

Package ‘bmscstan’

September 7, 2020

Type Package

Title Bayesian Multilevel Single Case Models using 'Stan'

Version 1.0.0

Description Analyse single case analyses against a control group.
Its purpose is to provide a flexible, with good power and
low first type error
approach that can manage at the same time controls' and patient's data.
The use of Bayesian statistics allows to test both the alternative and
null hypothesis.

BMSC	<i>Fit Bayesian Multilevel Single Case models</i>
------	---

Description

BMSC fits the Bayesian Multilevel Single Case models.

Usage

```
BMSC(  
  formula,  
  data_ctrl,  
  data_sc,  
  cores = 1,  
  chains = 4,  
  warmup = 2000,  
  iter = 4000,  
  seed = NA,  
  typeprior = "normal",  
  ...  
)
```

Arguments

formula	An object of class formula: a symbolic description of the model to be fitted.
data_ctrl	An object of class data.frame (or one that can be coerced to that class) containing data of all variables used in the model for the control group.
data_sc	An object of class data.frame (or one that can be coerced to that class) containing data of all variables used in the model for the Single Case
cores	The number of cores to use when executing the Markov chains in parallel. The default is 1.
chains	Number of Markov chains (defaults to 4).

warmup	A positive integer specifying number of warmup (aka burnin) iterations. This also specifies the number of iterations used for stepsize adaptation, so warmup samples should not be used for inference. The number of warmup should not be larger than iter and the default is 2000.
iter	Number of total iterations per chain (including warmup; defaults to 4000).
seed	The seed for random number generation to make results reproducible. If NA (the default), Stan will set the seed randomly.
typeprior	Set the desired prior distribution for the fixed effects. normal a normal distribution with $\mu = 0$ and $\sigma = 10$ cauchy a cauchy distribution with $\mu = 0$ and scale $\sqrt{2}/2$ student a Student's T distribution, with $\mu = 0$, $\nu = 3$ and $\sigma = 10$ The normal distribution is the default.
...	further arguments to be passed to stan function.

Value

a BMSC object

Examples

```
data(BSE)

# Linear regression of data coming from a body representation paradigm
# with a control sample of 12 participants and one patient with
# unilateral brachial plexus lesion
mdl <- BMSC(formula = RT ~ Body.District * Congruency * Side +
            (Body.District + Congruency + Side | ID),
            data_ctrl = data.ctrl,
            data_sc = data.pt,
            cores = 4)

# generate a summary of the results
summary(mdl)

# posterior predictive p-value checking
pp_check(mdl, limited = FALSE)

# plot of the results
plot(mdl)

# simulation of healthy controls data

Sigma.ctrl <- matrix(cbind(1, .7, .7, 1), nrow=2)

U <- t(chol(Sigma.ctrl))

numobs <- 100
```

```

set.seed(123)

random.normal <- matrix( rnorm( n = ncol(U) * numobs, mean = 3, sd = 1),
                          nrow = ncol(U), ncol = numobs)

X = U %*% random.normal

dat.ctrl <- as.data.frame(t(X))

names(dat.ctrl) <- c("y","x")

cor(dat.ctrl)

# simulation of patient data

Sigma.pt <- matrix(cbind(1, 0, 0, 1) ,nrow=2)

U <- t(chol(Sigma.pt))

numobs <- 20

set.seed(0)

random.normal <- matrix( rnorm( n = ncol(U) * numobs, mean = 3, sd = 1),
                          nrow = ncol(U), ncol = numobs)

X = U %*% random.normal

dat.pt <- as.data.frame(t(X))

names(dat.pt) <- c("y","x")

cor(dat.pt)

# fit the single case model

mdl.reg <- BMSC(y ~ x, data_ctrl = dat.ctrl, data_sc = dat.pt, seed = 10)

# summarize the data

summary(mdl.reg)

```

Description

The **bmscstan** package provides an interface to fit Bayesian Multilevel Single Case models. These models compare the performance of a Single Case against a control group, combining the flexibility of multilevel models and the potentiality of Bayesian Statistics.

Details

The package is now limited to gaussian data only, but we will further expand it to cover binomial and ordinal (Likert scales) data.

By means of **bmscstan** the effects of the control group and the effects of the deviance between the Single Case and the group will be estimated.

The model to estimate the controls parameters is:

$$y \sim N(\beta X + bZ, \sigma^2)$$

where y is the controls' dependent variable, X the contrast matrix for Population-level (or Fixed) Effects, and β are the unknown coefficients to be estimate. Z is the contrast matrix for the Varying (or Random, or Group-level) effects, and b are the unknown estimates for the varying effects. σ^2 is the variance.

In order to estimate the coefficients of the Single Case, the formula is the following:

$$y_{pt} \sim N(\phi X_{pt}, \sigma_{pt}^2)$$

where $\phi = \beta + \delta$.

The validation of the approach can be found here: <https://www.doi.org/10.31234/osf.io/sajdq>

Details

The main function of **bmscstan** is **BMSC**, which uses formula syntax to specify your model.

data.ctrl	<i>Data from a control group of 16 participants</i>
-----------	---

Description

A dataset containing the results from the Body Sidednedd Task from a control group of 16 participants

Usage

data.ctrl

Format

A data frame with 4049 rows and 5 variables

RT Reaction times, in milliseconds

Body.District Body district, categorial factor of Body Sidedness Task: FOOT or HAND

Congruency The trail was Congruent or Incongruent?

Side The trial showed a left or right limb

ID The participant ID

data.pt

Data from a Single Case with brachial plexious lesion

Description

A dataset containing the results from the Body Sidedness Task from a single Single Case

Usage

data.pt

Format

A data frame with 467 rows and 4 variables

RT Reaction times, in milliseconds

Body.District Body district, categorial factor of Body Sidedness Task: FOOT or HAND

Congruency The trail was Congruent or Incongruent?

Side The trial showed a left or right limb

pairwise.BMSC

Pairwise contrasts

Description

Calculate pairwise comparisons between marginal posterior distributions divided by group levels

Usage

```
pairwise.BMSC mdl, contrast, covariate = NULL, who = "delta")
```

Arguments

<code>mdl</code>	An object of class BMSC.
<code>contrast</code>	Character value giving the name of the coefficient whose levels need to be compared.
<code>covariate</code>	at the moment is silent
<code>who</code>	parameter to choose the estimates to contrast control only the controls singlecase only the single case ($\beta + \delta$) delta only the difference between the single case and controls

Value

a pairwise.BMSC object

Examples

```
data(BSE)

# Normal regression of data coming from a body representation paradigm
# with a control sample of 12 participants and one single case with
# unilateral brachial plexus lesion
mdl <- BMSC(formula = RT ~ Body.District * Congruency * Side +
             (Body.District + Congruency + Side | ID),
             data_ctrl = data.ctrl,
             data_sc = data.pt,
             cores = 4)

# generate a summary of the results
summary(mdl)

# posterior predictive p-value checking
pp_check(mdl, limited = FALSE)

# plot of the results
plot(mdl)

# compute pairwise contrasts
pairwise(mdl , contrast = "Body.District1:Side1")
```

plot.BMSC	<i>Plot estimates from a BMSC object.</i>
-----------	---

Description

Plot estimates from a BMSC object.

Usage

```
## S3 method for class 'BMSC'
plot(x, who = "both", type = "interval", CI = 0.95, ...)
```

Arguments

x	An object of class BMSC .
who	parameter to choose the estimates to plot both plot in the same graph both controls and the Single Case control only the controls single only the Single Case ($\beta + \delta$) delta only the difference between the Single Case and controls
type	a parameter to select the typology of graph interval the estimates will be represented by means of pointrange, with median and the boundaries of the credible interval area a density plot hist a density histogram
CI	the dimension of the Credible Interval (or Equally Tailed Interval). Default 0.95.
...	other arguments are ignored.

Value

a plot, a ggplot2 object, or a bayesplot object

Examples

```
data(BSE)

# Normal robust regression of data coming from a body representation paradigm
# with a control sample of 12 participants and one patient with
# unilateral brachial plexus lesion
mdl <- BMSC(formula = RT ~ Body.District * Congruency * Side +
             (Body.District + Congruency + Side | ID),
             data_ctrl = data.ctrl,
             data_pt = data.pt,
             cores = 4)
```

```
# generate a summary of the results
summary mdl

# posterior predictive p-value checking
pp_check mdl, limited = FALSE

# plot of the results
plot mdl

# simulation of healthy controls data

Sigma.ctrl <- matrix(cbind(1, .7, .7, 1), nrow=2)

U <- t(chol(Sigma.ctrl))

numobs <- 100

set.seed(123)

random.normal <- matrix( rnorm( n = ncol(U) * numobs, mean = 3, sd = 1),
                          nrow = ncol(U), ncol = numobs)

X = U %*% random.normal

dat.ctrl <- as.data.frame(t(X))

names(dat.ctrl) <- c("y", "x")

cor(dat.ctrl)

# simulation of patient data

Sigma.pt <- matrix(cbind(1, 0, 0, 1), nrow=2)

U <- t(chol(Sigma.pt))

numobs <- 20

set.seed(0)

random.normal <- matrix( rnorm( n = ncol(U) * numobs, mean = 3, sd = 1),
                          nrow = ncol(U), ncol = numobs)

X = U %*% random.normal

dat.pt <- as.data.frame(t(X))

names(dat.pt) <- c("y", "x")

cor(dat.pt)

# fit the single case model
```

```

mdl.reg <- BMSC(y ~ x, data_ctrl = dat.ctrl, data_pt = dat.pt, seed = 10)

# summarize the data

summary(mdl.reg)

# plot the results of both patient and control group

plot(mdl.reg)

# plot the results of the patient

plot(mdl.reg, who = "single")

# plot the results of the difference between the control group and the patient

plot(mdl.reg, who = "delta")

# density plots

plot(mdl.reg, type = "area")

# histograms

plot(mdl.reg, type = "hist")

```

`plot.pairwise.BMSC` *Plot estimates from a pairwise.BMSC object.*

Description

Plot estimates from a `pairwise.BMSC` object.

Usage

```

## S3 method for class 'pairwise.BMSC'
plot(x, type = "interval", CI = 0.95, ...)

```

Arguments

<code>x</code>	An object of class <code>pairwise.BMSC</code> .
<code>type</code>	a parameter to select the typology of graph interval the estimates will be represented by means of pointrange, with median and the boundaries of the credible interval area a density plot hist a density histogram

CI the dimension of the Credible Interval (or Equally Tailed Interval). Default 0.95.
 ... other arguments are ignored.

Value

a list of two ggplot2 objects

Examples

```
data(BSE)

# Normal regression of data coming from a body representation paradigm
# with a control sample of 12 participants and one patient with
# unilateral brachial plexus lesion
mdl <- BMSC(formula = RT ~ Body.District * Congruency * Side +
            (Body.District + Congruency + Side | ID),
            data_ctrl = data.ctrl,
            data_pt = data.pt,
            cores = 4)

# generate a summary of the results
summary(mdl)

# posterior predictive p-value checking
pp_check(mdl, limited = FALSE)

# plot of the results
plot(mdl)

# compute pairwise contrasts
ph <- pairwise(mdl , contrast = "Body.District1:Side1")

ph

# plot pairwise comparisons
plot(ph)

plot(ph , type = "area")

# customization of pairwise comparisons plot
plot(ph)[[1]]+theme_bw(base_size = 18)

plot(ph , type = "area")[[1]]+theme_bw(base_size = 18)+
  theme(strip.text.y = element_text( angle = 0))
```

pp_check.BMSC

*Posterior predictive check for BMSC objects***Description**

pp_check() plots the posterior predictive check for BMSC objects.

Usage

```
## S3 method for class 'BMSC'
pp_check(object, type = "dens", limited = FALSE, ...)
```

Arguments

object	a BMSC object
type	a parameter to select the typology of graph dens density overlay plot hist histogram plot mode the distribution of the mode statistic, over the simulated datasets, compared to the mode of the real data
limited	logical. TRUE if the output should be limited within the 95% credible interval, FALSE it should not. Default FALSE.
...	other arguments are ignored.

Value

a ggplot2 object

Examples

```
# simulation of healthy controls data

Sigma.ctrl <- matrix(cbind(1, .7, .7, 1), nrow=2)

U <- t(chol(Sigma.ctrl))

numobs <- 100

set.seed(123)

random.normal <- matrix( rnorm( n = ncol(U) * numobs, mean = 3, sd = 1),
                          nrow = ncol(U), ncol = numobs)

X = U %*% random.normal

dat.ctrl <- as.data.frame(t(X))
```

```

names(dat.ctrl) <- c("y","x")

cor(dat.ctrl)

# simulation of patient data

Sigma.pt <- matrix(cbind(1, 0, 0, 1) ,nrow=2)

U <- t(chol(Sigma.pt))

numobs <- 20

set.seed(0)

random.normal <- matrix( rnorm( n = ncol(U) * numobs, mean = 3, sd = 1),
                          nrow = ncol(U), ncol = numobs)

X = U %*% random.normal

dat.pt <- as.data.frame(t(X))

names(dat.pt) <- c("y","x")

cor(dat.pt)

# fit the single case model

mdl.reg <- BMSC(y ~ x, data_ctrl = dat.ctrl, data_pt = dat.pt, seed = 10)

# summarize the data

summary(mdl.reg)

# plot the posterior predictive checks

pp_check(mdl.reg, limited = FALSE)

pp_check(mdl.reg, limited = TRUE)

pp_check(mdl.reg, type = "mode", limited = FALSE)

pp_check(mdl.reg, type = "hist", limited = FALSE)

```

```
print.pairwise.BMSC
```

Print summaries of Pairwise Bayesian Multilevel Single Case objects

Description

Print summaries of Pairwise Bayesian Multilevel Single Case objects

Usage

```
## S3 method for class 'pairwise.BMSC'
print(x, ...)
```

Arguments

x An object of class `pairwise.BMSC`, resulting from the [pairwise.BMSC](#) function.
 ... further arguments passed to or from other methods.

<code>print.summary.BMSC</code>	<i>Print summaries of Bayesian Multilevel Single Case objects</i>
---------------------------------	---

Description

Print summaries of Bayesian Multilevel Single Case objects

Usage

```
## S3 method for class 'summary.BMSC'
print(x, ...)
```

Arguments

x An object of class `summary.BMSC`, resulting from the [summary.BMSC](#) function.
 ... further arguments passed to or from other methods.

<code>randomeffects</code>	<i>Random Effects specification on Bayesian Multilevel Single Case models using 'Stan'</i>
----------------------------	--

Description

The **BMSC** function allows the flexibility of multilevel (generalised) linear models on single case analysis.

In particular, it is possible to specify the population-level (a.k.a. mixed effects) and the group-level (a.k.a. random effects) coefficients.

The specification of the population- and group-level effects can be done using the well-known **lme4** notation with specific limitations:

- it is no possible to estimate uncorrelated group-level effects
- it is no possible to directly estimate nested effects. You need to use a trick that is specified in the **Details** section.

Details

lmer formulation	BMSC availability
(1 grouping_factor)	Yes
(1 + slope grouping_factor)	Yes
(0 + slope grouping_factor)	No
(1 grouping_factor1 : grouping_factor2)	Yes ^[1]
(1 grouping_factor1 / grouping_factor2)	Yes ^[2]

[¹]: The **BMSC** function dose not allow the use of the interaction symbol ":", but this problem is easily solved by creating a new variable within your dataframe given by the interaction of the two factors.

[²]: The (1 | grouping_factor1 / grouping_factor2) syntax is the equivalent of the explicit version (1 \ | grouping_factor1:grouping_factor2) + (1 | grouping_factor1).

Therefore, you need to create a new grouping factor representing the interaction between grouping_factor1 and grouping_factor2, and use this in the explicit version (1 | grouping_factor_interaction) + (1 | grouping_factor1).

summary.BMSC	<i>Summarizing Bayesian Multilevel Single Case objects</i>
--------------	--

Description

summary method for class "BMSC".

Usage

```
## S3 method for class 'BMSC'  
summary(object, ...)
```

Arguments

object An object of class BMSC, resulting from the [BMSC](#) function.
... other arguments are ignored.

Value

a summary.BMSC object
