Package ‘dmfc’

October 13, 2022

Type Package

Title Model Based Clustering of Binary Dissimilarity Measurements

Version 1.0.1

Date 2022-04-26

Description Functions for fitting a Bayesian model for grouping binary dissimilarity matrices in homogeneous clusters. Currently, it includes methods only for binary data (<doi:10.18637/jss.v100.i16>).

**Description**

The `dmbc` package implements a Bayesian algorithm for clustering a set of dissimilarity matrices within a model-based framework. In particular, we consider the case where $S$ matrices are available, each describing the dissimilarities among $n$ objects, possibly expressed by $S$ subjects (judges), or measured under different experimental conditions, or with reference to different characteristics of the objects themselves. Specifically, we focus on binary dissimilarities, taking values 0 or 1 depending on whether or not two objects are deemed as similar, with the goal of analyzing such data using multidimensional scaling (MDS). Differently from the standard MDS algorithms, we are interested in partitioning the dissimilarity matrices into clusters and, simultaneously, to extract a specific MDS configuration for each cluster. The parameter estimates are derived using a hybrid Metropolis-Gibbs Markov Chain Monte Carlo algorithm. We also include a BIC-like criterion for jointly selecting the optimal number of clusters and latent space dimensions.

For efficiency reasons, the core computations in the package are implemented using the C programming language and the `RcppArmadillo` package.

The `dmbc` package also supports the simulation of multiple chains through the support of the `parallel` package.

Plotting functionalities are imported from the nice `bayesplot` package. Currently, the package includes methods for binary data only. In future releases routines will be added specifically for continuous (i.e. normal), multinomial and count data.

**dmbc classes**

The `dmbc` package defines the following new classes:

- **dmbc_data**: defines the data to use in a DMBC model.
• `dmbc_model`: defines a DMBC model.
• `dmbc_fit`: defines the results of a DMBC analysis for a single MCMC chain.
• `dmbc_fit_list`: defines the results of a DMBC analysis for multiple MCMC chains.
• `dmbc_ic`: defines the results of the computation of the information criterion for a DMBC analysis.
• `dmbc_config`: defines the estimate of the latent configuration for a DMBC analysis.

The package includes `print`, `summary` and `plot` methods for each one of these classes.

Resources

• **Bug reports**: If you have noticed a bug that needs to be fixed, please let us know at the `dmbc` issue tracker on GitHub: [https://github.com/sergioventurini/dmbc/issues/](https://github.com/sergioventurini/dmbc/issues/).

• **General questions and help**: To ask a question about `dmbc` send and email to: <sergio.venturini@unicatt.it>.

---

`adjust_x`  
*Adjustment of the center and orientation of a latent configuration.*

**Description**

`adjust_x` adjusts the center and orientation of a latent configuration in Bayesian (metric) multidimensional scaling (BMDS).

**Usage**

`adjust_x(x)`

**Arguments**

`x`  
Numeric matrix containing the latent configuration.
animals

Value

A list with elements:

- `x` A real matrix containing the adjusted latent configuration.
- `Sig_x` The variance and covariance matrix of the adjusted latent configuration.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

See Also

- `bmds` for (one-way) Bayesian (metric) multidimensional scaling.

Examples

```r
n <- 100
nr <- 20
nc <- floor(n/nr)
x <- matrix(rnorm(1:n), nrow = nr, ncol = nc)
adj_x <- adjust_x(x)
adj_x$x
adj_x$Sig_x
```

animals

List of binary dissimilarity matrices among 18 animals.

Description

To illustrate the MDS analysis of sorting data, Takane et al. (2009) refer to judgments on the similarity between \( n = 18 \) animals expressed by \( S = 20 \) subjects. Each subject was asked to divide the animals into as many groups as needed, based on their similarity. We converted these values to 0 or 1 depending on whether a pair of animals is placed or not in the same group by a subject.

Usage

```r
data(animals)
```

Format

A `dmbc_data` object whose `diss` element is a list of 20 binary dissimilarity matrices. Each matrix is defined as a `dist` object measuring whether each pair of the 18 animals has is placed in the same group (1) or not (0).

The `dist` objects have rows and columns that are named as follows:

- `be` bear
- `cm` camel
References

Examples

data(animals)
library(bayesplot)
cols <- color_scheme_set("teal")
plot(animals, colors = unlist(cols[c(1, 6)]), font = 1, cex.font = 0.75)

bmds computes the Bayesian multidimensional scaling (BMDS) solutions using Markov Chain Monte Carlo for a range of specified latent space dimensions.
bmds

Usage

bmds(
  D,
  min_p = 1,
  max_pm1 = 6,
  burnin = 0,
  nsim = 13000,
  ic = TRUE,
  verbose = TRUE
)

Arguments

D               Observed dissimilarities (provided as a distance matrix).
min_p A length-one numeric vector providing the minimum value of the latent space
dimension to use.
max_pm1 A length-one numeric vector providing the maximum value of the latent space
dimension to use (minus 1).
burnin A length-one numeric vector providing the number of iterations to use for burnin.
nsim A length-one numeric vector providing the number of iterations to use in the
MCMC simulation after burnin.
ic Logical scalar. If TRUE computes the MDS information criterion (MDSIC) for
all solution requested.
verbose Logical scalar. If TRUE prints information regarding the evolution of the simula-

Value

A list with the following elements:
x.chain MCMC chain of the latent configuration coordinates.
sigma.chain MCMC chain of the random error.
lambda.chain MCMC chain of the latent configuration variances.
stress Numeric vector of the stress function values.
mdsIC List with two elements, the MDSIC and BIC values for the required solutions.
accept Numeric matrix of acceptance rates.

bmds_get_x_mode

bmds_get_x_mode(D, res, p.i, min_p, max_p, start, end)

Arguments

D 
Observed dissimilarities (provided as a distance matrix).

res 
Results of a BMDS analysis as obtained with the bmds function.

p.i 
A length-one numeric vector providing the index of the solution to use.

min_p 
A length-one numeric vector providing the minimum value of the latent space dimension to use.

max_p 
A length-one numeric vector providing the maximum value of the latent space dimension to use.

start 
A length-one numeric vector providing the iteration number to start from.

dend 
A length-one numeric vector providing the iteration number where to end.

Value

A real matrix containing the posterior mode latent configuration.

## End(Not run)
```
Description

`check_list_na()` compares two lists and fills in the missing elements in the first with those included in the second. The comparison is recursive in the sense that the process is repeated for all lists included in those given.

Usage

```r
check_list_na(orig, des)
```

Arguments

- `orig` A list whose content must be checked.
- `des` A list to use as a reference with which compare the first one.

Value

A list with all elements added.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

Examples

```r
G <- 5
prior <- list(eta = list(a = rep(1, G), b = rep(2, G)))
check_list_na(prior, dmbc_prior())
```

dmbc_config-method

Extract the final cluster memberships from a dmbc_config class instance.

Description

Extract the final cluster memberships from a dmbc_config class instance.

Usage

```r
## S4 method for signature 'dmbc_config'
clusters(object, newdata = NULL, ...)
```

Arguments

- `object` An object of class `dmbc_config`.
- `newdata` An object of no explicit specification (currently ignored).
- `...` Further arguments to pass on (currently ignored).
comp_ssr

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

---

comp_ssr  
*Sum of squared residuals (SSR) from the observed distances and the given latent configuration.*

Description

comp_ssr computes the sum of squared residuals (SSR) from the observed distances (diss) and the given latent coordinates (x).

Usage

```r
comp_ssr(x, diss)
```

Arguments

- **x**: Real matrix containing the latent configuration.
- **diss**: Observed dissimilarities (provided as a distance matrix).

Value

A length-one numeric vector providing the SSR for its arguments.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

See Also

- `bmgs` for (one-way) Bayesian (metric) multidimensional scaling.

Examples

```r
n <- 10000
nr <- 200
nc <- floor(n/nr)
x <- matrix(rnorm(1:n), nrow = nr, ncol = nc)
obsdiss <- dist(x)
ssr <- numeric(ncol(x))
for (i in 1:ncol(x)) {
  ssr[i] <- comp_ssr(x[, 1:i], obsdiss)
}
plot(ssr, xlab = "number of dimensions", ylab = "SSR", type = "b")
```
Estimation of a DMBC model.

dmbc()

Description

dmbc(), the main function of the package, estimates a DMBC model for a given set of dissimilarity matrices.

Usage

dmbc(
  data,  
  p = 2, 
  G = 3, 
  control = dmbc_control(), 
  prior = NULL, 
  cl = NULL, 
  post_all = FALSE
)

Arguments

data
  An object of class dmbc_data containing the data to analyze.
p
  A length-one numeric vector indicating the number of dimensions of the latent space.
G
  A length-one numeric vector indicating the number of clusters to partition the S subjects.
control
  A list of control parameters that affect the sampling but do not affect the posterior distribution. See dmbc_control() for more details.
prior
  A list containing the prior hyperparameters. See dmbc_prior() for more details.
cl
  An optional parallel or snow cluster for use if parallel = "snow". If not supplied, a cluster on the local machine is created for the duration of the dmbc() call.
post_all
  A length-one logical vector, which if TRUE applies a further post-processing to the simulated chains (in case these are more than one).

Value

A dmbc_fit_list object.

graph <- plot(z, size = 2, size_lbl = 3)
graph + panel_bg(fill = "gray90", color = NA)
## End(Not run)
```
**dmbc_check_groups**  
*Auxiliary function for checking the grouping results of a fitted DMBC model.*

**Description**

*dmbc_check_groups()* is an auxiliary function for checking whether the cluster membership estimates provided by the individual chains of the fitted model provided agree or not.

**Usage**

```r
dmbc_check_groups(res, est = "mean")
```

**Arguments**

- `res` : An object of class `dmbc_fit_list`.
- `est` : A length-one character vector indicating the estimate type to use.

**Value**

A length-one logical vector, which is equal to TRUE if all simulated chains provide the same cluster membership estimates, and FALSE otherwise.

---

**dmbc_config-class**  
*An S4 class to represent the latent configuration estimate for a DMBC model.*

### Description

An S4 class to represent the latent configuration estimate for a DMBC model.

### Slots

- **Z.est** An array containing the estimate of the latent configuration for a DMBC model.
- **Z.sd** An array containing the standard deviation of the latent configuration for a DMBC model.
- **cluster** A numeric vector providing the estimated group membership for the S subjects in the data.
- **est** A length-one character vector providing the estimate type returned in Z.est. Possible values are mean (posterior mean), median (posterior median), ml (maximum likelihood) and map (maximum-a-posteriori).
- **n** A length-one numeric vector providing the number of objects.
- **p** A length-one numeric vector providing the number of latent dimensions.
- **S** A length-one numeric vector providing the number of subjects.
- **G** A length-one numeric vector providing the number of clusters.
- **family** An object of class list; named list with elements representing the parameter estimates corresponding to different values of p and G.
- **chain** A length-one numeric vector representing the ID of the MCMC chain used to compute the estimates.
- **labels** A character vector for the (optional) strings to use in the plots for labeling the objects.

### dmbc_control

**Auxiliary Function for Controlling DMBC Model Fitting**

**Description**

`dmbc_control()` is an auxiliary function as user interface for `dmbc()` fitting. Typically only used when calling the `dmbc()` function. It is used to set parameters that affect the sampling but do not affect the posterior distribution.

`control_dmbc()` is an alias for `dmbc_control()`.

`check_control()` is an auxiliary function that verifies the correctness of the controls provided before a DMBC is fitted with `dmbc()`.

**Usage**

```r
dmbc_control(
  nsim = 5000,
  burnin = 10000,
  thin = 1,
  nchains = 1,
  threads = 1,
  seed = NULL,
  parallel = "no",
  z.prop = 1.5,
  alpha.prop = 0.75,
  random.start = TRUE,
  partition = NULL,
  method = "manhattan",
  procrustes = TRUE,
  relabel = TRUE,
  store.burnin = TRUE,
  verbose = FALSE
)
```

```r
control_dmbc(
  nsim = 5000,
  burnin = 10000,
  thin = 1,
  nchains = 1,
  threads = 1,
  seed = NULL,
  parallel = "no",
  z.prop = 1.5,
  alpha.prop = 0.75,
  random.start = TRUE,
  partition = NULL,
  method = "manhattan",
  procrustes = TRUE,
  relabel = TRUE,
  store.burnin = TRUE,
  verbose = FALSE
)
```
alpha.prop = 0.75,
random.start = TRUE,
partition = NULL,
method = "manhattan",
procrustes = TRUE,
relabel = TRUE,
store.burnin = TRUE,
verbose = FALSE
)

check_control(control)

Arguments

nsim A length-one numeric vector for the number of draws to be taken from the posterior distribution.
burnin A length-one numeric vector for the number of initial MCMC iterations (usually to be discarded).
thin A length-one numeric vector for the number of iterations between consecutive draws.
nchains A length-one numeric vector for the number of parallel chains to run.
threads A length-one numeric vector for the number of chains to run. If greater than 1, package parallel is used to take advantage of any multiprocessing or distributed computing capabilities that may be available.
seed An integer scalar. If supplied, provides the random number seed.
parallel A length-one character vector indicating the type of parallel operation to be used (if any). Possible values are multicore (which works only on Unix/macOS), snow and no (i.e. serial instead of parallel computing).
z.prop A length-one numeric vector providing the standard deviation of the proposal distribution for the jump in the individual latent space position.
alpha.prop A length-one numeric vector providing the standard deviation of the proposal distribution for the jump in the individual random effect value.
random.start A length-one logical vector. If TRUE the starting values are drawn randomly, otherwise a user-defined starting partition must be provided through the partition argument.
partition A length-one numeric vector providing the user-defined starting partition.
method A length-one character vector that specifies the distance measure to use in determining the initial partition. Allowed values are those from the dist() function.
procrustes A length-one logical vector. If TRUE the simulated MCMC chains are post-processed through a Procrustes transformation.
relabel A length-one logical vector. If TRUE the simulated MCMC chains are relabelled to address the label-switching problem.
store.burnin A logical scalar. If TRUE, the samples from the burnin are also stored and returned.
**Value**

A named list with the control options as components.

**See Also**

dmbc()

**Examples**

```r
## Not run:
data(simdiss, package = "dmbc")
# Shorter run than default.
sim.fit <- dmbc(simdiss,
  control = dmbc_control(burnin = 1000, nsim = 2000, thin = 5, verbose = TRUE))
## End(Not run)
```

---

**dmbc_data-class**

An S4 class to represent the data to use in a DMBC model.

**Description**

An S4 class to represent the data to use in a DMBC model.

**Slots**

diss A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the S subjects/raters. These matrices must be defined as a dist object.

n A length-one character vector representing the number of objects compared by each subject.

S A length-one numeric vector representing the number of subjects.

family A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.

**Author(s)**

Sergio Venturini <sergio.venturini@unicatt.it>
**References**

**Examples**

```r
showClass("dmbc_data")
```

---

**dmcbc_fit**

Fitter function for DMBC models.

**Description**

\texttt{dmcbc_fit()} is the main function that estimates a DMBC model.

**Usage**

```r
dmcbc_fit(D, p, G, family, control, prior, start)
```

**Arguments**

- **D** A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the \( S \) subjects/raters. These matrices must be defined as a \texttt{dist} object.
- **p** A length-one numeric vector indicating the number of dimensions of the latent space.
- **G** A length-one numeric vector indicating the number of cluster to partition the \( S \) subjects.
- **family** A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.
- **control** A list of control parameters that affect the sampling but do not affect the posterior distribution See \texttt{dmcbc_control()} for more details.
- **prior** A list containing the prior hyperparameters. See \texttt{dmcbc_prior()} for more details.
- **start** A named list of starting values for the MCMC algorithm (see \texttt{dmcbc_init}).

**Value**

A \texttt{dmcbc_fit_list} object.

**Author(s)**

Sergio Venturini <sergio.venturini@unicatt.it>

summary(z)
color_scheme_set("mix-pink-blue")
graph <- plot(z, size = 2, size_lbl = 3)
graph + panel_bg(fill = "gray90", color = NA)
## End(Not run)
```
An S4 class to represent the results of fitting DMBC model.

Description

An S4 class to represent the results of fitting DMBC model using a single Markov Chain Monte Carlo chain.

Slots

- **z.chain**: An object of class `array`; posterior draws from the MCMC algorithm for the (untransformed) latent configuration \( Z \).
- **z.chain.p**: An object of class `array`; posterior draws from the MCMC algorithm for the (Procrustes-transformed) latent configuration \( Z \).
- **alpha.chain**: An object of class `matrix`; posterior draws from the MCMC algorithm for the \( \alpha \) parameters.
- **eta.chain**: An object of class `matrix`; posterior draws from the MCMC algorithm for the \( \eta \) parameters.
- **sigma2.chain**: An object of class `matrix`; posterior draws from the MCMC algorithm for the \( \sigma^2 \) parameters.
- **lambda.chain**: An object of class `matrix`; posterior draws from the MCMC algorithm for the \( \lambda \) parameters.
- **prob.chain**: An object of class `array`; posterior draws from the MCMC algorithm for the cluster membership probabilities.
- **x.ind.chain**: An object of class `array`; posterior draws from the MCMC algorithm for the cluster membership indicators.
- **x.chain**: An object of class `matrix`; posterior draws from the MCMC algorithm for the cluster membership labels.
- **accept**: An object of class `matrix`; final acceptance rates for the MCMC algorithm.
- **diss**: An object of class `list`; list of observed dissimilarity matrices.
- **dens**: An object of class `list`; list of log-likelihood, log-prior and log-posterior values at each iteration of the MCMC simulation.
- **control**: An object of class `list`; list of the control parameters (number of burnin and sample iterations, number of MCMC chains, etc.). See `dmbc_control()` for more information.
- **prior**: An object of class `list`; list of the prior hyperparameters. See `dmbc_prior()` for more information.
- **dim**: An object of class `list`; list of dimensions for the estimated model, i.e. number of objects (\( n \)), number of latent dimensions (\( p \)), number of clusters (\( G \)), and number of subjects (\( S \)).
- **model**: An object of class `dmbc_model`.

Examples

```
showClass("dmbc_fit")
```

---

**dmbc_fit_list-class**  An S4 class to represent the results of fitting DMBC model.

Description

An S4 class to represent the results of fitting DMBC model using multiple Markov Chain Monte Carlo chains.

Slots

results An object of class list; list of *dmbc_fit* objects corresponding to the parallel MCMC chains simulated during the estimation.

References

See Also

*dmbc_fit* for more details on the components of each element of the list.

Examples

```
showClass("dmbc_fit_list")
```
Description

dmbc_fit_list_to_list converts an object of class dmbc_fit_list to a list of arrays including all the parameter chains. It is intended for internal use mainly.

Usage

dmbc_fit_list_to_list(res, include.burnin = FALSE, verbose = TRUE)

Arguments

res An object of type dmbc_fit_list.
include.burnin A logical scalar. If TRUE the burnin iterations (if available) are not removed.
verbose A logical scalar. If TRUE prints additional warnings during the conversion.

Value

An object of type mcmc.list.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

dmbc() for for fitting a DMBC model; dmbc_fit_list-class.

Examples

## Not run:
data(simdiss, package = "dmbc")

G <- 3
p <- 2
prm.prop <- list(z = 1.5, alpha = .75)
burnin <- 2000
nsim <- 1000
seed <- 2301

set.seed(seed)

control <- list(burnin = burnin, nsim = nsim, z.prop = prm.prop[["z"]], alpha.prop = prm.prop[["alpha"]], nchains = 2, verbose = TRUE)
sim.dmbc <- dmbc(simdiss, p, G, control)
sim.list <- dmbc_fit_list_to_list(sim.dmbc, TRUE)
library(bayesplot)
mcmc_trace(sim.list, regex_pars = "lambda")

## End(Not run)

dmbc_fit_list_to_mcmc.list

Conversion of an dmbc_fit_list object to an object of class mcmc.list.

Description
dmbc_fit_list_to_mcmc.list converts an object of class dmbc_fit_list to an object with class mcmc.list.

Usage
dmbc_fit_list_to_mcmc.list(res, include.burnin = FALSE, verbose = TRUE)

Arguments

res An object of type dmbc_fit_list.
include.burnin A logical scalar. If TRUE the burnin iterations (if available) are not removed.
verbose A logical scalar. If TRUE prints additional warnings during the conversion.

Value
An object of type mcmc.list.

Author(s)
Sergio Venturini <sergio.venturini@unicatt.it>

See Also
dmbc() for for fitting a DMBC model; dmbc_fit_list-class; mcmc.list.

Examples

## Not run:
data(simdiss, package = "dmbc")

G <- 3
p <- 2
prm.prop <- list(z = 1.5, alpha = .75)
burnin <- 2000
nsim <- 1000
seed <- 2301

```r
set.seed(seed)
control <- list(burnin = burnin, nsim = nsim, z.prop = prm.prop["z"],
               alpha.prop = prm.prop["alpha"], nchains = 2, verbose = TRUE)
sim.dmbc <- dmbc(simdiss, p, G, control)
sim.mcmc <- dmbc_fit_list_to_mcmc.list(sim.dmbc, TRUE)
plot(sim.mcmc)
## End(Not run)
```

---

**Description**

`dmbc_fit_to_mcmc` converts an object of class `dmbc_fit` to an object with class `mcmc`.

**Usage**

```r
dmbc_fit_to_mcmc(res, include.burnin = FALSE, verbose = TRUE)
```

**Arguments**

- **res** An object of type `dmbc_fit`.
- **include.burnin** A logical scalar. If `TRUE` the burnin iterations (if available) are not removed.
- **verbose** A logical scalar. If `TRUE` prints additional warnings during the conversion.

**Value**

An object of type `mcmc`.

## Not run:
data(simdiss, package = "dmbc")
G <- 3
p <- 2
prm.prop <- list(z = 1.5, alpha = .75)
burnin <- 2000
nsim <- 1000
```
seed <- 2301
set.seed(seed)

control <- list(burnin = burnin, nsim = nsim, z.prop = prm.prop["z"],
                alpha.prop = prm.prop["alpha"], verbose = TRUE)
sim.dm <- dmbc(simdiss, p, G, control)
sim.mcmc <- dmbc_fit_to_mcmc(sim.dm@results[[1]], TRUE)
plot(sim.mcmc)

## End(Not run)

dmbc_get_configuration

Extractor function for a fitted DMBC model.

Description
dmbc_get_configuration() is an extractor function for extracting the latent configuration estimates of a fitted DMBC model.

Usage
dmbc_get_configuration(res, chain = 1, est = "mean", labels = character(0))

Arguments
  res An object of class dmbc_fit_list.
  chain A length-one numeric vector indicating the MCMC chain number to use.
  est A length-one character vector indicating the estimate type to use.
  labels An optional character vector with the object labels.

Value
  A dmbc_config object.

Author(s)
Sergio Venturini <sergio.venturini@unicatt.it>

References

graph <- plot(z, size = 2, size_lbl = 3)
graph + panel_bg(fill = "gray90", color = NA)

## End(Not run)

dmbc_get_map

Extractor function for a fitted DMBC model.

Description
dmbc_get_map() is an extractor function for extracting the maximum-a-posterior estimates of the parameters for a fitted DMBC model.

Usage
dmbc_get_map(res, chain = 1)
Arguments

res          An object of class dmbc_fit_list.
chain        A length-one numeric vector indicating the MCMC chain number to use.

Value

A named list with the following elements:

z: array of latent coordinates posterior mean estimates
alpha: numeric vector of alpha posterior mean estimates
eta: numeric vector of eta posterior mean estimates
sigma2: numeric vector of sigma2 posterior mean estimates
lambda: numeric vector of lambda posterior mean estimates
prob: numeric matrix of probability posterior mean estimates
cluster: numeric vector of cluster membership posterior mean estimates
logpost: length-one numeric vector of the maximum log-posterior value
chain: length-one numeric vector of the MCMC chain number used

## End(Not run)

---

dmbc_get_ml

Extractor function for a fitted DMBC model.

Description
dmbc_get_ml() is an extractor function for extracting the maximum likelihood estimates of the parameters for a fitted DMBC model.

Usage
dmbc_get_ml(res, chain = 1)

Arguments

- **res**: An object of class dmbc_fit_list.
- **chain**: A length-one numeric vector indicating the MCMC chain number to use.

Value
A named list with the following elements:

- **z**: array of latent coordinates posterior mean estimates
- **alpha**: numeric vector of alpha posterior mean estimates
- **eta**: numeric vector of eta posterior mean estimates
- **sigma2**: numeric vector of sigma2 posterior mean estimates
- **lambda**: numeric vector of lambda posterior mean estimates
- **prob**: numeric matrix of probability posterior mean estimates
- **cluster**: numeric vector of cluster membership posterior mean estimates
- **loglik**: length-one numeric vector of the maximum log-likelihood value

**dmbc_IC**  
*Model selection of DMBC models.*

**Description**

dmbc_IC() is the main function for simultaneously selecting the optimal latent space dimension ($p$) and number of clusters ($G$) for a DMBC analysis.

**Usage**

dmbc_IC(
  data,  
pmax = 3,  
Gmax = 5,  
control = dmbc_control(),  
prior = NULL,  
est = "mean"
)
**Arguments**

- **data**: An object of class `dmbc_data` containing the data to analyze.
- **pmax**: A length-one numeric vector indicating the maximum number of dimensions of the latent space to consider.
- **Gmax**: A length-one numeric vector indicating the maximum number of cluster to consider.
- **control**: A list of control parameters that affect the sampling but do not affect the posterior distribution. See `dmbc_control()` for more details.
- **prior**: A list containing the prior hyperparameters. See `dmbc_prior()` for more details.
- **est**: A length-one character vector indicating the estimate type to use. Possible values are `mean`, `median`, `ml` and `map`.

**Value**

A `dmbc_ic` object.

**Author(s)**

Sergio Venturini <sergio.venturini@unicatt.it>

**References**

**See Also**

**Examples**

```r
## Not run:
data(simdiss, package = "dmbc")
pmax <- 2
Gmax <- 2
prm.prop <- list(z = 1.5, alpha = .75)
burnin <- 2000
nsim <- 1000
seed <- 1809
set.seed(seed)

control <- list(burnin = burnin, nsim = nsim, z.prop = prm.prop[["z"]],
aprma.prop = prm.prop[["alpha"]], random.start = TRUE, verbose = TRUE,
thin = 10, store.burnin = TRUE)
```
```r
dmbc_ic <- dmbc_IC(data = simdiss, pmax = pmax, Gmax = Gmax, control = control, est = "mean")
pmax <- pmax + 1
Gmax <- Gmax + 2
new.ic <- update(sim.ic, pmax = pmax, Gmax = Gmax)
new.ic

# plot the results
library(bayesplot)
library(ggplot2)
color_scheme_set("mix-yellow-blue")
p <- plot(new.ic, size = c(4, 1.5))
p + panel_bg(fill = "gray90", color = NA)
```

---

**dmbc_ic-class**

An S4 class to represent the comparison of a set of DMBC models.

### Description

An S4 class to represent the comparison of a set of DMBC models through the dissimilarity model-based clustering information criterion (DCIC).

### Slots

- **logprior**: An object of class matrix providing the log-prior values corresponding to different values of \( p \) and \( G \).
- **logmlik**: An object of class matrix providing the marginal log-likelihood values corresponding to different values of \( p \) and \( G \).
- **logcorrfact**: An object of class matrix providing the logarithm of the correction factors corresponding to different values of \( p \) and \( G \).
- **DCIC**: An object of class matrix providing the values of the DCIC index corresponding to different values of \( p \) and \( G \).
- **post.est**: An object of class list; named list with elements representing the parameter estimates corresponding to different values of \( p \) and \( G \).
- **est**: A length-one character vector representing the estimate type used in computing the DCIC index. Possible values are mean, median, ml and map. See `dmbc_ic()` for more details about these values.
- **res_last_p**: An object of class list; list of `dmbc_fit_list` objects with the results of fitting the DMBC models corresponding to the last value of \( p \). This is needed in case of an update of the DCIC calculations using additional \( p \) and/or \( G \) values.

Examples

\texttt{showClass("dmbc_ic")}

\begin{verbatim}
\textbf{dmbc_init} \hspace{1cm} Function to compute the starting values before fitting a DMBC models.
\end{verbatim}

Description

\texttt{dmbc_init()} is the main function that estimates a DMBC model.

Usage

\texttt{dmbc_init(D, p, G, family, random.start, method, partition)}

Arguments

\begin{itemize}
  \item \texttt{D} A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the \textit{S} subjects/raters. These matrices must be defined as a \texttt{dist} object.
  \item \texttt{p} A length-one numeric vector indicating the number of dimensions of the latent space.
  \item \texttt{G} A length-one numeric vector indicating the number of cluster to partition the \textit{S} subjects.
  \item \texttt{family} A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.
  \item \texttt{random.start} A length-one logical vector. If \texttt{TRUE} the starting values are drawn randomly, otherwise.
  \item \texttt{method} A length-one character vector specifying the distance measure to use in determining the initial partition. Allowed values are those from the \texttt{dist()} function.
  \item \texttt{partition} A length-one numeric vector providing the user-defined starting partition.
\end{itemize}
Value

A named list with the following items:

- **z**: array of latent coordinates starting values
- **x**: numeric vector of initial cluster memberships
- **ng**: numeric vector of initial cluster sizes
- **alpha**: numeric vector of alpha starting values
- **eta**: numeric vector of eta starting values
- **sigma2**: numeric vector of sigma2 starting values
- **lambda**: numeric vector of lambda starting values

**dmbc_logLik**

Log-likelihood for DMBC models.

Description

* dmbc_logLik() computes the log-likelihood value for a DMBC model.

Usage

```
dmbc_logLik(D, Z, alpha, lambda, x)
```
Arguments

- **D**: A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the subjects/raters. These matrices must be defined as a `dist` object.
- **Z**: A numeric matrix containing the latent configuration.
- **alpha**: A numeric vector containing the alpha values.
- **lambda**: A numeric vector containing the alpha lambda.
- **x**: A numeric vector containing the cluster indicator values.

Value

A length-one numeric vector of the log-likelihood value.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

**dmbc_match_groups**

*Auxiliary function for realigning the grouping of a fitted DMBC model.*

**Description**

`dmbc_match_groups()` is an auxiliary function for realigning the cluster membership estimates provided by the individual chains of the fitted model if they do not agree.

**Usage**

```r
dmbc_match_groups(res, est = "mean", ref = 1)
```

**Arguments**

- `res`: An object of class `dmbc_fit_list`.
- `est`: A length-one character vector indicating the estimate type to use.
- `ref`: A length-one numeric vector indicating the chain number to use as the reference.

**Value**

An object of class `dmbc_fit_list`.

**Author(s)**

Sergio Venturini <sergio.venturini@unicatt.it>

dmvc_model-class

An S4 class to represent a $DMBC$ model.

Description

An S4 class to represent a $DMBC$ model.

Slots

p A length-one character vector representing the number of dimensions of the latent space to use in the MDS analysis.

G A length-one numeric vector representing the number of clusters to partition the subjects into.

family A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.

Examples
showClass("dmbc_model")

dmbc_prior

\textit{Auxiliary Function for Setting DMBC Model Priors}

Description
dmbc\_prior() is an auxiliary function as user interface for dmbc() fitting. Typically only used when calling the dmbc() function. It is used to set prior hyperparameters.
prior\_dmbc() is an alias for dmbc\_prior().
check\_prior() is an auxiliary function that verifies the correctness of the prior hyperparameters provided before a DMBC is fitted with dmbc().
update\_prior() is an auxiliary function to modify a set of prior choices using a new value of \( p \) and \( G \). It is intended for internal use mainly in the dmbc\_ic() function.

Usage
\begin{verbatim}
dmbc_prior(
  eta = list(a = rep(1.5, .dmbcEnv$current_G), b = rep(0.5, .dmbcEnv$current_G)),
  sigma2 = list(a = 0.1, b = 0.1),
  lambda = rep(1, .dmbcEnv$current_G)
)
prior_dmbc(
  eta = list(a = rep(1.5, .dmbcEnv$current_G), b = rep(0.5, .dmbcEnv$current_G)),
  sigma2 = list(a = 0.1, b = 0.1),
  lambda = rep(1, .dmbcEnv$current_G)
)
check_prior(prior)
update_prior(prior, p, G)
\end{verbatim}

Arguments
\begin{itemize}
  \item \texttt{eta} A named list containing the hyperparameters for the prior distribution of the \( \eta_1, \ldots, \eta_G \) parameters. It should contain two numeric vectors, namely \texttt{a} and \texttt{b}.
\end{itemize}
initialize,dmbc_config-method

Create an instance of the dmbc_config class using new/initialize.

Description

Create an instance of the dmbc_config class using new/initialize.

sigma2  A named list containing the hyperparameters for the prior distributions of the $\sigma_1^2, \ldots, \sigma_G^2$ parameters. It should contain two numeric scalars, namely a and b.

lambda  A list containing the hyperparameters for the prior distribution of the $\lambda_1, \ldots, \lambda_G$ parameters. It should contain a single numeric vector.

prior  A named list of prior hyperparameters.

p  A length-one numeric vector indicating the number of dimensions of the latent space.

G  A length-one numeric vector indicating the number of cluster to partition the S subjects.

Value

A list with the prior hyperparameters as components.

dmbc()

Examples

## Not run:
data(simdiss, package = "dmbc")
# Shorter run than default.
sim.fit <- dmbc(simdiss,
  control = dmbc_control(burnin = 1000, nsim = 2000, thin = 1, verbose = TRUE),
  prior = dmbc_prior(sigma2 = list(a = 1, b = 4)))
## End(Not run)
initialize.dmcb_config-method

Usage

```r
## S4 method for signature 'dmcb_config'
initialize(
  .Object,
  Z.est = array(),
  Z.sd = array(),
  cluster = numeric(),
  est = character(),
  n = numeric(),
  S = numeric(),
  p = numeric(),
  G = numeric(),
  family = character(),
  chain = numeric(),
  labels = character()
)
```

Arguments

- `.Object` Prototype object from the class `dmcb_config`.
- `Z.est` An array containing the estimate of the latent configuration for a DMBC model.
- `Z.sd` An array containing the standard deviation of the latent configuration for a DMBC model.
- `cluster` A numeric vector providing the estimated group membership for the `S` subjects in the data.
- `est` A length-one character vector providing the estimate type returned in `Z.est`. Possible values are `mean` (posterior mean), `median` (posterior median), `ml` (maximum likelihood) and `map` (maximum-a-posteriori).
- `n` A length-one numeric vector providing the number of objects.
- `S` A length-one numeric vector providing the number of subjects.
- `p` A length-one numeric vector providing the number of latent dimensions.
- `G` A length-one numeric vector providing the number of clusters.
- `family` An object of class `list`; named list with elements representing the parameter estimates corresponding to different values of `p` and `G`.
- `chain` A length-one numeric vector representing the ID of the MCMC chain used to compute the estimates.
- `labels` A character vector for the (optional) strings to use in the plots for labeling the objects.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>
initialize.dmbc_data-method

Create an instance of the dmbc_data class using new/initialize.

Description

Create an instance of the dmbc_data class using new/initialize.

Usage

```r
## S4 method for signature 'dmbc_data'
initialize(
  .Object,
  diss = list(),
  n = numeric(),
  S = numeric(),
  family = character()
)
```

Arguments

- `.Object` Prototype object from the class `dmbc_data`.
- `diss` A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the `S` subjects/raters. These matrices must be defined as a `dist` object.
- `n` A length-one character vector representing the number of objects compared by each subject.
- `S` A length-one numeric vector representing the number of subjects.
- `family` A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

initialize.dmbc_fit-method

Create an instance of the dmbc_fit class using new/initialize.

Description

Create an instance of the dmbc_fit class using new/initialize.
Usage

## S4 method for signature 'dmbc_fit'
initialize(
  .Object,
  z.chain = array(),
  z.chain.p = array(),
  alpha.chain = matrix(),
  eta.chain = matrix(),
  sigma2.chain = matrix(),
  lambda.chain = matrix(),
  prob.chain = array(),
  x.ind.chain = array(),
  x.chain = matrix(),
  accept = matrix(),
  diss = list(),
  dens = list(),
  control = list(),
  prior = list(),
  dim = list(),
  model = NA
)

Arguments

.Object Prototype object from the class dmbc_fit.

z.chain An object of class array; posterior draws from the MCMC algorithm for the (untransformed) latent configuration Z.

z.chain.p An object of class array; posterior draws from the MCMC algorithm for the (Procrustes-transformed) latent configuration Z.

alpha.chain An object of class matrix; posterior draws from the MCMC algorithm for the α parameters.

eta.chain An object of class matrix; posterior draws from the MCMC algorithm for the η parameters.

sigma2.chain An object of class matrix; posterior draws from the MCMC algorithm for the σ² parameters.

lambda.chain An object of class matrix; posterior draws from the MCMC algorithm for the λ parameters.

prob.chain An object of class array; posterior draws from the MCMC algorithm for the cluster membership probabilities.

x.ind.chain An object of class array; posterior draws from the MCMC algorithm for the cluster membership indicators.

x.chain An object of class matrix; posterior draws from the MCMC algorithm for the cluster membership labels.

accept An object of class matrix; final acceptance rates for the MCMC algorithm.

diss An object of class list; list of observed dissimilarity matrices.
initialize,dmbc_fit_list-method

Create an instance of the dmbc_fit_list class using new/initialize.

Description

Create an instance of the dmbc_fit_list class using new/initialize.

Usage

```r
## S4 method for signature 'dmbc_fit_list'
initialize(.Object, results = list())
```

Arguments

- `.Object` Prototype object from the class `dmbc_fit_list`.
- `results` A list whose elements are the `dmbc_fit` objects for each simulated chain.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>
**initialize, dmbc_ic-method**

Create an instance of the `dmbc_ic` class using `new`/`initialize`.

---

**Description**

Create an instance of the `dmbc_ic` class using `new`/`initialize`.

**Usage**

```r
## S4 method for signature 'dmbc_ic'
initialize(
  .Object,
  logprior = matrix(),
  logmlik = matrix(),
  logcorrfact = matrix(),
  DCIC = matrix(),
  post.est = list(),
  est = character(),
  res_last_p = list()
)
```

**Arguments**

- `.Object` Prototype object from the class `dmbc_ic`.
- `logprior` An object of class `matrix` providing the log-prior values corresponding to different values of `p` and `G`.
- `logmlik` An object of class `matrix` providing the marginal log-likelihood values corresponding to different values of `p` and `G`.
- `logcorrfact` An object of class `matrix` providing the logarithm of the correction factors corresponding to different values of `p` and `G`.
- `DCIC` An object of class `matrix` providing the values of the DCIC index corresponding to different values of `p` and `G`.
- `post.est` An object of class `list`; named list with elements representing the parameter estimates corresponding to different values of `p` and `G`.
- `est` A length-one character vector representing the estimate type used in computing the DCIC index. Possible values are `mean`, `median`, `ml` and `map`. See `dmbc_ic()` for more details about these values.
- `res_last_p` An object of class `list`; list of `dmbc_fit_list` objects with the results of fitting the DMBC models corresponding to the last value of `p`. This is needed in case of an update of the DCIC calculations using additional `p` and/or `G` values.

**Author(s)**

Sergio Venturini <sergio.venturini@unicatt.it>
initialize,dmbc_model-method

Create an instance of the dmbc_model class using new/initialize.

Description

Create an instance of the dmbc_model class using new/initialize.

Usage

```r
## S4 method for signature 'dmbc_model'
initialize(.Object, p = numeric(), G = numeric(), family = character())
```

Arguments

- `.Object`: Prototype object from the class `dmbc_model`.
- `p`: A length-one character vector representing the number of dimensions of the latent space to use in the MDS analysis.
- `G`: A length-one numeric vector representing the number of clusters to partition the subjects into.

kinship

List of binary dissimilarity matrices among 15 kinship terms.

Description

Rosenberg and Kim (1975) designed an experiment to analyze the perceived similarities of 15 kinship terms.

Here, we consider the data relative to 85 females made available in Rosenberg (1982). Each subject was asked to group the kinship terms according to the perceived similarity. Thus, 85 binary dissimilarity matrices are available whose elements (0 or 1) indicate whether or not two kinship terms were grouped together by each individual.

Usage

```r
data(kinship)
```
**Format**

A `dmbc_data` object whose `diss` element is a list of 85 binary dissimilarity matrices. Each matrix is defined as a `dist` object measuring whether each pair of the 15 kinship terms is judged as similar (1) or not (0).

The `dist` objects have rows and columns that are named as follows:

- **GrF** grandfather
- **GrM** grandmother
- **GrD** granddaughter
- **GrS** grandson
- **Bro** brother
- **Sis** sister
- **Fat** father
- **Mot** mother
- **Dau** daughter
- **Son** son
- **Nep** nephew
- **Nie** niece
- **Cou** cousin
- **Aun** aunt
- **Unc** uncle

**References**

**Examples**

```r
data(kinship)
library(bayesplot)
cols <- color_scheme_set("mix-red-blue")
plot(kinship, colors = unlist(cols)[c(1, 6)], font = 1, cex.font = 0.75)
```
mdsic  

*Information criterion for Bayesian multidimensional scaling (BMDS).*

**Description**

`mdsic` computes the information criterion for a set of Bayesian multidimensional scaling (BMDS) solutions using the approach in Oh & Raftery (2001).

**Usage**

```r
mdsic(x_star, rmin_ssr, n, min_p = 1, max_p = 6)
```

**Arguments**

- `x_star` An array containing the latent configurations estimated using `bmds`.
- `rmin_ssr` A numeric vector providing the ratios of SSR for the latent dimensions requested.
- `n` A length-one numeric vector providing the number of objects.
- `min_p` A length-one numeric vector providing the minimum value of the latent space dimension to use.
- `max_p` A length-one numeric vector providing the maximum value of the latent space dimension to use.

**Value**

A list with the following elements:

- `mdsic` A numeric vector with the values of MDSIC index.
- `bic` A numeric vector with the values of the BIC index.

**Author(s)**

Sergio Venturini <sergio.venturini@unicatt.it>

**References**

**See Also**

`bmds` for Bayesian (metric) multidimensional scaling and `comp_ssr` for the computation of SSR.
Examples

## Not run:
```r
# Road distances (in km) between 21 cities in Europe
data(eurodist, package = "datasets")

min_p <- 1
max_p <- 10
burnin <- 200
nsim <- 1000
totiter <- burnin + nsim

eurodist.mds <- cmdscale(eurodist, max_p)
eurodist.bmds <- bmds(eurodist, min_p, max_p, burnin, nsim)

plot((min_p:max_p), eurodist.bmds$mdsIC$mdsic, type = "b",
     main = "MDS Information Criterion", xlab = "p", ylab = "MDSIC")
MDSICmin <- which.min(eurodist.bmds$mdsIC$mdsic)
points((min_p:max_p)[MDSICmin], eurodist.bmds$mdsIC$mdsic[MDSICmin],
       col = "red", pch = 10, cex = 1.75, lwd = 1.5)
```
## End(Not run)

---

**plot.dmbc_config,ANY-method**

Provide a graphical summary of a dmbc_config class instance.

**Description**

Provide a graphical summary of a dmbc_config class instance.

**Usage**

```r
## S4 method for signature 'dmbc_config,ANY'
plot(
    x,
    size = NULL,
    size_lbl = NULL,
    nudge_x = 0,
    nudge_y = 0,
    label_objects = TRUE,
    ...
)
```

**Arguments**

- **x**: An object of class `dmbc_config`.
- **size**: A length-two numeric vector providing the optional sizes of points and lines in the plot.
size_lbl A length-one numeric vector providing the size of labels.
nudge_x A length-one numeric vector providing the optional horizontal adjustment to nudge labels by.
nudge_y A length-one numeric vector providing the optional vertical adjustment to nudge labels by.
label_objects A length-one logical vector. If TRUE, labels are added to the plot.
... Further arguments to pass on (currently ignored).

Author(s)
Sergio Venturini <sergio.venturini@unicatt.it>

plot.dmbc_data,ANY-method

Provide a graphical summary of a dmbc_data class instance.

Description
Provide a graphical summary of a dmbc_data class instance.

Usage
## S4 method for signature 'dmbc_data,ANY'
plot(x, colors = c("white", "black"), font = NA, cex.font = NA, ...)

Arguments
x An object of class dmbc_data.
colors A character vector providing the colors to use in the plot.
font A length-one numeric vector for the font to use for text. Can be a vector. NA values (the default) mean use par("font").
cex.font A length-one numeric vector for the character expansion factor. NULL and NA are equivalent to 1.0. This is an absolute measure, not scaled by par("cex") or by setting 'par("mfgrow") or par("mfcol"). Can be a vector.
... Further arguments to pass on (currently ignored).

Author(s)
Sergio Venturini <sergio.venturini@unicatt.it>

Examples
data(simdiss)
library(bayesplot)
cols <- color_scheme_set("brightblue")
plot(simdiss, colors = unlist(cols)[c(1, 6)], font = 1, cex.font = 0.75)
plot.dmbc_fit,ANY-method

Provide a graphical summary of a dmbc_fit class instance.

Description

Provide a graphical summary of a dmbc_fit class instance.

Usage

```r
## S4 method for signature 'dmbc_fit,ANY'
plot(
  x,
  what = "trace",
  pars = character(),
  regex_pars = "lambda",
  include.burnin = FALSE,
  combo = NULL,
  ...,
)
```

Arguments

- **x**: An object of class `dmbc_fit`.
- **what**: A length-one character vector providing the plot type to produce. Admissible values are those provided by the `bayesplot` package, that is: `acf`, `areas`, `dens`, `hex`, `hist`, `intervals`, `neff`, `pairs`, `parcoord`, `recover`, `rhat`, `scatter`, `trace`, `violin` or `combo`. In particular, `combo` allows to mix different plot types. For more details see the documentation of the `bayesplot` package, starting from this overview page.
- **pars**: An optional character vector of parameter names. If neither `pars` nor `regex_pars` is specified, the default is to use all parameters.
- **regex_pars**: An optional regular expression to use for parameter selection. Can be specified instead of `pars` or in addition to `pars`.
- **include.burnin**: A length-one logical vector. If `TRUE` the burnin iterations (if available) are included in the summary.
- **combo**: A character vector providing the plot types to combine (see `mcmc_combo`).
- **...**: Further arguments to pass on.

Author(s)

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

show.dmbc_ic-method

Show an instance of the dmbc_ic class.

Description

Show an instance of the dmbc_ic class.

Usage

## S4 method for signature 'dmbc_ic'
show(object)

Arguments

object  An object of class dmbc_ic.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>
show.dmbc_model-method

Show an instance of the dmbc_model class.

Description

Show an instance of the dmbc_model class.

Usage

## S4 method for signature 'dmbc_model'
show(object)

Arguments

object

An object of class dmbc_model.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

simdiss

Simulated binary dissimilarity matrices.

Description

A dataset containing a list of simulated binary dissimilarity matrices.

Usage

data(simdiss)

Format

A dmbc_data object whose diss element is a list of 10 binary dissimilarity matrices. Each matrix is defined as a dist object measuring the agreement among 16 different units.

Examples

data(simdiss)
library(bayesplot)
cols <- color_scheme_set("brightblue")
plot(simdiss, colors = unlist(cols)[c(1, 6)], font = 1, cex.font = 0.75)
### Description

Subsetting a `dmbc_fit` object.

### Usage

```r
## S4 method for signature 'dmbc_fit'
subset(x, pars = character(), regex_pars = character(), ...)
```

### Arguments

- **x**: An object of class `dmbc_fit`.
- **pars**: An optional character vector of parameter names. If neither `pars` nor `regex_pars` is specified, the default is to use all parameters.
- **regex_pars**: An optional regular expression to use for parameter selection. Can be specified instead of `pars` or in addition to `pars`.
- **...**: Further arguments to pass on (currently ignored).

### Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

### Description

Subsetting a `dmbc_fit_list` object.

### Usage

```r
## S4 method for signature 'dmbc_fit_list'
subset(x, pars = character(), regex_pars = character(), ...)
```

### Arguments

- **x**: An object of class `dmbc_fit_list`.
- **pars**: An optional character vector of parameter names. If neither `pars` nor `regex_pars` is specified, the default is to use all parameters.
- **regex_pars**: An optional regular expression to use for parameter selection. Can be specified instead of `pars` or in addition to `pars`.
- **...**: Further arguments to pass on (currently ignored).
summary.dmbc_config-method

Provide a summary of a dmbc_config class instance.

Description

Provide a summary of a dmbc_config class instance.

Usage

## S4 method for signature 'dmbc_config'
summary(object)

Arguments

object An object of class dmbc_config.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

summary.dmbc_data-method

Provide a summary of a dmbc_data class instance.

Description

Provide a summary of a dmbc_data class instance.

Usage

## S4 method for signature 'dmbc_data'
summary(object)

Arguments

object An object of class dmbc_data.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>
summary.dmbc_fit-method

Provide a summary of a dmbc_fit class instance.

Description

Provide a summary of a dmbc_fit class instance.

Usage

## S4 method for signature 'dmbc_fit'
summary(object, include.burnin = FALSE, summary.Z = FALSE, ...)

Arguments

object An object of class dmbc_fit.
include.burnin A length-one logical vector. If TRUE the burnin iterations (if available) are included in the summary.
summary.Z A length-one logical vector. If TRUE the summary also includes the latent configuration coordinates.
... Further arguments to pass on (currently ignored).

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

summary.dmbc_fit_list-method

Provide a summary of a dmbc_fit_list class instance.

Description

Provide a summary of a dmbc_fit_list class instance.

Usage

## S4 method for signature 'dmbc_fit_list'
summary(object, include.burnin = FALSE, summary.Z = FALSE, ...)

Arguments

object An object of class dmbc_fit_list.
include.burnin A length-one logical vector. If TRUE the burnin iterations (if available) are included in the summary.
summary.Z A length-one logical vector. If TRUE the summary also includes the latent configuration coordinates.
... Further arguments to pass on (currently ignored).
Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

summary.dmbc_ic-method

Provide a summary of a dmbc_ic class instance.

Description

Provide a summary of a dmbc_ic class instance.

Usage

## S4 method for signature 'dmbc_ic'
summary(object, p = NULL, G = NULL)

Arguments

object
An object of class dmbc_ic.

p
An optional length-one numeric vector providing the number of latent space dimension to use in the summary.

G
An optional length-one numeric vector providing the number of clusters to use in the summary.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

update.dmbc_ic-method

Provide an update of a dmbc_ic class instance.

Description

Provide an update of a dmbc_ic class instance.

Usage

## S4 method for signature 'dmbc_ic'
update(object, pmax = NULL, Gmax = NULL, ...)

Arguments

object
An object of class dmbc_ic.

pmax
An optional length-one numeric vector providing the number of latent space dimension to use in the update.

Gmax
An optional length-one numeric vector providing the number of clusters to use in the update.
Arguments

- **object**: An object of class `dmbc_ic`.
- **pmax**: A length-one numeric vector indicating the maximum number of dimensions of the latent space to consider.
- **Gmax**: A length-one numeric vector indicating the maximum number of cluster to consider.
- **...**: Further arguments to pass on (currently ignored).

Value

A `dmbc_ic` object.

Author(s)

Sergio Venturini <sergio.venturini@unicatt.it>

References

Examples

```r
## Not run:
data(simdiss, package = "dmbc")
pmax <- 2
Gmax <- 2
prm.prop <- list(z = 1.5, alpha = .75)
burnin <- 2000
nsim <- 1000
seed <- 1809
set.seed(seed)

control <- list(burnin = burnin, nsim = nsim, z.prop = prm.prop["z"],
                alpha.prop = prm.prop["alpha"], random.start = TRUE, verbose = TRUE,
                thin = 10, store.burnin = TRUE)
sim.ic <- dmbc_IC(data = simdiss, pmax = pmax, Gmax = Gmax, control = control,
est = "mean")

pmax <- pmax + 1
Gmax <- Gmax + 2
new.ic <- update(sim.ic, pmax = pmax, Gmax = Gmax)
```
new.ic

# plot the results
library(bayesplot)
library(ggplot2)
color_scheme_set("mix-yellow-blue")
p <- plot(new.ic, size = c(4, 1.5))
p + panel_bg(fill = "gray90", color = NA)
