

# Package ‘bcTSNE’

December 1, 2021

**Type** Package

**Title** Projected t-SNE for Batch Correction

**Version** 0.11.1

**Maintainer** Dayne L Filer <dayne.filer@gmail.com>

**Description** Implements the projected t-SNE method for batch correction of high-dimensional data. Please see Aliverti et al. (2020) <[doi:10.1093/bioinformatics/btaa189](https://doi.org/10.1093/bioinformatics/btaa189)> for more information.

**Imports** stats, RSpectra, utils, Rtsne, graphics, splatter

**Suggests** data.table, batchelor, kBET, scater, knitr, lisi, harmony, dlfUtils, xtable

**VignetteBuilder** knitr

**SystemRequirements** GNU make

**License** GPL-3

**Encoding** UTF-8

**URL** [https://github.com/emanuelealiverti/BC\\_tsNE](https://github.com/emanuelealiverti/BC_tsNE)

**RoxygenNote** 7.1.2

**Additional\_repositories** <https://daynefiler.github.io/drat>

**NeedsCompilation** yes

**Author** Dayne L Filer [aut, cre],  
Emanuele Aliverti [aut],  
Jeff Tilson [aut],  
Kirk C Wilhelmsen [aut],  
David B Dunson [aut]

**Repository** CRAN

**Date/Publication** 2021-12-01 07:40:05 UTC

**R topics documented:**

apat . . . . .	2
bctsnr . . . . .	3
calcPvals . . . . .	4
grad . . . . .	5
ols . . . . .	5
sqdist . . . . .	6
ssx . . . . .	6
zeroMean . . . . .	7

<b>Index</b>	<b>8</b>
--------------	----------

---

apat	$A + t(A)$
------	------------

---

**Description**

$A + t(A)$

**Usage**

apat(A)

**Arguments**

A            numeric matrix

**Details**

Not exported; exists for testing C code.

**Value**

numeric matrix ( $A + t(A)$ )

---

bctsne *Calculate BC t-SNE by orthogonal gradient descent*

---

**Description**

Calculate BC t-SNE by orthogonal gradient descent

**Usage**

```
bctsne(X, Z, k = 50, outDim = 2, perplexity = 30, maxIter = 1000)
```

**Arguments**

X	numeric matrix, input matrix
Z	numeric matrix, covariate matrix
k	integer of length 1, reduced dimension (number of eigenvectors)
outDim	integer of length 1, the output dimension
perplexity	numeric of length 1, the t-SNE perplexity
maxIter	integer of length 1, the maximum iterations for the BC t-SNE algorithm

**Details**

X should be preprocessed (e.g. PCA, centered and scaled). Z is the full model matrix, excluding the intercept.

**Value**

list with the following items:

Xred numeric matrix, the reduced dimension input to bctsne  
 Z model matrix indicating batch membership  
 perplexity perplexity value used in computing t-SNE  
 Y batch-corrected projection matrix  
 maxIter maximum iterations used in training

**Examples**

```
## Create small simulated dataset, A, with embeded batch effects
set.seed(2731)
kRid <- 20
p <- 100
n <- 200

W <- matrix(rnorm(p*kRid), kRid)
S <- matrix(rnorm(n*kRid), n)
z <- sample(1:3, rep = TRUE, size = n)
```

```

Z <- model.matrix( ~ -1 + as.factor(z))
l <- matrix(rnorm(kRid*NCOL(Z)), kRid)
A <- (S - Z %*% t(l) ) %*% W

## Scale A to give input, X
X <- scale(A)

resUnadj <- Rtsne::Rtsne(X)          ## Standard t-SNE
resAdj   <- bctsne(X = X, Z = Z, k = 10) ## Batch-corrected t-SNE

## Plot results, no true effects were included in the simulated data, so
## we expect all batches to overlap with bcTSNE; batch membership indicated
## by color
plot(resUnadj$Y, col = z)
plot(resAdj$Y, col = z)

```

---

calcPvals

*Calculate t-SNE p-values based on a distance matrix*

---

## Description

Calculate t-SNE p-values based on a distance matrix

## Usage

```
calcPvals(D, perplexity = 30)
```

## Arguments

D	numeric matrix, distance matrix
perplexity	numeric of length 1, t-SNE perplexity

## Details

Not exported; exists for testing C code.

## Value

numeric matrix of p-values based on the given perplexity

---

grad	<i>Calculate t-SNE gradient</i>
------	---------------------------------

---

**Description**

Calculate t-SNE gradient

**Usage**

```
grad(Y, pval, Z)
```

**Arguments**

Y	numeric matrix, lower dimension embedding
pval	numeric matrix, input data p-values
Z	numeric covariate matrix

**Details**

Not exported; exists for testing C code.

**Value**

numeric matrix, t-SNE gradient

---

ols	<i>Ordinary least squares, solves <math>B = AX</math> for <math>X</math>.</i>
-----	---

---

**Description**

Ordinary least squares, solves  $B = AX$  for  $X$ .

**Usage**

```
ols(A, B)
```

**Arguments**

A	numeric matrix
B	numeric matrix

**Details**

Not exported; exists for testing C code.

**Value**

numeric matrix ( $X$ )

---

sqdist	<i>Calculate squared Euclidean distance</i>
--------	---

---

**Description**

Calculate squared Euclidean distance

**Usage**

sqdist(X)

**Arguments**

X                    numeric matrix

**Details**

Not exported; exists for testing C code.

**Value**

numeric squared distance matrix

---

ssx	<i>Sum of squares</i>
-----	-----------------------

---

**Description**

Sum of squares

**Usage**

ssx(X)

**Arguments**

X                    numeric matrix

**Details**

Not exported; exists for testing C code.

**Value**

vector with the row sum of squares

---

zeroMean	<i>Subtract the column means from X</i>
----------	---

---

**Description**

Subtract the column means from  $X$

**Usage**

zeroMean( $X$ )

**Arguments**

$X$                   numeric matrix

**Details**

Not exported; exists for testing C code.

**Value**

numeric matrix with column means subtracted
