Package ‘biwavelet’

Type Package
Title Conduct Univariate and Bivariate Wavelet Analyses
Version 0.20.19
Date 2019-08-01
Author Tarik C. Gouhier, Aslak Grinsted, Viliam Simko
Maintainer Tarik C. Gouhier <tarik.gouhier@gmail.com>
Description This is a port of the WTC MATLAB package written by Aslak Grinsted and the wavelet program written by Christopher Torrence and Gibert P. Compo. This package can be used to perform univariate and bivariate (cross-wavelet, wavelet coherence, wavelet clustering) analyses.

Description

This is a port of the WTC MATLAB package written by Aslak Grinsted and the wavelet program written by Christopher Torrence and Gibert P. Compo. This package can be used to perform univariate and bivariate (cross-wavelet, wavelet coherence, wavelet clustering) wavelet analyses.

Details

As of biwavelet version 0.14, the bias-corrected wavelet and cross-wavelet spectra are automatically computed and plotted by default using the methods described by Liu et al. (2007) and Veleda et al. (2012). This correction is needed because the traditional approach for computing the power spectrum (e.g., Torrence and Compo 1998) leads to an artificial and systematic reduction in power at lower periods.
Author(s)

Tarik C. Gouhier

Maintainer: Tarik C. Gouhier <tarik.gouhier@gmail.com>

Code based on WTC MATLAB package written by Aslak Grinsted and the wavelet MATLAB program written by Christopher Torrence and Gibert P. Compo.

Examples

# As of biwavelet version 0.14, the bias-corrected wavelet and cross-wavelet spectra # are automatically computed and plotted by default using the methods # described by Liu et al. (2007) and Veleda et al. (2012). This correction # is needed because the traditional approach for computing the power spectrum # (e.g., Torrence and Compo 1998) leads to an artificial and systematic reduction # in power at low periods.

# EXAMPLE OF BIAS CORRECTION:
require(biwavelet)

# Generate a synthetic time series 's' with the same power at three distinct periods
t1=sin(seq(from=0, to=2*5*pi, length=1000))
t2=sin(seq(from=0, to=2*15*pi, length=1000))
t3=sin(seq(from=0, to=2*40*pi, length=1000))
s=t1+t2+t3

# Compare non-corrected vs. corrected wavelet spectrum
wt1=wt(cbind(1:1000, s))
par(mfrow=c(1,2))
plot(wt1, type="power.corr.norm", main="Bias-corrected")
plot(wt1, type="power.norm", main="Not-corrected")

# ADDITIONAL EXAMPLES
t1 <- cbind(1:100, rnorm(100))
t2 <- cbind(1:100, rnorm(100))

# Continuous wavelet transform
wt.t1 <- wt(t1)

# Plot power
# Make room to the right for the color bar
par oma = c(0, 0, 0, 1), mar = c(5, 4, 4, 5) + 0.1
plot(wt.t1, plot.cb=TRUE, plot.phase=FALSE)

# Compute cross-wavelet
xwt.t1t2 <- xwt(t1, t2)

# Plot cross wavelet power and phase difference (arrows)
plot(xwt.t1t2, plot.cb=TRUE)

# Wavelet coherence; nrands should be large (>= 1000)
wtc.t1t2=wtc(t1, t2, nrands=10)
# Plot wavelet coherence and phase difference (arrows)
# Make room to the right for the color bar
par oma=c(0, 0, 0, 1), mar=c(5, 4, 4, 5) + 0.1
plot(wtc.t1t2, plot.cb=TRUE)

# Perform wavelet clustering of three time series
t1=cbind(1:100, sin(seq(from=0, to=10*2*pi, length.out=100)))
t2=cbind(1:100, sin(seq(from=0, to=10*2*pi, length.out=100)+0.1*pi))
t3=cbind(1:100, rnorm(100))

# Compute wavelet spectra
wt.t1=wt(t1)
wt.t2=wt(t2)
wt.t3=wt(t3)

# Store all wavelet spectra into array
w.arr=array(NA, dim=c(3, NROW(wt.t1$wave), NCOL(wt.t1$wave)))
w.arr[1, , ]=wt.t1$wave
w.arr[2, , ]=wt.t2$wave
w.arr[3, , ]=wt.t3$wave

# Compute dissimilarity and distance matrices
w.arr.dis <= wclust(w.arr)
plot(hclust(w.arr.dis$dist.mat, method = "ward.D"), sub = "", main = "", ylab = "Dissimilarity", hang = -1)
**Description**

Generate the power spectrum of a random time series with a specific AR(1) coefficient.

**Usage**

```
ar1.spectrum(ar1, periods)
```

**Arguments**

- `ar1` : First order coefficient desired.
- `periods` : Periods of the time series at which the spectrum should be computed.

**Value**

Returns the power spectrum as a vector of real numbers.

**Author(s)**

Tarik C. Gouhier (tarik.gouhier@gmail.com) Code based on WTC MATLAB package written by Aslak Grinsted.

**References**

**Examples**

```
p <- ar1.spectrum(0.5, 1:25)
```

---

**ar1_ma0_sim**

_Slightly faster `arima.sim` implementation which assumes AR(1) and ma=0._

**Description**

Slightly faster `arima.sim` implementation which assumes AR(1) and ma=0.

**Usage**

```
ar1_ma0_sim(minroots, ar, n)
```
Arguments

minroots  Output from `get_minroots` function.
ar        The ‘ar’ part of AR(1)
n        Length of output series, before un-differencing. A strictly positive integer.

`arima.sim`

---

**arrow**  
`Helper function for phase.plot (not exported)`

Description

Helper function for `phase.plot` (not exported)

Usage

```r
arrow(x, y, l = 0.1, w = 0.3 * l, alpha, col = "black")
```

Arguments

- `x`: X-coordinate of the arrow.
- `y`: Y-coordinate of the arrow.
- `l`: Length of the arrow.
- `w`: Width of the arrow.
- `alpha`: Angle of the arrow in radians (0 .. 2*pi).
- `col`: Color of the arrow.

Examples

```r
plot.new()
arrow(0,0, alpha = 0)
```
**arrow2**

This is an alternative helper function that plots arrows. It uses `text()` to print a character using a default font. This way, it is possible to render different types of arrows.

---

**Description**

This is an alternative helper function that plots arrows. It uses `text()` to print a character using a default font. This way, it is possible to render different types of arrows.

**Usage**

```r
arrow2(x, y, angle, size = 0.1, col = "black",
       chr = intToUtf8(10139))
```

**Arguments**

- `x`: X-coordinate of the arrow.
- `y`: Y-coordinate of the arrow.
- `angle`: Angle in radians.
- `size`: Similar to `arrow.len` parameter. Notice that we don’t need the `arrow.lwd` anymore.
- `col`: Color of the arrow.
- `chr`: Character representing the arrow. You should provide the character as escaped UTF-8.

**Author(s)**

Viliam Simko

**Examples**

```r
# Not run: arrow2(x[j], y[i], angle = phases[i, j],
# Not run: col = arrow.col, size = arrow.len)
```

---

**check.data**

Check the format of time series

---

**Description**

Check the format of time series

**Usage**

```r
check.data(y, x1 = NULL, x2 = NULL)
```
Arguments

y  Time series y in matrix format (n rows x 2 columns). The first column should contain the time steps and the second column should contain the values.
x1 Time series x1 in matrix format (n rows x 2 columns). The first column should contain the time steps and the second column should contain the values.
x2 Time series x2 in matrix format (n rows x 2 columns). The first column should contain the time steps and the second column should contain the values.

Value

Returns a named list containing:

  t  Time steps
  dt Size of a time step
  n.obs Number of observations

Author(s)

Tarik C. Gouhier (tarik.gouhier@gmail.com)

References

Examples

t1 <- cbind(1:100, rnorm(100))
check.data(y = t1)

check.datum  Helper function

Description

Helper function

Usage

check.datum(x)

Arguments

x  matrix
convolve2D

Value

list(t, dt, n.obs)

Note

This function is not exported

---

convolve2D  

Fast column-wise convolution of a matrix

Description

Use the Fast Fourier Transform to perform convolutions between a sequence and each column of a matrix.

Usage

convolve2D(x, y, conj = TRUE, type = c("circular", "open"))

Arguments

- **x**: M x n matrix.
- **y**: Numeric sequence of length N.
- **conj**: Logical; if TRUE, take the complex conjugate before back-transforming. TRUE is used for usual convolution.
- **type**: Character; one of circular, open (beginning of word is ok). For circular, the two sequences are treated as circular, i.e., periodic. For open and filter, the sequences are padded with zeros (from left and right) first; filter returns the middle sub-vector of open, namely, the result of running a weighted mean of x with weights y.

Details

This is a corrupted version of convolve made by replacing fft with mvfft in a few places. It would be nice to submit this to the R Developers for inclusion.

Value

M x n matrix

Note

This function was copied from waveslim to limit package dependencies.

Author(s)

Brandon Whitcher
convolve2D_typeopen  

*Speed-optimized version of convolve2D*

**Description**
Equivalent to `convolve2D(x, y, type = "open")`. The motivation for this function was that convolution is called many times in a loop from `smooth.wavelet`, always with the `type = "open"` parameter.

**Usage**

```
convolve2D_typeopen(x, y)
```

**Arguments**

- `x`  
  M x n matrix.
- `y`  
  Numeric sequence of length N.

**Author(s)**

Viliam Simko

`convolve2D`

---

enviro.data  

*Multivariate ENSO (MEI), NPGO, and PDO indices*

**Description**

Monthly indices of ENSO, NPGO, and PDO from 1950 to 2009

**Usage**

```
data(enviro.data)
```

**Format**

A data frame with 720 observations on the following 6 variables.

- `month`  
  a numeric vector containing the month
- `year`  
  a numeric vector containing the year
- `date`  
  a numeric vector containing the date
- `mei`  
  a numeric vector containing the MEI index
- `npgo`  
  a numeric vector containing the NPGO index
- `pdo`  
  a numeric vector containing the PDO index
get_minroots

Source

MEI: http://www.esrl.noaa.gov/psd/enso/mei  
NPGO: http://www.o3d.org/npgo  
PDO: http://jisao.washington.edu/pdo

References

Examples

data(enviro.data)
head(enviro.data)

get_minroots  

*Helper function (not exported)*

Description

Helper function (not exported)

Usage

get_minroots(ar)

Arguments

ar The ‘ar’ part of AR(1)

Value

double
**MOTHERS**

*Supported mother wavelets*

**Description**

The list of supported mother wavelets is used in multiple places therefore, we provide it as a lazily evaluated promise.

**Usage**

```r
MOTHERS
```

**Format**

An object of class `character` of length 3.

---

**phase.plot**

*Plot phases with arrows*

**Description**

Plot phases with arrows

**Usage**

```r
phase.plot(x, y, phases, arrow.len = min(par()$pin[2]/30, par()$pin[1]/40), arrow.col = "black", arrow.lwd = arrow.len * 0.3)
```

**Arguments**

- `x` X-coordinates
- `y` Y-coordinates
- `phases` Phases
- `arrow.len` Size of the arrows. Default is based on plotting region.
- `arrow.col` Arrow line color.
- `arrow.lwd` Width/thickness of arrows.

**Note**

Arrows pointing to the right mean that `x` and `y` are in phase.
Arrows pointing to the left mean that `x` and `y` are in anti-phase.
Arrows pointing up mean that `y` leads `x` by `π/2`.
Arrows pointing down mean that `x` leads `y` by `π/2`.
Author(s)

Tarik C. Gouhier (tarik.gouhier@gmail.com)

Huidong Tian provided a much better implementation of the phase.plot function that allows for more accurate phase arrows.

Original code based on WTC MATLAB package written by Aslak Grinsted.

Examples

# Not run: phase.plot(x, y, phases)

plot.biwavelet

Plot biwavelet objects

Description

Plot biwavelet objects such as the cwt, cross-wavelet and wavelet coherence.

Usage

## S3 method for class 'biwavelet'
plot(x, ncol = 64, fill.cols = NULL, 
  xlab = "Time", ylab = "Period", tol = 1, plot.cb = FALSE, 
  plot.phase = FALSE, type = "power.corr.norm", plot.coi = TRUE, 
  lwd.coi = 1, col.coi = "white", lty.coi = 1, alpha.coi = 0.5, 
  plot.sig = TRUE, lwd.sig = 4, col.sig = "black", lty.sig = 1, 
  bw = FALSE, legend.loc = NULL, legend.horiz = FALSE, 
  arrow.len = min(par()$pin[2]/30, par()$pin[1]/40), 
  arrow.lwd = arrow.len * 0.3, arrow.cutoff = 0.8, 
  arrow.col = "black", xlim = NULL, ylim = NULL, zlim = NULL, 
  xaxt = "s", yaxt = "s", form = "%Y", ...)

Arguments

x biwavelet object generated by \textit{wt, xwt, or wtc}.

ncol Number of colors to use.

fill.cols Vector of fill colors to be used. Users can specify color vectors using \texttt{colorRampPalette} or \texttt{brewer.pal} from package \texttt{RColorBrewer}. Value \texttt{NULL} generates MATLAB's jet color palette.

xlab X-label of the figure.

ylab Y-label of the figure.

tol Tolerance level for significance contours. Significance contours will be drawn around all regions of the spectrum where spectrum/percentile $\geq$ tol. If strict $i^{th}$ percentile regions are desired, then tol must be set to 1.
plot.biwavelet

plot.cb  Plot color bar if TRUE.
plot.phase  Plot phases with black arrows.
type  Type of plot to create. Can be power to plot the power, power.corr to plot the bias-corrected power, power.norm to plot the power normalized by the variance, power.corr.norm to plot the bias-corrected power normalized by the variance, wavelet to plot the wavelet coefficients, or phase to plot the phase.
plot.coi  Plot cone of influence (COI) as a semi-transparent polygon if TRUE. Areas that fall within the polygon can be affected by edge effects.
lwd.coi  Line width of COI.
col.coi  Color of COI.
lty.coi  Line type of COI. Value 1 is for solide lines.
alpha.coi  Transparency of COI. Range is 0 (full transparency) to 1 (no transparency).
plot.sig  Plot contours for significance if TRUE.
lwd.sig  Line width of significance contours.
col.sig  Color of significance contours.
lty.sig  Line type of significance contours.
bw  plot in black and white if TRUE.
legend.loc  Legend location coordinates as defined by image.plot.
legend.horiz  Plot a horizontal legend if TRUE.
arrows.len  Size of the arrows. Default is based on plotting region.
arrows.lwd  Width/thickness of arrows.
arrows.cutoff  Cutoff value for plotting phase arrows. Phase arrows will be be plotted in regions where the significance of the z-values exceeds arrows.cutoff for wt and xwt objects. For pwtc and wtc objects, phase arrows will be plotted in regions where the rsq value exceeds arrows.cutoff. If the object being plotted does not have a significance field, regions whose z-values exceed the arrows.cutoff quantile will be plotted.
arrows.col  Color of arrows.
xlim  The x limits.
ylim  The y limits.
zlim  The z limits.
xaxt  Add x-axis? Use n for none.
yaxt  Add y-axis? Use n for none.
form  Format to use to display dates on the x-axis. See Date for other valid formats.
...  Other parameters.

Details

Arrows pointing to the right mean that x and y are in phase.
Arrows pointing to the left mean that x and y are in anti-phase.
Arrows pointing up mean that y leads x by π/2.
Arrows pointing down mean that x leads y by π/2.
Author(s)

*image.plot*

pwtc

*pwtc*  
*Compute partial wavelet coherence*

Description
Compute partial wavelet coherence between $y$ and $x_1$ by partialling out the effect of $x_2$

Usage
```
pwtc(y, x1, x2, pad = TRUE, dj = 1/12, s0 = 2 * dt, J1 = NULL,  
   max.scale = NULL, mother = "morlet", param = -1, lag1 = NULL,  
   sig.level = 0.95, sig.test = 0, nrands = 300, quiet = FALSE)
```

Arguments

- **y**  
  Time series $y$ in matrix format ($n$ rows x 2 columns). The first column should contain the time steps and the second column should contain the values.

- **x1**  
  Time series $x_1$ in matrix format ($n$ rows x 2 columns). The first column should contain the time steps and the second column should contain the values.

- **x2**  
  Time series $x_2$ whose effects should be partialled out in matrix format ($n$ rows x 2 columns). The first column should contain the time steps and the second column should contain the values.

- **pad**  
  Pad the values will with zeros to increase the speed of the transform.

- **dj**  
  Spacing between successive scales.

- **s0**  
  Smallest scale of the wavelet.
Number of scales - 1.

Maximum scale. Computed automatically if left unspecified.

Type of mother wavelet function to use. Can be set to morlet, dog, or paul. Significance testing is only available for morlet wavelet.

Nondimensional parameter specific to the wavelet function.

Vector containing the AR(1) coefficient of each time series.

Significance level.

Type of significance test. If set to 0, use a regular $\chi^2$ test. If set to 1, then perform a time-average test. If set to 2, then do a scale-average test.

Number of Monte Carlo randomizations.

Do not display progress bar.

Return a `biwavelet` object containing:

- `coi`: matrix containing cone of influence
- `wave`: matrix containing the cross-wavelet transform of y and x1
- `rsq`: matrix of partial wavelet coherence between y and x1 (with x2 partialled out)
- `phase`: matrix of phases between y and x1
- `period`: vector of periods
- `scale`: vector of scales
- `dt`: length of a time step
- `t`: vector of times
- `xaxis`: vector of values used to plot xaxis
- `s0`: smallest scale of the wavelet
- `dj`: spacing between successive scales
- `y.sigma`: standard deviation of y
- `x1.sigma`: standard deviation of x1
- `mother`: mother wavelet used
- `type`: type of `biwavelet` object created (`pwtc`)
- `signif`: matrix containing `sig.level` percentiles of wavelet coherence based on the Monte Carlo AR(1) time series

The Monte Carlo randomizations can be extremely slow for large datasets. For instance, 1000 randomizations of a dataset consisting of 1000 samples will take ~30 minutes on a 2.66 GHz dual-core Xeon processor.

Tarik C. Gouhier (tarik.gouhier@gmail.com) Code based on WTC MATLAB package written by Aslak Grinsted.
rcpp_row_quantile

References

---

**rcpp_row_quantile**  
*Row-wise quantile of a matrix*

**Description**

This is a C++ speed-optimized version. It is equivalent to R version `quantile(data,q,na.rm = TRUE)`

**Usage**

```r
ccpp_row_quantile(data, q)
```

**Arguments**

- **data**  
  Numeric matrix whose row quantiles are wanted.

- **q**  
  Probability with value in [0,1]

**Value**

A vector of length `nrows(data)`, where each element represents row quantile.

**Author(s)**

Viliam Simko
rcpp_wt_bases_dog

Optimized "wt.bases.dog" function.

Description

This is a C++ version optimized for speed. Computes the wavelet as a function of Fourier frequency for "dog" mother wavelet.

Usage

rcpp_wt_bases_dog(k, scale, param = -1L)

Arguments

k vector of frequencies at which to calculate the wavelet.

scale the wavelet scale.

param nondimensional parameter specific to the wavelet function.

Value

Returns a list containing:

daughter wavelet function

fourier.factor ratio of fourier period to scale

coi cone of influence

dof degrees of freedom for each point in wavelet power

Note

This c++ implementation is approx. 50

Author(s)

Viliam Simko
Description

This is a C++ version optimized for speed. Computes the wavelet as a function of Fourier frequency for "morlet" mother wavelet.

Usage

rcpp_wt_bases_morlet(k, scale, param = -1L)

Arguments

k vector of frequencies at which to calculate the wavelet.

scale the wavelet scale.

param nondimensional parameter specific to the wavelet function.

Value

Returns a list containing:

daughter wavelet function

fourier.factor ratio of fourier period to scale

coi cone of influence

dof degrees of freedom for each point in wavelet power

Note

This C++ implementation is approx. 60

Author(s)

Viliam Simko
rcpp_wt_bases_paul  

Optimized "wt.bases.paul" function.

Description

This is a C++ version optimized for speed. Computes the wavelet as a function of Fourier frequency for "paul" mother wavelet.

Usage

rcpp_wt_bases_paul(k, scale, param = -1L)

Arguments

k  
vector of frequencies at which to calculate the wavelet.

scale  
the wavelet scale.

param  
nondimensional parameter specific to the wavelet function.

Value

Returns a list containing:

daughter  
wavelet function

fourier.factor  
ratio of fourier period to scale

coi  
cone of influence

dof  
degrees of freedom for each point in wavelet power

Note

This c++ implementation is approx. 59

Viliam Simko
smooth.wavelet

Smooth wavelet in both the time and scale domains

Description

The time smoothing uses a filter given by the absolute value of the wavelet function at each scale, normalized to have a total weight of unity, which is a Gaussian function for the Morlet wavelet. The scale smoothing is done with a boxcar function of width 0.6, which corresponds to the decorrelation scale of the Morlet wavelet.

Usage

smooth.wavelet(wave, dt, dj, scale)

Arguments

wave
wavelet coefficients
dt
size of time steps
dj
number of octaves per scale
scale
wavelet scales

Value

Returns the smoothed wavelet.

Note

This function is used internally for computing wavelet coherence. It is only appropriate for the morlet wavelet.

Author(s)

Tarik C. Gouhier (tarik.gouhier@gmail.com)
Code based on WTC MATLAB package written by Aslak Grinsted.

Examples

# Not run: smooth.wt1 <- smooth.wavelet(wave, dt, dj, scale)
wclust  

*Compute dissimilarity between multiple wavelet spectra*

**Description**

Compute dissimilarity between multiple wavelet spectra

**Usage**

```
wclust(w.arr, quiet = FALSE)
```

**Arguments**

- `w.arr` N x p x t array of wavelet spectra where N is the number of wavelet spectra to be compared, p is the number of periods in each wavelet spectrum and t is the number of time steps in each wavelet spectrum.
- `quiet` Do not display progress bar.

**Value**

Returns a list containing:

- `diss.mat` square dissimilarity matrix
- `dist.mat` (lower triangular) distance matrix

**Author(s)**

Tarik C. Gouhier (tarik.gouhier@gmail.com)

**References**

wdist

**Compute dissimilarity between two wavelet spectra**

**Description**
Compute dissimilarity between two wavelet spectra

**Usage**
wdist(wt1, wt2, cutoff = 0.99)

**Arguments**
- **wt1** power, wave or rsq matrix from biwavelet object generated by `wt`, `xwt`, or `wtc`.
- **wt2** power, wave or rsq matrix from biwavelet object generated by `wt`, `xwt`, or `wtc`.
- **cutoff** Cutoff value used to compute dissimilarity. Only orthogonal axes that contribute more than \(1 - \text{cutoff}\) to the total covariance between the two wavelet spectra will be used to compute their dissimilarity.

**Value**
Returns wavelet dissimilarity.

**Author(s)**
Tarik C. Gouhier (tarik.gouhier@gmail.com)

**References**

wt

**Compute wavelet transform**

**Description**
Compute wavelet transform
Usage

wt(d, pad = TRUE, dt = NULL, dj = 1/12, s0 = 2 * dt, J1 = NULL, max.scale = NULL, mother = "morlet", param = -1, lag1 = NULL, sig.level = 0.95, sig.test = 0, do.sig = TRUE, arima.method = "CSS")

Arguments

d Time series in matrix format (n rows x 2 columns). The first column should contain the time steps and the second column should contain the values.
pad Pad the values will with zeros to increase the speed of the transform.
dt Length of a time step.
dj Spacing between successive scales.
s0 Smallest scale of the wavelet.
J1 Number of scales - 1.
max.scale Maximum scale. Computed automatically if left unspecified.
mother Type of mother wavelet function to use. Can be set to morlet, dog, or paul.
param Nondimensional parameter specific to the wavelet function.
lag1 AR(1) coefficient of time series used to test for significant patterns.
sig.level Significance level.
sig.test Type of significance test. If set to 0, use a regular $\chi^2$ test. If set to 1, then perform a time-average test. If set to 2, then do a scale-average test.
do.sig Perform significance testing if TRUE.
arima.method Fitting method. This parameter is passed as the method Parameter to the arima function.

Value

Returns a biwavelet object containing:

coi matrix containing cone of influence
wave matrix containing the wavelet transform
power matrix of power
power.corr matrix of bias-corrected power using the method described by Liu et al. (2007)
phase matrix of phases
period vector of periods
scale vector of scales
dt length of a time step
t vector of times
xaxis vector of values used to plot xaxis
s0 smallest scale of the wavelet
wt.bases

Computes wavelet

Description

Computes the wavelet as a function of Fourier frequency.

Usage

wt.bases(mother = "morlet", ...)

Arguments

mother

Type of mother wavelet function to use. Can be set to morlet, dog, or paul.

... See parameters k, scale and param in functions: wt.bases.morlet, wt.bases.paul and wt.bases.dog

dj spacing between successive scales
sigma2 variance of time series
mother mother wavelet used
type type of biwavelet object created (wt)
signif matrix containing significance levels

wt.t1 <- wt(t1)

## Plot power
## Make room to the right for the color bar
par(oma = c(0, 0, 0, 1), mar = c(5, 4, 4, 5) + 0.1)
plot(wt.t1, plot.cb = TRUE, plot.phase = FALSE)
Value

Returns a list containing:

- daughter: wavelet function
- fourier.factor: ratio of fourier period to scale
- coi: cone of influence
- dof: degrees of freedom for each point in wavelet power

Author(s)

Tarik C. Gouhier (tarik.gouhier@gmail.com)

Code based on wavelet MATLAB program written by Christopher Torrence and Gibert P. Compo.

References

Examples

```r
# Not run: wb <- wt.bases(mother, k, scale[a1], param)
```

Description

Helper method (not exported)

Usage

```r
wt.bases.dog(k, scale, param = -1)
```

Arguments

- `k`: Vector of frequencies at which to calculate the wavelet.
- `scale`: The wavelet scale.
- `param`: Nondimensional parameter specific to the wavelet function.

Value

Returns a list containing:

- daughter: wavelet function
- fourier.factor: ratio of fourier period to scale
- coi: cone of influence
- dof: degrees of freedom for each point in wavelet power
wt.bases.morlet  

**Helper method (not exported)**

**Description**

Helper method (not exported)

**Usage**

wt.bases.morlet(k, scale, param = -1)

**Arguments**

- **k**: Vector of frequencies at which to calculate the wavelet.
- **scale**: The wavelet scale.
- **param**: Nondimensional parameter specific to the wavelet function.

**Value**

Returns a list containing:

- **daughter**: wavelet function
- **fourier.factor**: ratio of fourier period to scale
- **coi**: cone of influence
- **dof**: degrees of freedom for each point in wavelet power

---

wt.bases.paul  

**Helper method (not exported)**

**Description**

Helper method (not exported)

**Usage**

wt.bases.paul(k, scale, param = -1)

**Arguments**

- **k**: Vector of frequencies at which to calculate the wavelet.
- **scale**: The wavelet scale.
- **param**: Nondimensional parameter specific to the wavelet function.
**Value**

Returns a list containing:

- **daughter**: wavelet function
- **fourier.factor**: ratio of fourier period to scale
- **coi**: cone of influence
- **dof**: degrees of freedom for each point in wavelet power

---

**wt.sig**

*Determine significance of wavelet transform*

---

**Description**

Determine significance of wavelet transform

**Usage**

```r
wt.sig(d, dt, scale, sig.test = 0, sig.level = 0.95, dof = 2, 
lag1 = NULL, mother = "morlet", param = -1, sigma2 = NULL, 
arima.method = "CSS")
```

**Arguments**

- **d**: Time series in matrix format (n rows x 2 columns). The first column should contain the time steps and the second column should contain the values.
- **dt**: Length of a time step.
- **scale**: The wavelet scale.
- **sig.test**: Type of significance test. If set to 0, use a regular $\chi^2$ test. If set to 1, then perform a time-average test. If set to 2, then do a scale-average test.
- **sig.level**: Significance level.
- **dof**: Degrees of freedom for each point in wavelet power.
- **lag1**: AR(1) coefficient of time series used to test for significant patterns.
- **mother**: Type of mother wavelet function to use. Can be set to morlet, dog, or paul.
- **param**: Nondimensional parameter specific to the wavelet function.
- **sigma2**: Variance of time series
- **arima.method**: Fitting method. This parameter is passed as the method Parameter to the `arima` function.

**Value**

Returns a list containing:

- **signif**: vector containing significance level for each scale
- **signif**: vector of red-noise spectrum for each period
**Author(s)**

Tarik C. Gouhier (tarik.gouhier@gmail.com)

**References**

**Examples**

```r
# Not run: wt.sig(d, dt, scale, sig.test, sig.level, lag1,
# dof = -1, mother = "morlet", sigma2 = 1)
```

---

**wtc**

*Compute wavelet coherence*

**Description**

Compute wavelet coherence

**Usage**

```r
wtc(d1, d2, pad = TRUE, dj = 1/12, s0 = 2 * dt, J1 = NULL,
    max.scale = NULL, mother = "morlet", param = -1, lag1 = NULL,
    sig.level = 0.95, sig.test = 0, nrands = 300, quiet = FALSE)
```

**Arguments**

- **d1**: Time series 1 in matrix format (n rows x 2 columns). The first column should contain the time steps and the second column should contain the values.
- **d2**: Time series 2 in matrix format (n rows x 2 columns). The first column should contain the time steps and the second column should contain the values.
- **pad**: Pad the values will with zeros to increase the speed of the transform.
- **dj**: Spacing between successive scales.
- **s0**: Smallest scale of the wavelet.
- **J1**: Number of scales - 1.
- **max.scale**: Maximum scale. Computed automatically if left unspecified.
- **mother**: Type of mother wavelet function to use. Can be set to *morlet*, *dog*, or *paul*.
- **param**: Nondimensional parameter specific to the wavelet function.
- **lag1**: Vector containing the AR(1) coefficient of each time series.
- **sig.level**: Significance level.
sig.test Type of significance test. If set to 0, use a regular $\chi^2$ test. If set to 1, then perform a time-average test. If set to 2, then do a scale-average test.

nrands Number of Monte Carlo randomizations.

quiet Do not display progress bar.

Value

Return a biwavelet object containing:

coi matrix containing cone of influence
wave matrix containing the cross-wavelet transform
wave.corr matrix containing the bias-corrected cross-wavelet transform using the method described by Veleda et al. (2012)
power matrix of power
power.corr matrix of bias-corrected cross-wavelet power using the method described by Veleda et al. (2012)
rsq matrix of wavelet coherence
phase matrix of phases
period vector of periods
scale vector of scales
dt length of a time step
t vector of times
xaxis vector of values used to plot xaxis
s0 smallest scale of the wavelet
dj spacing between successive scales
d1.sigma standard deviation of time series 1
d2.sigma standard deviation of time series 2
mother mother wavelet used
type type of biwavelet object created (wtc)
signif matrix containing sig.level percentiles of wavelet coherence based on the Monte Carlo AR(1) time series

Note

The Monte Carlo randomizations can be extremely slow for large datasets. For instance, 1000 randomizations of a dataset consisting of 1000 samples will take ~30 minutes on a 2.66 GHz dual-core Xeon processor.

Examples

t1 <- cbind(1:100, rnorm(100))
t2 <- cbind(1:100, rnorm(100))

## Wavelet coherence
wtc.t1t2 <- wtc(t1, t2, nrands = 10)

## Plot wavelet coherence and phase difference (arrows)
## Make room to the right for the color bar
par oma = c(0, 0, 0, 1), mar = c(5, 4, 4, 5) + 0.1)
plot(wtc.t1t2, plot.cb = TRUE, plot.phase = TRUE)

wtc.sig

Determine significance of wavelet coherence

Description

Determine significance of wavelet coherence

Usage

`wtc.sig(nrands = 300, lag1, dt, ntimesteps, pad = TRUE, dj = 1/12, s0, J1, max.scale = NULL, mother = "morlet", sig.level = 0.95, quiet = FALSE)`

Arguments

nrands Number of Monte Carlo randomizations.
lag1 Vector containing the AR(1) coefficient of each time series.
dt Length of a time step.
ntimesteps Number of time steps in time series.
Pad the values will with zeros to increase the speed of the transform.

Spacing between successive scales.

Smallest scale of the wavelet.

Number of scales - 1.

Maximum scale.

Type of mother wavelet function to use. Can be set to morlet, dog, or paul. Significance testing is only available for morlet wavelet.

Significance level to compute.

Do not display progress bar.

Returns significance matrix containing the sig.level percentile of wavelet coherence at each time step and scale.

The Monte Carlo randomizations can be extremely slow for large datasets. For instance, 1000 randomizations of a dataset consisting of 1000 samples will take ~30 minutes on a 2.66 GHz dual-core Xeon processor.

Tarik C. Gouhier (tarik.gouhier@gmail.com)

Code based on WTC MATLAB package written by Aslak Grinsted.

# Not run: wtcsig <- wtc.sig(nrands, lag1 = c(d1.ar1, d2.ar1), dt, 
# pad, dj, J1, s0, mother = "morlet")
Description

Parallelized Monte Carlo simulation equivalent to `wtc.sig`.

Usage

```r
wtc_sig_parallel(nrands = 300, lag1, dt, ntimesteps, pad = TRUE,
                 dj = 1/12, s0, J1, max.scale = NULL, mother = "morlet",
                 sig.level = 0.95, quiet = TRUE)
```

Arguments

- `nrands`: Number of Monte Carlo randomizations.
- `lag1`: Vector containing the AR(1) coefficient of each time series.
- `dt`: Length of a time step.
- `ntimesteps`: Number of time steps in time series.
- `pad`: Pad the values will with zeros to increase the speed of the transform.
- `dj`: Spacing between successive scales.
- `s0`: Smallest scale of the wavelet.
- `J1`: Number of scales - 1.
- `max.scale`: Maximum scale.
- `mother`: Type of mother wavelet function to use. Can be set to `morlet`, `dog`, or `paul`. Significance testing is only available for `morlet` wavelet.
- `sig.level`: Significance level to compute.
- `quiet`: Do not display progress bar.

- `wtc.sig`

Examples

```r
# Not run: library(foreach)
# library(doParallel)
# cl <- makeCluster(4, outfile="") # number of cores. Notice 'outfile'
# registerDoParallel(cl)
# wtc_sig_parallel(your parameters go here)
# stopCluster(cl)
```
Compute cross-wavelet

Description
Compute cross-wavelet

Usage
\[
xwt(d1, d2, pad = TRUE, dj = 1/12, s0 = 2 * dt, J1 = NULL, 
max.scale = NULL, mother = "morlet", param = -1, lag1 = NULL, 
sig.level = 0.95, sig.test = 0, arima.method = "CSS")
\]

Arguments
- **d1**: Time series 1 in matrix format (\(n\) rows x 2 columns). The first column should contain the time steps and the second column should contain the values.
- **d2**: Time series 2 in matrix format (\(n\) rows x 2 columns). The first column should contain the time steps and the second column should contain the values.
- **pad**: Pad the values will with zeros to increase the speed of the transform.
- **dj**: Spacing between successive scales.
- **s0**: Smallest scale of the wavelet.
- **J1**: Number of scales - 1.
- **max.scale**: Maximum scale. Computed automatically if left unspecified.
- **mother**: Type of mother wavelet function to use. Can be set to \textit{morlet}, \textit{dog}, or \textit{paul}. Significance testing is only available for \textit{morlet} wavelet.
- **param**: Nondimensional parameter specific to the wavelet function.
- **lag1**: Vector containing the AR(1) coefficient of each time series.
- **sig.level**: Significance level.
- **sig.test**: Type of significance test. If set to 0, use a regular \(\chi^2\) test. If set to 1, then perform a time-average test. If set to 2, then do a scale-average test.
- **arima.method**: Fitting method. This parameter is passed as the \textit{method} parameter to the \texttt{arima} function.

Value
Returns a \texttt{biwavelet} object containing:

- **coi**: matrix containing cone of influence
- **wave**: matrix containing the cross-wavelet transform
- **wave.corr**: matrix containing the bias-corrected cross-wavelet transform using the method described by Veleda et al. (2012)
- **power**: matrix of power
power.corr

matrix of bias-corrected cross-wavelet power using the method described by Veleda et al. (2012)

phase

matrix of phases

period

vector of periods

scale

vector of scales

dt

length of a time step

t

vector of times

xaxis

vector of values used to plot xaxis

s0

smallest scale of the wavelet

dj

spacing between successive scales

d1.sigma

standard deviation of time series 1

d2.sigma

standard deviation of time series 2

mother

mother wavelet used

type

type of biwavelet object created (xwt)

signif

matrix containing significance levels
