

Package ‘astsa’

December 15, 2017

Type Package

Title Applied Statistical Time Series Analysis

Version 1.8

Date 2017-12-13

Author David Stoffer

Maintainer David Stoffer <stoffer@pitt.edu>

Description Included are data sets and scripts to accompany Time Series Analysis and Its Applications: With R Examples (4th ed), by R.H. Shumway and D.S. Stoffer. Springer Texts in Statistics, 2017. <DOI:10.1007/978-3-319-52452-8>.

astsa-package *Applied Statistical Time Series Analysis*

Description

Includes data and scripts to accompany *Time Series Analysis and Its Applications: With R Examples* (4th ed) by R.H. Shumway and D.S. Stoffer. Springer Texts in Statistics, 2017. <DOI:10.1007/978-3-319-52452-8>.

Details

Package: astsa
 Type: Package
 Version: 1.8
 Date: 2017-12-13
 License: GPL (>= 2)
 LazyLoad: yes
 LazyData: yes

Note

This is most likely the last version of the package that I will submit to CRAN... I can NOT deal with these crazy people any more. However, the most recent working version of the package will always be on GitHub. See <https://github.com/nickpoison/astsa> for details.

acf1 *Plot and print ACF of a time series*

Description

Produces a plot (and a printout) of the sample ACF. The zero lag value of the ACF is removed.

Usage

```
acf1(series, max.lag=NULL, main=paste("Series: ", deparse(substitute(series))),
      na.action = na.pass, ...)
```

Arguments

| | |
|-----------|---|
| series | The data. Does not have to be a time series object. |
| max.lag | Maximum lag. Can be omitted. Defaults to $\sqrt{n} + 10$ unless $n < 60$. If the series is seasonal, this will be at least 4 seasons by default. |
| main | Title of graphic; defaults to name of series. |
| na.action | How to handle missing data; default is na.pass |
| ... | Additional arguments passed to acf |

Details

This is basically a wrapper for `acf()` provided in `tseries`. The zero lag (which is always 1) has been removed. The error bounds are approximate white noise bounds, $0 \pm 2/\sqrt{n}$; no other option is given.

Value

| | |
|-----|----------------|
| ACF | The sample ACF |
|-----|----------------|

Author(s)

D.S. Stoffer

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Examples

```
acf1(rnorm(100))
acf1(rnorm(100), 25, main='') # no title
```

acf2

Plot and print ACF and PACF of a time series

Description

Produces a simultaneous plot (and a printout) of the sample ACF and PACF on the same scale. The zero lag value of the ACF is removed.

Usage

```
acf2(series, max.lag=NULL, plot=TRUE,
      main=paste("Series: ", deparse(substitute(series))),
      na.action = na.pass, ...)
```

Arguments

| | |
|-----------|---|
| series | The data. Does not have to be a time series object. |
| max.lag | Maximum lag. Can be omitted. Defaults to $\sqrt{n} + 10$ unless $n < 60$. If the series is seasonal, this will be at least 4 seasons by default. |
| plot | If FALSE, no graph is produced but the values are still printed. |
| main | Title of graphic; defaults to name of series. |
| na.action | How to handle missing data; default is na.pass |
| ... | Additional arguments passed to acf |

Details

This is basically a wrapper for `acf()` provided in `tseries`. The error bounds are approximate white noise bounds, $0 \pm 2/\sqrt{n}$; no other option is given.

Value

| | |
|------|-----------------|
| ACF | The sample ACF |
| PACF | The sample PACF |

Author(s)

D.S. Stoffer

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Examples

```
acf2(rnorm(100))
acf2(rnorm(100), 25, main='') # no title
acf2(rnorm(100), plot=FALSE)[,'ACF'] # print only ACF
```

| | |
|---------|-------------------------------|
| ar1miss | <i>AR with Missing Values</i> |
|---------|-------------------------------|

Description

Data used in Chapter 6

Format

The format is: Time-Series [1:100] with NA for missing values.

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

| | |
|-----|-------------------------|
| arf | <i>Simulated ARFIMA</i> |
|-----|-------------------------|

Description

1000 simulated observations from an ARFIMA(1, 1, 0) model with $\phi = .75$ and $d = .4$.

Format

The format is: Time-Series [1:1000] from 1 to 1000: -0.0294 0.7487 -0.3386 -1.0332 -0.2627 ...

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

`arma.spec`*Spectral Density of an ARMA Model*

Description

Gives the ARMA spectrum (on a log scale), tests for causality, invertibility, and common zeros.

Usage

```
arma.spec(ar = 0, ma = 0, var.noise = 1, n.freq = 500, ...)
```

Arguments

| | |
|------------------------|-------------------------|
| <code>ar</code> | vector of AR parameters |
| <code>ma</code> | vector of MA parameters |
| <code>var.noise</code> | variance of the noise |
| <code>n.freq</code> | number of frequencies |
| <code>...</code> | additional arguments |

Details

The basic call is `arma.spec(ar, ma)` where `ar` and `ma` are vectors containing the model parameters. Use `log="no"` if you do not want the plot on a log scale. If the model is not causal or invertible an error message is given. If there are common zeros, a spectrum will be displayed and a warning will be given; e.g., `arma.spec(ar= .9, ma= -.9)` will yield a warning and the plot will be the spectrum of white noise.

Value

| | |
|-------------------|---|
| <code>freq</code> | frequencies - returned invisibly |
| <code>spec</code> | spectral ordinates - returned invisibly |

Author(s)

D.S. Stoffer

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Examples

```
arma.spec(ar = c(1, -.9), ma = .8, log="no")
```

ARMAtoAR

Convert ARMA Process to Infinite AR Process

Description

Gives the π -weights in the invertible representation of an ARMA model.

Usage

```
ARMAtoAR(ar = 0, ma = 0, lag.max=20)
```

Arguments

| | |
|---------|------------------------------|
| ar | vector of AR coefficients |
| ma | vector of MA coefficients |
| lag.max | number of pi-weights desired |

Value

A vector of coefficients.

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Examples

```
# From Section 3.1
ARMAtoAR(ar=.9, ma=.5, 10)
```

beamd*Infrasonic Signal from a Nuclear Explosion*

Description

Infrasonic signal from a nuclear explosion.

Usage

```
data(beamd)
```

Format

A data frame with 2048 observations (rows) on 3 numeric variables (columns): sensor1, sensor2, sensor3.

Details

This is a data frame consisting of three columns (that are not time series objects). The data are an infrasonic signal from a nuclear explosion observed at sensors on a triangular array.

References

| | |
|-------|---------------------------------|
| birth | <i>U.S. Monthly Live Births</i> |
|-------|---------------------------------|

Description

Monthly live births (adjusted) in thousands for the United States, 1948-1979.

Format

The format is: Time-Series [1:373] from 1948 to 1979: 295 286 300 278 272 268 308 321 313 308 ...

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

| | |
|-------|-------------------------|
| blood | <i>Daily Blood Work</i> |
|-------|-------------------------|

Description

Multiple time series of measurements made for 91 days on the three variables, log(white blood count) [WBC], log(platelet) [PLT] and hematocrit [HCT]. Missing data code is NA.

Format

The format is: mts [1:91, 1:3]

Details

This is the data set used in Chapter 6 with NA as the missing data code.

```
## Not run: plot(blood, type="o", pch=19)
```

| | |
|----------|---|
| bnrf1ebv | <i>Nucleotide sequence - BNRF1 Epstein-Barr</i> |
|----------|---|

Description

Nucleotide sequence of the BNRF1 gene of the Epstein-Barr virus (EBV): 1=A, 2=C, 3=G, 4=T. The data are used in Chapter 7.

Format

The format is: Time-Series [1:3954] from 1 to 3954: 1 4 3 3 1 1 3 1 3 1 ...

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

| | |
|----------|---|
| bnrf1hvs | <i>Nucleotide sequence - BNRF1 of Herpesvirus saimiri</i> |
|----------|---|

Description

Nucleotide sequence of the BNRF1 gene of the herpesvirus saimiri (HVS): 1=A, 2=C, 3=G, 4=T. The data are used in Chapter 7.

Format

The format is: Time-Series [1:3741] from 1 to 3741: 1 4 3 2 4 4 3 4 4 4 ...

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

`ccf2`*Cross Correlation Plot*

Description

Produces a nice graphic (and only a plot) of the sample CCF of two time series.

Usage

```
ccf2(x, y, max.lag = NULL, main=NULL, ylab="CCF", na.action = na.pass, ... )
```

Arguments

| | |
|------------------------|---|
| <code>x, y</code> | univariate time series. |
| <code>max.lag</code> | maximum lag for which to calculate the CCF. |
| <code>main</code> | plot title - if NULL, uses x and y names. |
| <code>ylab</code> | vertical axis label; default is 'CCF'. |
| <code>na.action</code> | how to handle missing values; default is <code>na.pass</code> |
| <code>...</code> | additional arguments passed to <code>acf</code> |

Details

This will produce a graphic of the sample $\text{corr}[x(t+\text{lag}), y(t)]$ from `-max.lag` to `max.lag`.

climhyd

Lake Shasta inflow data

Description

Lake Shasta inflow data This is a data frame.

Format

A data frame with 454 observations (rows) on the following 6 numeric variables (columns): Temp, DewPt, CldCvr, WndSpd, Precip, Inflow.

Details

The data are 454 months of measured values for the climatic variables: air temperature, dew point, cloud cover, wind speed, precipitation, and inflow, at Lake Shasta, California. The man-made lake is famous for the placard stating, "We don't swim in your toilet, so don't pee in our lake."

econ5

Five Quarterly Economic Series

Description

Data frame containing quarterly U.S. unemployment, GNP, consumption, and government and private investment, from 1948-III to 1988-II.

Usage

```
data(econ5)
```

Format

A data frame with 161 observations (rows) on the following 5 numeric variables (columns): unemp, gnp, consum, govinv, prinv.

Source

Young, P.C. and Pedregal, D.J. (1999). Macro-economic relativity: government spending, private investment and unemployment in the USA 1948-1998. *Structural Change and Economic Dynamics*, 10, 359-380.

 EM0

EM Algorithm for Time Invariant State Space Models

Description

Estimation of the parameters in the model (6.1)–(6.2) via the EM algorithm.

Usage

```
EM0(num, y, A, mu0, Sigma0, Phi, cQ, cR, max.iter = 50, tol = 0.01)
```

Arguments

| | |
|----------|--|
| num | number of observations |
| y | observation vector or time series |
| A | time-invariant observation matrix |
| mu0 | initial state mean vector |
| Sigma0 | initial state covariance matrix |
| Phi | state transition matrix |
| cQ | Cholesky-like decomposition of state error covariance matrix Q – see details below |
| cR | Cholesky-like decomposition of state error covariance matrix R – see details below |
| max.iter | maximum number of iterations |
| tol | relative tolerance for determining convergence |

Details

Practically, the script only requires that Q or R may be reconstructed as $t(cQ) \% \% (cQ)$ or $t(cR) \% \% (cR)$, respectively.

Value

| | |
|--------|---|
| Phi | Estimate of Phi |
| Q | Estimate of Q |
| R | Estimate of R |
| mu0 | Estimate of initial state mean |
| Sigma0 | Estimate of initial state covariance matrix |
| like | -log likelihood at each iteration |
| niter | number of iterations to convergence |
| cvg | relative tolerance at convergence |

Author(s)

D.S. Stoffer

References<http://www.stat.pitt.edu/stoffer/tsa4/>

EM1

*EM Algorithm for General State Space Models***Description**

Estimation of the parameters in the general state space model via the EM algorithm. Inputs are not allowed; see the note.

Usage

```
EM1(num, y, A, mu0, Sigma0, Phi, cQ, cR, max.iter = 100, tol = 0.001)
```

Arguments

| | |
|----------|--|
| num | number of observations |
| y | observation vector or time series; use 0 for missing values |
| A | observation matrices, an array with $\text{dim} = c(q, p, n)$; use 0 for missing values |
| mu0 | initial state mean |
| Sigma0 | initial state covariance matrix |
| Phi | state transition matrix |
| cQ | Cholesky-like decomposition of state error covariance matrix Q – see details below |
| cR | R is diagonal here, so $cR = \text{sqrt}(R)$ – also, see details below |
| max.iter | maximum number of iterations |
| tol | relative tolerance for determining convergence |

Details

Practically, the script only requires that Q or R may be reconstructed as $t(cQ) \% \% (cQ)$ or $t(cR) \% \% (cR)$, respectively.

Value

| | |
|--------|---|
| Phi | Estimate of Phi |
| Q | Estimate of Q |
| R | Estimate of R |
| mu0 | Estimate of initial state mean |
| Sigma0 | Estimate of initial state covariance matrix |
| like | -log likelihood at each iteration |
| niter | number of iterations to convergence |
| cvg | relative tolerance at convergence |

Note

Inputs are not allowed (and hence not estimated). The script uses Ksmooth1 and everything related to inputs are set equal to zero when it is called.

It would be relatively easy to include estimates of 'Ups' and 'Gam' because conditional on the states, these are just regression coefficients. If you decide to alter EM1 to include estimates of the 'Ups' or 'Gam', feel free to notify me with a workable example and I'll include it in the next update.

EQ5

Seismic Trace of Earthquake number 5

Description

Seismic trace of an earthquake [two phases or arrivals along the surface, the primary wave ($t = 1, \dots, 1024$) and the shear wave ($t = 1025, \dots, 2048$)] recorded at a seismic station.

Format

The format is: Time-Series [1:2048] from 1 to 2048: 0.01749 0.01139 0.01512 0.01477 0.00651 ...

eqexp

Earthquake and Explosion Seismic Series

Description

This is a data frame of the earthquake and explosion seismic series used throughout the text.

Format

A data frame with 2048 observations (rows) on 17 variables (columns). Each column is a numeric vector.

Details

The matrix has 17 columns, the first eight are earthquakes, the second eight are explosions, and the last column is the Novaya Zemlya event of unknown origin.

The column names are: EQ1, EQ2, . . . , EQ8; EX1, EX2, . . . , EX8; NZ. The first 1024 observations correspond to the P wave, the second 1024 observations correspond to the S wave.

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

EXP6

Seismic Trace of Explosion number 6

Description

Seismic trace of an explosion [two phases or arrivals along the surface, the primary wave ($t = 1, \dots, 1024$) and the shear wave ($t = 1025, \dots, 2048$)] recorded at a seismic station.

Format

The format is: Time-Series [1:2048] from 1 to 2048: -0.001837 -0.000554 -0.002284 -0.000303 -0.000721 ...

FDR

Basic False Discovery Rate

Description

Computes the basic false discovery rate given a vector of p-values.

Usage

```
FDR(pvals, qllevel = 0.05)
```

Arguments

| | |
|---------|--|
| pvals | a vector of pvals on which to conduct the multiple testing |
| qllevel | the proportion of false positives desired |

Value

| | |
|--------|---|
| fdr.id | NULL if no significant tests, or the index of the maximal p-value satisfying the FDR condition. |
|--------|---|

fmri *fMRI - complete data set*

Description

Data (as a vector list) from an fMRI experiment in pain, listed by location and stimulus. The data are BOLD signals when a stimulus was applied for 32 seconds and then stopped for 32 seconds. The signal period is 64 seconds and the sampling rate was one observation every 2 seconds for 256 seconds ($n = 128$). The number of subjects under each condition varies.

Details

The LOCATIONS of the brain where the signal was measured were [1] Cortex 1: Primary Somatosensory, Contralateral, [2] Cortex 2: Primary Somatosensory, Ipsilateral, [3] Cortex 3: Secondary Somatosensory, Contralateral, [4] Cortex 4: Secondary Somatosensory, Ipsilateral, [5] Caudate, [6] Thalamus 1: Contralateral, [7] Thalamus 2: Ipsilateral, [8] Cerebellum 1: Contralateral and [9] Cerebellum 2: Ipsilateral.

The TREATMENTS or stimuli (and number of subjects in each condition) are [1] Awake-Brush (5 subjects), [2] Awake-Heat (4 subjects), [3] Awake-Shock (5 subjects), [4] Low-Brush (3 subjects), [5] Low-Heat (5 subjects), and [6] Low-Shock (4 subjects). Issue the command `summary(fmri)` for further details. In particular, awake (Awake) or mildly anesthetized (Low) subjects were subjected levels of periodic brushing (Brush), application of heat (Heat), and mild shock (Shock) effects.

As an example, `fmri$LT6` (Location 1, Treatment 6) will show the data for the four subjects receiving the Low-Shock treatment at the Cortex 1 location; note that `fmri[[6]]` will display the same data.

fmri1

fMRI Data Used in Chapter 1

Description

A data frame that consists of average fMRI BOLD signals at eight locations.

Usage

```
data(fmri1)
```

Format

The format is: mts [1:128, 1:9]

Details

Multiple time series consisting of fMRI BOLD signals at eight locations (in columns 2-9, column 1 is time period), when a stimulus was applied for 32 seconds and then stopped for 32 seconds. The signal period is 64 seconds and the sampling rate was one observation every 2 seconds for 256 seconds ($n = 128$). The columns are labeled: "time" "cort1" "cort2" "cort3" "cort4" "thal1" "thal2" "cere1" "cere2".

globtemp

Global mean land-ocean temperature deviations - updated

Description

Global mean land-ocean temperature deviations (from 1951-1980 average), measured in degrees centigrade, for the years 1880-2015. This is an update of gtemp.

Format

The format is: Time-Series [1:136] from 1880 to 2015: -0.2 -0.11 -0.1 -0.2 -0.28 -0.31 -0.3 -0.33 -0.2 -0.11 ...

Details

The data were changed after 2011, so there are discrepancies between this data set and gtemp. The differences are explained here: <http://www1.ncdc.noaa.gov/pub/data/ghcn/v3/GHCNM-v3.2.0-FAQ.pdf>.

jj *Johnson and Johnson Quarterly Earnings Per Share*

Description

Johnson and Johnson quarterly earnings per share, 84 quarters (21 years) measured from the first quarter of 1960 to the last quarter of 1980.

Format

The format is: Time-Series [1:84] from 1960 to 1981: 0.71 0.63 0.85 0.44 0.61 0.69 0.92 0.55 0.72 0.77 ...

Details

This data set is also included with the R distribution as JohnsonJohnson

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Description

Returns the filtered values for the basic time invariant state-space model; inputs are not allowed.

Usage

Kfilter0(num, y, A, mu0, Sigma0, Phi, cQ, cR)

Arguments

| | |
|--------|--|
| num | number of observations |
| y | data matrix, vector or time series |
| A | time-invariant observation matrix |
| mu0 | initial state mean vector |
| Sigma0 | initial state covariance matrix |
| Phi | state transition matrix |
| cQ | Cholesky-type decomposition of state error covariance matrix Q – see details below |
| cR | Cholesky-type decomposition of observation error covariance matrix R – see details below |

Details

Practically, the script only requires that Q or R may be reconstructed as $t(cQ) \times t(cQ)$ or $t(cR) \times t(cR)$, respectively.

Value

| | |
|-------|--|
| xp | one-step-ahead state prediction |
| Pp | mean square prediction error |
| xf | filter value of the state |
| Pf | mean square filter error |
| like | the negative of the log likelihood |
| innov | innovation series |
| sig | innovation covariances |
| Kn | last value of the gain, needed for smoothing |

Author(s)

D.S. Stoffer

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Kfilter1

Kalman Filter - Model may be time varying or have inputs

Description

Returns both the predicted and filtered values for a linear state space model. Also evaluates the likelihood at the given parameter values.

Usage

```
Kfilter1(num, y, A, mu0, Sigma0, Phi, Ups, Gam, cQ, cR, input)
```

Arguments

| | |
|--------|--|
| num | number of observations |
| y | data matrix, vector or time series |
| A | time-varying observation matrix, an array with $\text{dim}=\text{c}(q, p, n)$ |
| mu0 | initial state mean |
| Sigma0 | initial state covariance matrix |
| Phi | state transition matrix |
| Ups | state input matrix; use Ups = 0 if not needed |
| Gam | observation input matrix; use Gam = 0 if not needed |
| cQ | Cholesky-type decomposition of state error covariance matrix Q – see details below |
| cR | Cholesky-type decomposition of observation error covariance matrix R – see details below |
| input | matrix or vector of inputs having the same row dimension as y; use input = 0 if not needed |

Details

Practically, the script only requires that Q or R may be reconstructed as $\text{t}(cQ)\%*\%(\text{cQ})$ or $\text{t}(cR)\%*\%(\text{cR})$, respectively.

Value

| | |
|-------|--|
| xp | one-step-ahead prediction of the state |
| Pp | mean square prediction error |
| xf | filter value of the state |
| Pf | mean square filter error |
| like | the negative of the log likelihood |
| innov | innovation series |
| sig | innovation covariances |
| Kn | last value of the gain, needed for smoothing |

Author(s)

D.S. Stoffer

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

| | |
|----------|--|
| Kfilter2 | <i>Kalman Filter - Model may be time varying or have inputs or correlated errors</i> |
|----------|--|

Description

Returns the filtered values for the state space model. In addition, the script returns the evaluation of the likelihood at the given parameter values and the innovation sequence.

Usage

```
Kfilter2(num, y, A, mu0, Sigma0, Phi, Ups, Gam, Theta, cQ, cR,
         S, input)
```

Arguments

| | |
|--------|--|
| num | number of observations |
| y | data matrix, vector or time series |
| A | time-varying observation matrix, an array with <code>dim = c(q,p,n)</code> |
| mu0 | initial state mean |
| Sigma0 | initial state covariance matrix |
| Phi | state transition matrix |

| | |
|-------|--|
| Ups | state input matrix; use Ups = 0 if not needed |
| Gam | observation input matrix; use Gam = 0 if not needed |
| Theta | state error pre-matrix |
| cQ | Cholesky decomposition of state error covariance matrix Q – see details below |
| cR | Cholesky-type decomposition of observation error covariance matrix R – see details below |
| S | covariance-type matrix of state and observation errors |
| input | matrix or vector of inputs having the same row dimension as y; use input = 0 if not needed |

Details

Practically, the script only requires that Q or R may be reconstructed as $t(cQ) \times t(cQ)$ or $t(cR) \times t(cR)$, respectively.

Value

| | |
|-------|--|
| xp | one-step-ahead prediction of the state |
| Pp | mean square prediction error |
| xf | filter value of the state |
| Pf | mean square filter error |
| like | the negative of the log likelihood |
| innov | innovation series |
| sig | innovation covariances |
| K | last value of the gain, needed for smoothing |

Author(s)

D.S. Stoffer

Ksmooth0

Kalman Filter and Smoother - Time invariant model without inputs

Description

Returns both the filtered values and smoothed values for the state-space model.

Usage

Ksmooth0(num, y, A, mu0, Sigma0, Phi, cQ, cR)

Arguments

| | |
|--------|--|
| num | number of observations |
| y | data matrix, vector or time series |
| A | time-invariant observation matrix |
| mu0 | initial state mean vector |
| Sigma0 | initial state covariance matrix |
| Phi | state transition matrix |
| cQ | Cholesky-type decomposition of state error covariance matrix Q – see details below |
| cR | Cholesky-type decomposition of observation error covariance matrix R – see details below |

Details

Practically, the script only requires that Q or R may be reconstructed as $t(cQ) \times (cQ)$ or $t(cR) \times (cR)$, respectively, which allows more flexibility.

Value

| | |
|------|--|
| xs | state smoothers |
| Ps | smoother mean square error |
| x0n | initial mean smoother |
| P0n | initial smoother covariance |
| J0 | initial value of the J matrix |
| J | the J matrices |
| xp | one-step-ahead prediction of the state |
| Pp | mean square prediction error |
| xf | filter value of the state |
| Pf | mean square filter error |
| like | the negative of the log likelihood |
| Kn | last value of the gain |

Author(s)

D.S. Stoffer

References

 Ksmooth1

Kalman Filter and Smoother - General model

Description

Returns both the filtered and the smoothed values for the state-space model.

Usage

```
Ksmooth1(num, y, A, mu0, Sigma0, Phi, Ups, Gam, cQ, cR, input)
```

Arguments

| | |
|--------|---|
| num | number of observations |
| y | data matrix, vector or time series |
| A | time-varying observation matrix, an array with $\text{dim}=\text{c}(q, p, n)$ |
| mu0 | initial state mean |
| Sigma0 | initial state covariance matrix |
| Phi | state transition matrix |
| Ups | state input matrix; use <code>Ups = 0</code> if not needed |
| Gam | observation input matrix; use <code>Gam = 0</code> if not needed |
| cQ | Cholesky-type decomposition of state error covariance matrix Q – see details below |
| cR | Cholesky-type decomposition of observation error covariance matrix R – see details below |
| input | matrix or vector of inputs having the same row dimension as y; use <code>input = 0</code> if not needed |

Details

Practically, the script only requires that Q or R may be reconstructed as `t(cQ)**(cQ)` or `t(cR)**(cR)`, respectively, which allows more flexibility.

Value

| | |
|-------------------|--|
| <code>xs</code> | state smoothers |
| <code>Ps</code> | smoother mean square error |
| <code>x0n</code> | initial mean smoother |
| <code>P0n</code> | initial smoother covariance |
| <code>J0</code> | initial value of the J matrix |
| <code>J</code> | the J matrices |
| <code>xp</code> | one-step-ahead prediction of the state |
| <code>Pp</code> | mean square prediction error |
| <code>xf</code> | filter value of the state |
| <code>Pf</code> | mean square filter error |
| <code>like</code> | the negative of the log likelihood |
| <code>Kn</code> | last value of the gain |

Author(s)

D.S. Stoffer

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Ksmooth2

Kalman Filter and Smoother - General model, may have correlated errors

Description

Returns the filtered and smoothed values for the state-space model. This is the smoother companion to `Kfilter2`.

Usage

```
Ksmooth2(num, y, A, mu0, Sigma0, Phi, Ups, Gam, Theta, cQ, cR,
          S, input)
```

Arguments

| | |
|--------|---|
| num | number of observations |
| y | data matrix, vector or time series |
| A | time-varying observation matrix, an array with $\text{dim} = c(q, p, n)$ |
| mu0 | initial state mean |
| Sigma0 | initial state covariance matrix |
| Phi | state transition matrix |
| Ups | state input matrix; use <code>Ups = 0</code> if not needed |
| Gam | observation input matrix; use <code>Gam = 0</code> if not needed |
| Theta | state error pre-matrix |
| cQ | Cholesky-type decomposition of state error covariance matrix Q – see details below |
| cR | Cholesky-type decomposition of observation error covariance matrix R – see details below |
| S | covariance matrix of state and observation errors |
| input | matrix or vector of inputs having the same row dimension as y; use <code>input = 0</code> if not needed |

Details

Practically, the script only requires that Q or R may be reconstructed as $t(cQ) \% \% (cQ)$ or $t(cR) \% \% (cR)$, respectively, which allows more flexibility.

Value

| | |
|------|--|
| xs | state smoothers |
| Ps | smoother mean square error |
| J | the J matrices |
| xp | one-step-ahead prediction of the state |
| Pp | mean square prediction error |
| xf | filter value of the state |
| Pf | mean square filter error |
| like | the negative of the log likelihood |
| Kn | last value of the gain |

`lag1.plot`*Lag Plot - one time series*

Description

Produces a grid of scatterplots of a series versus lagged values of the series.

Usage

```
lag1.plot(series, max.lag = 1, corr = TRUE, smooth = TRUE)
```

Arguments

| | |
|----------------------|--|
| <code>series</code> | the data |
| <code>max.lag</code> | maximum lag |
| <code>corr</code> | if TRUE, shows the autocorrelation value in a legend |
| <code>smooth</code> | if TRUE, adds a lowess fit to each scatterplot |

Author(s)

D.S. Stoffer

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Examples

```
lag1.plot(soi, 9)
```

`lag2.plot`*Lag Plot - two time series*

Description

Produces a grid of scatterplots of one series versus another. The first named series is the one that gets lagged.

Usage

```
lag2.plot(series1, series2, max.lag = 0, corr = TRUE, smooth = TRUE)
```

Arguments

| | |
|---------|--|
| series1 | first series (the one that gets lagged) |
| series2 | second series |
| max.lag | maximum number of lags |
| corr | if TRUE, shows the cross-correlation value in a legend |
| smooth | if TRUE, adds a lowess fit to each scatterplot |

Author(s)

D.S. Stoffer

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Examples

```
lag2.plot(soi, rec, 8)
```

LagReg

Lagged Regression

Description

Performs lagged regression as discussed in Chapter 4.

Usage

```
LagReg(input, output, L = c(3, 3), M = 40, threshold = 0,
        inverse = FALSE)
```

Arguments

| | |
|-----------|---|
| input | input series |
| output | output series |
| L | degree of smoothing; see spans in the help file for spec.pgram. |
| M | must be even; number of terms used in the lagged regression |
| threshold | the cut-off used to set small (in absolute value) regression coefficients equal to zero |
| inverse | if TRUE, will fit a forward-lagged regression |

Details

For a bivariate series, input is the input series and output is the output series. The degree of smoothing for the spectral estimate is given by L ; see spans in the help file for `spec.pgram`. The number of terms used in the lagged regression approximation is given by M , which must be even. The threshold value is the cut-off used to set small (in absolute value) regression coefficients equal to zero (it is easiest to run `LagReg` twice, once with the default threshold of zero, and then again after inspecting the resulting coefficients and the corresponding values of the CCF). Setting `inverse=TRUE` will fit a forward-lagged regression; the default is to run a backward-lagged regression. The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta.

Value

Graphs of the estimated impulse response function, the CCF, and the output with the predicted values superimposed.

| | |
|-------------------|---|
| <code>beta</code> | Estimated coefficients |
| <code>fit</code> | The output series, the fitted values, and the residuals |

| | |
|------|--------------------------|
| lead | <i>Leading Indicator</i> |
|------|--------------------------|

Description

Leading indicator, 150 months; taken from Box and Jenkins (1970).

Usage

```
data(lead)
```

Format

The format is: Time-Series [1:150] from 1 to 150: 10.01 10.07 10.32 9.75 10.33 ...

Details

This is also the R time series `BJsales.lead`: The sales time series `BJsales` and leading indicator `BJsales.lead` each contain 150 observations. The objects are of class "ts".

See Also

[sales](#)

Description

This is `spec.pgram` with a few changes in the defaults and written so you can easily extract the estimate of the multivariate spectral matrix as `fxx`. The bandwidth calculation has been changed to the more practical definition given in the text. Can be used to replace `spec.pgram` for univariate series.

Usage

```
mvspec(x, spans = NULL, kernel = NULL, taper = 0, pad = 0,
       fast = TRUE, demean = FALSE, detrend = TRUE,
       plot = TRUE, na.action = na.fail, ...)
```

Arguments

| | |
|------------------------|---|
| <code>x</code> | univariate or multivariate time series (i.e., the <code>p</code> columns of <code>x</code> are time series) |
| <code>spans</code> | specify smoothing; same as <code>spec.pgram</code> |
| <code>kernel</code> | specify kernel; same as <code>spec.pgram</code> |
| <code>taper</code> | specify taper; same as <code>spec.pgram</code> with different default |
| <code>pad</code> | specify padding; same as <code>spec.pgram</code> |
| <code>fast</code> | specify use of FFT; same as <code>spec.pgram</code> |
| <code>demean</code> | if TRUE, series is demeaned first; same as <code>spec.pgram</code> |
| <code>detrend</code> | if TRUE, series is detrended first; same as <code>spec.pgram</code> |
| <code>plot</code> | plot the estimate; same as <code>spec.pgram</code> |
| <code>na.action</code> | same as <code>spec.pgram</code> |
| <code>...</code> | additional arguments; same as <code>spec.pgram</code> |

Details

This is `spec.pgram` with a few changes in the defaults and written so you can easily extract the estimate of the multivariate spectral matrix as `fxx`. The bandwidth calculation has been changed to the more practical definition given in the text, $(L_h/n.used) * frequency(x)$. Although meant to be used to easily obtain multivariate spectral estimates, this script can be used for univariate time series. Note that the script does not taper by default (`taper=0`); this forces the user to do "conscious tapering".

Value

An object of class "spec", which is a list containing at least the following components:

| | |
|--------|---|
| fx | spectral matrix estimates; an array of dimensions $\text{dim} = c(p, p, \text{nfreq})$ |
| freq | vector of frequencies at which the spectral density is estimated. |
| spec | vector (for univariate series) or matrix (for multivariate series) of estimates of the spectral density at frequencies corresponding to freq. |
| coh | NULL for univariate series. For multivariate time series, a matrix containing the squared coherency between different series. Column $i + (j - 1) * (j - 2) / 2$ of coh contains the squared coherency between columns i and j of x , where $i < j$. |
| phase | NULL for univariate series. For multivariate time series a matrix containing the cross-spectrum phase between different series. The format is the same as coh. |
| Lh | Number of frequencies (approximate) used in the band, as defined in Chapter 4. |
| n.used | Sample length used for the FFT |
| series | The name of the time series. |
| snames | For multivariate input, the names of the component series. |
| method | The method used to calculate the spectrum. |

The results are returned invisibly if plot is true.

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

Examples

```
# univariate example
plot(co2) # co2 is an R data set
mvspec(co2, spans=c(5,5), taper=.5)

# multivariate example
ts.plot(mdeaths, fdeaths, col=1:2) # an R data set, male/female monthly deaths ...
dog = mvspec(cbind(mdeaths, fdeaths), spans=c(3,3), taper=.1)
dog$fx # look a spectral matrix estimates
dog$bandwidth # bandwidth with time unit = year
dog$bandwidth/frequency(mdeaths) # ... with time unit = month
plot(dog, plot.type="coherency") # plot of squared coherency
```

 sarima

Fit ARIMA Models

Description

Fits ARIMA models (including improved diagnostics) in a short command. It can also be used to perform regression with autocorrelated errors. This is a front end to `arima()` with a different back door.

Usage

```
sarima(xdata, p, d, q, P = 0, D = 0, Q = 0, S = -1,
       details = TRUE, xreg=NULL, Model=TRUE,
       tol = sqrt(.Machine$double.eps),
       no.constant = FALSE)
```

Arguments

| | |
|--------------------------|---|
| <code>xdata</code> | univariate time series |
| <code>p</code> | AR order (must be specified) |
| <code>d</code> | difference order (must be specified) |
| <code>q</code> | MA order (must be specified) |
| <code>P</code> | SAR order; use only for seasonal models |
| <code>D</code> | seasonal difference; use only for seasonal models |
| <code>Q</code> | SMA order; use only for seasonal models |
| <code>S</code> | seasonal period; use only for seasonal models |
| <code>xreg</code> | Optionally, a vector or matrix of external regressors, which must have the same number of rows as <code>xdata</code> . |
| <code>Model</code> | if TRUE (default), the model orders are printed on the diagnostic plot. |
| <code>details</code> | if FALSE, turns off the diagnostic plot and the output from the nonlinear optimization routine, which is <code>optim</code> . The default is TRUE. |
| <code>tol</code> | controls the relative tolerance (<code>reltol</code> in <code>optim</code>) used to assess convergence. The default is <code>sqrt(.Machine\$double.eps)</code> , the R default. |
| <code>no.constant</code> | controls whether or not <code>sarima</code> includes a constant in the model. In particular, if there is no differencing (<code>d = 0</code> and <code>D = 0</code>) you get the mean estimate. If there is differencing of order one (either <code>d = 1</code> or <code>D = 1</code> , but not both), a constant term is included in the model. These two conditions may be overridden (i.e., no constant will be included in the model) by setting this to TRUE; e.g., <code>sarima(x, 1, 1, 0, no.constant=TRUE)</code> . Otherwise, no constant or mean term is included in the model. If regressors are included (via <code>xreg</code>), this is ignored. |

Details

If your time series is in `x` and you want to fit an ARIMA(p,d,q) model to the data, the basic call is `sarima(x,p,d,q)`. The values p,d,q must be specified as there is no default. The results are the parameter estimates, standard errors, AIC, AICc, BIC (as defined in Chapter 2) and diagnostics. To fit a seasonal ARIMA model, the basic call is `sarima(x,p,d,q,P,D,Q,S)`. For example, `sarima(x,2,1,0)` will fit an ARIMA(2,1,0) model to the series in `x`, and `sarima(x,2,1,0,0,1,1,12)` will fit a seasonal ARIMA(2,1,0) * (0,1,1)₁₂ model to the series in `x`. The difference between the information criteria given by `sarima()` and `arima()` is that they essentially differ by a factor of the sample size. Precise details are explained in Chapter 2, footnote 2.

Value

| | |
|---------------------------------|--|
| <code>fit</code> | the arima object |
| <code>degrees_of_freedom</code> | Error degrees of freedom |
| <code>ttable</code> | a little t-table with two-sided p-values |
| AIC | value of the AIC |
| AICc | value of the AICc |
| BIC | value of the BIC |

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

[sarima.for](#)

Examples

```
sarima(log(AirPassengers),0,1,1,0,1,1,12)
(dog <- sarima(log(AirPassengers),0,1,1,0,1,1,12))
summary(dog$fit) # fit has all the returned arima() values
plot(resid(dog$fit)) # plot the innovations (residuals)
sarima(log(AirPassengers),0,1,1,0,1,1,12,details=FALSE)$BIC # print model BIC only
```

sarima.for

ARIMA Forecasting

Description

ARIMA forecasting - this is a wrapper for R's `predict.Arima`.

Usage

```
sarima.for(xdata, n.ahead, p, d, q, P = 0, D = 0, Q = 0, S = -1,
          tol = sqrt(.Machine$double.eps), no.constant = FALSE,
          plot.all=FALSE, xreg = NULL, newxreg = NULL)
```

Arguments

| | |
|-------------|--|
| xdata | univariate time series |
| n.ahead | forecast horizon (number of periods) |
| p | AR order |
| d | difference order |
| q | MA order |
| P | SAR order; use only for seasonal models |
| D | seasonal difference; use only for seasonal models |
| Q | SMA order; use only for seasonal models |
| S | seasonal period; use only for seasonal models |
| tol | controls the relative tolerance (reltol) used to assess convergence. The default is <code>sqrt(.Machine\$double.eps)</code> , the R default. |
| no.constant | controls whether or not a constant is included in the model. If <code>no.constant=TRUE</code> , no constant is included in the model. See sarima for more details. |
| plot.all | if <code>TRUE</code> , all the data are plotted in the graphic; otherwise, only the last 100 observations are plotted in the graphic. |
| xreg | Optionally, a vector or matrix of external regressors, which must have the same number of rows as the series. If this is used, <code>newxreg</code> MUST be specified. |
| newxreg | New values of <code>xreg</code> to be used for prediction. Must have at least <code>n.ahead</code> rows. |

Details

For example, `sarima.for(x, 5, 1, 0, 1)` will forecast five time points ahead for an ARMA(1,1) fit to `x`. The output prints the forecasts and the standard errors of the forecasts, and supplies a graphic of the forecast with +/- 1 and 2 prediction error bounds.

Value

| | |
|------|----------------------------------|
| pred | the forecasts |
| se | the prediction (standard) errors |

nureg = time(soi)[nummy] + seq(1,n.ahead)/12
sarima.for(soi,n.ahead,2,0,0,2,0,0,12, xreg=time(soi), newxreg=nureg)

```

SigExtract

*Signal Extraction And Optimal Filtering***Description**

Performs signal extraction and optimal filtering as discussed in Chapter 4.

Usage

```
SigExtract(series, L = c(3, 3), M = 50, max.freq = 0.05)
```

Arguments

| | |
|----------|---|
| series | univariate time series to be filtered |
| L | degree of smoothing (may be a vector); see spans in spec.pgram for more details |
| M | number of terms used in the lagged regression approximation |
| max.freq | truncation frequency, which must be larger than 1/M. |

Details

The basic function of the script, and the default setting, is to remove frequencies above 1/20 (and, in particular, the seasonal frequency of 1 cycle every 12 time points). The sampling frequency of the time series is set to unity prior to the analysis.

Value

Returns plots of (1) the original and filtered series, (2) the estimated spectra of each series, (3) the filter coefficients and the desired and attained frequency response function. The filtered series is returned invisibly.

Note

The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta.

|-----------|---|
| stoch.reg | <i>Frequency Domain Stochastic Regression</i> |
|-----------|---|

Description

Performs frequency domain stochastic regression discussed in Chapter 7.

Usage

```
stoch.reg(data, cols.full, cols.red, alpha, L, M, plot.which)
```

Arguments

| | |
|------------|---|
| data | data matrix |
| cols.full | specify columns of data matrix that are in the full model |
| cols.red | specify columns of data matrix that are in the reduced model (use NULL if there are no inputs in the reduced model) |
| alpha | test size |
| L | smoothing - see spans in spec.pgram |
| M | number of points in the discretization of the integral |
| plot.which | coh or F.stat, to plot either the squared-coherencies or the F-statistics, respectively |

Value

| | |
|------------|----------------------------------|
| power.full | spectrum under the full model |
| power.red | spectrum under the reduced model |
| Betahat | regression parameter estimates |
| eF | pointwise (by frequency) F-tests |
| coh | coherency |

Note

The script is based on code that was contributed by Professor Doug Wiens, Department of Mathematical and Statistical Sciences, University of Alberta. See Example 7.1 on page 417 for a demonstration.

sunspotz

Biannual Sunspot Numbers

Description

Biannual smoothed (12-month moving average) number of sunspots from June 1749 to December 1978; n = 459. The "z" on the end is to distinguish this series from the one included with R (called sunspots).

Format

The format is: Time Series: Start = c(1749, 1) End = c(1978, 1) Frequency = 2

References

<http://www.stat.pitt.edu/stoffer/tsa4/>

`SVfilter`*Switching Filter (for Stochastic Volatility Models)*

Description

Performs a special case switching filter when the observational noise is a certain mixture of normals. Used to fit a stochastic volatility model.

Usage

```
SVfilter(num, y, phi0, phi1, sQ, alpha, sR0, mu1, sR1)
```

Arguments

| | |
|--------------------|---|
| <code>num</code> | number of observations |
| <code>y</code> | time series of returns |
| <code>phi0</code> | state constant |
| <code>phi1</code> | state transition parameter |
| <code>sQ</code> | state standard deviation |
| <code>alpha</code> | observation constant |
| <code>sR0</code> | observation error standard deviation for mixture component zero |
| <code>mu1</code> | observation error mean for mixture component one |
| <code>sR1</code> | observation error standard deviation for mixture component one |

Value

| | |
|-------------------|--|
| <code>xp</code> | one-step-ahead prediction of the volatility |
| <code>Pp</code> | mean square prediction error of the volatility |
| <code>like</code> | the negative of the log likelihood at the given parameter values |

| | |
|---------|-------------------------|
| tspplot | <i>Time Series Plot</i> |
|---------|-------------------------|

Description

Produces a nice plot of a univariate time series in one easy line.

Usage

```
tspplot(x, y=NULL, main=NULL, ylab=NULL, xlab='Time', type='l', margins=.25, ... )
```

Arguments

| | |
|---------|---|
| x, y | time series to be plotted; if both present, x will be the time index. |
| main | add a plot title - the default is no title. |
| ylab | y-axis label - the default is the name of the ts object. |
| xlab | x-axis label - the default is 'Time'. |
| type | type of plot - the default is line. |
| margins | inches to add (or subtract) to the margins. |
| ... | other graphical parameteres; see par . |

Note

This script is meant to be used for demonstrations so that a nice time series plot can be produced in one quick and easy statement. You can use it to do tricks, but you might get warnings because I had to use 2 levels of graphics to avoid having the grid on top of the line. For example, `axes = FALSE` will work, but you will get a warning because it applies to one level and not the other.
