows:

$DatesR  [POSIXlt] series of dates
$PotEvap [numeric] series of input potential evapotranspiration [mm/d]
$Precip  [numeric] series of input total precipitation [mm/d]
$Prod    [numeric] series of production store level [mm]
$AE      [numeric] series of actual evapotranspiration [mm/d]
$Perc    [numeric] series of percolation (PERC) [mm/d]
$PR      [numeric] series of PR=PN-PS+PERC [mm/d]
$Q9      [numeric] series of UH1 outflow (Q9) [mm/d]
$Q1      [numeric] series of UH2 outflow (Q1) [mm/d]
$Rout    [numeric] series of routing store level [mm]
$Exch    [numeric] series of potential semi-exchange between catchments [mm/d]
$AExch   [numeric] series of actual exchange between catchments (1+2) [mm/d]
$QR      [numeric] series of routing store outflow (QR) [mm/d]
$QD      [numeric] series of direct flow from UH2 after exchange (QD) [mm/d]
$Qsim    [numeric] series of Qsim [mm/d]
$StateEnd [numeric] states at the end of the run (res. levels, UH1 levels, UH2 levels) [mm]

RunModel_GR5J  Run with the GR5J hydrological model

### Description
Function which performs a single run for the GR5J daily lumped model over the test period.

### Usage
RunModel_GR5J(InputsModel, RunOptions, Param)

### Arguments
- **InputsModel**  [object of class *InputsModel*] see CreateInputsModel for details
- **RunOptions**   [object of class *RunOptions*] see CreateRunOptions for details
- **Param**        [numeric] vector of 5 parameters
  - **GR5J X1**  production store capacity [mm]
  - **GR5J X2**  intercatchment exchange coefficient [mm/d]
  - **GR5J X3**  routing store capacity [mm]
  - **GR5J X4**  unit hydrograph time constant [d]
  - **GR5J X5**  intercatchment exchange threshold [-]

### Details
For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.
Value

list  list containing the function outputs organised as follows:

$DatesR    [POSIXlt] series of dates
$PotEvap   [numeric] series of input potential evapotranspiration [mm/d]
$Precip    [numeric] series of input total precipitation [mm/d]
$Prod      [numeric] series of production store level [mm]
$AE        [numeric] series of actual evapotranspiration [mm/d]
$Perc      [numeric] series of percolation (PERC) [mm/d]
$PR        [numeric] series of PR=PN-PS+PERC [mm/d]
$Q9        [numeric] series of UH1 outflow (Q9) [mm/d]
$Q1        [numeric] series of UH2 outflow (Q1) [mm/d]
$Rout      [numeric] series of routing store level [mm]
$Exch      [numeric] series of potential semi-exchange between catchments [mm/d]
$AExch     [numeric] series of actual exchange between catchments (1+2) [mm/d]
$QR        [numeric] series of routing store outflow (QR) [mm/d]
$QD        [numeric] series of direct flow from UH2 after exchange (QD) [mm/d]
$Qsim      [numeric] series of Qsim [mm/d]
$StateEnd  [numeric] states at the end of the run (res. levels, UH1 levels, UH2 levels) [mm]

(refer to the provided references or to the package source code for further details on these model outputs)

## loading catchment data
data(L0123001)

## preparation of the InputsModel object
RunModel_GR6J

Description

Function which performs a single run for the GR6J daily lumped model over the test period.

Usage

RunModel_GR6J(InputsModel, RunOptions, Param)

Arguments

InputsModel   [object of class InputsModel] see CreateInputsModel for details
RunOptions    [object of class RunOptions] see CreateRunOptions for details
Param         [numeric] vector of 6 parameters

GR6J X1 production store capacity [mm]
GR6J X2 intercatchment exchange coefficient [mm/d]
GR6J X3 routing store capacity [mm]
GR6J X4 unit hydrograph time constant [d]
GR6J X5 intercatchment exchange threshold [-]
GR6J X6 coefficient for emptying exponential store [mm]
Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see `CreateRunOptions`.

Value

list  list containing the function outputs organised as follows:

SeriesAggreg

Conversion of time series to another time step (aggregation only)

Description

Conversion of time series to another time step (aggregation only).
Warning: on the aggregated outputs, the dates correspond to the beginning of the time step
(e.g. for daily time-series 01/03/2005 00:00 = value for period 01/03/2005 00:00 - 01/03/2005 23:59)
(e.g. for monthly time-series 01/03/2005 00:00 = value for period 01/03/2005 00:00 - 31/03/2005 23:59)
(e.g. for yearly time-series 01/03/2005 00:00 = value for period 01/03/2005 00:00 - 28/02/2006 23:59)

Usage

SeriesAggreg(TabSeries, TimeFormat, NewTimeFormat, ConvertFun, YearFirstMonth = 1, TimeLag = 0, verbose = TRUE)
Arguments

TabSeries  [POSIXt+numeric] data.frame containing the vector of dates (POSIXt) and the time series values numeric
TimeFormat [character] desired format (i.e. "hourly", "daily", "monthly" or "yearly")
NewTimeFormat [character] desired format (i.e. "hourly", "daily", "monthly" or "yearly")
ConvertFun [character] names of aggregation functions (e.g. for P[mm], T[deg], Q[mm]: ConvertFun <- c("sum", "mean", "sum"))
YearFirstMonth (optional) [numeric] integer used when NewTimeFormat = "yearly" to set when the starting month of the year (e.g. 01 for calendar year or 09 for hydrological year starting in September)
TimeLag (optional) [numeric] numeric indicating a time lag (in seconds) for the time series aggregation (especially useful to aggregate hourly time series in daily time series)
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = FALSE

Value

POSIXct+numeric data.frame containing a vector of aggregated dates (POSIXct) and time series values numeric

Author(s)

Laurent Coron (March 2015)

Examples

library(airGR)

## loading catchment data
data(L0123002)

## preparation of the initial time series data frame at the daily time step
TabSeries <- data.frame(BasinObs$DatesR, BasinObs$P, BasinObs$E, BasinObs$T, BasinObs$Qmm)
TimeFormat <- "daily"

## conversion at the monthly time step
NewTimeFormat <- "monthly"
ConvertFun <- c("sum", "sum", "mean", "sum")
NewTabSeries <- SeriesAggreg(TabSeries = TabSeries, TimeFormat, NewTimeFormat, ConvertFun)

## conversion at the yearly time step
NewTimeFormat <- "yearly"
ConvertFun <- c("sum", "sum", "mean", "sum")
NewTabSeries <- SeriesAggreg(TabSeries = TabSeries, TimeFormat, NewTimeFormat, ConvertFun)
Description

Function which transforms model parameters using the provided function (from raw to transformed parameters and vice versa).

Usage

TransfoParam(ParamIn, Direction, FUN_TRANSFO)

Arguments

ParamIn [numeric] matrix of parameter sets (sets in line, parameter values in column)
Direction [character] direction of the transformation: use "RT" for Raw->Transformed and "TR" for Transformed->Raw
FUN_TRANSFO [function] model parameters transformation function (e.g. TransfoParam_GR4J, TransfoParam_CemaNeigeGR4J)

Value

ParamOut [numeric] matrix of parameter sets (sets in line, parameter values in column)

Author(s)

Laurent Coron (June 2014)

                 +4.50, -0.10, +5.00, -8.10),
                 ncol = 4, byrow = TRUE)
Xraw <- TransfoParam(ParamIn = Xtran, Direction = "TR", FUN_TRANSFO = TransfoParam_GR4J)
Transformation of the parameters of the CemaNeige module

Description

Function which transforms model parameters of the CemaNeige module (from raw to transformed parameters and vice versa).

Usage

`TransfoParam_CemaNeige(ParamIn, Direction)`

Arguments

- **ParamIn**: [numeric] matrix of parameter sets (sets in line, parameter values in column)
- **Direction**: [character] direction of the transformation: use "RT" for Raw->Transformed and "TR" for Transformed->Raw

Value

- **ParamOut**: [numeric] matrix of parameter sets (sets in line, parameter values in column)

Xraw <- TransfoParam_CemaNeige(ParamIn = Xtran, Direction = "TR")
```
**TransfoParam_GR2M**

**Description**

Function which transforms model parameters of the GR2M model (from real to transformed parameters and vice versa).

**Usage**

TransfoParam_GR2M(ParamIn, Direction)

**Arguments**

<table>
<thead>
<tr>
<th>ParamIn</th>
<th>[numeric] matrix of parameter sets (sets in line, parameter values in column)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction</td>
<td>[character] direction of the transformation: use &quot;RT&quot; for Raw-&gt;Transformed and &quot;TR&quot; for Transformed-&gt;Raw</td>
</tr>
</tbody>
</table>

**Value**

ParamOut [numeric] matrix of parameter sets (sets in line, parameter values in column)

**Author(s)**

Laurent Coron (March 2015)
**Transformation of the parameters of the GR4H model**

**Value**

*ParamOut* [numeric] matrix of parameter sets (sets in line, parameter values in column)
