Package ‘deeptime’

January 11, 2022

Title  Plotting Tools for Anyone Working in Deep Time
Version  0.2.1
Maintainer  William Gearty <willgearty@gmail.com>
Description  Extends the functionality of other plotting packages like ‘ggplot2’ and ‘lattice’ to help facilitate the plotting of data over long time intervals, including, but not limited to, geological, evolutionary, and ecological data. The primary goal of ‘deeptime’ is to enable users to add highly customizable timescales to their visualizations. Other functions are also included to assist with other areas of deep time visualization.

Description

coord_geo behaves similarly to coord_trans in that it occurs after statistical transformation and will affect the visual appearance of geoms. The main difference is that it also adds a geological timescale to the specified side of the plot.

Usage

coord_geo(
  pos = "bottom",
  dat = "periods",
  xlim = NULL,
  ylim = NULL,
  xtrans = identity_trans(),
  ytrans = identity_trans(),
  clip = "on",
  expand = FALSE,
  fill = NULL,
  color = "black",
  alpha = 1,
  height = unit(2, "line"),
  lab = TRUE,
  rot = 0,
  abbrv = TRUE,
  skip = c("Quaternary", "Holocene", "Late Pleistocene"),
coord_geo

size = 5,
lwd = 0.25,
neg = FALSE,
bord = c("left", "right", "top", "bottom"),
center_end_labels = FALSE,
dat_is_discrete = FALSE,
fittext_args = list()
)

Arguments

pos Which side to add the scale to (left, right, top, or bottom). First letter may also be used.

dat Either A) a string indicating a built-in dataframe with interval data from the ICS ("periods", "epochs", "stages", "cons", or "eras"), B) a string indicating a timescale from macrostrat (see list here: https://macrostrat.org/api/defs/timescales?all), or C) a custom data.frame of time interval boundaries (see Details).
xlim, ylim Limits for the x and y axes.
xtrans, ytrans Transformers for the x and y axes. For more information see coord_trans.
clip Should drawing be clipped to the extent of the plot panel? For more information see coord_trans.
expand If ‘FALSE’, the default, limits are taken exactly from the data or ‘xlim’/’ylim’. If ‘TRUE’, adds a small expansion factor to the limits to ensure that data and axes don’t overlap.
fill The fill color of the boxes. The default is to use the colors included in dat. If a custom dataset is provided with dat without color and without fill, a greyscale will be used. Custom fill colors can be provided with this option and will be recycled if/as necessary.

color The outline color of the interval boxes.
alpha The transparency of the fill colors.
height The height (or width if pos is left or right) of the scale.
lab Whether to include labels.
rot The amount of counter-clockwise rotation to add to the labels (in degrees).
abbrv If including labels, whether to use abbreviations instead of full interval names.
skip A vector of interval names indicating which intervals should not be labeled. If abbrv is TRUE, this can also include interval abbreviations.
size Label size. Either a number as you would specify in geom_text or "auto" to use geom_fit_text.
lwd Line width.
neg Set this to true if your x-axis is using negative values.
bord A vector specifying on which sides of the scale to add borders (same options as pos).
center_end_labels
Should labels be centered within the visible range of intervals at the ends of the axis?

dat_is_discrete
Are the ages in dat already converted for a discrete scale?

fittext_args
A list of named arguments to provide to `geom_fit_text`. Only used if size is set to "auto".

Details
Transforming the side with the scale is not currently implemented. If a custom data.frame is provided (with dat), it should consist of at least 3 columns of data. See `data(periods)` for an example.

- The `name` column lists the names of each time interval. These will be used as labels if no abbreviations are provided.
- The `max_age` column lists the oldest boundary of each time interval.
- The `min_age` column lists the youngest boundary of each time interval.
- The `abbr` column is optional and lists abbreviations that may be used as labels.
- The `color` column is also optional and lists a hex color code (which can be obtained with `rgb()`) for each time interval.

If the axis of the time scale is discrete, `max_age` and `min_age` will automatically be converted to the discrete scale. In this case, the categories of the discrete axis should match the values in the `name` column. If the ages within `dat` are already discretized, you can set `dat_is_discrete` to `TRUE` to prevent this automatic conversion. This can be useful for adding a time scale where categories and time intervals are not 1:1.

`pos` may also be a list of sides (including duplicates) if multiple time scales should be added to the plot. In this case, `dat`, `fill`, `color`, `alpha`, `height`, `lab`, `rot`, `abbrv`, `skip`, `size`, `lwd`, `neg`, `bord`, `center_end_labels`, and `dat_is_discrete` can also be lists. If these lists are not as long as `pos`, the elements will be recycled. If individual values are used for these parameters, they will be applied to all time scales.

Examples

```r
library(ggplot2)
#single scale on bottom
ggplot() +
  geom_point(aes(y = runif(1000, 0, 8), x = runif(1000, 0, 1000))) +
  scale_x_reverse() +
  coord_geo(xlim = c(1000, 0), ylim = c(0,8)) +
  theme_classic()

#stack multiple scales
ggplot() +
  geom_point(aes(y = runif(1000, 0, 8), x = runif(1000, 0, 1000))) +
  scale_x_reverse() +
  coord_geo(xlim = c(100, 0), ylim = c(0,8), pos = as.list(rep("bottom", 3)),
            dat = list("stages", "epochs", "periods"),
            height = list(unit(4, "lines"), unit(4, "lines"), unit(2, "line")),
```
coord_trans_flip

```
rot = list(90, 90, 0), size = list(2.5, 2.5, 5), abbrv = FALSE) +
theme_classic()
```

**Description**

coord_trans_flip behaves similarly to coord_trans in that it occurs after statistical transformation and will affect the visual appearance of geoms. The main difference is that it also flips the x and y coordinates like coord_flip.

**Usage**

```
coord_trans_flip(
  x = "identity",
  y = "identity",
  xlim = NULL,
  ylim = NULL,
  clip = "on",
  expand = TRUE
)
```

**Arguments**

- **x**: Transformers for x and y axes or their names.
- **y**: Transformers for x and y axes or their names.
- **xlim**: Limits for the x and y axes.
- **ylim**: Limits for the x and y axes.
- **clip**: Should drawing be clipped to the extent of the plot panel? A setting of "on" (the default) means yes, and a setting of "off" means no. In most cases, the default of "on" should not be changed, as setting clip = "off" can cause unexpected results. It allows drawing of data points anywhere on the plot, including in the axes, the legend, the plot title, or the plot margins. If limits are set via xlim and ylim and some data points fall outside those limits, then those data points may show up in places such as the axes.
- **expand**: If TRUE, the default, adds a small expansion factor to the limits to ensure that data and axes don’t overlap. If FALSE, limits are taken exactly from the data or xlim/ylim.

**Examples**

```
library(ggplot2)
ggplot(mtcars, aes(disp, wt)) +
  geom_point() +
  coord_trans_flip(x = "log10", y = "log10")
```
Description

coord_trans_xy behaves similarly to coord_trans in that it occurs after statistical transformation and will affect the visual appearance of geoms. The main difference is that it takes a single transformer that is applied to the x and y axes simultaneously. Any transformers produced by linear_trans that have x and y arguments should work, but any other transformers produced using trans_new that take x and y arguments should also work. Axis limits will be adjusted to account for transformation unless limits are specified with ‘xlim’ or ‘ylim’. This only works with geoms where all points are defined with x and y coordinates (e.g. geom_point, geom_polygon). This does not currently work with geoms where point coordinates are extrapolated (e.g. geom_rect).

Usage

coord_trans_xy(
  trans = NULL,
  xlim = NULL,
  ylim = NULL,
  expand = TRUE,
  default = FALSE,
  clip = "on"
)

Arguments

trans Transformer for x and y axes.
xlim, ylim Limits for the x and y axes.
expand If ‘TRUE’, the default, adds a small expansion factor to the limits to ensure that data and axes don’t overlap. If ‘FALSE’, limits are taken exactly from the data or ‘xlim’/’ylim’.
default Is this the default coordinate system? If ‘FALSE’ (the default), then replacing this coordinate system with another one creates a message alerting the user that the coordinate system is being replaced. If ‘TRUE’, that warning is suppressed.
clip Should drawing be clipped to the extent of the plot panel? A setting of “on” (the default) means yes, and a setting of “off” means no. In most cases, the default of “on” should not be changed, as setting ‘clip = ”off”‘ can cause unexpected results. It allows drawing of data points anywhere on the plot, including in the plot margins. If limits are set via ‘xlim’ and ‘ylim’ and some data points fall outside those limits, then those data points may show up in places such as the axes, the legend, the plot title, or the plot margins.
Examples

```r
#make transformer
library(ggforce)
trans <- linear_trans(shear(2, 0), rotate(-pi / 3))

#set up data to be plotted
square <- data.frame(x = c(0, 0, 4, 4), y = c(0, 1, 1, 0))
points <- data.frame(x = runif(100, 0, 4), y = runif(100, 0, 1))

#plot data normally
library(ggplot2)
ggplot(data = points, aes(x = x, y = y)) +
  geom_polygon(data = square, fill = NA, color = "black") +
  geom_point(color = "black") +
  coord_cartesian(expand = FALSE) +
  theme_classic()

#plot data with transformation
ggplot(data = points, aes(x = x, y = y)) +
  geom_polygon(data = square, fill = NA, color = "black") +
  geom_point(color = "black") +
  coord_trans_xy(trans = trans, expand = FALSE) +
  theme_classic()
```

disparity_through_time

*Disparity through time plot using lattice*

Description

Plots points on 2-D surfaces within a 3-D framework. See `wireframe` and `panel.cloud` for customization options.

Usage

```r
disparity_through_time(
  x,
  data,
  groups,
  pch = 16,
  col.point = c("blue"),
  scales = list(arrows = FALSE, distance = 1, col = "black", z = list(rot = 90)),
  colorkey = FALSE,
  screen = list(z = 90, x = 70, y = 180),
  aspect = c(1.5, 4),
  drape = TRUE,
  col.regions = c("white"),
  alpha.regions = c(1),
```
disparity_through_time

disparity_through_time

perspective = FALSE,
R.mat = matrix(c(1, 1, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 4, 4),
par.settings = list(axis.line = list(col = "transparent"), layout.heights =
list(top.padding = 0, main.key.padding = 0, key.axis.padding = 0, axis.xlab.padding =
0, xlab.key.padding = 0, key.sub.padding = 0, bottom.padding = 0), layout.widths =
list(left.padding = 0, key.ylab.padding = 0, ylab.axis.padding = 0, axis.key.padding
= 0, right.padding = 0)),
lattice.options = list(axis.padding = list(factor = 0)),
... }

Arguments

x a formula (most likely of the form z ~ x * y)
data a data frame in which variables in the formula are to be evaluated
groups a variable in data to be used as a grouping variable (this is probably the z vari-
able)
pch the point type
col.point color(s) for points on surfaces
scales a list specifying how the axes are drawn (see xyplot for details)
colorkey logical, should a legend be drawn (or a list describing the legend; see levelplot
for details)
screen a list of the rotations that should be applied to each axis
aspect a numeric vector of length 2, giving the relative aspects of the y-size/x-size and
z-size/x-size of the enclosing cube
drape logical, whether the surfaces should be colored based on col.regions and
alpha.regions
col.regions color(s) for surfaces
alpha.regions alpha value(s) for surfaces
perspective logical, whether to plot a perspective view
R.mat a transformational matrix that is applied to the orientation of the axes
par.settings plotting settings (see trellis.par.set)
lattice.options lattice settings (see lattice.options)
... Other arguments passed to wireframe

Value

An object of class "trellis", as output by wireframe.
Examples

g <- data.frame(x = runif(100, 0, 60), y = runif(100,0,10),
                 z = factor(rep(periods$name[1:5], each=20),
                            levels = periods$name[1:5])

disparity_through_time(z~x*y, data = g, groups = z, aspect = c(1.5,2),
                        xlim = c(0,60), ylim = c(0,10),
                        col.regions = "lightgreen",
                        col.point = c("red","blue"))

---

eons  Eon data from the International Commission on Stratigraphy
       (v2021/05)

Description

A dataset containing the boundary ages, abbreviations, and colors for the eons of the Geologic Time Scale. Based on The ICS International Chronostratigraphic Chart (v2021/05), by Cohen, Finney, Gibbard, and Fan.

Usage

eons

Format

A data frame with 3 rows and 5 variables:

- **name**: eon name
- **max_age**: maximum age, in millions of years
- **min_age**: minimum age, in millions of years
- **abbr**: eon name abbreviations
- **color**: the colors for each eon, according to the Commission for the Geological Map of the World

Source

### epochs

**Epoch data from the International Commission on Stratigraphy (v2021/05)**

| Description | A dataset containing the boundary ages, abbreviations, and colors for the epochs of the Geologic Time Scale. Based on The ICS International Chronostratigraphic Chart (v2021/05), by Cohen, Finney, Gibbard, and Fan. |
| Usage | epochs |
| Format | A data frame with 34 rows and 5 variables: |
| | **name** epoch name |
| | **max_age** maximum age, in millions of years |
| | **min_age** minimum age, in millions of years |
| | **abbr** epoch name abbreviations |
| | **color** the colors for each epoch, according to the Commission for the Geological Map of the World |

### eras

**Era data from the International Commission on Stratigraphy (v2021/05)**

| Description | A dataset containing the boundary ages, abbreviations, and colors for the eras of the Geologic Time Scale. Based on The ICS International Chronostratigraphic Chart (v2021/05), by Cohen, Finney, Gibbard, and Fan. |
| Usage | eras |

**getScaleData**

**Format**

A data frame with 10 rows and 5 variables:

- **name**: era name
- **max_age**: maximum age, in millions of years
- **min_age**: minimum age, in millions of years
- **abbr**: era name abbreviations
- **color**: the colors for each era, according to the Commission for the Geological Map of the World

**Source**

---

**getScaleData**  
*Get geological timescale data*

**Description**

This function takes a name of a geological timescale and returns data for the timescale.

**Usage**

getScaleData(name)

**Arguments**

- **name**: The name of the desired timescale.

**Details**

Valid names include those of built-in dataframes ("periods", "epochs", "stages", "eons", or "eras") and those hosted by macrostrat (see list here: https://macrostrat.org/api/defs/timescales?all).

**Value**

A dataframe with the following columns:

- **name**: the names of the time intervals.
- **max_age**: the oldest boundaries of the time intervals, in millions of years.
- **min_age**: the youngest boundaries of the time intervals, in millions of years.
- **abbr**: either traditional abbreviations of the names of the time intervals (if they exist) or custom abbreviations created with R.
- **color**: hex color codes associated with the time intervals (if applicable).
Description

Arrange multiple ggplot, grobified ggplot, or geo_scale objects on a page, aligning the plot panels, axes, and axis titles.

Usage

```r
ggarrange2(
  ..., 
  plots = list(...),
  layout = NULL,
  nrow = NULL,
  ncol = NULL,
  widths = NULL,
  heights = NULL,
  byrow = TRUE,
  top = NULL,
  bottom = NULL,
  left = NULL,
  right = NULL,
  padding = unit(0.5, "line"),
  margin = unit(0.5, "line"),
  clip = "on",
  draw = TRUE,
  newpage = TRUE,
  debug = FALSE,
  labels = NULL,
  label.args = list(gp = gpar(font = 4, cex = 1.2))
)
```

Arguments

- `...`: ggplot, grobified ggplot (gtable), or geo_scale objects
- `plots`: list of ggplot, gtable, or geo_scale objects
- `layout`: a matrix of integers specifying where each plot should go, like `mat` in `layout`:
  - `NA` or a value less than 0 or greater than the number of plots indicates a blank plot; overrides `nrow/ncol/byrow`
- `nrow`: number of rows
- `ncol`: number of columns
- `widths`: list of requested widths
- `heights`: list of requested heights
- `byrow`: logical, fill by rows
Add a geologic scale to ggplots

Description

This function takes a ggplot object and adds a geologic time scale at the specified side.
gggeo_scale

Usage

gggeo_scale(obj, ...)

## S3 method for class 'gtable'

gggeo_scale(
  obj,
  lims,
  dat = "periods",
  fill = NULL,
  color = "black",
  alpha = 1,
  height = unit(2, "line"),
  pos = "bottom",
  lab = TRUE,
  rot = 0,
  abbrv = TRUE,
  skip = c("Quaternary", "Holocene", "Late Pleistocene"),
  size = 5,
  lwd = 0.25,
  margin = unit(0, "line"),
  neg = FALSE,
  bord = c("left", "right", "top", "bottom"),
  center_end_labels = FALSE,
  ...
)

## S3 method for class 'ggplot'

gggeo_scale(
  obj,
  dat = "periods",
  fill = NULL,
  color = "black",
  alpha = 1,
  height = unit(2, "line"),
  pos = "bottom",
  lab = TRUE,
  rot = 0,
  abbrv = TRUE,
  skip = c("Quaternary", "Holocene", "Late Pleistocene"),
  size = 5,
  lwd = 0.25,
  margin = unit(0, "line"),
  neg = FALSE,
  bord = c("left", "right", "top", "bottom"),
  center_end_labels = FALSE,
  ...
)
## S3 method for class 'geo_scale'

gggeo_scale(
    obj,
    dat = "periods",
    fill = NULL,
    color = "black",
    alpha = 1,
    height = unit(2, "line"),
    pos = "bottom",
    lab = TRUE,
    rot = 0,
    abbrv = TRUE,
    skip = c("Quaternary", "Holocene", "Late Pleistocene"),
    size = 5,
    lwd = 0.25,
    margin = unit(0, "line"),
    neg = FALSE,
    bord = c("left", "right", "top", "bottom"),
    center_end_labels = FALSE,
    ...
)

## S3 method for class 'geo_scale'

print(x, ...)

### Arguments

- **obj**: An object of class ggplot, gtable, or geo_scale (as produced by this function).
- **...**: further arguments passed to `grid.draw`.
- **lims**: The limits of the axis of the desired side of the plot. Only required if using a gtable object not created by this function.
- **dat**: Either A) a string indicating a built-in dataframe with interval data from the ICS ("periods", "epochs", "stages", "eons", or "eras"), B) a string indicating a timescale from macrostrat (see list here: https://macrostrat.org/api/defs/timescales?all), or C) a custom dataframe of time interval boundaries (see Details).
- **fill**: The fill color of the boxes. The default is to use the colors included in dat. If a custom dataset is provided with dat without color and without fill, a greyscale will be used. Custom fill colors can be provided with this option and will be recycled if/as necessary.
- **color**: The outline color of the interval boxes.
- **alpha**: The transparency of the fill colors.
- **height**: The height (or width if pos is left or right) of the scale.
- **pos**: Which side to add the scale to (left, right, top, or bottom). First letter may also be used.
lab
Whether to include labels.

rot
The amount of counter-clockwise rotation to add to the labels (in degrees).

abbrv
If including labels, whether to use abbreviations instead of full interval names.

skip
A vector of interval names indicating which intervals should not be labeled.

size
Label size.

lwd
Line width.

margin
The width of the margin around the returned object (can be a vector of length 4).

neg
Set this to true if your x-axis is using negative values.

bord
A vector specifying on which sides of the scale to add borders (same options as pos).

center_end_labels
Should labels be centered within the visible range of intervals at the ends of the axis?

x
An object of class geo_scale.

Details
If custom data is provided (with dat), it should consist of at least 3 columns of data. See data(periods) for an example. The name column lists the names of each time interval. These will be used as labels if no abbreviations are provided. The max_age column lists the oldest boundary of each time interval. The min_age column lists the youngest boundary of each time interval. The abbr column is optional and lists abbreviations that may be used as labels. The color column is also optional and lists a hex color code (which can be obtained with rgb()) for each time interval.

Value
A geo_scale object. Basically a gtable object but with the axis limits included.

Examples
library(ggplot2)
# bottom scale by default
p <- ggplot() +
  geom_point(aes(y = runif(1000, 0, 8), x = runif(1000, 0, 1000))) +
  scale_x_reverse() +
  coord_cartesian(xlim = c(1000, 0), ylim = c(0, 8), expand = FALSE) +
  theme_classic()
  gggeo_scale(p)

# can specify any side of the plot
p <- ggplot() +
  geom_point(aes(x = runif(1000, 0, 8), y = runif(1000, 0, 1000))) +
  scale_y_reverse() +
  coord_cartesian(xlim = c(0, 8), ylim = c(1000, 0), expand = FALSE) +
  theme_classic()
  gggeo_scale(p, pos = "left", rot = 90)
# can add multiple scales
p <- ggplot() +
  geom_point(aes(y = runif(1000, 0, 8), x = runif(1000, 0, 100))) +
  scale_x_reverse() +
  coord_cartesian(xlim = c(100, 0), ylim = c(0, 8), expand = FALSE) +
  theme_classic()
p <- gggeo_scale(p, abbrv = FALSE)
p <- gggeo_scale(p, dat = "epochs", height = unit(4, "lines"), rot = 90, size = 2.5, abbrv = FALSE)
gggeo_scale(p, dat = "stages", height = unit(4, "lines"), rot = 90, size = 2.5, abbrv = FALSE)

# intervals on both sides for different timescales (ICS stages vs North American Land Mammal Ages)
p <- ggplot() +
  geom_point(aes(x = runif(1000, 0, 10), y = runif(1000, 0, 65))) +
  scale_y_reverse() +
  coord_cartesian(xlim = c(0, 10), ylim = c(65, 0), expand = FALSE) +
  theme_classic()
p <- gggeo_scale(p, dat = "stages", pos = "left", height = unit(4, "lines"), size = 2.5, abbrv = FALSE)
gggeo_scale(p, dat = "North American Land Mammal Ages", pos = "right", height = unit(4, "lines"), size = 2.5, abbrv = FALSE)

# can add scales to a faceted plot
# use gggeo_scale_old() if you have more than one column
df <- data.frame(x = runif(1000, 0, 541), y = runif(1000, 0, 8),
  z = sample(c(1, 2, 3, 4), 1000, TRUE))
p <- ggplot(df) +
  geom_point(aes(x, y)) +
  scale_x_reverse() +
  coord_cartesian(xlim = c(541, 0), ylim = c(0, 8), expand = FALSE) +
  theme_classic() +
  facet_wrap(~z, ncol = 1)
gggeo_scale(p)

# can even add a scale to a phylogeny (using ggtree)
library(phytools)
library(ggtree)
tree <- pbtree(b = .03, d = .01, n=100)
p <- ggtree(tree) +
  coord_cartesian(xlim = c(-500, 0), ylim = c(-2, Ntip(tree)), expand = FALSE) +
  scale_x_continuous(breaks=seq(-500, 0, 100), labels=abs(seq(-500, 0, 100))) +
  theme_tree2()
p <- revts(p)
gggeo_scale(p, neg = TRUE)

---

**gggeo_scale_old**  
Add a geologic scale to ggplots (old version)

**Description**

This function takes a ggplot object and adds a geologic time scale at the specified side.
Usage

gggeo_scale_old(
  gg,
  dat = "periods",
  fill = NULL,
  color = "black",
  alpha = 1,
  height = 0.05,
  gap = 0,
  pos = "bottom",
  lab = TRUE,
  rot = 0,
  abbrv = TRUE,
  skip = c("Quaternary", "Holocene", "Late Pleistocene"),
  size = 5,
  neg = FALSE
)

Arguments

- **gg**  
The ggplot object.

- **dat**  
  Either A) a string indicating a built-in dataframe with interval data from the ICS ("periods", "epochs", "stages", "cons", or "eras"), B) a string indicating a timescale from macrostrat (see list here: https://macrostrat.org/api/defs/timescales?all), or C) a custom dataframe of time interval boundaries (see Details).

- **fill**  
The fill color of the boxes. The default is to use the colors included in dat. If a custom dataset is provided with dat without color and without fill, a greyscale will be used. Custom fill colors can be provided with this option and will be recycled if/as necessary.

- **color**  
The outline color of the interval boxes.

- **alpha**  
The transparency of the fill colors.

- **height**  
The proportional height (or width if pos is left or right) of the entire plot to use for the scale.

- **gap**  
The proportional height (or width) of the entire plot to use as a gap between the axis and the scale.

- **pos**  
Which side to add the scale to (left, right, top, or bottom). First letter may also be used.

- **lab**  
Whether to include labels.

- **rot**  
The amount of counter-clockwise rotation to add to the labels (in degrees).

- **abbrv**  
If including labels, whether to use abbreviations instead of full interval names.

- **skip**  
A vector of interval names indicating which intervals should not be labeled.

- **size**  
Label size.

- **neg**  
Set this to true if your x-axis is using negative values.
gggeo_scale_old

Details

If custom data is provided (with dat), it should consist of at least 3 columns of data. See data(periods) for an example. The name column lists the names of each time interval. These will be used as labels if no abbreviations are provided. The max_age column lists the oldest boundary of each time interval. The min_age column lists the youngest boundary of each time interval. The abbr column is optional and lists abbreviations that may be used as labels. The color column is also optional and lists a hex color code (which can be obtained with rgb()) for each time interval.

Value

A ggplot object.

Examples

```r
library(ggplot2)
# bottom scale by default
p <- ggplot() +
  geom_point(aes(y = runif(1000, .5, 8), x = runif(1000, 0, 1000))) +
  scale_x_reverse() +
  coord_cartesian(xlim = c(0, 1000), ylim = c(0,8), expand = FALSE) +
  theme_classic()
gggeo_scale_old(p)

# can specify any side of the plot
p <- ggplot() +
  geom_point(aes(x = runif(1000, .5, 8), y = runif(1000, 0, 1000))) +
  scale_y_reverse() +
  coord_cartesian(xlim = c(0, 8), ylim = c(0,1000), expand = FALSE) +
  theme_classic()
gggeo_scale_old(p, pos = "left", rot = 90)

# can add multiple scales
p <- ggplot() +
  geom_point(aes(y = runif(1000, 1, 8), x = runif(1000, 0, 1000))) +
  scale_x_reverse() +
  coord_cartesian(xlim = c(0, 100), ylim = c(0,8), expand = FALSE) +
  theme_classic()
p <- gggeo_scale_old(p, height = .03, abbrv = FALSE)
p <- gggeo_scale_old(p, dat = "epochs", gap = .03, height = .1, rot = 90, size = 2.5, abbrv = FALSE)

# intervals on both sides for different timescales (ICS stages vs North American Land Mammal Ages)
p <- ggplot()
  geom_point(aes(x = runif(1000, 1, 9), y = runif(1000, 0, 65))) +
  scale_y_reverse() +
  coord_cartesian(xlim = c(0, 10), ylim = c(0,65), expand = FALSE) +
  theme_classic()
p <- gggeo_scale_old(p, dat = "stages", pos = "left", height = .1, size = 2.5, abbrv = FALSE)
gggeo_scale_old(p, dat = "North American Land Mammal Ages", pos = "right", height = .1, size = 2.5,
  abbrv = FALSE)

#can add scales to a faceted plot
```
df <- data.frame(x = runif(1000, 0, 541), y = runif(1000, .5, 8), z = sample(c(1, 2, 3, 4), 1000, TRUE))
p <- ggplot(df) +
  geom_point(aes(x, y)) +
  scale_x_reverse() +
  coord_cartesian(xlim = c(0, 541), ylim = c(0, 8), expand = FALSE) +
  theme_classic() +
  facet_wrap(~z, nrow = 2)
gggeo_scale_old(p)

# can even add a scale to a phylogeny (using ggtree)
library(phytools)
library(ggtree)
tree <- pbtree(b = .03, d = .01, n=100)
p <- ggtree(tree) +
  coord_cartesian(xlim = c(0,-500), ylim = c(-10,Ntip(tree)), expand = FALSE) +
  scale_x_continuous(breaks=seq(-500,0,100), labels=abs(seq(-500,0,100))) +
  theme_tree2()
p <- revts(p)
gggeo_scale_old(p, neg = TRUE)

df <- data.frame(x = runif(1000, 0, 541), y = runif(1000, .5, 8), z = sample(c(1, 2, 3, 4), 1000, TRUE))
p <- ggplot(df) +
  geom_point(aes(x, y)) +
  scale_x_reverse() +
  coord_cartesian(xlim = c(0, 541), ylim = c(0, 8), expand = FALSE) +
  theme_classic() +
  facet_wrap(~z, nrow = 2)
gggeo_scale_old(p)

---

gtable_frame2
gtable_frame2

Description

Reformat the gtable associated with a ggplot object into a 7x7 gtable where the central cell corresponds to the plot panel(s), the rectangle of cells around that corresponds to the axes, and the rectangle of cells around that corresponds to the axis titles.

Usage

gtable_frame2(
g, width = unit(1l, "null"),
height = unit(1l, "null"),
default = FALSE
)

Arguments

g gtable
width requested width
height requested height
default logical draw gtable cells
Panel.disparity

Value

7x7 gtable wrapping the plot

Examples

```r
library(grid)
library(gridExtra)
library(ggplot2)
p1 <- ggplot(mtcars, aes(mpg, wt, colour = factor(cyl))) + geom_point()
p2 <- ggplot(mtcars, aes(mpg, wt, colour = factor(cyl))) + geom_point() + facet_wrap(~ cyl, ncol=2, scales = 'free') + guides(colour='none') + theme()
p3 <- ggplot(mtcars, aes(mpg, wt, colour = factor(cyl))) + geom_point() + facet_grid(~ cyl, scales = 'free')
g1 <- ggplotGrob(p1); g2 <- ggplotGrob(p2); g3 <- ggplotGrob(p3);
fg1 <- gtable_frame2(g1)
fg2 <- gtable_frame2(g2)
fg12 <- gtable_frame2(gtable_rbind(fg1,fg2), width=unit(2,'null'), height=unit(1,'null'))
fg3 <- gtable_frame2(g3, width=unit(1,'null'), height=unit(1,'null'))
grid.newpage()
combined <- gtable_cbind(fg12, fg3)
grid.draw(combined)
```

Description

Plots the provided data on 2-D surfaces within a 3-D framework. See `disparity_through_time`.

Usage

```r
panel.disparity(x, y, z, groups, subscripts, ...)
```

Arguments

- `x, y, z, groups, subscripts, ...`
  - Same as for `panel.cloud`

Value

No return value, plots the results of both `panel.cloud` and `panel.wireframe`. 
periods

Period data from the International Commission on Stratigraphy (v2021/05)

Description

A dataset containing the boundary ages, abbreviations, and colors for the periods of the Geologic Time Scale. Based on The ICS International Chronostratigraphic Chart (v2021/05), by Cohen, Finney, Gibbard, and Fan.

Usage

periods

Format

A data frame with 22 rows and 5 variables:

- name: period name
- max_age: maximum age, in millions of years
- min_age: minimum age, in millions of years
- abbr: period name abbreviations
- color: the colors for each period, according to the Commission for the Geological Map of the World

Source

stages

Stage data from the International Commission on Stratigraphy (v2021/05)

Description

A dataset containing the boundary ages, abbreviations, and colors for the stages of the Geologic Time Scale. Based on The ICS International Chronostratigraphic Chart (v2021/05), by Cohen, Finney, Gibbard, and Fan.

Usage

stages
Format

A data frame with 102 rows and 5 variables:

- **name**  stage name
- **max_age** maximum age, in millions of years
- **min_age** minimum age, in millions of years
- **abbr** stage name abbreviations
- **color** the colors for each stage, according to the Commission for the Geological Map of the World
