Package ‘arcpullr’

March 9, 2022

Type Package
Title Pull Data from an 'ArcGIS REST' API
Version 0.2.3
License GPL-3
Encoding UTF-8
LazyData true
Description Functions to efficiently query 'ArcGIS REST' APIs
<https://developers.arcgis.com/rest/>. Both spatial and SQL queries can be used to retrieve data. Simple Feature (sf) objects are utilized to perform spatial queries. This package was neither produced nor is maintained by Esri.
Depends R (>= 3.6.0), sf (>= 0.9.7),
Imports httr (>= 1.4.1), jsonlite (>= 1.6.1), dplyr (>= 1.0.2),
ggplot2 (>= 3.3.0), tidyr (>= 1.0.2), rlang (>= 0.4.7), raster (>= 3.4.5), methods, bslib, DT, rgdal
RoxygenNote 7.1.2
Suggests testthat (>= 3.0.1), knitr (>= 1.30), rmarkdown (>= 2.6),
vest (>= 0.3.6), xml2 (>= 1.3.2), stringr (>= 1.4.0), cowplot (>= 1.1.1), magick (>= 2.5.2)

arcpullr-package

arcpullr-package

2
Description

A package for pulling spatial data from an ArcGIS REST API

Details

The role of the arcpullr package is simple...to pull spatial data from an ArcGIS REST API. These APIs are housed by various different agencies, organizations, entities, etc., but allow a consistent format for storing and retrieving spatial data.

get_spatial_layer

This function makes up the core of the package. It allows users to pull spatial data given a URL of an ArcGIS REST API. There are many additional query parameters that can (and probably should) be added; however, we’ve simplified many of these out for you with the functions below.
**get_layer_by_spatial family of functions**

These functions allow you to pull layers using a spatial query. The abstract syntax is wrapped into the functions, so all you have to do is pass these functions an sf object of the spatial area, line, or point you want to query by. These functions include `get_layer_by_poly`, `get_layer_by_point`, `get_layer_by_line`, `get_layer_by_multipoint`, and `get_layer_by_envelope`. It should be fairly obvious what type of spatial layer each function takes with the exception of `get_layer_by_envelope` except that it isn’t particularly useful for a single point.

**get_image_layer**

This is one of the core functions of the package. It retrieves image service layers from an ArcGIS REST API designated by the URL.

**get_map_layer**

This is one of the core functions of the package. It retrieves map service layers from an ArcGIS REST API designated by the URL.

**Helper functions**

There are a few utility functions to help you along the way. The first is `plot_layer`, which is a useful way to plot the spatial layer you’ve tried to pull just to make sure it works. If you want fancier maps you’d be better served with ggplot2 or tmaps, though.

Other helpers include the `sf_objects` functions, which allow you to easily create sf points, lines, and polygons with a few coordinates.

Lastly, there is a `sql_where` function to help aid in building more complex SQL WHERE clauses used to query by the where argument in the retrieval functions above.

---

**format_coords**

*Convert coordinates from an `sf` object to formatted well-known text*

**Description**

Use this function to convert the coordinates of a sf polygon object to a string of well known text. The output can be passed to an ArcGIS REST API to perform a spatial query.

**Usage**

```r
format_polygon_coords(sf_obj)
format_line_coords(sf_obj)
format_multipoint_coords(sf_obj)
format_point_coords(sf_obj)
```
format_envelope_coords(sf_obj)

format_coords(sf_obj, geom_type)

Arguments

sf_obj An sf object
geom_type Either "points", "paths", or "rings". Choose wisely

Details

Spatial queries from an ArcGIS REST API require specific text inputs formatted in a way called well-known text (WKT). ArcGIS REST APIs have their own syntax for how the text is taken. These functions will format sf objects in the correct way to be able to make spatial queries from an ArcGIS REST API

Value

String of well known text

Examples

mke_polygon_coords <- format_polygon_coords(mke_county)

get_geometry_type

Description

Get Geometry Type

Usage

get_geometry_type(url)

Arguments

url A character string of a feature services URL

Value

A character string of the layers geometry type

Examples

## Not run:
get_geometry_type(reykjanes_lava_flow_url)

## End(Not run)
get_image_layer

Retrieve an image service layer from an ArcGIS REST API

Description
This function retrieves image service layers from an ArcGIS REST services API and returns them as a RasterStack object.

Usage
get_image_layer(
  url,
  sf_object = NULL,
  bbox = NULL,
  token = "",
  clip_raster = TRUE,
  format = "png",
  transparent = TRUE,
  ...
)

Arguments
url A character string of the url for the layer to pull
sf_object An sf object used for the bounding box
bbox Character string of the bounding box
token A character string of the token (if needed)
clip_raster Logical. Should the raster be clipped to contain only the pixels that reside in the sf_object? By default, ArcGIS returns some overlapping edge pixels. Setting clip_raster to TRUE (default) will remove these using mask from the raster package
format The raster format desired. Default is "png"
transparent Logical. Retrieve a raster with a transparent background (TRUE, default) or not (FALSE)
... Additional arguments to pass to the ArcGIS REST API

Details
This is one of the core functions of the package. It retrieves image service layers from an ArcGIS REST API designated by the URL. These layers require a bounding box to query the map layer, which is either taken from the sf_object argument or optionally can be passed via the bbox argument. Either sf_object or bbox are optional, but one of them must be present.

All of the querying parameters are sent via a POST request to the URL, so if there are issues with passing additional parameters via ... first determine how they fit into the POST request and make adjustments as needed. This syntax can be tricky if you’re not used to it.
Value

A "RasterStack" object

Examples

```r
## Not run:
wi_leaf_off_layer <- get_image_layer(wi_leaf_off_url, wis_poly)
plot_layer(wi_leaf_off_layer, outline_poly = wis_poly)
## End(Not run)
```

---

get_layers_by_spatial  Retrieve ArcGIS REST API spatial layer by spatial query

Description

These functions are wrappers around `get_spatial_layer` that are specialized for querying by a spatial layer. They will make a POST request to the query URL which returns data (if available) based on the appropriate spatial feature (geometry) and relationship (sp_rel).

Usage

```r
get_layer_by_poly(url, geometry, sp_rel = "esriSpatialRelContains", ...)

get_layer_by_line(url, geometry, sp_rel = "esriSpatialRelIntersects", ...)

get_layer_by_point(url, geometry, sp_rel = "esriSpatialRelIntersects", ...)

get_layer_by_multipoint(
  url,
  geometry,
  sp_rel = "esriSpatialRelIntersects",
  ...  
)

get_layer_by_envelope(url, geometry, sp_rel = "esriSpatialRelIntersects", ...)

get_layer_by_spatial(
  url,
  geometry,
  geom_type,
  sp_ref = NULL,
  sp_rel = "esriSpatialRelIntersects",
  ...  
)
```
get_layer_html

Arguments

url  
A character string of the url for the layer to pull

geometry  
An sf object used for the spatial query

sp_rel  
Character. The type of relationship to query by.

...  
Additional arguments to pass to get.spatial_layer

geom_type  
A character of the geometry type to be used. This param is automatically specified in all get_layer_by_* functions except get.spatial_layer

sp_ref  
The spatial reference value

Value

An object of class "sf" of the appropriate layer

Examples

base_wdnr_url <- "https://dnrmaps.wi.gov/arcgis/rest/services/
hydro_path <- "WT_SWDV/WT_Inland_Water_Resources_WTM_Ext_v2/MapServer/2"
hydro_url <- paste0(base_wdnr_url, hydro_path)
mke_waters <- get_layer_by_poly(url = hydro_url, mke_county)

get_layer_html  
Pull the HTML body from a web page

Description

Used internally to pull HTML for a layer’s web page so that the call doesn’t have to be made twice in get.geometry_type if the url provided there is for a raster layer.

Usage

get_layer_html(url)

Arguments

url  
Character. The URL of the web page

Value

A character string of the HTML body
get_layer_legend

Returns a legend for a raster layer

Description

Raster layers are accompanied with legends to identify what the colors mean. This function retrieves those legend values and returns them as a data.frame with the associated RGB color values. This will likely be most useful for plotting and analysis of map layers.

Usage

get_layer_legend(url)

Arguments

url A URL to a Map or Image Service layer

Value

A data.frame with two columns (color, values) and the number of rows equal to the number of values in a layer

Examples

## Not run:
get_layer_legend(wi_landcover_url)
## End(Not run)

get_map_layer

Retrieve a map service layer from an ArcGIS REST API

Description

This function retrieves map service layers from an ArcGIS REST services API and returns them as a RasterLayer object

Usage

get_map_layer(
  url,
  sf_object = NULL,
  bbox = NULL,
  token = "",
  clip_raster = TRUE,
  format = "png",
)
get_map_layer

  transparent = TRUE,
  add_legend = TRUE,
  ...
)

Arguments

  url        A character string of the url for the layer to pull
  sf_object  An sf object used for the bounding box
  bbox       Character string of the bounding box
  token      A character string of the token (if needed)
  clip_raster Logical. Should the raster be clipped to contain only the pixels that reside in the
                 sf_object? By default, ArcGIS returns some overlapping edge pixels. Setting
                 clip_raster to TRUE (default) will remove these using mask from the raster
                 package
  format     The raster format desired. Default is "png"
  transparent Logical. Retrieve a raster with a transparent background (TRUE, default) or not
                 (FALSE)
  add_legend Logical. Pull legend and match to color values (TRUE, default) or not (FALSE)

Details

This is one of the core functions of the package. It retrieves map service layers from an ArcGIS
REST API designated by the URL. These layers require a bounding box to query the map layer,
which is either taken from the sf_object argument or optionally can be passed via the bbox argu-
ment. Either sf_object or bbox are optional, but one of them must be present.

All of the querying parameters are sent via a POST request to the URL, so if there are issues with
passing additional parameters via ... first determine how they fit into the POST request and make
adjustments as needed. This syntax can be tricky if you’re not used to it.

Value

  A "RasterLayer" object

Examples

## Not run:
wi_landcover<- get_map_layer(wi_landcover_url, wis_poly)
plot_layer(wi_landcover, outline_poly = wis_poly)

## End(Not run)
**get_raster_layer**

*Pull a raster layer from a map service or image service layer of an ArcGIS REST API*

**Description**

This is an internal function to pull raster layers from either a map service or an image service of an ArcGIS REST API. This function is the engine that drives `get_map_layer` and `get_image_layer`.

**Usage**

```r
get_raster_layer(
  url,
  sf_object = NULL,
  bbox = NULL,
  token = "",
  clip_raster = TRUE,
  format = "png",
  transparent = TRUE,
  export_type = "map",
  add_legend = FALSE,
  ...
)
```

**Arguments**

- `url` A character string of the url for the layer to pull
- `sf_object` An `sf` object used for the bounding box
- `bbox` Character string of the bounding box
- `token` A character string of the token (if needed)
- `clip_raster` Logical. Should the raster be clipped to contain only the pixels that reside in the `sf_object`? By default, ArcGIS returns some overlapping edge pixels. Setting `clip_raster` to TRUE (default) will remove these using `mask` from the `raster` package
- `format` The raster format desired. Default is "png"
- `transparent` Logical. Retrieve a raster with a transparent background (TRUE, default) or not (FALSE)
- `export_type` Character. Either "map" or "image" for the respective service layer desired
- `add_legend` Logical. Pull legend and match to color values (TRUE, default) or not (FALSE)
- `...` Additional arguments to pass to the ArcGIS REST API

**Value**

An object of type `RasterLayer` if `export_type = "map"` or an object of type `RasterStack` if `export_type = "image"`
get_service_type

Get elements of a Service or Layer from an ArcGIS REST endpoint

Description

This family of functions is meant to pull attributes from a particular service or layer hosted on an ArcGIS REST API. If the service is an ImageServer or MapServer, then the behavior will be slightly different than for a Feature Layer (see details).

Usage

get_service_type(url, ...)

Arguments

  url         A character string of a valid layer URL.
  ...         Only used internally, but html can be passed

Details

get_service_type will return the type of service or layer for the respective URL (or html) that is passed to the function. For a feature layer the function should return "feature_layer", for a Image or Map Server the function will return "image" or "map", respectively.

get_geometry_type will return the geometry type of feature service layers housed on an ArcGIS REST API server. If a URL is provided that points to a map or image layer the function will return an error (i.e. only feature layers have geometry types).

get_supported_operations will simply return a character vector that lists the supported operations for url.

Value

A character string defining the layer type

Examples

## Not run:
get_service_type(reykjanes_lava_flow_url)

## End(Not run)
get_sf_crs  
*Return CRS value of an sf object*

**Description**

Return CRS value of an sf object

**Usage**

`get_sf_crs(sf_obj)`

**Arguments**

- **sf_obj**: An object of class sf

**Value**

A numeric value referring to the coordinate reference system

**Examples**

`get_sf_crs(iceland_poly)`

---

get_spatial_layer  
*Retrieve a feature service layer from an ArcGIS REST API*

**Description**

This function retrieves spatial layers present in Feature Service layers of an ArcGIS REST services API and returns them as an sf object

**Usage**

```r
get_spatial_layer(
  url, 
  out_fields = c("*"), 
  where = "1=1", 
  token = "", 
  sf_type = NULL, 
  ... 
)
```
**match_raster_colors**

**Arguments**

- **url**: A character string of the url for the layer to pull
- **out_fields**: A character string of the fields to pull for each layer
- **where**: A character string of the where condition. Default is 1=1
- **token**: A character string of the token (if needed)
- **sf_type**: A character string specifying the layer geometry to convert to sf ("esriGeometryPolygon", "esriGeometryPoint", "esriGeometryPolyline"), if NULL (default) the server will take its best guess
  
  Additional arguments to pass to the ArcGIS REST POST request

**Details**

This is one of the core functions of this package. It retrieves spatial layers from feature services of an ArcGIS REST API designated by the URL. Additional querying features can be passed such as a SQL WHERE statement (where argument) or spatial queries as well as any other types of queries that the ArcGIS REST API accepts (using ...). However, for easier spatial querying see **get_layers_by_spatial**.

All of the querying parameters are sent via a POST request to the URL, so if there are issues with passing additional parameters via ... first determine how they fit into the POST request and make adjustments as needed. This syntax can be tricky if you’re not used to it.

**Value**

An object of class "sf" of the appropriate layer

**Examples**

```r
## Not run:
# lava flows on Reykjanes (pr. 'rake-yah-ness') peninsula in Iceland
lava_flows <- get_spatial_layer(reykjanes_lava_flow_url)
plot_layer(lava_flows, outline_poly = reykjanes_poly)
plot_layer(lava_flows, outline_poly = iceland_poly)

## End(Not run)
```

**match_raster_colors**

*Match colors in RasterLayer color space to the provided legend values*

**Description**

Colors provided by the legend do not always correspond exactly with the colors in the colortable of a RasterLayer object. They are usually pretty close, though, so this function finds the closest colors, maps them to the appropriate colors in the RasterLayer object, and applies that to the legend.

**Usage**

```r
match_raster_colors(legend, x)
```
Arguments

legend An object of class raster_legend as returned by get_layer_legend
x A RasterLayer object as returned by get_map_layer

Details

Raster colors in x are mapped to those in legend by converting the RGB hexadecimal values to a 3D vector of values for red, green and blue. The closest values are then assigned using 3D Pythagorean theorem to compute the distance among all colors. The minimum distance in three dimensional space is the color in x that gets mapped to the appropriate color in legend.

Value

A raster_legend object with corrected colors to match those in x

Examples

```r
## Not run:
wi_landcover <- get_map_layer(wi_landcover_url, wis_poly)
legend <- get_layer_legend(wi_landcover_url)
new_legend <- match_raster_colors(legend, wi_landcover_url)
## End(Not run)
```
Arguments

- **x**: An sf or Raster* object as returned from a `get_*_layer` function
- **...**: Additional arguments to `plot_layer`
- **outline_poly**: Optional. An sf polygon to outline `sf_data` for context
- **outline_size**: Numeric argument that controls width of parameter
- **outline_color**: A character vector of a valid color
- **plot_pkg**: Character. The plotting environment to use. Either "ggplot" (default) or "base"

Value

Either a `ggplot` object, or simply plots x if `plot_pkg = "base"

Examples

```r
## Not run:
plot_layer(iceland_poly)
plot_layer(portage_county, outline_poly = wis_poly)

## End(Not run)
```

Description

Plot a RasterBrick object

Usage

```r
## S4 method for signature 'RasterBrick'
plot_layer(
  x,
  outline_poly = NULL,
  outline_size = 1.2,
  outline_color = "gray30",
  plot_pkg = "ggplot",
  ...
)
```
plot_layer,RasterLayer-method

Arguments

x An sf or Raster* object as returned from a get_*_layer function
outline_poly Optional. An sf polygon to outline sf_data for context
outline_size Numeric argument that controls width of parameter
outline_color A character vector of a valid color
plot_pkg Character. The plotting environment to use. Either "ggplot" (default) or "base"
... Additional arguments to plot_layer

Examples

## Not run:
wi_aerial <- get_map_layer(wi_leaf_off_url, wis_poly)
plot_layer(wi_aerial, outline_poly = wis_poly)
## End(Not run)

plot_layer,RasterLayer-method

Plot a RasterLayer object

Description

Plot a RasterLayer object

Usage

## S4 method for signature 'RasterLayer'
plot_layer(
  x,
  outline_poly = NULL,
  outline_size = 1.2,
  outline_color = "gray30",
  legend = TRUE,
  plot_pkg = "ggplot",
  ...
)

Arguments

x An sf or Raster* object as returned from a get_*_layer function
outline_poly Optional. An sf polygon to outline sf_data for context
outline_size Numeric argument that controls width of parameter
outline_color A character vector of a valid color
legend Logical. Only valid when plotting RasterLayers retrieved from get_map_layer
where legend was also retrieved
plot_pkg Character. The plotting environment to use. Either "ggplot" (default) or "base"
... Additional arguments to plot_layer
Examples
## Not run:
wi_landcover <- get_map_layer(wi_landcover_url, wis_poly)
plot_layer(wi_landcover, outline_poly = wis_poly)

## End(Not run)

plot_layer, RasterStack-method

Plot a RasterStack object

Description
Plot a RasterStack object

Usage
## S4 method for signature 'RasterStack'
plot_layer(
  x,
  outline_poly = NULL,
  outline_size = 1.2,
  outline_color = "gray30",
  plot_pkg = "ggplot",
  ...
)

Arguments

  x            An sf or Raster* object as returned from a get_*_layer function
  outline_poly Optional. An sf polygon to outline sf_data for context
  outline_size Numeric argument that controls width of parameter
  outline_color A character vector of a valid color
  plot_pkg     Character. The plotting environment to use. Either "ggplot" (default) or "base"
  ...          Additional arguments to plot_layer

Examples
## Not run:
wi_aerial <- get_map_layer(wi_leaf_off_url, wis_poly)
plot_layer(wi_aerial, outline_poly = wis_poly)

## End(Not run)
Plot an sf object

## S4 method for signature 'sf'

```r
plot_layer(
  x,
  outline_poly = NULL,
  outline_size = 1.2,
  outline_color = "gray30",
  plot_pkg = "ggplot",
  ...
)
```

### Arguments

- `x`: An sf or Raster* object as returned from a `get_*_layer` function.
- `outline_poly`: Optional. An sf polygon to outline `sf_data` for context.
- `outline_size`: Numeric argument that controls width of parameter.
- `outline_color`: A character vector of a valid color.
- `plot_pkg`: Character. The plotting environment to use. Either "ggplot" (default) or "base".
- `...`: Additional arguments to `plot_layer`.

### Examples

```r
## Not run:
plot_layer(wis_poly)
## End(Not run)
```

Convert `RasterLayer` into `data.frame` of colors for each pixel that can be used for plotting.

This function is used internally by `plot_layer` to convert a Raster* object to a `data.frame` of colors for each pixel that can be used for plotting with ggplot2.
Usage

raster_colors(x)

Arguments

x

A Raster* object

Value

A data.frame with 3 columns and length(raster_object) rows. Two of these columns are the x-y coordinates of each pixel, and one is a value for color that can be used for plotting

Examples

## Not run:
wi_landcover <- get_map_layer(wi_landcover_url, wis_poly)
wi_landcover_data <- raster_colors(wi_landcover)
head(wi_landcover_data)

## End(Not run)

Description

This function is used internally by plot_layer to convert a RasterBrick object to a data.frame of colors for each pixel that can be used for plotting with ggplot2. Note that this function assumes that the first three bands in the RasterBrick objects are the RGB values and all additional bands are ignored.

Usage

## S4 method for signature 'RasterBrick'
raster_colors(x)

Arguments

x

A RasterBrick object

Value

A data.frame with 3 columns and length(raster_object) rows
raster_colors,RasterLayer-method

Convert RasterLayer into data.frame of colors that can be used for plotting

Description

This function is used internally by plot_layer to convert a RasterLayer object to a data.frame of colors for each pixel that can be used for plotting with ggplot2.

Usage

```
## S4 method for signature 'RasterLayer'
raster_colors(x)
```

Arguments

- `x` A RasterLayer object

Value

A data.frame with 3 columns and length(raster_object) rows

Examples

```
## Not run:
wi_landcover <- get_map_layer(wi_landcover_url, wis_poly)
wi_landcover_data <- raster_colors(wi_landcover)
## End(Not run)
```
**raster_colors, RasterStack-method**

*Convert RasterStack into data.frame of colors that can be used for plotting*

---

**Description**

This function is used internally by `plot_layer` to convert a RasterStack object to a data.frame of colors for each pixel that can be used for plotting with ggplot2. Note that this function assumes that the first three bands in the RasterStack objects are the RGB values and all additional bands are ignored.

**Usage**

```r
## S4 method for signature 'RasterStack'
raster_colors(x)
```

**Arguments**

- `x` A RasterStack object

**Value**

A data.frame with 3 columns and `length(raster_object)` rows

**Examples**

```r
## Not run:
wi_leaf_off_layer <- get_image_layer(wi_leaf_off_url, wis_poly)
wi_leaf_off_data <- raster_colors(wi_leaf_off_layer)
## End(Not run)
```

---

**sf_example_polys**

*Various example sf polygons*

---

**Description**

These are sf polygons that are used for examples throughout the package.
Usage

iceland_poly
mke_county
portage_county
reykjanes_poly
wis_counties
wis_poly
cook_creek_ws
cook_creek_streams
cook_creek_env
mke_river
poly_streams_contains
poly_streams_crosses
sugar_creek
sugar_creek_env
tROUT_hab_project_pt
tROUT_hab_project_pts
example_poly
tROUT_hab_project_pts

Format

An object of class sf and data.frame:
An object of class sf (inherits from data.frame) with 1 rows and 3 columns.
An object of class sf (inherits from data.frame) with 1 rows and 3 columns.
An object of class sf (inherits from data.frame) with 1 rows and 2 columns.
An object of class sf (inherits from data.frame) with 72 rows and 3 columns.
An object of class sf (inherits from data.frame) with 1 rows and 2 columns.
An object of class sf (inherits from data.frame) with 1 rows and 7 columns.
An object of class `sf` (inherits from `tbl_df`, `tbl`, `data.frame`) with 5 rows and 3 columns.
An object of class `sf` (inherits from `tbl_df`, `tbl`, `data.frame`) with 10 rows and 3 columns.
An object of class `sf` (inherits from `tbl_df`, `tbl`, `data.frame`) with 5 rows and 5 columns.
An object of class `sf` (inherits from `data.frame`) with 1 rows and 28 columns.
An object of class `sf` (inherits from `data.frame`) with 4 rows and 28 columns.
An object of class `sf` (inherits from `data.frame`) with 7 rows and 28 columns.
An object of class `sf` (inherits from `data.frame`) with 15 rows and 28 columns.
An object of class `sf` (inherits from `data.frame`) with 1 rows and 11 columns.
An object of class `sf` (inherits from `data.frame`) with 4 rows and 11 columns.
An object of class `sf` (inherits from `data.frame`) with 1 rows and 1 columns.
An object of class `sf` (inherits from `data.frame`) with 4 rows and 11 columns.

### sf_example_raster

<table>
<thead>
<tr>
<th>Various example raster objects</th>
</tr>
</thead>
</table>

**Description**

These are raster objects that are used for examples throughout the package

**Usage**

- `wi_landcover`
- `wi_aerial_imagery`

**Format**

- An object of class `RasterLayer` of dimension 400 x 400 x 1.
- An object of class `RasterBrick` of dimension 200 x 200 x 3.

**Source**

Wisconsin DNR ArcGIS Image Server
sf_objects  

*Create sf objects from coordinates*

**Description**

These are simple wrapper functions for creating sf objects from points.

**Usage**

```r
sf_line(..., crs = 4326)
sf_point(..., crs = 4326)
sf_points(..., crs = 4326)
sf_polygon(..., crs = 4326)
```

**Arguments**

- `...` The coordinates of the object
- `crs` The coordinate reference system. Defaults to 4326

**Value**

An sf object of the appropriate type

**Examples**

```r
pt_a <- c(-90, 45)
pt_b <- c(-89, 44)

sp_rel_lookups  

*Spatial relationship descriptor and lookup tables*

**Description**

These data.frames are used to lookup and explain which spatial relation types go with different spatial queries.

**Usage**

```r
sp_rel_valid
sp_rel_lookup
```
sql_where

Format

sp_rel_valid is a data.frame with 105 rows and 3 variables as follows:

feature_class A feature class to be queried

query_feature_class The feature class used to do a spatial query

sp_relations The spatial relationships that are valid for the feature class and query_feature_class combination

sp_rel_lookup is a data.frame with 9 rows and 2 variables as follows:

sp_relations The spatial relationship being described
description A description of the sp_relations

Details

sp_rel_lookup explains the various different types of spatial relationships available through ArcGIS REST APIs. sp_rel_valid shows which spatial relationships are valid with different geometry types being queried and used to do spatial queries

Source

sp_rel_valid–Independent tests done specifically by and for arcpullr

sql_where Format a SQL where clause from arguments

Description

This function will create a where statement that is compatible with get_spatial_layer). This statement can then be passed to the where argument in this function.

Usage

sql_where(..., rel_op = "=")

Arguments

... Named objects to be queried by

rel_op Character. The relational operator in the SQL clause (i.e. "="", "IN", "NOT IN", etc.). If a single rel_op is provide with multiple ... parameters then it will be recycled length(...) times.

Value

A character string that can be passed to the where argument of get_spatial_layer
valid_sp_rel

Examples

```r
## Not run:
wbics <- sql_where(WATERBODY_WBIC = c(805400, 804600), rel_op = "IN")
base_wdnr_url <- "https://dnrmaps.wi.gov/arcgis/rest/services/
hydro_path <- "WT_SWDV/WT_Inland_Water_Resources_WTM_Ext_v2/MapServer/3"
hydro_url <- paste0(base_wdnr_url, hydro_path)
lakes <- get_spatial_layer(url = hydro_url, where = wbics)
plot_layer(lakes)

## End(Not run)
```

valid_sp_rel

Check to see which spatial relation types are applicable to the feature classes being queried and the sf objects use do to a spatial query

Description

Check to see which spatial relation types are applicable to the feature classes being queried and the sf objects use do to a spatial query

Usage

```r
valid_sp_rel(fc1, fc2, pull = TRUE)
```

Arguments

- `fc1`: Character. The feature class type being queried. Available options are "point", "multipoint", "line", or "area".
- `fc2`: Character. The geometry type of the sf object used to do a spatial query. Available options are "point", "multipoint", "line", or "area".
- `pull`: Logical. Pull the available options (TRUE) or print all columns of the sp_rel_valid data.frame for the appropriate fc1 and fc2

Value

Either a vector or filtered data.frame showing the appropriate sp_rels for the given feature classes

Examples

```r
valid_sp_rel("line", "line")
```
