Package ‘cld3’

July 28, 2021

Type Package
Title Google's Compact Language Detector 3
Version 1.4.2
Description Google's Compact Language Detector 3 is a neural network model for language identification and the successor of 'cld2' (available from CRAN). The algorithm is still experimental and takes a novel approach to language detection with different properties and outcomes. It can be useful to combine this with the Bayesian classifier results from 'cld2'. See <https://github.com/google/cld3#readme> for more information.
License Apache License 2.0
Encoding UTF-8
Imports Rcpp
LinkingTo Rcpp
RoxygenNote 6.0.1.9000
SystemRequirements libprotobuf and protobuf-compiler
Suggests testthat, cld2
NeedsCompilation yes

Index 3
Compact Language Detector 3

Description

The function `detect_language()` is vectorised and guesses the language of each string in text or returns NA if the language could not reliably be determined. The function `detect_language_multi()` is not vectorised and detects all languages inside the entire character vector as a whole.

Usage

```r
detect_language(text)

detect_language_mixed(text, size = 3)
```

Arguments

- `text`: a string with text to classify or a connection to read from
- `size`: number of languages to detect

Examples

```r
# Vectorized best guess
text <- c("To be or not to be?", "Ce n'est pas grave.", "Hij heeft de klok horen luiden maar weet niet waar de klepel hangt.")
detect_language(text)

# Multiple languages in one text (doesn't seem to work well)
detect_language_mixed(text)
```
