Package ‘clhs’

Type Package

Title Conditioned Latin Hypercube Sampling

Version 0.7-2

Date 2019-05-06

Maintainer Pierre Roudier <roudierp@landcareresearch.co.nz>

Description Conditioned Latin hypercube sampling, as published by Minasny and McBratney (2006) <DOI:10.1016/j.cageo.2005.12.009>. This method proposes to stratify sampling in presence of ancillary data. An extension of this method, which propose to associate a cost to each individual and take it into account during the optimisation process, is also proposed (Roudier et al., 2012, <DOI:10.1201/b12728>).

Depends R (>= 2.14.0)

Imports utils, methods, grid, ggplot2, sp, raster, reshape2, plyr, scales, cluster

License GPL (>= 2)

LazyLoad yes

Suggests knitr, rmarkdown, testthat

VignetteBuilder knitr

RoxygenNote 6.0.1

NeedsCompilation no

Description

This package implements the conditioned Latin hypercube sampling, as published by Minasny and McBratney (2006) and the DLHS variant method (Minasny and McBratney, 2010). This method proposes to stratify sampling in presence of ancillary data.

Details

An extension of this method, which propose to associate a cost to each individual and take it into account during the optimisation process, is also proposed (Roudier et al., 2012).

clhs.data.frame  Conditioned Latin Hypercube Sampling

Description

Implementation of the conditioned Latin hypercube sampling, as published by Minasny and McBratney (2006) and the DLHS variant method (Minasny and McBratney, 2010). These methods propose to stratify sampling in presence of ancillary data. An extension of this method, which propose to associate a cost to each individual and take it into account during the optimisation process, is also proposed (Roudier et al., 2012).

Usage

## S3 method for class 'data.frame'
c lhs(x, size, include = NULL, cost = NULL,
   iter = 10000, temp = 1, tdecrease = 0.95, weights = list(numeric = 1,
   factor = 1, correlation = 1), eta = 1, obj.limit = -Inf,
   length.cycle = 10, simple = TRUE, progress = TRUE, track = NULL)

## S3 method for class 'Raster'
c lhs(x, ...)

c lhs(x, size, include, cost, iter, temp, tdecrease, weights, eta, obj.limit,
   length.cycle, simple, progress, track)

## S3 method for class 'SpatialPointsDataFrame'
c lhs(x, ...)

Arguments

x  A data.frame, SpatialPointsDataFrame or Raster object.
size  A non-negative integer giving the total number of items to select
include  A numeric vector giving the indices of the rows from \( x \) that must be included in the selected items. For the cost-constrained cLHS method, cost of these mandatory samples is set to 0. If NULL (default), all data are randomly chosen according to the classic cLHS method. If include is not NULL, argument size must include the total size of the final sample i.e. the size of mandatory samples given by include plus the size of the randomly chosen samples to pick.

cost  A character giving the name or an integer giving the index of the attribute in \( x \) that gives a cost that can be use to constrain the cLHS sampling. If NULL (default), the cost-constrained implementation is not used.

iter  A positive number, giving the number of iterations for the Metropolis-Hastings annealing process. Defaults to 10000.

temp  The initial temperature at which the simulated annealing begins. Defaults to 1.

tdecrease  A number between 0 and 1, giving the rate at which temperature decreases in the simulated annealing process. Defaults to 0.95.

weights  A list a length 3, giving the relative weights for continuous data, categorical data, and correlation between variables. Defaults to list(numeric = 1, factor = 1, correlation = 1).

eta  Either a number equal 1 to perform a classic cLHS or a constrained cLHS or a matrix to perform a cLHS that samples more on the edge of the distributions (DLHS, see details)

obj.limit  The minimal value at which the optimisation is stopped. Defaults to -Inf.

length.cycle  The duration (number of iterations) of the isothermal steps. Defaults to 10.

simple  TRUE or FALSE. If set to TRUE, only the indices of the selected samples are returned, as a numeric vector. If set to FALSE, a cLHS_result object is returned (takes more memory but allows to make use of cLHS_results methods such as plot.cLHS_result).

progress  TRUE or FALSE, displays a progress bar.

track  A character giving the name or an integer giving the index of the attribute in \( x \) that gives a cost associated with each individual. However, this method will only track the cost - the sampling process will not be constrained by this attribute. If NULL (default), this option is not used.

...  additional parameters passed to clhs

Details

For the DLHS method, the original paper defines parameter \( b \) as the importance of the edge of the distributions. A matrix \( \eta \) (size \( N \times K \), where \( N \) is the size of the final sample and \( K \) the number of continuous variables) is defined, to compute the objective function of the algorithm, where each column equal the vector \((b, 1, ..., 1, b)\) in order to give the edge of the distribution a probability \( b \) times higher to be sampled. In our function, instead of define the \( b \) parameter, users can defined their own \( \eta \) matrix so that they can give more complex probabilty design of sampling each strata of the distribution instead of just be able to give more importance to both edges of the distribution.

Value

* If the simple option is set to TRUE (default behaviour): A numeric vector containing the indices of the selected samples is returned
If the simple option is set to FALSE: An object of class clhs_result, with the following elements:

- `index_samples`: a vector giving the indices of the chosen samples.
- `sampled_data`: the sampled data.frame.
- `obj`: a vector giving the evolution of the objective function throughout the Metropolis-Hastings iterations.
- `cost`: a vector giving the evolution of the cost function throughout the Metropolis-Hastings iterations (if available).

**Examples**

```r
df <- data.frame(
  a = runif(1000),
  b = rnorm(1000),
  c = sample(LETTERS[1:5], size = 1000, replace = TRUE)
)

# Returning the indices of the sampled points
res <- clhs(df, size = 50, iter = 100, progress = FALSE, simple = TRUE)
str(res)

# Returning a clhs_result object for plotting
res <- clhs(df, size = 50, iter = 100, progress = FALSE, simple = FALSE)
str(res)
```
plot(res)

# Method DLHS with a linear increase of the strata weight (i.e. probability to be sampled)
# from 1 for the middle starta to 3 for the edge of the distribution
linear_increase <- 1+(2/24)*0:24
eta <- matrix(c(rev(linear_increase), linear_increase), ncol = 2, nrow = 50)
res <- clhs(df, size = 50, iter = 100, eta = eta, progress = FALSE, simple = FALSE)
str(res)
plot(res)

cLHS_result

**Conditioned Latin Hypercube Sampling result**

**Description**

A S3 class describing a cLHS result.

**Value**

An object of class `cLHS_result` contains the following slots:

- `index_samples` a vector giving the indices of the chosen samples.
- `sampled_data` the sampled data.frame.
- `obj` a vector giving the evolution of the objective function throughout the Meropolis-Hastings iterations.
- `cost` a vector giving the evolution of the cost function throughout the Meropolis-Hastings iterations, if available, otherwise NULL.

clhs
**plot.cLHS_result**

**Plot cLHS results**

**Description**

Produces a plot illustrating the result of a cLHS sampling procedure.

**Usage**

```r
## S3 method for class 'cLHS_result'
plot(x, modes = "obj", ...)
```

**Arguments**

- `x`: Object of class "cLHS_result".
- `modes`: A character vector describing the plot to produce (see Details).
- `...`: Other ggplot2 plotting parameters.

**Details**

The subplots to be included in the final illustration are controlled by the `modes` option:
- "obj" adds the evolution of the objective function over the iterations
- "cost" adds the evolution of the cost function over the iterations (if available in `x`)
- "hist" adds the comparison of the distributions of each variables in both the original object and the sampled result using histogram plots (for continuous variables).
- "dens" adds the comparison of the distributions of each variables in both the original object and the sampled result using density plots (for continuous variables).
- "box" adds the comparison of the distributions of each variables in both the original object and the sampled result using boxplots (for continuous variables).

**Author(s)**

Pierre Roudier

**See Also**

- `clhs`

**Examples**

```r
df <- data.frame(
  a = runif(1000),
  b = rnorm(1000),
  c = sample(LETTERS[1:5], size = 1000, replace = TRUE)
)

res <- clhs(df, size = 50, iter = 2000, progress = FALSE, simple = FALSE)
```
You can plot only the objective function
plot(res, mode = "obj")

# Or you can compare the distribution in the original object
# and in the sampled result
plot(res, mode = c("obj", "box"))

---

**similarity_buffer**  
*Gower similarity analysis*

**Description**

Calculates Gower's similarity index for every pixel within an given radius buffer of each sampling point.

**Usage**

```
similarity_buffer(covs, pts, buffer, fac = NA, metric = "gower", stand = FALSE, ...)
```

**Arguments**

- `covs`: raster stack of environmental covariates
- `pts`: sampling points, object of class SpatialPointsDataFrame
- `buffer`: Radius of the disk around each point that similarity will be calculated
- `fac`: numeric, can be > 1, (e.g., fac = c(2,3)). Raster layer(s) which are categorical variables. Set to NA if no factor is present
- `metric`: character string specifying the similarity metric to be used. The currently available options are "euclidean", "manhattan" and "gower" (the default). See daisy from the cluster package for more details
- `stand`: logical flag: if TRUE, then the measurements in x are standardized before calculating the dissimilarities.
- `...`: passed to plyr::alply

**Value**

a RasterStack
