Package ‘cusumcharter’

October 12, 2022

Title Easier CUSUM Control Charts
Version 0.1.0
Description Create CUSUM (cumulative sum) statistics from a vector or dataframe.
Also create single or faceted CUSUM control charts, with or without control limits.
Accepts vector, dataframe, tibble or data.table inputs.
License GPL (>= 3)
Encoding UTF-8
RoxygenNote 7.1.2
Suggests covr, dplyr, knitr, rmarkdown, testthat (>= 3.0.0), tibble
Config/testthat/edition 3
URL https://github.com/johnmackintosh/cusumcharter,
https://johnmackintosh.github.io/cusumcharter/
BugReports https://github.com/johnmackintosh/cusumcharter/issues
Imports rlang, ggplot2, data.table
VignetteBuilder knitr
NeedsCompilation no

cusum_control

Description

cusum_control

Usage

cusum_control(
  x,
  target = NULL,
  std_dev = NULL,
  desired_shift = 1,
  k = 0.5,
  h = 4
)

Arguments

x         input vector

  target   target value for comparison, the mean of x will be used if missing

  std_dev  Defaults to the screened moving range of x. A known or desired value for standard deviation can be supplied instead.

  desired_shift how many standard deviations do you want to detect? This value is typically between 0.5 to 1. Defaults to 1.

  k         allowable slack - defaults to half the standard deviation multiplied by desired shift

  h         action limits - usually between 4 and 5, defaults to 4. The standard deviation is multiplied by this value to determine the upper and lower limits on the chart

Value

data.frame showing original inputs and calculated control limits

Examples

test_vec3 <- c(1,1,2,3,5,7,11,7,5,7,8,9,5)
controls <- cusum_control(test_vec3, target = 4)
Description

cusum_control_median

Usage

cusum_control_median(
  x,
  target = NULL,
  std_dev = NULL,
  desired_shift = 1,
  k = 0.5,
  h = 4
)

Arguments

  x  input vector
  target  target value for comparison, the median of x will be used if missing
  std_dev  Defaults to the screened moving range of x. A known or desired value for standard deviation can be supplied instead.
  desired_shift  how many standard deviations do you want to detect? This value is typically between 0.5 to 1. Defaults to 1.
  k  allowable slack - defaults to half the standard deviation multiplied by desired shift
  h  action limits - usually between 4 and 5, defaults to 4. The standard deviation is multiplied by this value to determine the upper and lower limits on the chart

Value

data.frame showing original inputs and calculated control limits

Examples

test_vec3 <- c(1,1,2,3,5,7,11,7,5,7,8,9,5)
controls <- cusum_control_median(test_vec3, target = 4)
controls_median <- cusum_control_median(test_vec3)
Description

cusum_control_plot

Usage

cusum_control_plot(
  df,
  xvar,
  show_below = FALSE,
  pos_col = "#385581",
  centre_col = "black",
  neg_col = "#6dbac6",
  highlight_col = "#c9052c",
  facet_var = NULL,
  facet_scales = "free_y",
  scale_type = NULL,
  datebreaks = NULL,
  title_text = NULL,
  ...
)

Arguments

df input data frame generated by cusum_control function
xvar the variable on the x axis, typically an observation number or date/time
show_below whether to highlight points below the LCL, default is FALSE
pos_col line and point colour for positive values
centre_col line colour for centre line
neg_col line and point colour for negative values
highlight_col point colour for values outside UCL and (optionally) LCL
facet_var the grouping variable to facet the charts by. If not supplied a non-faceted plot is generated
facet_scales defaults to "free_y", but any of the usual ggplot2 facet values can be supplied e.g. "fixed" or "free_x"
scale_type if you need a date or datetime scale, specify either "date" or "datetime" here. Otherwise, leave as NULL and ggplot2 will pick an appropriate scale for you
datebreaks a character string specifying the breaks as text e.g. "2 days" or "3 weeks". See ggplot2 date_breaks for further details
title_text optional title for chart
... further arguments passed on to ggplot2
Value

ggplot2 object suited for further amendments if required.

Examples

test_vec3 <- c(1,1,2,3,5,7,11,7,5,7,8,9,5)
controls <- cusum_control(test_vec3, target = 4)
cusum_control_plot(controls, xvar = obs)

description
cusum_single

Usage

cusum_single(x, target = NULL)

Arguments

x a numeric vector from which to calculate the cumulative sum statistics

target value to compare each element of x to. If not provided, the mean of x will be calculated and used as a target value

Value

a vector of the cumulative sum statistic, centred on the target value

Examples

test_vec <- c(0.175, 0.152, 0.15, 0.207, 0.136, 0.212, 0.166)
cusum_single(test_vec)
cusum_single_df
cusum_single_df

Description
cusum_single_df

Usage
cusum_single_df(x, target = NULL)

Arguments
- x: a numeric vector from which to calculate the cumulative sum statistics
- target: value to compare each element of x to. If not provided, the mean of x will be calculated and used as a target value

Value
a dataframe with the original values, target, the variance, the cumulative sum of the variance, and the cumulative sum centered on the target value. This centering is achieved by adding the target value to the cumulative sum.

Examples

```r
test_vec <- c(0.175, 0.152, 0.15, 0.207, 0.136, 0.212, 0.166)
cusum_single_df(test_vec, target = 0.16)
```

cusum_single_median
cusum_single_median

Description
cusum_single_median

Usage
cusum_single_median(x, target = NULL)

Arguments
- x: a numeric vector from which to calculate the cumulative sum statistics
- target: value to compare each element of x to. If not provided, the median value of x will be calculated and used as a target value
**Value**

A vector of the cumulative sum statistic, centered on the target value.

**Examples**

```r
test_vec <- c(0.175, 0.152, 0.15, 0.207, 0.136, 0.212, 0.166)
cusum_single_median(test_vec)
```

**Description**

**Usage**

```r
cusum_single_median_df(x, target = NULL)
```

**Arguments**

- `x`: A numeric vector from which to calculate the cumulative sum statistics.
- `target`: Value to compare each element of `x` to. If not provided, the median value of `x` will be calculated and used as a target value.

**Value**

A dataframe with the original values, target, the variance, the cumulative sum of the variance, and the cumulative sum centered on the target value. This centering is achieved by adding the target value to the cumulative sum.

**Examples**

```r
test_vec <- c(0.175, 0.152, 0.15, 0.207, 0.136, 0.212, 0.166)
cusum_single_median_df(test_vec, target = 0.16)
cusum_single_median_df(test_vec)
```
