Package ‘airGR’

June 21, 2019

Type Package

Title Suite of GR Hydrological Models for Precipitation-Runoff Modelling

Version 1.3.2.23

Date 2019-06-20

Depends R (>= 3.0.1)

Suggests knitr, rmarkdown, coda, DEoptim, dplyr, FME, ggmcmc, hydroPSO, Rmalschains

Description Hydrological modelling tools developed at Irstea-Antony (HYCAR Research Unit, France). The package includes several conceptual rainfall-runoff models (GR4H, GR4J, GR5J, GR6J, GR2M, GR1A), a snow accumulation and melt model (CemaNeige) and the associated functions for their calibration and evaluation. Use help(airGR) for package description and references.

Index 81
Description

This package brings into R the hydrological modelling tools used at IRSTEA-Antony (HYCAR Research Unit, France), including rainfall-runoff models (GR4H, GR4J, GR5J, GR6J, GR2M, GR1A) and a snow accumulation and melt model (CemaNeige). Each model core is coded in FORTRAN to ensure low computational time. The other package functions (i.e. mainly the calibration algorithm and the computation of the efficiency criteria) are coded in R.

## —- Functions and objects

The airGR package has been designed to fulfil two major requirements: facilitate the use by non-expert users and allow flexibility regarding the addition of external criteria, models or calibration algorithms. The names of the functions and their arguments were chosen to this end.

The package is mostly based on three families of functions:
- the functions belonging to the RunModel family require three arguments: InputsModel, RunOptions and Param; please refer to help pages CreateInputsModel and CreateRunOptions for further details and examples;
- the functions belonging to the ErrorCrit family require two arguments: InputsCrit and OutputsModel; please refer to help pages CreateInputsCrit and RunModel for further details and examples;
- the functions belonging to the Calibration family require four arguments: InputsModel, RunOptions, InputsCrit and CalibOptions; please refer to help pages CreateInputsModel, CreateRunOptions, CreateInputsCrit and CreateCalibOptions for further details and examples.

In order to limit the risk of mis-use and increase the flexibility of these main functions, we imposed the structure of their arguments and defined their class. Most users will not need to worry about these imposed structures since functions are provided to prepare these arguments for them: CreateInputsModel, CreateRunOptions, CreateInputsCrit, CreateCalibOptions. However, advanced users wishing to supplement the package with their own models will need to comply with these imposed structures and refer to the package source codes to get all the specification requirements.

## —- Models

Six hydrological models and one snow melt and accumulation model are implemented in airGR. The snow model can also be used alone or with the daily hydrological models, and each hydrological model can either be used alone or together with the snow model.

These models can be called within airGR using the following functions:
- RunModel_Gr4H: four-parameter hourly lumped hydrological model (Mathevet, 2005)
- RunModel_Gr4J: four-parameter daily lumped hydrological model (Perrin et al., 2003)
- RunModel_Gr5J: five-parameter daily lumped hydrological model (Le Moine, 2008)
- RunModel_Gr6J: six-parameter daily lumped hydrological model (Pushpalatha et al., 2011)
- RunModel_Gr2M: two-parameter monthly lumped hydrological model (Mouelhi, 2003 ; Mouelhi
et al., 2006a)
- **RunModel_GR1A**: one-parameter yearly lumped hydrological model (Mouelhi, 2003; Mouelhi et al., 2006b)
- **RunModel_CemaNeige**: two-parameter degree-day snow melt and accumulation daily model (Valéry et al., 2014)
- **RunModel_CemaNeigeGR4H**: combined use of GR4H and CemaNeige
- **RunModel_CemaNeigeGR4J**: combined use of GR4J and CemaNeige
- **RunModel_CemaNeigeGR5J**: combined use of GR5J and CemaNeige
- **RunModel_CemaNeigeGR6J**: combined use of GR6J and CemaNeige

### — How to get started

To learn how to use the functions from the airGR package, it is recommended to follow the five steps described below:

1. refer to the help for **RunModel_GR4J** then run the provided example to assess how to make a simulation;
2. refer to the help for **CreateInputsModel** to understand how the inputs of a model are prepared/organised;
3. refer to the help for **CreateRunOptions** to understand how the run options of a model are parametrised/organised;
4. refer to the help for **ErrorCrit_NSE** and **CreateInputsCrit** to understand how the computation of an error criterion is prepared/made;
5. refer to the help for **Calibration_Michel**, run the provided example and then refer to the help for **CreateCalibOptions** to understand how a model calibration is prepared/made.

For more information and to get started with the package, you can refer to the vignette (**vignette("airGR")**) and go on the airGR website.

</thead>
<tbody>
<tr>
<td></td>
<td>Data sample: characteristics of a different catchments</td>
</tr>
</tbody>
</table>

**Description**

L0123001, L0123002 and L0123003 are fictional catchments.
X0310010 contains actual data from the Durance River at Embrun [La Clapière] (Hautes-Alpes, France).

R-object containing the code, station’s name, area and hypsometric curve of the catchment.

**Format**

List named 'BasinInfo' containing

- two strings: catchment’s code and station’s name
- one float: catchment's area in km²
- one numeric vector: catchment’s hypsometric curve (min, quantiles 01 to 99 and max) in metres

**See Also**

BasinObs.

**Examples**

```r
library(airGR)
data(L0123001)
str(BasinInfo)
```
Description

L0123001, L0123002 or L0123003 are fictional catchments. X0310010 contains actual data from the Durance River at Embrun [La Clapière] (Hautes-Alpes, France). The flows are provided by Electricity of France (EDF) and were retrieved from the Banque Hydro database (http://www.hydro.eaufrance.fr). The meteorological forcing are derived from the SAFRAN reanalysis from Météo-France (Vidal et al., 2010). R-object containing the times series of precipitation, temperature, potential evapotranspiration and discharge. X0310010 contains in addition MODIS snow cover area (SCA) data retrieved from the National Snow and Ice Data Center (NSIDC) repository (https://nsidc.org/). Five SCA time series are given, corresponding to 5 elevation bands of the CemaNeige model (default configuration). SCA data for days with important cloudiness (> 40%) were set to missing values for the sake of data representativeness.

Times series for L0123001, L0123002 and X0310010 are at the daily time step for use with daily models such as GR4J, GR5J, GR6J, CemaNeigeGR4J, CemaNeigeGR5J and CemaNeigeGR6J. Times series for X0310010 are provided in order to test hysteresis version of CemaNeige (see CreateRunOptions (Riboust et al., 2019). Times series for L0123003 are at the hourly time step for use with hourly models such as GR4H.

Format

Data frame named 'BasinObs' containing

- one POSIXct vector: time series dates in the POSIXct format
- five numeric vectors: time series of catchment average precipitation [mm/time step], catchment average air temperature [°C], catchment average potential evapotranspiration [mm/time step], outlet discharge [l/s], outlet discharge [mm/time step]

Calibration_Michel

Calibration algorithm that optimises the error criterion selected as objective function using the Irstea procedure described by C. Michel

Description

Calibration algorithm that optimises the error criterion selected as objective function.

The algorithm combines a global and a local approach. First, a screening is performed using either a rough predefined grid or a list of parameter sets. Then a steepest descent local search algorithm is performed, starting from the result of the screening procedure.

Usage

Calibration_Michel(InputsModel, RunOptions, InputsCrit, CalibOptions, FUN_MOD, FUN_CRIT, FUN_TRANSFO = NULL, verbose = TRUE)

Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
InputsCrit [object of class InputsCrit] see CreateInputsCrit for details
CalibOptions [object of class CalibOptions] see CreateCalibOptions for details
FUN_MOD [function] hydrological model function (e.g. RunModel_GR4J, RunModel_CemaNeigeGR4J)
FUN_CRIT (deprecated) [function] error criterion function (e.g. ErrorCrit_RMSE, ErrorCrit_NSE)
FUN_TRANSFO (optional) [function] model parameters transformation function, if the FUN_MOD used is native in the package FUN_TRANSFO is automatically defined
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Details

A screening is first performed either based on a rough predefined grid (considering various initial values for each parameter) or from a list of initial parameter sets. The best set identified in this screening is then used as a starting point for the steepest descent local search algorithm.

For this search, since the ranges of parameter values can be quite different, simple mathematical transformations are applied to parameters to make them vary in a similar range and get a similar sensitivity to a predefined search step. This is done using the TransfoParam functions.

During the steepest descent method, at each iteration, we start from a parameter set of NParam values (NParam being the number of free parameters of the chosen hydrological model) and we determine the 2*NParam-1 new candidates by changing one by one the different parameters (+/- search step).
All these candidates are tested and the best one kept to be the starting point for the next iteration. At the end of each iteration, the search step is either increased or decreased to adapt the progression speed. A composite step can occasionally be done. The calibration algorithm stops when the search step becomes smaller than a predefined threshold.

Value

<table>
<thead>
<tr>
<th>list list containing the function outputs organised as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ParamFinalR [numeric] parameter set obtained at the end of the calibration</td>

CreateCalibOptions  

Creation of the CalibOptions object required by the Calibration functions.

Description

Creation of the CalibOptions object required by the Calibration* functions.

Usage

CreateCalibOptions(FUN_MOD, FUN_CALIB = Calibration_Michel, 
FUN_TRANSFO = NULL, IsHyst = FALSE, FixedParam = NULL, 
SearchRanges = NULL, StartParamList = NULL, 
StartParamDistrib = NULL)
Arguments

**FUN_MOD**  [function] hydrological model function (e.g. RunModel_GR4J, RunModel_CemaNeigeGR4J)

**FUN_CALIB** (optional) [function] calibration algorithm function (e.g. Calibration_Michel), default = Calibration_Michel

**FUN_TRANSFO** (optional) [function] model parameters transformation function, if the FUN_MOD used is native in the package, FUN_TRANSFO is automatically defined

**IsHyst** [boolean] boolean indicating if the hysteresis version of CemaNeige is used. See details

**FixedParam** (optional) [numeric] vector giving the values set for the non-optimised parameter values (NParam columns, 1 line)
Example:

```
NA  NA  3.34  ...  NA
```

**SearchRanges** (optional) [numeric] matrix giving the ranges of real parameters (NParam columns, 2 lines)
Example:

```
[X1]  [X2]  [X3]  [...]  [Xj]
[1,]  0    -1   0    ...    0.0
[2,]  3000  +1  100   ...    3.0
```

**StartParamList** (optional) [numeric] matrix of parameter sets used for grid-screening calibration procedure (values in columns, sets in line)
Example:

```
[X1]  [X2]  [X3]  [...]  [Xj]
[set1]  800   -0.7  25   ...   1.0
[set2]  1000  -0.5  22   ...   1.1
[... ]  ...  ...  ...  ...  ...
[set n]  200   -0.3  17   ...   1.0
```

**StartParamDistrib** (optional) [numeric] matrix of parameter values used for grid-screening calibration procedure (values in columns, percentiles in line)
Example:

```
[X1]  [X2]  [X3]  [...]  [Xj]
[value1]  800   -0.7  25   ...   1.0
[value2]  1000  NA   50   ...   1.2
[value3]  1200  NA   NA   ...   1.6
```
## Details

Users wanting to use FUN_MOD, FUN_CALIB or FUN_TRANSFO functions that are not included in the package must create their own CalibOptions object accordingly.

```r
# Create CalibOptions object
CreateCalibOptions()
```

### CemaNeige version

If `ishyst = FALSE`, the original CemaNeige version from Valéry et al. (2014) is used.

If `ishyst = TRUE`, the CemaNeige version from Riboust et al. (2019) is used. Compared to the original version, this version of CemaNeige needs two more parameters and it includes a representation of the hysteretic relationship between the Snow Cover Area (SCA) and the Snow Water Equivalent (SWE) in the catchment. The hysteresis included in airGR is the Modified Linear hysteresis (LH*); it is represented on panel b) of Fig. 3 in Riboust et al. (2019). Riboust et al. (2019) advise to use the LH* version of CemaNeige with parameters calibrated using an objective function combining 75% of KGE calculated on discharge simulated from a rainfall-runoff model compared to observed discharge and 5% of KGE calculated on SCA on 5 CemaNeige elevation bands compared to satellite (e.g. MODIS) SCA (see Eq. (18), Table 3 and Fig. 6). Riboust et al. (2019)’s tests were realized with GR4J as the chosen rainfall-runoff model.

### Value

A list object of class `CalibOptions` containing the data required to evaluate the model outputs; it can include the following:

- `$FixedParam` [numeric] vector giving the values to allocate to non-optimised parameter values
- `$SearchRanges` [numeric] matrix giving the ranges of raw parameters
- `$StartParamList` [numeric] matrix of parameter sets used for grid-screening calibration procedure
- `$StartParamDistrib` [numeric] matrix of parameter values used for grid-screening calibration procedure

### Author(s)

Laurent Coron, Olivier Delaigue, Guillaume Thirel

### See Also

- `calibration`
- `runmodel`

### Examples

```r
library(airGR)

## loading catchment data
data(L0123001)

## preparation of InputsModel object
InputsModel <- CreateInputsModel(FUN_MOD = RunModel_GR4J, DatesR = BasinObs$DatesR,
                                  Precip = BasinObs$P, PotEvap = BasinObs$E)

## calibration period selection
```

---

*Original note:*

CreateCalibOptions

Details

Users wanting to use FUN_MOD, FUN_CALIB or FUN_TRANSFO functions that are not included in the package must create their own CalibOptions object accordingly.

```r
# Create CalibOptions object
CreateCalibOptions()
```

### CemaNeige version

If `ishyst = FALSE`, the original CemaNeige version from Valéry et al. (2014) is used.

If `ishyst = TRUE`, the CemaNeige version from Riboust et al. (2019) is used. Compared to the original version, this version of CemaNeige needs two more parameters and it includes a representation of the hysteretic relationship between the Snow Cover Area (SCA) and the Snow Water Equivalent (SWE) in the catchment. The hysteresis included in airGR is the Modified Linear hysteresis (LH*); it is represented on panel b) of Fig. 3 in Riboust et al. (2019). Riboust et al. (2019) advise to use the LH* version of CemaNeige with parameters calibrated using an objective function combining 75% of KGE calculated on discharge simulated from a rainfall-runoff model compared to observed discharge and 5% of KGE calculated on SCA on 5 CemaNeige elevation bands compared to satellite (e.g. MODIS) SCA (see Eq. (18), Table 3 and Fig. 6). Riboust et al. (2019)’s tests were realized with GR4J as the chosen rainfall-runoff model.

### Value

A list object of class `CalibOptions` containing the data required to evaluate the model outputs; it can include the following:

- `$FixedParam` [numeric] vector giving the values to allocate to non-optimised parameter values
- `$SearchRanges` [numeric] matrix giving the ranges of raw parameters
- `$StartParamList` [numeric] matrix of parameter sets used for grid-screening calibration procedure
- `$StartParamDistrib` [numeric] matrix of parameter values used for grid-screening calibration procedure

Details

20 numeric values are required for UH1 and 40 numeric values are required for UH2 if GR4J, GR5J or GR6J are used (respectively 20*24 and 40*24 for the hourly model GR4H). Please note that depending on the X4 parameter value that will be provided when running the model, not all the values may be used (only the first int(X4)+1 values are used for UH1 and the first 2*int(X4)+1 for UH2). GCemaNeigeLayers and eTGcemaNeigeLayers require each numeric values as many as given in CreateInputsModel with the NLayersargument. eTGcemaNeigeLayers values can be negatives. The structure of the object of class IniStates returned is always exactly the same for all models (except for the unit hydrographs levels that contain more values with GR4H), even if some states do not exist (e.g. $SUH$SUHI for GR2M).

If CemaNeige is not used, $SCemaNeigeLayersSG$ and $SCemaNeigeLayersSeTG$ are set to NA.
Nota: the StateEnd objects from the outputs of RunModel* functions already respect the format given by the CreateIniStates function.

Value

list object of class IniStates containing the initial model internal states; it always includes the following:

- **$Store**: [numeric] list of store levels ($Prod$, $Rout$ and $Exp$)
- **$SUH**: [numeric] list of unit hydrographs levels ($SUH1$ and $SUH2$)
- **$CemaNeigeLayers**: [numeric] list of CemaNeige variables ($G$ and $eTG$)

```
CreateInputsCrit

CreateInputsCrit

Create the InputsCrit object required to the ErrorCrit functions

Description

Creation of the InputsCrit object required to the ErrorCrit_+ functions. This function is used to define whether the user wants to calculate a single criterion, multiple criteria in the same time, or a composite criterion, which averages several criteria.

Usage

CreateInputsCrit(FUN_CRIT, InputsModel, RunOptions, Qobs, Obs, VarObs = "Q", BoolCrit = NULL, transfo = "", Weights = NULL, Ind_zeroes = NULL, epsilon = NULL, warnings = TRUE, verbose = TRUE)

Arguments

FUN_CRIT [function (atomic or list)] error criterion function (e.g. ErrorCrit_RMSE, ErrorCrit_NSE)
CreateInputsCrit

InputsModel  [object of class InputsModel] see CreateInputsModel for details
RunOptions  [object of class RunOptions] see CreateRunOptions for details
Qobs  (deprecated) [numeric (atomic or list)] series of observed discharges [mm/time step]
Obs  [numeric (atomic or list)] series of observed variable ([mm/time step] for discharge or SWE, [-] for SCA)
VarObs  (optional) [character (atomic or list)] names of the observed variable ("Q" by default, or one of "SCA", "SWE")
BoolCrit  (optional) [boolean (atomic or list)] boolean (the same length as Obs) giving the time steps to consider in the computation (all time steps are considered by default)
transfo  (optional) [character (atomic or list)] name of the transformation (e.g. ",", "sqrt", "log", "inv", "sort", "boxcox" or a numeric value for power transformation (see details))
Weights  (optional) [numeric (atomic or list)] vector of weights necessary to calculate a composite criterion (the same length as FUN_CRIT) giving the weights to use for elements of FUN_CRIT [-]. See details
Ind_zeros  (deprecated) [numeric] indices of the time steps where zeroes are observed
epsilon  (optional) [numeric (atomic or list)] small value to add to all observations and simulations when "log" or "inv" transformations are used [same unit as Obs]. See details
warnings  (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE
verbose  (deprecated) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Details

Users wanting to use FUN_CRIT functions that are not included in the package must create their own InputsCrit object accordingly.

The syntax of the power transformation allows a numeric or a string of characters. For example for a squared transformation, the following can be used: transf = 2, transf = "2" or transf = "*2". Negative values are allowed. Fraction values are not allowed (e.g., "-1/2" must instead be written "-0.5").

In order to make sure that KGE and KGE2 remain dimensionless and not impacted by zero values, the Box-Cox transformation (transf = "boxcox") uses the formulation given in Equation 10 of Santos et al. (2018). Lambda is set to 0.25 accordingly.

The epsilon value is useful when "log" or "inv" transformations are used (to avoid calculation of the inverse or of the logarithm of zero). The impact of this value and a recommendation about the epsilon value to use (usually one hundredth of average observation) are discussed in Pushpalatha et al. (2012) for NSE and in Santos et al. (2018) for KGE and KGE'.

CreateInputsCrit
We do not advise computing KGE or KGE’ with log-transformation as it might be wrongly influenced by discharge values close to 0 or 1 and the criterion value is dependent on the discharge unit. See Santos et al. (2018) for more details and alternative solutions (see the references list below).

Users can set the following arguments as atomic or list: FUN_CRIT, Obs, VarObs, BoolCrit, transfo, Weights. If the list format is chosen, all the lists must have the same length.

Calculation of a single criterion (e.g. NSE computed on discharge) is prepared by providing to CreateInputsCrit arguments atomics only.

Calculation of multiple criteria (e.g. NSE computed on discharge and RMSE computed on discharge) is prepared by providing to CreateInputsCrit arguments lists except for Weights that must be set as NULL.

Calculation of a composite criterion (e.g. the average between NSE computed on discharge and NSE computed on log of discharge) is prepared by providing to CreateInputsCrit arguments lists including Weights. ErrorCrit_RMSE cannot be used in a composite criterion since it is not a unitless value.

Value

list object of class InputsCrit containing the data required to evaluate the model outputs; it can include the following:

$FUN_CRIT [function] error criterion function (e.g. ErrorCrit_RMSE, ErrorCrit_NSE)
$Obs [numeric] series of observed variable(s) ([mm/time step] for discharge or SWE, [-] for SCA)
$VarObs [character] names of the observed variable(s)
$BoolCrit [boolean] boolean giving the time steps considered in the computation
$transfo [character] name of the transformation (e.g. "", "sqrt", "log", "inv", "sort", "boxcox" or a number for power transformation)
$epsilon [numeric] small value to add to all observations and simulations when "log" or "inv" transformations are used
$Weights [numeric] vector (same length as VarObs) giving the weights to use for elements of FUN_CRIT [-]

When Weights = NULL, CreateInputsCrit returns an object of class Single that is a list such as the one described above.

When Weights contains at least one NULL value and Obs contains a list of observations, CreateInputsCrit returns an object of class Multi that is a list of lists such as the one described above. The ErrorCrit function will then compute the different criteria prepared by CreateInputsCrit.

When Weights is a list of at least 2 numerical values, CreateInputsCrit returns an object of class Compo that is a list of lists such as the one described above. This object will be useful to compute composite criterion with the ErrorCrit function.

To calculate composite of multiple criteria, it is necessary to use the ErrorCrit function. The other ErrorCrit.* functions (e.g. ErrorCrit_RMSE, ErrorCrit_NSE) can only use objects of class Single (and not Multi or Compo).

CreateInputsModel

Description

Creation of the InputsModel object required to the RunModel functions.

Usage

CreateInputsModel(FUN_MOD, DatesR, Precip, PrecipScale = TRUE, PotEvap = NULL, 
TempMean = NULL, TempMin = NULL, TempMax = NULL, ZInputs = NULL, HypsoData = NULL, 
NLayers = 5, verbose = TRUE)

Arguments

FUN_MOD [function] hydrological model function (e.g. RunModel_Gr4J, RunModel_CemaNeigeGR4J) 
DatesR [POSIXt] vector of dates required to create the GR model and CemaNeige module inputs 
Precip [numeric] time series of total precipitation (catchment average) [mm/time step], required to create the GR model and CemaNeige module inputs 
PrecipScale (optional) [boolean] indicating if the mean of the precipitation interpolated on the elevation layers must be kept or not, required to create CemaNeige module inputs, default = TRUE (the mean of the precipitation is kept to the original value) 
PotEvap [numeric] time series of potential evapotranspiration (catchment average) [mm/time step], required to create the GR model inputs 
TempMean (optional) [numeric] time series of mean air temperature [°C], required to create the CemaNeige module inputs 
TempMin (optional) [numeric] time series of min air temperature [°C], possibly used to create the CemaNeige module inputs 
TempMax (optional) [numeric] time series of max air temperature [°C], possibly used to create the CemaNeige module inputs
CreateInputsModel

- **ZInputs** (optional) [numeric] real giving the mean elevation of the Precip and Temp series (before extrapolation) [m], possibly used to create the CemaNeige module inputs.
- **Hypsodata** (optional) [numeric] vector of 101 reals: min, q01 to q99 and max of catchment elevation distribution [m], if not defined a single elevation is used for CemaNeige.
- **NLayers** (optional) [numeric] integer giving the number of elevation layers requested [-], required to create CemaNeige module inputs, default=5.
- **verbose** (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE.

**Details**

Users wanting to use FUN_MOD functions that are not included in the package must create their own InputsModel object accordingly.

Please note that if CemaNeige is used, and ZInputs is different than Hypsodata, then precipitation and temperature are interpolated with the DataAltExtrapolation_Valery function.

**Value**

- `list` object of class `InputsModel` containing the data required to evaluate the model outputs; it can include the following:

  - `$DatesR` [POSIXlt] vector of dates.
  - `$Precip` [numeric] time series of total precipitation (catchment average) [mm/time step].
  - `$PotEvap` [numeric] time series of potential evapotranspiration (catchment average) [mm/time step], defined if FUN_MOD includes GR4H, GR4J, GR5J, GR6J, GR2M or GR1A.
  - `$LayerPrecip` [list] list of time series of precipitation (layer average) [mm/time step], defined if FUN_MOD includes CemaNeige.
  - `$LayerTempMean` [list] list of time series of mean air temperature (layer average) [°C], defined if FUN_MOD includes CemaNeige.
  - `$LayerFracSolidPrecip` [list] list of time series of solid precipitation fraction (layer average) [-], defined if FUN_MOD includes CemaNeige.

InputsCrit <- CreateInputsCrit(FUN_CRIT = ErrorCrit_NSE, InputsModel = InputsModel,
                                RunOptions = RunOptions, Obs = BasinObs$Qmm[Ind_Run])
OutputsCrit <- ErrorCrit_NSE(InputsCrit = InputsCrit, OutputsModel = OutputsModel)

CreateRunOptions

Creation of the RunOptions object required to the RunModel functions

Description

Creation of the RunOptions object required to the RunModel functions.

Usage

CreateRunOptions(FUN_MOD, InputsModel,
                IndPeriod_WarmUp = NULL, IndPeriod_Run,
                Inistates = NULL, IniResLevels = NULL,
                Outputs_Cal = NULL, Outputs_Sim = "all",
                RunSnowModule, MeanAnSolidPrecip = NULL,
                Ishyst = FALSE,
                warnings = TRUE, verbose = TRUE)
Arguments

**FUN_MOD** [function] hydrological model function (e.g. RunModel_GR4J, RunModel_CemaNeigeGR4J)

**InputsModel** [object of class InputsModel] see CreateInputsModel for details

**IndPeriod_WarmUp** (optional) [numeric] index of period to be used for the model warm-up [-]

**IndPeriod_Run** [numeric] index of period to be used for the model run [-]

**IniStates** (optional) [numeric] object of class IniStates [mm and °C], see CreateIniStates for details

**IniResLevels** (optional) [numeric] vector of initial fillings for the GR stores (2 or 3 values according to the model) [- and/or mm]; see details

**Outputs_Cal** (optional) [character] vector giving the outputs needed for the calibration (e.g. c("Qsim")), the fewer outputs the faster the calibration

**Outputs_Sim** (optional) [character] vector giving the requested outputs (e.g. c("DatesR", "Qsim", "SnowPack")), default = "all"

**RunSnowModule** (deprecated) [boolean] option indicating whether CemaNeige should be activated. Please adapt FUN_MOD instead

**MeanAnSolidPrecip** (optional) [numeric] vector giving the annual mean of average solid precipitation for each layer (computed from InputsModel if not defined) [mm/y]

**IsHyst** [boolean] boolean indicating if the hysteresis version of CemaNeige is used. See details

**warnings** (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE

**verbose** (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Details

Users wanting to use FUN_MOD functions that are not included in the package must create their own RunOptions object accordingly.

### — Initialisation options

The model initialisation options can either be set to a default configuration or be defined by the user. This is done via three vectors:

- **IndPeriod_WarmUp**, **IniStates**, **IniResLevels**.

A default configuration is used for initialisation if these vectors are not defined.

1. Default initialisation options:

   - **IndPeriod_WarmUp** default setting ensures a one-year warm-up using the time steps preceding the **IndPeriod_Run**. The actual length of this warm-up might be shorter depending on data availability (no missing value of climate inputs being allowed in model input series).
   - **IniStates** and **IniResLevels** are automatically set to initialise all the model states at 0, except for the production and routing stores which are respectively initialised at 30 % and 50 % of their capacity. In case GR6J is used, the exponential store is initialised by default with 0 mm. This initialisation is made at the very beginning of the model call (i.e. at the beginning of **IndPeriod_WarmUp** or at the beginning of **IndPeriod_Run** if the warm-up period is disabled).
(2) Customisation of initialisation options:

- **IndPeriod_WarmUp** can be used to specify the indices of the warm-up period (within the time series prepared in InputsModel).
  - remark 1: for most common cases, indices corresponding to one or several years preceding **IndPeriod_Run** are used (e.g. **IndPeriod_WarmUp** = 1000:1365 and **IndPeriod_Run** = 1366:5000). However, it is also possible to perform a long-term initialisation if other indices than the warm-up ones are set in **IndPeriod_WarmUp** (e.g. **IndPeriod_WarmUp** = c(1:5000, 1:5000, 1:5000, 1000:1366).
  - remark 2: it is also possible to completely disable the warm-up period when using **IndPeriod_WarmUp = @L**. This is necessary if you want **IniStates** and/or **IniResLevels** to be the actual initial values of the model variables from your simulation (e.g. to perform a forecast form a given initial state).

- **IniStates** and **IniResLevels** can be used to specify the initial model states.
  - remark 1: **IniStates** and **IniResLevels** can not be used with GR1A.
  - remark 2: if **IniStates** is used, two possibilities are offered:
    - **IniStates** can be set to the **$StateEnd** output of a previous **RunModel** call, as **$StateEnd** already respects the correct format;
    - **IniStates** can be created with the **CreateIniStates** function.
  - remark 3: in addition to **IniStates**, **IniResLevels** allows to set the filling rate of the production and routing stores for the GR models. For instance for GR4J and GR5J: **IniResLevels** = c(0.3, 0.5) should be used to obtain initial fillings of 30 % and 50 % for the production and routing stores, respectively. For GR6J, **IniResLevels** = c(0.3, 0.5, 0) should be used to obtain initial fillings of 30 % and 50 % for the production, routing stores and 0 mm for the exponential store, respectively. **IniResLevels** is optional and can only be used if **IniStates** is also defined (the state values corresponding to these two other stores in **IniStates** are not used in such case).

## —- CemaNeige version

If **IsHyst = FALSE**, the original CemaNeige version from Valéry et al. (2014) is used.
If **IsHyst = TRUE**, the CemaNeige version from Riboust et al. (2019) is used. Compared to the original version, this version of CemaNeige needs two more parameters and it includes a representation of the hysteretic relationship between the Snow Cover Area (SCA) and the Snow Water Equivalent (SWE) in the catchment. The hysteresis included in airGR is the Modified Linear hysteresis (LH*); it is represented on panel b) of Fig. 3 in Riboust et al. (2019). Riboust et al. (2019) advise to use the LH* version of CemaNeige with parameters calibrated using an objective function combining 75 % of KGE calculated on discharge simulated from a rainfall-runoff model compared to observed discharge and 5 % of KGE calculated on SCA on 5 CemaNeige elevation bands compared to satellite (e.g. MODIS) SCA (see Eq. (18), Table 3 and Fig. 6). Riboust et al. (2019)’s tests were realized with GR4J as the chosen rainfall-runoff model.

### Value

**list** object of class **RunOptions** containing the data required to evaluate the model outputs; it can include the following:
CreateRunOptions

IndPeriod_WarmUp [numeric] index of period to be used for the model warm-up [-]
IndPeriod_Run [numeric] index of period to be used for the model run [-]
IniStates [numeric] vector of initial model states [mm and °C]
IniResLevels [numeric] vector of initial filling rates for production and routing stores [-] and level for the exponential store [mm]
Outputs_Cal [character] character vector giving only the outputs needed for the calibration
Outputs_Sim [character] character vector giving the requested outputs
MeanAnSolidPrecip [numeric] vector giving the annual mean of average solid precipitation for each layer [mm/y]

Altitudinal extrapolation of precipitation and temperature series described by A. Valery

Description

Function which extrapolates the precipitation and air temperature series for different elevation layers (method from Valéry, 2010).

Usage

```r
dataaltiextrapolation_valeryHdatesrL precipL precipscaleL tempmeanL tempminL tempmaxL zinputsL hypsodataL nlayersL verboseL
```

Arguments

- **DatesR** [POSIXt] vector of dates
- **Precip** [numeric] time series of daily total precipitation (catchment average) [mm/time step]
- **PrecipScale** (optional) [boolean] indicating if the mean of the precipitation interpolated on the elevation layers must be kept or not, required to create CemaNeige module inputs, default = TRUE (the mean of the precipitation is kept to the original value)
- **TempMean** [numeric] time series of daily mean air temperature [°C]
- **TempMin** (optional) [numeric] time series of daily min air temperature [°C]
- **TempMax** (optional) [numeric] time series of daily max air temperature [°C]
- **ZInputs** [numeric] real giving the mean elevation of the Precip and Temp series (before extrapolation) [m]
- **Hypsodata** [numeric] vector of 101 reals: min, q01 to q99 and max of catchment elevation distribution [m]
- **NLayers** [numeric] integer giving the number of elevation layers requested [-]
- **Verbose** (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Details

Elevation layers of equal surface are created the 101 elevation quantiles (Hypsodata) and the number requested elevation layers (NLayers).
Forcing data (precipitation and air temperature) are extrapolated using gradients from Valery (2010). (e.g. gradP = 0.0004 [m-1] for France and gradT = 0.434 [°C/100m] for January, 1st).
This function is used by the `createInputsModel` function.

Value

list containing the extrapolated series of precip. and air temp. on each elevation layer
ErrorCrit

### Description
Function which computes an error criterion with the provided function.

### Usage
ErrorCrit(InputsCrit, OutputsModel, FUN_CRIT, warnings = TRUE, verbose = TRUE)

### Arguments
- **InputsCrit**: [object of class `InputsCrit`] see `CreateInputsCrit` for details
- **OutputsModel**: [object of class `OutputsModel`] see `RunModel_GR4J` or `RunModel_CemaNeigeGR4J` for details
- **FUN_CRIT**: (deprecated) [function] error criterion function (e.g. `ErrorCrit_RMSE`, `ErrorCrit_NSE`)

### References

ErrorCrit

warnings (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Value

If InputsCrit is of class Single:

[list] containing the ErrorCrit_* functions outputs, see ErrorCrit_RMSE or ErrorCrit_NSE for details

If InputsCrit is of class Multi:

[list] of list containing the ErrorCrit_* functions outputs, see ErrorCrit_RMSE or ErrorCrit_NSE for details

If InputsCrit is of class Compo:

$CritValue [numeric] value of the composite criterion
$CritName [character] name of the composite criterion
$CritBestValue [numeric] theoretical best criterion value
$Multiplier [numeric] integer indicating whether the criterion is indeed an error (+1) or an efficiency (-1)
$CritCompo$MultiCritValues [numeric] values of the sub-criteria
$CritCompo$MultiCritNames [numeric] names of the sub-criteria
$CritCompo$MultiCritWeights [character] weighted values of the sub-criteria
$MultiCrit [list] of list containing the ErrorCrit_* functions outputs, see ErrorCrit_NSE or ErrorCrit_RMSE

ErrorCrit_KGE

Error criterion based on the KGE formula

Description

Function which computes an error criterion based on the KGE formula proposed by Gupta et al. (2009).

Usage

ErrorCrit_KGE(InputsCrit, OutputsModel, warnings = TRUE, verbose = TRUE)
Arguments

InputsCrit [object of class InputsCrit] see CreateInputsCrit for details
OutputsModel [object of class OutputsModel] see RunModel_GR4J or RunModel_CemaNeigeGR4J for details
warnings (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Details

In addition to the criterion value, the function outputs include a multiplier (-1 or +1) which allows the use of the function for model calibration: the product CritValue * Multiplier is the criterion to be minimised (Multiplier = -1 for KGE).

The KGE formula is

$$KGE = 1 - \sqrt{(r - 1)^2 + (\alpha - 1)^2 + (\beta - 1)^2}$$

with the following sub-criteria:

$$r = \text{the linear correlation coefficient between } sim \text{ and } obs$$
$$\alpha = \frac{\sigma_{sim}}{\sigma_{obs}}$$
$$\beta = \frac{\mu_{sim}}{\mu_{obs}}$$

Value

list list containing the function outputs organised as follows:

- $CritValue [numeric] \text{ value of the criterion}
- $CritName [character] \text{ name of the criterion}
- $SubCritValues [numeric] \text{ values of the sub-criteria}
- $SubCritNames [character] \text{ names of the components of the criterion}
- $CritBestValue [numeric] \text{ theoretical best criterion value}
- $Multiplier [numeric] \text{ integer indicating whether the criterion is indeed an error (+1) or an efficiency (-1)}
- $Ind_notcomputed [numeric] \text{ indices of the time steps where InputsCrit$BoolCrit = FALSE or no data is available}

RunOptions = RunOptions, Obs = BasinObs$Qmm[Ind_Run],
BoolCrit = BoolCrit)
OutputsCrit <- ErrorCrit_KGE(InputsCrit = InputsCrit, OutputsModel = OutputsModel)
Description
Function which computes an error criterion based on the KGE’ formula proposed by Kling et al. (2012).

Usage
ErrorCrit_KGE2(InputsCrit, OutputsModel, warnings = TRUE, verbose = TRUE)

Arguments
InputsCrit [object of class InputsCrit] see CreateInputsCrit for details
OutputsModel [object of class OutputsModel] see RunModel_GR4J or RunModel_CemaNeigeGR4J for details
warnings (optional) [boolean] boolean indicating if the warning messages are shown, default = TRUE
verbose (optional) [boolean] boolean indicating if the function is run in verbose mode or not, default = TRUE

Details
In addition to the criterion value, the function outputs include a multiplier (-1 or +1) which allows
the use of the function for model calibration: the product CritValue * Multiplier is the criterion to
be minimised (Multiplier = -1 for KGE2).

The KGE’ formula is

\[ KGE' = 1 - \sqrt{(r - 1)^2 + (\gamma - 1)^2 + (\beta - 1)^2} \]

with the following sub-criteria:

\[ r = \text{the linear correlation coefficient between } \text{sim} \text{ and } \text{obs} \]

\[ \gamma = \frac{CV_{\text{sim}}}{CV_{\text{obs}}} \]

\[ \beta = \frac{\mu_{\text{sim}}}{\mu_{\text{obs}}} \]
Value

list containing the function outputs organised as follows:

- $CritValue [numeric] value of the criterion
- $CritName [character] name of the criterion
- $SubCritValues [numeric] values of the sub-criteria
- $SubCritNames [character] names of the components of the criterion
- $CritBestValue [numeric] theoretical best criterion value
- $Multiplier [numeric] integer indicating whether the criterion is indeed an error (+1) or an efficiency (-1)
- $Ind_notcomputed [numeric] indices of the time steps where InputsCrit$BoolCrit = FALSE or no data is available

**ErrorCrit_NSE**

Function which computes an error criterion based on the NSE formula proposed by Nash & Sutcliffe (1970).

**Usage**

```
ErrorCrit_NSE(InputsCrit, OutputsModel, warnings = TRUE, verbose = TRUE)
```

**Arguments**

- **InputsCrit** [object of class `InputsCrit`]: see `CreateInputsCrit` for details
- **OutputsModel** [object of class `OutputsModel`]: see `RunModel_GR4J` or `RunModel_CemaNeigeGR4J` for details
- **warnings** (optional) [boolean]: boolean indicating if the warning messages are shown, default = TRUE
- **verbose** (optional) [boolean]: boolean indicating if the function is run in verbose mode or not, default = TRUE

**Details**

In addition to the criterion value, the function outputs include a multiplier (-1 or +1) which allows the use of the function for model calibration: the product `CritValue * Multiplier` is the criterion to be minimised (Multiplier = -1 for NSE).
ErrorCrit_NSE

Value

### Description

These parameter sets can be used as an alternative for the grid-screening calibration procedure (i.e. first step in Calibration_Michel). Please note that the given GR4J X4u variable does not correspond to the actual GR4J X4 parameter. As explained in Andréassian et al. (2014; section 2.1), the given GR4J X4u value has to be adjusted (rescaled) using catchment area (S) [km²] as follows: X4 = X4u / 5.995 * S^0.3 (please note that the formula is erroneous in the publication). Please, see the example below.

As shown in Andréassian et al. (2014; figure 4), only using these parameters sets as the tested values for calibration is more efficient than a classical calibration when the amount of data is low (6 months or less).

### Format

Data frame of parameters containing four numeric vectors

- GR4J X1 production store capacity [mm]
- GR4J X2 intercatchment exchange coefficient [mm/d]
- GR4J X3 routing store capacity [mm]
- GR4J X4u unajusted unit hydrograph time constant [d]

PE_Oudin

Computation of series of potential evapotranspiration at the daily or hourly time steps with Oudin's formula

Description

Function which computes PE using the formula from Oudin et al. (2005). PE can be computed at the daily time step from hourly or daily temperature and at the hourly time step with hourly or daily temperature through a disaggregation of daily PE (see details).

Usage

PE_Oudin(JD, Temp, Lat, LatUnit, 
    TimeStepIn = "daily", TimeStepOut = "daily")

## deprectated function 
PEDaily_Oudin(JD, Temp, LatRad, Lat, LatUnit)

Arguments

JD          [numeric] time series of Julian day of the year [-]; see details
Temp        [numeric] time series of daily (or hourly) mean air temperature [°C]
LatRad      [deprecated][numeric] latitude of measurement for the temperature series [radians]. Please use Lat instead
Lat         [numeric] latitude of measurement for the temperature series [radians or degrees]
LatUnit     [character] latitude unit (default = "rad" or "deg")
TimeStepIn  [character] time step of inputs (e.g. "daily" or "hourly", default = "daily")
TimeStepOut [character] time step of outputs (e.g. "daily" or "hourly", default = "daily")
Details

In the JD argument, the Julian day of the year of the 1st of January is equal to 1 and the 31st of December to 365 (366 in leap years). If the Julian day of the year is computed on an object of the POSIXlt class, the user has to add 1 to the returned value (e.g., \texttt{as.POSIXlt("2016-12-31")$yday + 1}).

When hourly temperature is provided, all the values of the same day have to be set to the same Julian day of the year (e.g., \texttt{as.POSIXlt("2016-12-31 00:00:00")$yday + 1} and \texttt{as.POSIXlt("2016-12-31 00:01:00")$yday}).

Each single day must be provided 24 identical Julian day values (one for each hour).

Four cases are possible:

- \texttt{TimeStepIn = "daily"} and \texttt{TimeStepOut = "daily"}: this is the classical application of the Oudin et al. (2005) formula
- \texttt{TimeStepIn = "daily"} and \texttt{TimeStepOut = "hourly"}: the daily temperature is used inside the \texttt{PE_Oudin} function to calculate daily PE, which is then disaggregated at the hourly time step with use of a sinusoidal function (see Lobligeois, 2014, p. 78)
- \texttt{TimeStepIn = "hourly"} and \texttt{TimeStepOut = "daily"}: the hourly temperature is aggregated at the daily time step and the daily PE is calculated normally within \texttt{PE_Oudin}
- \texttt{TimeStepIn = "hourly"} and \texttt{TimeStepOut = "hourly"}: the hourly temperature is aggregated at the daily time step, the daily PE is then calculated normally within \texttt{PE_Oudin}, which is finally disaggregated at the hourly time step with use of a sinusoidal function (see Lobligeois, 2014, p. 78)

The use of the \texttt{PEdaily_Oudin} corresponds to the first case of the use of \texttt{PE_Oudin}.

Value

numeric time series of daily potential evapotranspiration [mm/time step]

Author(s)

Laurent Coron, Ludovic Oudin, Olivier Delaigue, Guillaume Thirel

References

Examples

\begin{verbatim}
library(aGR)
data(L0123001)
PotEvap <- PE_Oudin(JD = as.POSIXlt(BasinObs$DatesR)$yday + 1,
                      Temp = BasinObs$T,
                      Lat = 0.8, LatUnit = "rad")
\end{verbatim}
Function which creates a screen plot giving an overview of the model outputs.

Usage

## S3 method for class 'OutputsModel'
plot(x, Qobs = NULL, IndPeriod_Plot = NULL,
    BasinArea = NULL, which = "synth", log_scale = FALSE,
    cex.axis = 1, cex.lab = 0.9, cex.leg = 0.9, lwd = 1,
    LayoutMat = NULL,
    LayoutWidths = rep.int(1, ncol(LayoutMat)),
    LayoutHeights = rep.int(1, nrow(LayoutMat)),
    verbose = TRUE, ...)

Arguments

x [object of class OutputsModel] list of model outputs (which must at least include DatesR, Precip and Qsim) [POSIXlt, mm/time step, mm/time step]
Qobs (optional) [numeric] time series of observed flow (for the same time steps than simulated) [mm/time step]
IndPeriod_Plot (optional) [numeric] indices of the time steps to be plotted (among the OutputsModel series)
BasinArea (optional) [numeric] basin area [km2], used to plot flow axes in m3/s
which (optional) [character] choice of plots (e.g. c("Precip"", "Temp", "SnowPack", "Flows", "Regime", "CumFreq", "CorQQ")), default = "synth", see details below
log_scale (optional) [boolean] indicating if the flow time series axis and the flow error time series axis are to be logarithmic, default = FALSE
cex.axis (optional) [numeric] the magnification to be used for axis annotation relative to the current setting of cex
cex.lab (optional) [numeric] the magnification to be used for x and y labels relative to the current setting of cex
cex.leg (optional) [numeric] the magnification to be used for the legend labels relative to the current setting of cex
lwd (optional) [numeric] the line width (a positive number)
LayoutMat (optional) [numeric] a matrix object specifying the location of the next N figures on the output device. Each value in the matrix must be 0 or a positive integer. If N is the largest positive integer in the matrix, then the integers 1, ..., N-1 must also appear at least once in the matrix (see layout)
**plot.OutputsModel**

- **LayoutWidths** (optional) [numeric] a vector of values for the widths of columns on the device (see `layout`)
- **LayoutHeights** (optional) [numeric] a vector of values for the heights of rows on the device (see `layout`)
- **verbose** (optional) [boolean] indicating if the function is run in verbose mode or not, default = TRUE
- **...** other parameters to be passed through to plotting functions

**Details**

Different types of independent graphs are available (depending on the model, but always drawn in this order):

- "Precip": time series of total precipitation
- "PotEvap": time series of potential evapotranspiration
- "Temp": time series of temperature (plotted only if CemaNeige is used)
- "SnowPack": time series of snow water equivalent (plotted only if CemaNeige is used)
- "Flows": time series of simulated flows (and observed flows if provided)
- "Regime": interannual median monthly simulated flow (and observed flows if provided)
- "CorQQ": correlation plot between simulated and observed flows (only if observed flows provided)
- "CumFreq": cumulative frequency plot for simulated flows (and observed flows if provided)

Different dashboards of results including various graphs are available:

- "perf": corresponds to "Error", "Regime", "CumFreq" and "CorQQ"
- "ts": corresponds to "Precip", "PotEvap", "Temp", "SnowPack" and "Flows"
- "synth": corresponds to "Precip", "Temp", "SnowPack", "Flows", "Regime", "CumFreq" and "CorQQ"
- "all": corresponds to "Precip", "PotEvap", "Temp", "SnowPack", "Flows", "Error", "Regime", "CumFreq" and "CorQQ"

If several dashboards are selected, or if an independent graph is called with a dashboard, the graphical device will include all the requested graphs without redundancy.

**Value**

Screen plot window.

RunModel

Run with the provided hydrological model function
Description
Function which performs a single model run with the provided function over the selected period.

Usage
RunModel(InputsModel, RunOptions, Param, FUN_MOD)

Arguments
InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of model parameters
FUN_MOD [function] hydrological model function (e.g. RunModel_GR4J, RunModel_CemaNeigeGR4J)

Value
list see RunModel_GR4J or RunModel_CemaNeigeGR4J for details

Author(s)
Laurent Coron, Olivier Delaigue

See Also

## Run with the CemaNeige snow module

### Description

Function which performs a single run for the CemaNeige snow module at the daily or hourly time step.

### Usage

```r
RunModel_CemaNeige(InputsModel, RunOptions, Param)
```

### Arguments

- **InputsModel**
  - [object of class `InputsModel`]: see `CreateInputsModel` for details
- **RunOptions**
  - [object of class `RunOptions`]: see `CreateRunOptions` for details
- **Param**
  - [numeric] vector of 2 (or 4 parameters if `ishyst` = TRUE, see `CreateRunOptions` for details)

- **CemaNeige X1**
  - weighting coefficient for snow pack thermal state [-]
- **CemaNeige X2**
  - degree-day melt coefficient [mm°C/time step]
- **CemaNeige X3**
  - (optional) accumulation threshold [mm] (needed if `ishyst` = TRUE)
- **CemaNeige X4**
  - (optional) percentage (between 0 and 1) of annual snowfall defining the melt threshold [-] (needed if `ishyst` = TRUE)

### Details

The choice of the CemaNeige version (i.e. with or without hysteresis) is explained in `CreateRunOptions`. For further details on the model, see the references section. For further details on the argument structures and initialisation options, see `CreateRunOptions`.

### Value

list  list containing the function outputs organised as follows:

- **$DatesR**
  - [POSIXlt] series of dates
- **$CemaNeigeLayers**
  - [list] list of CemaNeige outputs (1 list per layer)
- **$CemaNeigeLayers[[iLayer]]$Plaq**
  - [numeric] series of liquid precip. [mm/d]
- **$CemaNeigeLayers[[iLayer]]$Psol**
  - [numeric] series of solid precip. [mm/d]
$CemaNeigeLayers[[iLayer]]$SnowPack [numeric] series of snow pack [mm]
$CemaNeigeLayers[[iLayer]]$ThermalState [numeric] series of snow pack thermal state [°C]
$CemaNeigeLayers[[iLayer]]$Gratio [numeric] series of Gratio [0-1]
$CemaNeigeLayers[[iLayer]]$PotMelt [numeric] series of potential snow melt [mm/d]
$CemaNeigeLayers[[iLayer]]$Melt [numeric] series of actual snow melt [mm/d]
$CemaNeigeLayers[[iLayer]]$PlaqAndMelt [numeric] series of liquid precip. + actual snow melt [mm/d]
$CemaNeigeLayers[[iLayer]]$Temp [numeric] series of air temperature [°C]
$CemaNeigeLayers[[iLayer]]$Gthreshold [numeric] series of melt threshold [mm]
$CemaNeigeLayers[[iLayer]]$Glocalmax [numeric] series of local melt threshold for hysteresis [mm]
$StateEnd [numeric] states at the end of the run: CemaNeige states [mm & °C], see CreateIniStates for more details

(refer to the provided references or to the package source code for further details on these model outputs)

## run period selection
RunModel_CemaNeigeGR4H

Run with the CemaNeigeGR4H hydrological model

Description
Function which performs a single run for the CemaNeige-GR4H daily lumped model over the test period.

Usage
RunModel_CemaNeigeGR4H(InputsModel, RunOptions, Param)

Arguments
InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 6 (or 8 parameters if IsHyst = TRUE, see CreateRunOptions for details)

GR4H X1 production store capacity [mm]
GR4H X2 intercatchment exchange coefficient [mm/h]
GR4H X3 routing store capacity [mm]
GR4H X4 unit hydrograph time constant [d]
CemaNeige X1 weighting coefficient for snow pack thermal state [-]
CemaNeige X2 degree-hour melt coefficient [mm/°C/h]
CemaNeige X3 (optional) accumulation threshold [mm] (needed if IsHyst = TRUE)
CemaNeige X4 (optional) percentage (between 0 and 1) of annual snowfall defining the melt threshold [-] (needed if IsHyst = TRUE)

Details

The choice of the CemaNeige version is explained in CreateRunOptions.
For further details on the model, see the references section.
For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list list containing the function outputs organised as follows:

$DatesR [POSIXlt] series of dates
$PotEvap [numeric] series of input potential evapotranspiration [mm/h]
$Precip [numeric] series of input total precipitation [mm/h]
$Prod [numeric] series of production store level [mm]
$Pn [numeric] series of net rainfall [mm/h]
$Ps [numeric] series of the part of Pn filling the production store [mm/h]
$AE [numeric] series of actual evapotranspiration (PERC) [mm/h]
$PR [numeric] series of PR=Pn-Ps-Perc [mm/h]
$Q9 [numeric] series of UH1 outflow (Q9) [mm/h]
$Q1 [numeric] series of UH2 outflow (Q1) [mm/h]
$Rout [numeric] series of routing store level [mm]
$Exch [numeric] series of potential semi-exchange between catchments [mm/h]
$AEch1 [numeric] series of actual exchange between catchments for branch 1 [mm/h]
$AEch2 [numeric] series of actual exchange between catchments for branch 2 [mm/h]
$AEch [numeric] series of actual exchange between catchments (1+2) [mm/h]
$QR [numeric] series of routing store outflow (QR) [mm/h]
$QD [numeric] series of direct flow from UH2 after exchange (QD) [mm/h]
$Qsim [numeric] series of simulated discharge [mm/h]
$CemaNeigeLayers [list] list of CemaNeige outputs (1 list per layer)
$CemaNeigeLayers[[iLayer]]$Pliq [numeric] series of liquid precip. [mm/h]
$CemaNeigeLayers[[iLayer]]$Psol [numeric] series of solid precip. [mm/h]
$CemaNeigeLayers[[iLayer]]$SnowPack [numeric] series of snow pack [mm]
$CemaNeigeLayers[[iLayer]]$ThermalState [numeric] series of snow pack thermal state [°C]
$CemaNeigeLayers[[iLayer]]$Gratio [numeric] series of Gratio [0-1]
$\text{CemaNeigeLayers}[[iLayer]]$PotMelt
$\text{CemaNeigeLayers}[[iLayer]]$Melt
$\text{CemaNeigeLayers}[[iLayer]]$PliqAndMelt
$\text{CemaNeigeLayers}[[iLayer]]$Temp
$\text{CemaNeigeLayers}[[iLayer]]$Gthreshold
$\text{CemaNeigeLayers}[[iLayer]]$Glocalmax
$\text{StateEnd}$

(series of potential snow melt [mm/h])
(series of actual snow melt [mm/h])
(series of liquid precip. + actual snow melt [mm/h])
(series of air temperature [°C])
(series of melt threshold [mm])
(series of local melt threshold for hysteresis [mm])
(states at the end of the run: store & unit hydrographs levels [mm], CemaNeige states [mm & °C].

Run with the CemaNeigeGR4J hydrological model

Description

Function which performs a single run for the CemaNeige-GR4J daily lumped model over the test period.

Usage

RunModel_CemaNeigeGR4J(InputsModel, RunOptions, Param)

Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 6 (or 8 parameters if IsHyst = TRUE, see CreateRunOptions for details)

GR4J X1 production store capacity [mm]
GR4J X2 intercatchment exchange coefficient [mm/d]
GR4J X3 routing store capacity [mm]
GR4J X4 unit hydrograph time constant [d]
CemaNeige X1 weighting coefficient for snow pack thermal state [-]
CemaNeige X2 degree-day melt coefficient [mm/°C/d]
CemaNeige X3 (optional) accumulation threshold [mm] (needed if IsHyst = TRUE)
CemaNeige X4 (optional) percentage (between 0 and 1) of annual snowfall defining the melt threshold [-] (needed if IsHyst = TRUE)

Details

The choice of the CemaNeige version is explained in CreateRunOptions.
For further details on the model, see the references section.
For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list list containing the function outputs organised as follows:

Run with the CemaNeigeGR5J hydrological model

Description

Function which performs a single run for the CemaNeige-GR5J daily lumped model.

Usage

RunModel_CemaNeigeGR5J(InputsModel, RunOptions, Param)

Arguments

- InputsModel: [object of class InputsModel] see CreateInputsModel for details
- RunOptions: [object of class RunOptions] see CreateRunOptions for details
- Param: [numeric] vector of 7 (or 9 parameters if IsHyst = TRUE, see CreateRunOptions for details)

- GR5J X1: production store capacity [mm]
- GR5J X2: intercatchment exchange coefficient [mm/d]
- GR5J X3: routing store capacity [mm]
- GR5J X4: unit hydrograph time constant [d]
- GR5J X5: intercatchment exchange threshold [-]
- CemaNeige X1: weighting coefficient for snow pack thermal state [-]
- CemaNeige X2: degree-day melt coefficient [mm°C/d]
- CemaNeige X3: (optional) accumulation threshold [mm] (needed if IsHyst = TRUE)
- CemaNeige X4: (optional) percentage (between 0 and 1) of annual snowfall defining the melt threshold [-] (needed if IsHyst = TRUE)

Details

The choice of the CemaNeige version is explained in CreateRunOptions.
For further details on the model, see the references section.
For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list list containing the function outputs organised as follows:

- $DatesR: [POSIXlt] series of dates
- $PotEvap: [numeric] series of input potential evapotranspiration [mm/d]
- $Precip: [numeric] series of input total precipitation [mm/d]
- $Prod: [numeric] series of production store level [mm]
- $Pn: [numeric] series of net rainfall [mm/d]
- $Ps: [numeric] series of the part of Pn filling the production store [mm/d]
- $AE: [numeric] series of actual evapotranspiration [mm/d]
- $Perc: [numeric] series of percolation (PERC) [mm/d]
$PR$ [numeric] series of $\text{PR}=\text{Pn}-\text{Ps}+\text{Perc} \text{ mm/d}$

$Q9$ [numeric] series of $\text{UH1 outflow (Q9)} \text{ mm/d}$

$Q1$ [numeric] series of $\text{UH2 outflow (Q1)} \text{ mm/d}$

$\text{SRout}$ [numeric] series of routing store level [mm]

$\text{SEch}$ [numeric] series of potential semi-exchange between catchments [mm/d]

$\text{SAExch1}$ [numeric] series of actual exchange between catchments for branch 1 [mm/d]

$\text{SAExch2}$ [numeric] series of actual exchange between catchments for branch 2 [mm/d]

$\text{SAExch}$ [numeric] series of actual exchange between catchments (1+2) [mm/d]

$\text{QR}$ [numeric] series of routing store outflow ($\text{QR}$) [mm/d]

$\text{QD}$ [numeric] series of direct flow from UH2 after exchange ($\text{QD}$) [mm/d]

$\text{SQsim}$ [numeric] series of simulated discharge [mm/d]

$\text{CemaNeigeLayers}$ [list] list of CemaNeige outputs (1 list per layer)

$\text{CemaNeigeLayers}[\text{[iLayer]}]$Pliq [numeric] series of liquid precip. [mm/d]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$Psol [numeric] series of solid precip. [mm/d]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$SnowPack [numeric] series of snow pack [mm]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$ThermalState [numeric] series of snow pack thermal state [°C]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$Gratio [numeric] series of Gratio [0-1]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$PotMelt [numeric] series of potential snow melt [mm/d]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$Melt [numeric] series of actual snow melt [mm/d]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$PliqAndMelt [numeric] series of liquid precip. + actual snow melt [mm/d]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$Temp [numeric] series of air temperature [°C]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$Gthreshold [numeric] series of melt threshold [mm]

$\text{CemaNeigeLayers}[\text{[iLayer]}]$Glocalmax [numeric] series of local melt threshold for hysteresis [mm]

$\text{StateEnd}$ [numeric] states at the end of the run: store & unit hydrographs levels [mm], CemaNeige states [mm & °C]. see $\text{CreateIniStates}$ for more details

---

**RunModel_CemaNeigeGR6J**

*Run with the CemaNeigeGR6J hydrological model*

---

**Description**

Function which performs a single run for the CemaNeige-GR6J daily lumped model.

**Usage**

```
RunModel_CemaNeigeGR6J(InputsModel, RunOptions, Param)
```

**Arguments**

- `InputsModel` [object of class `InputsModel`] see [CreateInputsModel](#) for details
- `RunOptions` [object of class `RunOptions`] see [CreateRunOptions](#) for details
- `Param` [numeric] vector of 8 (or 10 parameters if `IsHyst = TRUE`, see [CreateRunOptions](#) for details)

- **GR6J X1** production store capacity [mm]
- **GR6J X2** intercatchment exchange coefficient [mm/d]
- **GR6J X3** routing store capacity [mm]
- **GR6J X4** unit hydrograph time constant [d]
- **GR6J X5** intercatchment exchange threshold [-]
- **GR6J X6** coefficient for emptying exponential store [mm]
- **CemaNeige X1** weighting coefficient for snow pack thermal state [-]
- **CemaNeige X2** degree-day melt coefficient [mm/°C/d]
- **CemaNeige X3** (optional) accumulation threshold [mm] (needed if `IsHyst = TRUE`)
- **CemaNeige X4** (optional) percentage (between 0 and 1) of annual snowfall defining the melt threshold [-] (needed if `IsHyst = TRUE`)

---
Details

The choice of the CemaNeige version is explained in CreateRunOptions.
For further details on the model, see the references section.
For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list  list containing the function outputs organised as follows:

$DatesR [POSIXlt] series of dates
$PotEvap [numeric] series of input potential evapotranspiration [mm/d]
$Precip [numeric] series of input total precipitation [mm/d]
$Prod [numeric] series of production store level [mm]
$Pn [numeric] series of net rainfall [mm/d]
$Ps [numeric] series of the part of Ps filling the production store [mm/d]
$AE [numeric] series of actual evapotranspiration [mm/d]
$Perc [numeric] series of percolation (PERC) [mm/d]
$PR [numeric] series of PR=PN-PS+PERC [mm/d]
$Q9 [numeric] series of UH1 outflow (Q9) [mm/d]
$Q1 [numeric] series of UH2 outflow (Q1) [mm/d]
$Rout [numeric] series of routing store level [mm]
$Exch [numeric] series of potential semi-exchange between catchments [mm/d]
$AEch1 [numeric] series of actual exchange between catchments for branch 1 [mm/d]
$AEch2 [numeric] series of actual exchange between catchments for branch 2 [mm/d]
$Q [numeric] series of routing store outflow (QR) [mm/d]
$QExp [numeric] series of exponential store outflow (QExp) [mm/d]
$Exp [numeric] series of exponential store level (negative) [mm]
$QD [numeric] series of direct flow from UH2 after exchange (QD) [mm/d]
$Qsim [numeric] series of Qsim [mm/d]
$CemaNeigeLayers [list] list of CemaNeige outputs (1 list per layer)
$CemaNeigeLayers[iLayer]$Pliq [numeric] series of liquid precip. [mm/d]
$CemaNeigeLayers[iLayer]$Psol [numeric] series of solid precip. [mm/d]
$CemaNeigeLayers[iLayer]$SnowPack [numeric] series of snow pack [mm]
$CemaNeigeLayers[iLayer]$PotMelt [numeric] series of potential snow melt [mm/d]
$CemaNeigeLayers[iLayer]$Melt [numeric] series of actual snow melt [mm/d]
$CemaNeigeLayers[iLayer]$PliqAndMelt [numeric] series of liquid precip. + actual snow melt [mm/d]
$CemaNeigeLayers[iLayer]$Gthreshold [numeric] series of local melt threshold for hysteresis [mm]
$CemaNeigeLayers[iLayer]$Glocalmax [numeric] series of melt threshold [mm]
$StateEnd [numeric] states at the end of the run:
store & unit hydrographs levels [mm], CemaNeige states [mm & °C],
see CreateIniStates for more details

### RunModel_GR1A

*Run with the GR1A hydrological model*

**Description**

Function which performs a single run for the GR1A annual lumped model over the test period.

**Usage**

RunModel_GR1A(InputsModel, RunOptions, Param)
Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 1 parameter

GR1A X1 model parameter [-]

Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list list containing the function outputs organised as follows:

$DatesR [POSIXlt] series of dates
$PotEvap [numeric] series of input potential evapotranspiration [mm/y]
$Precip [numeric] series of input total precipitation [mm/y]
$Qsim [numeric] series of simulated discharge [mm/y]
$StateEnd [numeric] states at the end of the run (NULL) [-]

(refer to the provided references or to the package source code for further details on these model outputs)

data(L0123001)

## conversion of example data from daily to yearly time step
Run with the GR2M hydrological model

**Description**

Function which performs a single run for the GR2M monthly lumped model over the test period.

**Usage**

```r
RunModel_GR2M(inputsModel, runOptions, Param)
```

**Arguments**

- `inputsModel` [object of class `InputsModel`]: see `CreateInputsModel` for details
- `runOptions` [object of class `RunOptions`]: see `CreateRunOptions` for details
RunModel

| Param | [numeric] vector of 2 parameters |

65
GR2M X1  production store capacity [mm]
GR2M X2  groundwater exchange coefficient [-]

Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list  list containing the function outputs organised as follows:

- **DatesR**  [POSIXlt] series of dates
- **PotEvap**  [numeric] series of input potential evapotranspiration [mm/month]
- **Precip**  [numeric] series of input total precipitation [mm/month]
- **AE**  [numeric] series of actual evapotranspiration [mm/month]
- **Pn**  [numeric] series of net rainfall (P1) [mm/month]
- **Perc**  [numeric] series of percolation (P2) [mm/month]
- **PR**  [numeric] series of PR=Pn+Perc (P3) [mm/month]
- **Exch**  [numeric] series of potential exchange between catchments [mm/month]
- **Prod**  [numeric] series of production store level [mm]
- **Rout**  [numeric] series of routing store level [mm]
- **Qsim**  [numeric] series of simulated discharge [mm/month]
- **StateEnd**  [numeric] states at the end of the run (production store level and routing store level) [mm], see CreateIniStates for more details

(refer to the provided references or to the package source code for further details on these model outputs)

RunModel_GR4H  
Run with the GR4H hydrological model

Description

Function which performs a single run for the GR4H hourly lumped model.

Usage

RunModel_GR4H(InputsModel, RunOptions, Param)
Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 4 parameters
  GR4H X1 production store capacity [mm]
  GR4H X2 groundwater exchange coefficient [mm/h]
  GR4H X3 routing store capacity [mm]
  GR4H X4 unit hydrograph time constant [h]

Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list list containing the function outputs organised as follows:

$DatesR [POSIXlt] series of dates
$PotEvap [numeric] series of input potential evapotranspiration [mm/h]
$Precip [numeric] series of input total precipitation [mm/h]
$Prod [numeric] series of production store level [mm]
$AE [numeric] series of actual evapotranspiration [mm/h]
$Perc [numeric] series of percolation (PERC) [mm/h]
$PR [numeric] series of PR=Pn-Ps+Perc [mm/h]
$Q9 [numeric] series of UH1 outflow (Q9) [mm/h]
$Q1 [numeric] series of UH2 outflow (Q1) [mm/h]
$Rout [numeric] series of routing store level [mm]
$Exch [numeric] series of potential semi-exchange between catchments [mm/h]
$AExch [numeric] series of actual exchange between catchments (1+2) [mm/h]
$QR [numeric] series of routing store outflow (QR) [mm/h]
$QD [numeric] series of direct flow from UH2 after exchange (QD) [mm/h]
$Qsim [numeric] series of simulated discharge [mm/h]
$StateEnd [numeric] states at the end of the run (res. levels, UH1 levels, UH2 levels) [mm], see CreateIniStates for more details

RunModel_GR4J

Run with the GR4J hydrological model

Description

Function which performs a single run for the GR4J daily lumped model over the test period.
Usage

RunModel_GR4J(InputsModel, RunOptions, Param)

Arguments

InputsModel [object of class InputsModel] see CreateInputsModel for details
RunOptions [object of class RunOptions] see CreateRunOptions for details
Param [numeric] vector of 4 parameters

- GR4J X1 production store capacity [mm]
- GR4J X2 intercatchment exchange coefficient [mm/d]
- GR4J X3 routing store capacity [mm]
- GR4J X4 unit hydrograph time constant [d]

Details

For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.

Value

list  list containing the function outputs organised as follows:

$DatesR  [POSIXlt] series of dates
$PotEvap  [numeric] series of input potential evapotranspiration [mm/d]
RunModel_GR4J

$\texttt{Precip}$ [numeric] series of input total precipitation [mm/d]

```
RunModel_GR5J

### Description
Function which performs a single run for the GR5J daily lumped model over the test period.

### Usage
```r
RunModel_GR5J(InputsModel, RunOptions, Param)
```

### Arguments
- **InputsModel**: [object of class `InputsModel`]
  - see `CreateInputsModel` for details
- **RunOptions**: [object of class `RunOptions`]
  - see `CreateRunOptions` for details
- **Param**: [numeric] vector of 5 parameters
  - `GR5J X1`: production store capacity [mm]
  - `GR5J X2`: intercatchment exchange coefficient [mm/d]
  - `GR5J X3`: routing store capacity [mm]
  - `GR5J X4`: unit hydrograph time constant [d]
  - `GR5J X5`: intercatchment exchange threshold [-]

### Details
For further details on the model, see the references section. For further details on the argument structures and initialisation options, see `CreateRunOptions`.

Run with the GR6J hydrological model

Description
Function which performs a single run for the GR6J daily lumped model over the test period.

Usage
RunModel_GR6J(InputsModel, RunOptions, Param)

Arguments
- InputsModel: [object of class InputsModel] see CreateInputsModel for details
- RunOptions: [object of class RunOptions] see CreateRunOptions for details
- Param: [numeric] vector of 6 parameters
  - GR6J X1: production store capacity [mm]
  - GR6J X2: intercatchment exchange coefficient [mm/d]
  - GR6J X3: routing store capacity [mm]
  - GR6J X4: unit hydrograph time constant [d]
  - GR6J X5: intercatchment exchange threshold [-]
  - GR6J X6: coefficient for emptying exponential store [mm]

Details
For further details on the model, see the references section. For further details on the argument structures and initialisation options, see CreateRunOptions.
Value

list list containing the function outputs organised as follows:

$DatesR [POSIXlt] series of dates
$PotEvap [numeric] series of input potential evapotranspiration [mm/d]
$Precip [numeric] series of input total precipitation [mm/d]

SeriesAggreg  

Conversion of time series to another time step (aggregation only)

Description

Conversion of time series to another time step (aggregation only).
Warning: on the aggregated outputs, the dates correspond to the beginning of the time step
(e.g. for daily time-series 2005-03-01 00:00 = value for period 2005-03-01 00:00 - 2005-03-01 23:59)
(e.g. for monthly time-series 2005-03-01 00:00 = value for period 2005-03-01 00:00 - 2005-03-31 23:59)
(e.g. for yearly time-series 2005-03-01 00:00 = value for period 2005-03-01 00:00 - 2006-02-28 23:59)

Usage

SeriesAggreg(TabSeries, TimeFormat, NewTimeFormat, ConvertFun,
YearFirstMonth = 1, TimeLag = 0, verbose = TRUE)

Arguments

TabSeries         [POSIXt+numeric] data.frame containing the vector of dates (POSIXt) and the
time series values numeric)
TimeFormat        [character] desired format (i.e. "hourly", "daily", "monthly" or "yearly")
NewTimeFormat     [character] desired format (i.e. "hourly", "daily", "monthly" or "yearly")
ConvertFun        [character] names of aggregation functions (e.g. for P[mm], T[degC], Q[mm]:
                    ConvertFun = c("sum", "mean", "sum"))
YearFirstMonth    (optional) [numeric] integer used when NewTimeFormat = "yearly" to set
                    when the starting month of the year (e.g. 01 for calendar year or 09 for hydro-
                    logical year starting in September)
TimeLag           (optional) [numeric] numeric indicating a time lag (in seconds) for the time se-
                    ries aggregation (especially useful to aggregate hourly time series in daily time
                    series)
verbose           (optional) [boolean] boolean indicating if the function is run in verbose mode or
                    not, default = FALSE

Value

POSIXct+numeric data.frame containing a vector of aggregated dates (POSIXct) and time series values
numeric)

Author(s)

Laurent Coron
Examples

library(airGR)

## loading catchment data
data(L0123002)

## preparation of the initial time series data frame at the daily time step
TabSeries <- BasinObs[, c("Dates", "P", "E", "T", "Qmm")]

## conversion at the monthly time step
NewTabSeries <- SeriesAggreg(TabSeries = TabSeries,
                           TimeFormat = "daily", NewTimeFormat = "monthly",
                           ConvertFun = c("sum", "sum", "mean", "sum"))

## conversion at the yearly time step
NewTabSeries <- SeriesAggreg(TabSeries = TabSeries,
                           TimeFormat = "daily", NewTimeFormat = "yearly",
                           ConvertFun = c("sum", "sum", "mean", "sum"))

### TransfoParam

**Transformation of the parameters using the provided function**

#### Description

Function which transforms model parameters using the provided function (from raw to transformed parameters and vice versa).

#### Usage

- **Generic function**
  
  TransfoParam(ParamIn, Direction, FUN_TRANSFO)

- **Specific functions**
  
  TransfoParam_GR1A(ParamIn, Direction)
  TransfoParam_GR2M(ParamIn, Direction)
  TransfoParam_GR4J(ParamIn, Direction)
  TransfoParam_GR5J(ParamIn, Direction)
  TransfoParam_GR6J(ParamIn, Direction)
  TransfoParam_GR4H(ParamIn, Direction)
  TransfoParam_CemaNeige(ParamIn, Direction)
  TransfoParam_CemaNeigeHyst(ParamIn, Direction)

#### Arguments

- **ParamIn** [numeric] vector or matrix of parameter sets (sets in line, parameter values in column)
Direction [character] direction of the transformation: use "RT" for Raw -> Transformed and "TR" for Transformed -> Raw

FUN_TRANSFO [function] model parameters transformation function (e.g. TransfoParam_GR4J, TransfoParam_CemaNeige)

Value

ParamOut [numeric] matrix of parameter sets (sets in line, parameter values in column)

Author(s)
Laurent Coron, Olivier Delaigue

Examples

library(airGR)

## ---- generic function

## transformation Raw -> Transformed for the GR4J model
Xraw <- matrix(c(+221.41, -3.63, +30.00, +1.37,  
                +347.23, -1.03, +60.34, +1.76,  
                +854.06, -0.10, +148.41, +2.34),  
                ncol = 4, byrow = TRUE)  
Xtran <- TransfoParam(ParamIn = Xraw, Direction = "RT", FUN_TRANSFO = TransfoParam_GR4J)

## transformation Transformed -> Raw for the GR4J model
Xtran <- matrix(c(+3.60, -2.00, +3.40, -9.10,  
                +3.90, -0.90, +4.10, -8.70,  
                +4.50, -0.10, +5.00, -8.10),  
                ncol = 4, byrow = TRUE)  
Xraw <- TransfoParam(ParamIn = Xtran, Direction = "TR", FUN_TRANSFO = TransfoParam_GR4J)

## ---- specific function

## transformation Raw -> Transformed for the GR4J model
Xraw <- matrix(c(+221.41, -3.63, +30.00, +1.37,  
                +347.23, -1.03, +60.34, +1.76,  
                +854.06, -0.10, +148.41, +2.34),  
                ncol = 4, byrow = TRUE)
