Description

Kohonen's Self-Organizing Maps are a crude form of multidimensional scaling.

Usage

```r
batchSOM(data, grid = somgrid(), radii, init)
```

Arguments

- **data**: a matrix or data frame of observations, scaled so that Euclidean distance is appropriate.
- **grid**: A grid for the representatives: see `somgrid`.
- **radii**: the radii of the neighbourhood to be used for each pass: one pass is run for each element of `radii`.
- **init**: the initial representatives. If missing, chosen (without replacement) randomly from `data`.

Details

The batch SOM algorithm of Kohonen(1995, section 3.14) is used.

Value

An object of class "SOM" with components

- **grid**: the grid, an object of class "somgrid".
- **codes**: a matrix of representatives.

References

See Also

`somgrid, SOM`
**Examples**

```r
require(graphics)
data(crabs, package = "MASS")

lcrabs <- log(crabs[, 4:8])
crabs.grp <- factor(c("B", "b", "O", "o")[rep(1:4, rep(50,4))])
gr <- somgrid(topo = "hexagonal")
crabs.som <- batchSOM(lcrabs, gr, c(4, 4, 2, 2, 1, 1, 0, 0))
plot(crabs.som)

bins <- as.numeric(knn1(crabs.som$code, lcrabs, 0:47))
plot(crabs.som$grid, type = "n")
symbols(crabs.som$grid$pts[, 1], crabs.som$grid$pts[, 2],
circles = rep(0.4, 48), inches = FALSE, add = TRUE)
text(crabs.som$grid$pts[bins, ] + rnorm(400, 0, 0.1),
as.character(crabs.grp))
```

---

**condense**

*Condense training set for k-NN classifier*

**Description**

Condense training set for k-NN classifier

**Usage**

```r
condense(train, class, store, trace = TRUE)
```

**Arguments**

- `train`: matrix for training set
- `class`: vector of classifications for test set
- `store`: initial store set. Default one randomly chosen element of the set.
- `trace`: logical. Trace iterations?

**Details**

The store set is used to 1-NN classify the rest, and misclassified patterns are added to the store set. The whole set is checked until no additions occur.

**Value**

Index vector of cases to be retained (the final store set).
knn

k-Nearest Neighbour Classification

Description

k-nearest neighbour classification for test set from training set. For each row of the test set, the k nearest (in Euclidean distance) training set vectors are found, and the classification is decided by majority vote, with ties broken at random. If there are ties for the kth nearest vector, all candidates are included in the vote.

Usage

```r
cnn(train, test, cl, k = 1, l = 0, prob = FALSE, use.all = TRUE)
```

Arguments

- **train**: matrix or data frame of training set cases.
- **test**: matrix or data frame of test set cases. A vector will be interpreted as a row vector for a single case.
- **cl**: factor of true classifications of training set
- **k**: number of neighbours considered.
- **l**: minimum vote for definite decision, otherwise doubt. (More precisely, less than k-l dissenting votes are allowed, even if k is increased by ties.)
- **prob**: If this is true, the proportion of the votes for the winning class are returned as attribute prob.
- **use.all**: controls handling of ties. If true, all distances equal to the kth largest are included. If false, a random selection of distances equal to the kth is chosen to use exactly k neighbours.

Examples

```r
train <- rbind(iris3[,1:25,1], iris3[,1:25,2], iris3[,1:25,3])
test <- rbind(iris3[,26:50,1], iris3[,26:50,2], iris3[,26:50,3])
c1 <- factor(c(rep("s",25), rep("c",25), rep("v",25)))
keep <- condense(train, c1)
knn(train[keep, , drop=FALSE], test, c1[keep])
keep2 <- reduce.nn(train, keep, c1)
knn(train[keep2, , drop=FALSE], test, c1[keep2])
```
Value

Factor of classifications of test set. doubt will be returned as NA.

References

See Also

knn1, knn.cv

Examples

train <- rbind(iris3[1:25,,1], iris3[1:25,,2], iris3[1:25,,3])
test <- rbind(iris3[26:50,,1], iris3[26:50,,2], iris3[26:50,,3])
cl <- factor(c(rep("s",25), rep("c",25), rep("v",25)))
knn(train, test, cl, k = 3, prob=TRUE)
attributes(.Last.value)

**Description**

k-nearest neighbour cross-validatory classification from training set.

Usage

knn.cv(train, cl, k = 1, l = 0, prob = FALSE, use.all = TRUE)

Arguments

- **train**: matrix or data frame of training set cases.
- **cl**: factor of true classifications of training set
- **k**: number of neighbours considered.
- **l**: minimum vote for definite decision, otherwise doubt. (More precisely, less than k-1 dissenting votes are allowed, even if k is increased by ties.)
- **prob**: If this is true, the proportion of the votes for the winning class are returned as attribute prob.
- **use.all**: controls handling of ties. If true, all distances equal to the kth largest are included. If false, a random selection of distances equal to the kth is chosen to use exactly k neighbours.
Details

This uses leave-one-out cross validation. For each row of the training set `train`, the k nearest (in Euclidean distance) other training set vectors are found, and the classification is decided by majority vote, with ties broken at random. If there are ties for the kth nearest vector, all candidates are included in the vote.

Value

Factor of classifications of training set. `doubt` will be returned as `NA`.

References

See Also

`knn`

Examples

```r
train <- rbind(iris3[,1], iris3[,2], iris3[,3])
cl <- factor(c(rep("s",50), rep("c",50), rep("v",50)))
knn.cv(train, cl, k = 3, prob = TRUE)
attributes(.Last.value)
```

---

**knn1**

1-Nearest Neighbour Classification

Description

Nearest neighbour classification for test set from training set. For each row of the test set, the nearest (by Euclidean distance) training set vector is found, and its classification used. If there is more than one nearest, a majority vote is used with ties broken at random.

Usage

`knn1(train, test, cl)`

Arguments

- `train` matrix or data frame of training set cases.
- `test` matrix or data frame of test set cases. A vector will be interpreted as a row vector for a single case.
- `cl` factor of true classification of training set.
Value

Factor of classifications of test set.

References

See Also

knn

Examples

```r
train <- rbind(iris3[1:25,,1], iris3[1:25,,2], iris3[1:25,,3])
test <- rbind(iris3[26:50,,1], iris3[26:50,,2], iris3[26:50,,3])
c1 <- factor(c(rep("s",25), rep("c",25), rep("v",25)))
knn1(train, test, c1)
```

Description

Moves examples in a codebook to better represent the training set.

Usage

```r
lvq1(x, c1, codebk, niter = 100 * nrow(codebk$x), alpha = 0.03)
```

Arguments

- `x`: a matrix or data frame of examples
- `c1`: a vector or factor of classifications for the examples
- `codebk`: a codebook
- `niter`: number of iterations
- `alpha`: constant for training

Details

Selects `niter` examples at random with replacement, and adjusts the nearest example in the codebook for each.

Value

A codebook, represented as a list with components `x` and `c1` giving the examples and classes.
References

See Also

`lvqinit`, `olvq1`, `lvq2`, `lvq3`, `lvqtest`

Examples

```r
train <- rbind(iris3[1:25,,1], iris3[1:25,,2], iris3[1:25,,3])
test <- rbind(iris3[26:50,,1], iris3[26:50,,2], iris3[26:50,,3])
c1 <- factor(c(rep("s",25), rep("c",25), rep("v",25)))
cd <- lvqinit(train, c1, 10)
.lvqtest(cd, train)
cd0 <- olvq1(train, c1, cd)
.lvqtest(cd0, train)
cd1 <- lvq1(train, c1, cd0)
.lvqtest(cd1, train)
```

Description

Moves examples in a codebook to better represent the training set.

Usage

```r
lvq2(x, cl, codebk, niter = 100 * nrow(codebk$x), alpha = 0.03,
     win = 0.3)
```

Arguments

- **x**: a matrix or data frame of examples
- **cl**: a vector or factor of classifications for the examples
- **codebk**: a codebook
- **niter**: number of iterations
- **alpha**: constant for training
- **win**: a tolerance for the closeness of the two nearest vectors.

Details

Selects `niter` examples at random with replacement, and adjusts the nearest two examples in the codebook if one is correct and the other incorrect.
lvq3

Value

A codebook, represented as a list with components x and cl giving the examples and classes.

References

See Also

lvqinit, lvq1, olvq1, lvq3, lvqtest

Examples

```r
train <- rbind(iris3[1:25,,1], iris3[1:25,,2], iris3[1:25,,3])
test <- rbind(iris3[26:50,,1], iris3[26:50,,2], iris3[26:50,,3])
cl <- factor(c(rep("s",25), rep("c",25), rep("v",25)))
cd <- lvqinit(train, cl, 10)
lvqtest(cd, train)
cd0 <- olvq1(train, cl, cd)
lvqtest(cd0, train)
cd2 <- lvq2(train, cl, cd0)
lvqtest(cd2, train)
```

Description

Moves examples in a codebook to better represent the training set.

Usage

```r
lvq3(x, cl, codebk, niter = 100*nrow(codebk$x), alpha = 0.03, win = 0.3, epsilon = 0.1)
```

Arguments

- `x`: a matrix or data frame of examples
- `cl`: a vector or factor of classifications for the examples
- `codebk`: a codebook
- `niter`: number of iterations
- `alpha`: constant for training
- `win`: a tolerance for the closeness of the two nearest vectors.
- `epsilon`: proportion of move for correct vectors

**lvq3**

*Learning Vector Quantization 3*

---

Learn more about R programming and machine learning with the R packages `scikit-learn`, `TensorFlow`, and `PyTorch`. Explore the latest research in deep learning, natural language processing, and computer vision with these tools.
Details

Selects niter examples at random with replacement, and adjusts the nearest two examples in the codebook for each.

Value

A codebook, represented as a list with components x and cl giving the examples and classes.

References

Examples

```r
train <- rbind(iris3[1:25,,1], iris3[1:25,,2], iris3[1:25,,3])
test <- rbind(iris3[26:50,,1], iris3[26:50,,2], iris3[26:50,,3])
cl <- factor(c(rep("s",25), rep("c",25), rep("v",25)))

cd <- lvqinit(train, cl, 10)
lvqtest(cd, train)
cd0 <- olvq1(train, cl, cd)
lvqtest(cd0, train)
cd3 <- lvq3(train, cl, cd0)
lvqtest(cd3, train)
```

---

### lvqinit

*Initialize a LVQ Codebook*

**Description**

Construct an initial codebook for LVQ methods.

**Usage**

`lvqinit(x, cl, size, prior, k = 5)`
Arguments

- **x**: a matrix or data frame of training examples, \( n \) by \( p \).
- **cl**: the classifications for the training examples. A vector or factor of length \( n \).
- **size**: the size of the codebook. Defaults to \( \min(\text{round}(0.4 \times n_g \times (n_g - 1 + p/2), 0), n) \) where \( n_g \) is the number of classes.
- **prior**: Probabilities to represent classes in the codebook. Default proportions in the training set.
- **k**: \( k \) used for k-NN test of correct classification. Default is 5.

Details

Selects \( size \) examples from the training set without replacement with proportions proportional to the prior or the original proportions.

Value

A codebook, represented as a list with components **x** and **cl** giving the examples and classes.

References

- lvq1, lvq2, lvq3, olvq1, lvqtest

Examples

```R
train <- rbind(iris3[1:25,,1], iris3[1:25,,2], iris3[1:25,,3])
test <- rbind(iris3[26:50,,1], iris3[26:50,,2], iris3[26:50,,3])
c1 <- factor(c(rep("s",25), rep("c",25), rep("v",25)))
cd <- lvqinit(train, cl, 10)
lvqtest(cd, train)
cd1 <- olvq1(train, cl, cd)
lvqtest(cd1, train)
```
**Description**

Classify a test set by 1-NN from a specified LVQ codebook.

**Usage**

```r
lvqtest(codebk, test)
```

**Arguments**

- `codebk`: codebook object returned by other LVQ software
- `test`: matrix of test examples

**Details**

Uses 1-NN to classify each test example against the codebook.

**Value**

Factor of classification for each row of `x`

**References**

**See Also**

- `lvqinit`, `olvq1`

**Examples**

```r
# The function is currently defined as
function(codebk, test) knn1(codebk$x, test, codebk$cl)
```
**Multiedit for k-NN Classifier**

**Description**

Multiedit for k-NN classifier

**Usage**

`multiedit(x, class, k = 1, V = 3, I = 5, trace = TRUE)`

**Arguments**

- `x` matrix of training set.
- `class` vector of classification of training set.
- `k` number of neighbours used in k-NN.
- `V` divide training set into V parts.
- `I` number of null passes before quitting.
- `trace` logical for statistics at each pass.

**Value**

Index vector of cases to be retained.

**References**

**See Also**

`condense`, `reduce.nn`

**Examples**

```r
tr <- sample(1:50, 25)
train <- rbind(iris3[tr,,1], iris3[tr,,2], iris3[tr,,3])
test <- rbind(iris3[-tr,,1], iris3[-tr,,2], iris3[-tr,,3])
c1 <- factor(c(rep(1,25),rep(2,25), rep(3,25)), labels=c("s", "c", "v"))
table(c1, knn(train, test, c1, 3))
ind1 <- multiedit(train, c1, 3)
length(ind1)
table(c1, knn(train[ind1, , drop=FALSE], test, c1[ind1], 1))
ntrain <- train[ind1,]; ncl <- c1[ind1]
```
ind2 <- condense(ntrain, ncl)
length(ind2)
table(cl, knn(ntrain[ind2, , drop=FALSE], test, ncl[ind2], 1))

olvq1

*Optimized Learning Vector Quantization 1*

**Description**

Moves examples in a codebook to better represent the training set.

**Usage**

```r
olvq1(x, cl, codebk, niter = 40 * nrow(codebk$x), alpha = 0.3)
```

**Arguments**

- `x`: a matrix or data frame of examples
- `cl`: a vector or factor of classifications for the examples
- `codebk`: a codebook
- `niter`: number of iterations
- `alpha`: constant for training

**Details**

Selects `niter` examples at random with replacement, and adjusts the nearest example in the codebook for each.

**Value**

A codebook, represented as a list with components `x` and `cl` giving the examples and classes.

**References**

**See Also**

`lvqinit`, `lvqtest`, `lvq1`, `lvq2`, `lvq3`
**reduce.nn**

Reduce training set for a k-NN classifier. Used after condense.

### Usage

```r
reduce.nn(train, ind, class)
```

### Arguments

- **train**: matrix for training set
- **ind**: Initial list of members of the training set (from condense).
- **class**: vector of classifications for test set

### Details

All the members of the training set are tried in random order. Any which when dropped do not cause any members of the training set to be wrongly classified are dropped.

### Value

Index vector of cases to be retained.

### References

### See Also

`condense`, `multiedit`
Examples

```r
train <- rbind(iris3[1:25,,1], iris3[1:25,,2], iris3[1:25,,3])
test <- rbind(iris3[26:50,,1], iris3[26:50,,2], iris3[26:50,,3])
c1 <- factor(c(rep("s",25), rep("c",25), rep("v",25)))
keep <- condense(train, c1)
knn(train[keep,], test, c1[keep])
keep2 <- reduce.nn(train, keep, c1)
knn(train[keep2,], test, c1[keep2])
```

SOM  
**Self-Organizing Maps: Online Algorithm**

Description

Kohonen’s Self-Organizing Maps are a crude form of multidimensional scaling.

Usage

```r
SOM(data, grid = somgrid(), rlen = 10000, alpha, radii, init)
```

Arguments

- **data**: a matrix or data frame of observations, scaled so that Euclidean distance is appropriate.
- **grid**: A grid for the representatives: see `somgrid`.
- **rlen**: the number of updates: used only in the defaults for alpha and radii.
- **alpha**: the amount of change: one update is done for each element of alpha. Default is to decline linearly from 0.05 to 0 over rlen updates.
- **radii**: the radii of the neighbourhood to be used for each update: must be the same length as alpha. Default is to decline linearly from 4 to 1 over rlen updates.
- **init**: the initial representatives. If missing, chosen (without replacement) randomly from data.

Details

- `alpha` and `radii` can also be lists, in which case each component is used in turn, allowing two- or more phase training.

Value

An object of class "SOM" with components

- **grid**: the grid, an object of class "somgrid".
- **codes**: a matrix of representatives.
References

See Also

somgrid, batchSOM

Examples

```r
require(graphics)
data(crabs, package = "MASS")

lcrabs <- log(crabs[, 4:8])
crabs.grp <- factor(c("B", "b", "O", "o")[rep(1:4, rep(50,4))])
gr <- somgrid(topo = "hexagonal")
crabs.som <- SOM(lcrabs, gr)
plot(crabs.som)

## 2-phase training
crabs.som2 <- SOM(lcrabs, gr,
  alpha = list(seq(0.05, 0, len = 1e4), seq(0.02, 0, len = 1e5)),
  radii = list(seq(8, 1, len = 1e4), seq(4, 1, len = 1e5)))
plot(crabs.som2)
```

somgrid  

*Plot SOM Fits*

Description

Plotting functions for SOM results.

Usage

```r
somgrid(xdim = 8, ydim = 6, topo = c("rectangular", "hexagonal"))

## S3 method for class 'somgrid'
plot(x, type = "p", ...)

## S3 method for class 'SOM'
plot(x, ...)
```
Arguments

xdim, ydim dimensions of the grid

topo the topology of the grid.

x an object inheriting from class "somgrid" or "SOM".

type, ... graphical parameters.

Details

The class "somgrid" records the coordinates of the grid to be used for (batch or on-line) SOM: this has a plot method.

The plot method for class "SOM" plots a stars plot of the representative at each grid point.

Value

For somgrid, an object of class "somgrid", a list with components

pts a two-column matrix giving locations for the grid points.

xdim, ydim, topo

as in the arguments to somgrid.
