Package ‘cancensus’

January 23, 2023

Type Package

Title Access, Retrieve, and Work with Canadian Census Data and Geography

Version 0.5.5

Description Integrated, convenient, and uniform access to Canadian Census data and geography retrieved using the ‘CensusMapper’ API. This package produces analysis-ready tidy data frames and spatial data in multiple formats, as well as convenience functions for working with Census variables, variable hierarchies, and region selection. API keys are freely available with free registration at <https://censusmapper.ca/api>. Census data and boundary geometries are reproduced and distributed on an “as is” basis with the permission of Statistics Canada (Statistics Canada 2001; 2006; 2011; 2016; 2021).

add_unique_names_to_region_list

Convenience function for creating unique names from region list

Description

Names of municipalities are not always unique, especially at the CSD level. This function takes as input a subset of a regions list as generated from ‘list_census_regions()’ and de-duplicates names as needed by adding the municipal status in parenthesis. If this does not de-duplicate the name then the geographic identifier will be further added in parenthesis behind that.

Usage

add_unique_names_to_region_list(region_list)

Arguments

region_list a subset of a regions list as gotten from ‘list_census_regions()’

Value

The same list of regions with an extra column ‘Name‘ with de-duplicated names.

Examples

## Not run:
# This will return a warning that no match was found, but will suggest similar named regions.
library(dplyr)
list_census_regions("CA21") %>%
  filter(level="CSD", CMA_UID="59933") %>%
  add_unique_names_to_region_list()
## End(Not run)

as_census_region_list Convert a (suitably filtered) data frame from list_census_regions to a list suitable for passing to get_census.

Description

Convert a (suitably filtered) data frame from list_census_regions to a list suitable for passing to get_census.

Usage

as_census_region_list(tbl)
Arguments

tbl A data frame, suitably filtered, as returned by list_census_regions.

Examples

## Not run:
library(dplyr, warn.conflicts = FALSE)

# Query the CensusMapper API for the total occupied dwellings # of 20 random Census Subdivisions, in Census 2016.
regions <- list_census_regions("CA16") %>%
  filter(level == "CSD") %>%
  sample_n(20) %>%
  as_census_region_list()

occupied <- get_census("CA16", regions = regions,
  vectors = \{v_CA16_408\},
  level = "Regions")

## End(Not run)

child_census_vectors List all child variables from vector hierarchies given either a list of Census variables returned by list_census_vectors, search_census_vectors, find_census_vectors, or a direct string reference to the vector code.

Description

List all child variables from vector hierarchies given either a list of Census variables returned by list_census_vectors, search_census_vectors, find_census_vectors, or a direct string reference to the vector code.

Usage

child_census_vectors(
  vector_list,
  leaves_only = FALSE,
  max_level = NA,
  keep_parent = FALSE
)

Arguments

vector_list the list of vectors to be used, either a character vector or a filtered tibble as returned from list_census_vectors.

leaves_only boolean flag to indicate if only final leaf vectors should be returned, i.e. terminal vectors that themselves do not have children.
max_level  optional, maximum depth to look for child vectors. Default is NA and will return all child census vectors.
keep_parent optional, also return parent vector in list of results. Default is set to FALSE.

Examples

# Query parent vectors directly using vector identifier
child_census_vectors("v_CA16_2510")

## Not run:

# Example using multiple vectors coerced into a list
child_census_vectors(c("v_CA16_2510","v_CA16_2511","v_CA16_2512"))

# or, equivalently
selected_vectors <- c("v_CA16_2510","v_CA16_2511","v_CA16_2512")
child_census_vectors(selected_vectors)

# Example using dplyr and piped arguments
library(dplyr, warn.conflicts = FALSE)

list_census_vectors("CA16") %>%
  filter(vector == "v_CA16_2510") %>%
  child_census_vectors(TRUE)

# this will return the equivalent of c("v_CA16_2510", child_census_vectors("v_CA16_2510"))
list_census_vectors("CA16") %>%
  filter(vector == "v_CA16_2510") %>%
  child_census_vectors(TRUE, keep_parent = TRUE)

## End(Not run)

A dataset with code table summaries for census data

Description

A dataset with code table summaries for census data

Author(s)

derived from StatCan definitions

References

COV_SKYTRAIN_STATIONS  A dataset City of Vancouver skytrain station locations

Description

A dataset City of Vancouver skytrain station locations

Author(s)

City of Vancouver Open Data

References

https://opendata.vancouver.ca/explore/dataset/rapid-transit-stations/information/

dataset_attribution  Get attribution for datasets

Description

Get attribution for datasets

Usage

dataset_attribution(datasets)

Arguments

datasets  Vector of dataset identifiers

Value

Returns a string to be used as attribution for the given datasets.

Examples

# Attribution string for the 2006 and 2016 census datasets
dataset_attribution(c('CA06','CA16'))
**explore_census_regions**

*Interactively browse Census variables and regions on Censusmapper.ca in a new browser window*

**Description**

Finding the right Census variables or regions can be complicated. `explore_census_vectors(dataset)` and `explore_census_regions(dataset)` will open a new browser page or tab to an interactive Census variable and region exploration and selection tool on the Censusmapper.ca website. Interactive tools available for the CA16, CA11, CA06, and CA01 Census datasets and geographies.

**Usage**

```r
explore_census_regions(dataset = "CA16")
```

**Arguments**

- `dataset` The dataset to query for available vectors, e.g. 'CA16'. Interactive tools available for the CA16, CA11, CA06, and CA01 Census datasets and geographies.

**Examples**

```r
## Not run:
explore_census_vectors(dataset = "CA16")
explore_census_regions(dataset = "CA11")
## End(Not run)
```

**explore_census_vectors**

*Interactively browse Census variables and regions on Censusmapper.ca in a new browser window*

**Description**

Finding the right Census variables or regions can be complicated. `explore_census_vectors(dataset)` and `explore_census_regions(dataset)` will open a new browser page or tab to an interactive Census variable and region exploration and selection tool on the Censusmapper.ca website. Interactive tools available for the CA16, CA11, CA06, and CA01 Census datasets and geographies.

**Usage**

```r
explore_census_vectors(dataset = "CA16")
```
Arguments

dataset The dataset to query for available vectors, e.g. 'CA16'. Interactive tools available for the CA16, CA11, CA06, and CA01 Census datasets and geographies.

Examples

```r
## Not run:
explore_census_vectors(dataset = "CA16")
explore_census_regions(dataset = "CA11")

## End(Not run)
```

Description

Query the available list of Census vectors based on their label and return details including vector code. Default search behaviour expects an exact match, but keyword or semantic searches can be used instead by setting `query_type='keyword'` or `query_type='semantic'` instead. Keyword search is useful when looking to explore Census vectors based on broad themes like "income" or "language". Keyword search separates the query into unigrams and returns Census vectors with matching words, ranked by incidence of matches. Semantic search is designed for more precise searches while allowing room for error for spelling or phrasing, as well as for finding closely related vector matches. Semantic search separates the query into n-grams and relies on string distance measurement using a generalized Levenshtein distance approach.

Some census vectors return population counts segmented by Female and Male populations, in addition to a total aggregate. By default, query matches will return matches for the Total aggregation, but can optionally return only the Female or Male aggregations by adding `type = 'female'` or `type = 'male'` as a parameter.

Usage

```r
find_census_vectors(query, dataset, type = "all", query_type = "exact", ...)
```

Arguments

query The term or phrase to search for e.g. 'Oji-cree'. Search queries are case insensitive.

dataset The dataset to query for available vectors, e.g. 'CA16'. To see a list of available datasets: `list_census_datasets()`
**get_census**  

Access to Canadian census data through the CensusMapper API

---

### Description

This function allows convenient access to Canadian census data and boundary files through the CensusMapper API. An API key is required to retrieve data.

### Usage

```r
get_census(
  dataset,
  regions,
  level = NA,
  vectors = c(),
  type = 'all',
  query_type = 'exact',
  ...)
```

- **type**: One of 'all', 'total', 'male' or 'female'. If specified, only return aggregations of specified 'type'. By default, only the 'total' aggregation will be returned.
- **query_type**: One of exact, 'semantic' or 'keyword'. By default, assumes exact string matching, but the alternatives may be better options in some cases. See description section for more details on query types.

---

### Examples

```r
find_census_vectors('Oji-cree', dataset = 'CA16', type = 'total', query_type = 'exact')

find_census_vectors('commuting duration', dataset = 'CA11', type = 'female', query_type = 'keyword')

find_census_vectors('after tax income', dataset = 'CA16', type = 'total', query_type = 'semantic')

## Not run:
# This incorrect spelling will return a warning that no match was found,
# but will suggest trying semantic or keyword search.
find_census_vectors('Ojibwey', dataset = 'CA16', type = 'total')

# This will find near matches as well
find_census_vectors('Ojibwey', dataset = 'CA16', type = 'total', query_type = "semantic")

find_census_vectors('commute duration', dataset = 'CA16', type = 'female', query_type = 'keyword')

find_census_vectors('commute duration', dataset = 'CA11', type = 'all', query_type = 'keyword')

find_census_vectors('ukrainian origin', dataset = 'CA16', type = 'total', query_type = 'keyword')

## End(Not run)
```
get_census

geo_format = NA,
resolution = "simplified",
labels = "detailed",
use_cache = TRUE,
quiet = FALSE,
api_key = Sys.getenv("CM_API_KEY")
)

Arguments

dataset          A CensusMapper dataset identifier.
regions          A named list of census regions to retrieve. Names must be valid census aggregation levels.
level            The census aggregation level to retrieve, defaults to "Regions". One of "Regions", "PR", "CMA", "CD", "CSD", "CT", "DA", "EA" (for 1996), or "DB" (for 2001-2016).
vectors          An R vector containing the CensusMapper variable names of the census variables to download. If no vectors are specified only geographic data will get downloaded.
geo_format       By default is set to NA and appends no geographic information. To include geographic information with census data, specify one of either "sf" to return an sf object (requires the sf package) or "sp" to return a SpatialPolygonsDataFrame-class object (requires the rgdal package). If user requests geo-spatial data and neither package is available, a context menu will prompt to install the sf package.
resolution       Resolution of the geographic data. cancensus will download simplified geometries by default. For lower level geometries like DB or DA this will be very close to the high resolution data. Simplification generally increases as the geographic aggregation level increases. If high resolution geometries are required then this option can be set to 'high'. By default this setting is set to 'simplified'.
labels           Set to "detailed" by default, but truncated Census variable names can be selected by setting labels = "short". Use label_vectors(...) to return variable label information in detail.
use_cache        If set to TRUE (the default) data will be read from the local cache if available.
quiet            When TRUE, suppress messages and warnings.
api_key          An API key for the CensusMapper API. Defaults to options() and then the CM_API_KEY environment variable.

Details

For help selecting regions and vectors, see list_census_regions and list_census_vectors, or check out the interactive selection tool at https://censusmapper.ca/api by calling explore_census_vectors()

Source

Census data and boundary geographies are reproduced and distributed on an "as is" basis with the permission of Statistics Canada (Statistics Canada 1996; 2001; 2006; 2011; 2016).
get_intersecting_geometries

Examples

# Query the API for data on dwellings in Vancouver, at the census subdivision
# level:
## Not run:
census_data <- get_census(dataset='CA16', regions=list(CMA="59933"),
                   vectors=c("v_CA16_408","v_CA16_409","v_CA16_410"),
                   level='CSD')

# Query the API for data on dwellings in Vancouver, at the census subdivision
# level, and return the associated geography files in \code{sf} format:
census_data <- get_census(dataset='CA16', regions=list(CMA="59933"),
                   vectors=c("v_CA16_408","v_CA16_409","v_CA16_410"),
                   level='CSD', geo_format = "sf")

# Make the same query, but this time drop descriptive vector names:
census_data <- get_census(dataset='CA16', regions=list(CMA="59933"),
                   vectors=c("v_CA16_408","v_CA16_409","v_CA16_410"),
                   level='CSD', geo_format = "sf", labels="short")

# Get details for truncated vectors:
label_vectors(census_data)

## End(Not run)

get_intersecting_geometries

Get identifiers for census regions intersecting a geometry

Description

This function returns a list of regions that intersect a given geometry input. This list of regions can be used directly to query census when one is interested in census data for a particular geographic region that does not coincide with defined census geometries. The returned value can be used as the regions parameter in get_census to get corresponding census geographies and variables that cover the give geometry. Input spatial objects can be any \code{sf} or \code{sfc} class objects such as \code{POINT}, \code{MULTIPOINT} or \code{POLYGON}.

This function comes with CensusMapper API limits

Usage

get_intersecting_geometries(
  dataset,
  level,
  geometry,
  simplified = FALSE,
  use_cache = TRUE,
  quiet = FALSE,
  api_key = Sys.getenv("CM_API_KEY")
)
get_statcan_geographic_attributes

**Arguments**

- **dataset**
  A CensusMapper dataset identifier.

- **level**
  The census aggregation level to retrieve. One of "Regions", "PR", "CMA", "CD", "CSD", "CT", "DA", "EA" (for 1996 census), or "DB" (for 2001-2016 censuses).

- **geometry**
  A valid sf or sfc class object. As long as the geometry is valid, any projection is accepted. Objects will be reprojected as server-side intersections use lat/lon projection.

- **simplified**
  If TRUE will return a region list compatible with get_census, otherwise will return a character vector of matching region ids.

- **use_cache**
  If set to TRUE (the default) data will be read from the local cache if available.

- **quiet**
  When TRUE, suppress messages and warnings.

- **api_key**
  An API key for the CensusMapper API. Defaults to options() and then the CM_API_KEY environment variable.

**Source**

Census data and boundary geographies are reproduced and distributed on an "as is" basis with the permission of Statistics Canada (Statistics Canada 1996; 2001; 2006; 2011; 2016).

**Examples**

```r
## Not run:
# Example using a POINT-class object from a pair of lat/lon coordinates
point_geo <- sf::st_sfc(sf::st_point(c(-123.25149, 49.27026)), crs=4326)
regions <- get_intersecting_geometries(dataset = 'CA16', level = 'CT', geometry = point_geo)
census_data <- get_census(dataset='CA16', regions=regions,
                         vectors=c("v_CA16_408","v_CA16_409","v_CA16_410"),
                         level='CT')

# Example using a POLYGON-class object from a bounding box with four coordinates
poly_geo <- sf::st_as_sfc(sf::st_bbox(c(ymin = 49.25, ymax = 49.30,
                                       xmin = -123.25, xmax = -123.30)), crs = 4326)
regions <- get_intersecting_geometries(dataset = 'CA16', level = 'CT', geometry = poly_geo)
census_data <- get_census(dataset='CA16', regions=regions,
                         vectors=c("v_CA16_408","v_CA16_409","v_CA16_410"), level='CT')
```

## End(Not run)

---

**get_statcan_geographic_attributes**

*Read the Geographic Attributes File*
get_statcan_geographies

Description
Reads the Geographies Attributes File for the given census year. The table contains the information on how all the geographic levels are related for each area, and population, dwelling and household counts. Data gets cached after first download if the cancensus cache path has been set. A reference guide is available at https://www150.statcan.gc.ca/n1/en/catalogue/92-151-G2021001

Usage
get_statcan_geographic_attributes(census_year = "2021", refresh = FALSE)

Arguments

- **census_year** - census year to get the data for, right now only 2006, 2011, 2016, 2021 are supported
- **refresh** - (logical) refresh the cache if true

Value
tibble with the relationship data

Examples

```r
# list add the cached census data
## Not run:
get_statcan_geographic_attributes("2021")
## End(Not run)
```

---

get_statcan_geographies

*Read the geosuite data*

Description

Reads the original unprocessed geographic boundary files from Statistics Canada

Usage

```r
get_statcan_geographies(
    census_year,
    level,
    type = "cartographic",
    cache_path = NULL,
    timeout = 1000,
    refresh = FALSE,
    quiet = FALSE
)
```
**get_statcan_geo_suite**

**Arguments**

- **census_year**: census year to get the data for, right now only 2021 is supported
- **level**: geographic level to return the data for, valid choices are "PR", "CD", "CMACA", "CSD", "CT", "ADA", "DA", "ADA", "CT", "CSD", "CMACA", "CD", "PR", "FED", "DPL", "ER", "PN", "POPCTR"
- **type**: type of geographic data, valid choices are "cartographic" or "digital"
- **cache_path**: optional path to cache the data. If the cancensus cache path is set the geographic data gets cached in the "geographies" subdirectory of the cancensus cache path.
- **timeout**: optional timeout parameter, adjust as needed if the data download times out when using slow connections
- **refresh**: (logical) refresh the cache if true
- **quiet**: (logical) suppress messages if `TRUE`

**Value**

a spatial dataframe with the geographic data

**Examples**

```r
# get the digital geographic boundaries for provinces and territories
## Not run:
get_statcan_geographies(census_year="2021",level="PR",type="digital")
## End(Not run)
```

**Description**

Reads the geosuite data for the given level and census year. Data gets cached after first download if the cancensus cache path has been set. For older years `get_statcan_geographic_attributes()` can fill in most of the information

**Usage**

```r
get_statcan_geo_suite(level, census_year = "2021", refresh = FALSE)
```

**Arguments**

- **level**: geographic level to return the data for, valid choices are "DB", "DA", "ADA", "CT", "CSD", "CMACA", "CD", "PR", "FED", "DPL", "ER", "PN", "POPCTR"
- **census_year**: census year to get the data for, right now only 2021 is supported
- **refresh**: (logical) refresh the cache if true

**Value**

tibble with the geosuite data
get_statcan_wds_data

Examples

```r
# list add the cached census data
## Not run:
get_statcan_geo_suite("DA","2021")

## End(Not run)
```

get_statcan_wds_data  
Query the StatCan WDS for data

Description

Get official census data from Statistics Canada for a given set of DGUIDs. Only available for the 2021 census. The downloaded data gets enriched by geographic and characteristic names based on metadata obtained via `get_statcan_wds_metadata()`. Data is cached for the duration of the R session.

Usage

```r
get_statcan_wds_data(
  DGUIDs, 
  members = NULL, 
  gender = "All", 
  language = "en", 
  refresh = FALSE
)
```

Arguments

- **DGUIDs**  
  census year to get the data for, right now only 2021 is supported. Valid DGUIDs for a given geographic level can be queried via `get_statcan_wds_metadata()`.  
- **members**  
  list of Member IOs to download data for. By default all characteristics are downloaded. Valid Member IDs and their descriptions can be queried via the `get_statcan_wds_metadata()` call.  
- **gender**  
  optionally query data for only one gender. By default this queries data for all genders, possible values are "Total", "Male", "Female" to only query total data, or for males only or for females only.  
- **language**  
  specify language for geography and characteristic names that get added, valid choices are "en" and "fr"  
- **refresh**  
  default is ‘FALSE’ will refresh the temporary cache if ‘TRUE’

Value

tibble with the enriched census data
Examples

```r
# get data for federal electoral district 2013A000459021
## Not run:
get_statcan_wds_data(DGUIDs="2013A000459021",level="FED")

## End(Not run)
```

---

get_statcan_wds_metadata

*Query the StatCan WDS for metadata*

Description

Get official metadata information from Statistics Canada for a given geographic level. Only available for the 2021 census. Data is cached for the duration of the R session.

Usage

```r
get_statcan_wds_metadata(census_year, level, refresh = FALSE)
```

Arguments

- `census_year` : census year to get the data for, right now only 2021 is supported
- `level` : geographic level to return the data for, valid choices are "PR","CD","CMACA","CSD","CT","ADA","DA","ER","FED","DPL","POPCNTR"
- `refresh` : default is ‘FALSE’ will refresh the temporary cache if ‘TRUE’

Value

- tibble with the metadata

Examples

```r
# get metadata for federal electoral districts
## Not run:
get_statcan_wds_metadata(census_year="2021",level="FED")

## End(Not run)
```
label_vectors

Return Census variable names and labels as a tidy data frame

Description

Return Census variable names and labels as a tidy data frame

Usage

label_vectors(x)

Arguments

x  
A data frame, sp or sf object returned from get_census or similar.

Value

A data frame with a column variable containing the truncated variable name, and a column label describing it.

Examples

```r
## Not run:
# Query census data with truncated labels:
label_data <- get_census(dataset='CA16', regions=list(CMA="59933"),
                        vectors=c("v_CA16_408","v_CA16_409","v_CA16_410"),
                        level='CSD', geo_format = "sf", labels="short")

# Get details for truncated vectors:
label_vectors(label_data)

## End(Not run)
```

list_cancensus_cache

List cached files

Description

Lists all cached data and metadata if available

Usage

list_cancensus_cache()

Value

tibble with metadata on cached data
list_census_datasets

Examples

# list add the cached census data
list_cancensus_cache()

list_census_datasets

Description

Query the CensusMapper API for available datasets.

Usage

list_census_datasets(use_cache = TRUE, quiet = FALSE)

Arguments

use_cache
If set to TRUE (the default), data will be read from a temporary local cache for the duration of the R session, if available. If set to FALSE, query the API for the data, and refresh the temporary cache with the result.

quiet
When TRUE, suppress messages and warnings.

Value

Returns a data frame with a column dataset containing the code for the dataset, a column description describing it, a geo_dataset column identifying the geography dataset the data is based on, a attribution column with an attribution string, a reference column with a reference identifier, and a reference_url column with a link to reference materials.

Examples

# List available datasets in CensusMapper
list_census_datasets()
list_census_regions  

Query the CensusMapper API for available regions in a given dataset.

Description

Query the CensusMapper API for available regions in a given dataset.

Usage

list_census_regions(dataset, use_cache = TRUE, quiet = FALSE)

Arguments

dataset  The dataset to query for available regions, e.g. "CA16".
use_cache  If set to TRUE (the default), data will be read from a local cache that is maintained for the duration of the R session, if available. If set to FALSE, query the API for the data, and refresh the local cache with the result.
quiet  When TRUE, suppress messages and warnings.

Value

Returns a data frame with the following columns:

region  The region identifier.
name  The name of that region.
level  The census aggregation level of that region.
pop  The population of that region.
municipal_status  Additional identifiers to distinguish the municipal status of census subdivisions.
CMA_UID  The identifier for the Census Metropolitan Area the region is in (if any).
CD_UID  The identifier for the Census District the region is in (if any).
PR_UID  The identifier for the Province the region is in (if unique).

Examples

list_census_regions('CA16')
list_census_vectors  
*Query the CensusMapper API for available vectors for a given dataset.*

### Description

Query the CensusMapper API for available vectors for a given dataset.

### Usage

```r
list_census_vectors(dataset, use_cache = TRUE, quiet = TRUE)
```

### Arguments

- **dataset**: The dataset to query for available vectors, e.g. "CA16".
- **use_cache**: If set to TRUE (the default), data will be read from a local cache that is maintained for the duration of the R session, if available. If set to FALSE, query the API for the data, and refresh the local cache with the result.
- **quiet**: When FALSE, shows messages and warnings. Set to TRUE by default.

### Value

Returns a data frame detailing the available Census vectors (i.e. variables) for a given Census dataset. This data frame has columns `vector` containing the short code for the variable, `type` describing whether it’s a female, male, or total aggregate, `label` indicating the name of the variable, `units` indicating whether the value represents a numeric integer, percentage, dollar figure, or ratio, `parent_vector` to show hierarchical relationship, `aggregation` indicating whether the value is additive or a transformation, and a column `details` with a detailed description of the variable generated by traversing all labels within its hierarchical structure.

### Examples

```r
## Not run:
# List all vectors for a given Census dataset in CensusMapper
list_census_vectors('CA16')

## End(Not run)
```
list_recalled_cached_data

List recalled data stored in local cache

Description
Checks the local cached database for recalled data and lists all recalled cached entries

Usage

```r
list_recalled_cached_data(
  cached_data = list_cancensus_cache(),
  warn_only_once = FALSE
)
```

Arguments

- `cached_data` List of locally cached data to check for recall, default is `list_cancensus_cache()` in which case it will get checked against all locally cached data.
- `warn_only_once` Will only warn on first run during each session, ‘FALSE’ by default.

Value
tibble with rows describing locally cached recalled data

Examples

```r
## Not run:
list_recalled_cached_data()

## End(Not run)
```

parent_census_vectors

List all parent variables from vector hierarchies given either a list of Census variables returned by `list_census_vectors`, `search_census_vectors`, `find_census_vectors`, or a direct string reference to the vector code.

Description
List all parent variables from vector hierarchies given either a list of Census variables returned by `list_census_vectors`, `search_census_vectors`, `find_census_vectors`, or a direct string reference to the vector code.

Usage

```r
parent_census_vectors(vector_list)
```
remove_from_cancensus_cache

Arguments

vector_list The list of vectors to be used, either a character vector or a filtered tibble as returned from list_census_vectors.

Examples

# Query parent vectors directly using vector identifier
parent_census_vectors("v_CA16_2519")
## Not run:
# Example using multiple vectors coerced into a list
parent_census_vectors(c("v_CA16_2519","v_CA16_2520","v_CA16_2521"))

# or, equivalently
selected_vectors <- c("v_CA16_2519","v_CA16_2520","v_CA16_2521")
parent_census_vectors(selected_vectors)

# Example using dplyr and piped arguments
library(dplyr, warn.conflicts = FALSE)

list_census_vectors("CA16") %>%
  filter(vector == "v_CA16_2519") %>%
  parent_census_vectors()

## End(Not run)

remove_from_cancensus_cache

Remove cached files

Description

Remove cached data for paths given

Usage

remove_from_cancensus_cache(paths)

Arguments

paths list of paths to remove, as returned by the path column in ‘list_cancensus_cache’

Value

freed-up disk space
### remove_recalled_cached_data

#### Examples

```r
## Not run:
# remove the first cached dataset
cache_data <- list_cancensus_cache()
remove_from_cancensus_cache(cache_data$path[1])
## End(Not run)
```

#### Description

Removes recalled data from the local cache.

#### Usage

```r
remove_recalled_cached_data()
```

#### Value

Storage size of removed locally cached data that got freed up in number of bytes.

#### Examples

```r
## Not run:
remove_recalled_cached_data()
## End(Not run)
```

---

### search_census_regions

#### Query the CensusMapper API for regions with names matching a searchterm.

#### Description

Runs a query against the CensusMapper API to retrieve region data with names matching specific queries. Users can optionally specify the target geography level (e.g., `level = 'CMA'`, `level = 'CSD'`, etc.). Alternatively, calling `explore_census_vectors()` will launch the interactive region selection tool on the CensusMapper site in a new web page or tab.

#### Usage

```r
search_census_regions(searchterm, dataset, level = NA, ...)
```
search_census_vectors

**Arguments**

- **searchterm**: The term to search for e.g. "Victoria". Search terms are case insensitive. If unable to find a given search term, this function will suggest the correct spelling to use when possible.
- **dataset**: The dataset to query for available regions, e.g. "CA16".
- **level**: One of NA, 'C', 'PR', 'CMA', 'CD', or 'CSD'. If specified, only return variables of specified 'level'.

... Further arguments passed on to `list_census_regions`.

**Value**

A census region list of the same format as `list_census_regions()` containing the matches.

**Examples**

```r
## Not run:
# This will return a warning that no match was found, but will suggest similar named regions.
search_census_regions("Victoria", "CA16")

# This will limit region results to only include CMA level regions
search_census_regions("Victoria", "CA16", level = "CMA")

## End(Not run)
```

---

search_census_vectors **Query the CensusMapper API for vectors with descriptions matching a search term or phrase (deprecated)**

**Description**

Query the CensusMapper API for vectors with descriptions matching a search term or phrase (deprecated)

**Usage**

```r
search_census_vectors(searchterm, dataset, type = NA, ...)
```

**Arguments**

- **searchterm**: The term or phrase to search for e.g. "Ojibway". Search terms are case insensitive. If unable to find a given string, this function will suggest similarly named objects.
- **dataset**: The dataset to query for available vectors, e.g. "CA16".
- **type**: One of NA, 'Total', 'Male' or 'Female'. If specified, only return variables of specified 'type'.

... Further arguments passed on to `list_census_vectors`. 
set_cancensus_api_key

Examples

```r
search_census_vectors(’Ojibway’, ’CA16’)
## Not run:
# This will return a warning that no match was found, but will suggest similar terms.
search_census_vectors(’Ojibwe’, ’CA16’, ’Total’)

## End(Not run)
```

Description

Cancensus requires a free Censusmapper API key to retrieve data. This function helps set the key for either the duration of the session (default) or permanently for use across sessions.

Usage

```r
set_cancensus_api_key(key, overwrite = FALSE, install = FALSE)
```

Arguments

- `key`: a Censusmapper API key. For more information on keys see the API key section.
- `overwrite`: Option to overwrite any existing Censusmapper keys already stored locally.
- `install`: Option to install permanently for use across sessions.

Examples

```r
## Not run:
set_cancensus_api_key(”YOUR_CM_API_KEY”)

# This will set the key permanently until overwritten again
set_cancensus_api_key(”YOUR_CM_API_KEY”, install = TRUE)

## End(Not run)
```

set_cancensus_cache_path

Set persistent cancensus cache location

Description

Cancensus provides session caching for retrieved data to increase speeds and reduce API usage. This function will create a persistent cache across sessions.
show_cancensus_api_key

Usage

set_cancensus_cache_path(cache_path, overwrite = FALSE, install = FALSE)

Arguments

  cache_path  a local directory to use for saving cached data
  overwrite   Option to overwrite any existing cache path already stored locally.
  install     Option to install permanently for use across sessions.

Examples

## Not run:
set_cancensus_cache_path("~/cancensus_cache")

# This will set the cache path permanently until overwritten again
set_cancensus_cache_path("~/cancensus_cache", install = TRUE)

## End(Not run)

show_cancensus_api_key

View saved Censusmapper API key

Description

View saved API key'

Usage

show_cancensus_api_key()

Examples

  show_cancensus_api_key()
show_census_cache_path

View saved cache directory path

Description

View saved cache path

Usage

show_census_cache_path()

Examples

show_census_cache_path()}
