Package ‘earthtide’

June 30, 2022

**Type** Package

**Title** Parallel Implementation of 'ETERNA 3.40' for Prediction and Analysis of Earth Tides

**Version** 0.0.14

**Maintainer** Jonathan Kennel <jkennel@uoguelph.ca>

**BugReports** https://github.com/jkennel/earthtide/issues

**URL** https://github.com/jkennel/earthtide

**License** GPL-3

**Depends** R (>= 3.4.0)

**Imports** Rcpp (>= 1.0.0), RcppParallel (>= 4.4.2), R6 (>= 2.3.0)

**LinkingTo** Rcpp (>= 1.0.0), RcppParallel (>= 4.4.2), RcppArmadillo (>= 0.9.200.7.0), BH (>= 1.69.0-1)

**Suggests** testthat (>= 2.1.0), knitr, rmarkdown

**RoxygenNote** 7.2.0

**VignetteBuilder** knitr

**Encoding** UTF-8

**LazyData** TRUE

**NeedsCompilation** yes

**SystemRequirements** C++11

**Author** Jonathan Kennel [aut, cre, trl], Beth Parker [ths], Wenzel Hans-Georg [ctb]

**Repository** CRAN

**Date/Publication** 2022-06-30 07:40:06 UTC
R topics documented:

- get_main_frequency ....................................... 8

Index

earthtide-package earthtide: R port of the earth tide processing package ETERNA (by Hans-Georg Wenzel) including the Kudryavtsev wave catalog.

Description

The goal of this package is to generate synthetic earth tides for use in the R programming language and in particular environmental models. Code was parallelized and refactored to minimize duplication, and to allow for future improvements.

Details

You can learn about the earthtide package in the vignettes: browseVignettes(package = "earthtide")

Author(s)

Maintainer: Jonathan Kennel <jkennel@uoguelph.ca> [translator]

Other contributors:
- Beth Parker <bparker@uoguelph.ca> [thesis advisor]
- Wenzel Hans-Georg [contributor]

calc_earthtide

Description

This is a wrapper to the Earthtide R6 class for the prediction of Earth tides. This function is provided for users who would prefer a more typical R function.

Usage

calc_earthtide(
  utc,
  do_predict = TRUE,
  method = "gravity",
  astro_update = 1,
  latitude = 0,
  longitude = 0,
  elevation = 0,
  azimuth = 0,
  gravity = 0,
  earth_radius = 6378136.3,
  earth_eccen = 0.0066943979514,
  cutoff = 1e-06,
  wave_groups = NULL,
  catalog = "ksm04",
  eop = NULL,
  return_matrix = FALSE,
  scale = TRUE,
  ...
)

Arguments

utc The date-time in UTC (POSIXct vector).
do_predict run in predict or analyze mode
method One or more of "gravity", "tidal_potential", "tidal_tilt", "vertical_displacement",
         "horizontal_displacement", "n_s_displacement", "e_w_displacement", "vertical_strain",
         "areal_strain", "volume_strain", "horizontal_strain", or "ocean_tides", "pole_tide",
         "lod_tide". The pole tide and lod_tide are used in predict mode even if do_predict is FALSE. More than one value can only be used if do_predict == TRUE.
astro_update Integer that determines how often to phases are updated in number of samples. Defaults to 1 (every sample), but speed gains are realized with larger values. Typically updating every hour will have speed gains and keep precision (ie 3600 for one second data, 60 for minute data, 1 for hourly data).
latitude The station latitude (numeric) defaults to 0.
longitude The station longitude (numeric) defaults to 0.
elevation  The station elevation (m) (numeric) defaults to 0.
azimuth   Earth azimuth (numeric) defaults to 0.
gravity   Gravity at the station (m/s^2) (numeric) 0 to estimate gravity from elevation and latitude.
earth_radius Radius of earth (m) (numeric) defaults to 6378136.3
earth_eccen Eccentricity of earth (numeric) defaults to 6.69439795140e-3
cutoff    Cutoff amplitude for constituents (numeric) defaults to 1e-6.
wave_groups Two column data.frame having start and end of frequency groups (data.frame). This data.frame must have two columns with the names 'start', and 'end' signifying the start and end of the wave groupings. An optional third column 'multiplier' can be provided to scale the particular wave group. If column names do no match, the inferred column positions are start, end, multiplier.
catalog   Use the "hw95s" catalog or "ksm04" catalog (character).
eop       User defined Earth Orientation Parameter (EOP) data.frame with the following columns: datetime, ddt, ut1_utc, lod, x, y, dx, dy
return_matrix Return a matrix of tidal values instead of data.frame. The datetime column will not be present in this case (logical).
scale     Scale results when do_predict is FALSE
...       Currently not used.

Value
data.frame of tidal results

Examples

tms <- as.POSIXct('1990-01-01', tz = 'UTC') + c(0, 3600)
wave_groups = data.frame(start = 0, end = 8, multiplier = 1.5)
et <- calc_earthtide(utc = tms,
do_predict = TRUE,
method = c('tidal_potential', 'lod_tide', 'pole_tide'),
astro_update = 1,
latitude = 52.3868,
longitude = 9.7144,
elevation = 110,
gravity = 9.8127,
cutoff = 1.0e-5,
catalog = 'ksm04',
wave_groups = wave_groups)
**Earthtide**

**Earthtide class**

**Description**

Class to generate synthetic earthtide signals.

**Format**

An [R6Class](https://CRAN.R-project.org/package=R6) generator object

**Usage**

```r
et <- Earthtide$new(
  utc = as.POSIXct("2017-01-01", tz = "UTC") + 0:(24 * 7) * 3600,
  latitude = 52.3868,
  longitude = 9.7144,
  catalog = "ksm04",
  wave_groups = data.frame(start = 0.0, end = 6.0))

et$predict(method = "gravity", astro_update = 1)
et$analyze(method = "gravity", astro_update = 1)
et$lod_tide()
et$pole_tide()
et$tide()
et$print()
```

**Arguments**

Earthtide$new

- **et**: An Earthtide object.
- **utc**: The date-time in UTC (POSIXct vector).
- **latitude**: The station latitude (WGS84) (degree) (numeric) defaults to 0.
- **longitude**: The station longitude (WGS84) (degree) (numeric) defaults to 0.
- **elevation**: The station ellipsoidal height (WGS84) (m) (numeric) defaults to 0.
- **azimuth**: Earth azimuth (numeric) defaults to 0 (degrees)
- **gravity**: Gravity at the station (m/s^2) (numeric) 0 to estimate gravity from elevation and latitude.
- **earth_radius**: Radius of earth (m) (numeric) defaults to 6378136.3
- **earth_eccen**: Eccentricity of earth (numeric) defaults to 6.69439795140e-3
- **cutoff**: Cutoff amplitude for constituents (numeric) defaults to 1e-6
**Earthtide**

- **wave_groups**: Two column data.frame having start and end of frequency groups (data.frame). This data.frame must have two columns with the names 'start', and 'end' signifying the start and end of the wave groupings. An optional third column 'multiplier' can be provided to scale the particular wave group. If column names do not match, the inferred column positions are start, end, multiplier.

- **catalog**: Use the "hw95s" catalog or "ksm04" catalog (character).

- **eop**: User defined Earth Orientation Parameter (EOP) data.frame with the following columns: datetime, ddt, ut1_utc, lod, x, y, dx, dy

- **...**: Currently not used.

Earthtide$predict, Earthtide$analyze

- **method**: For predict and analyze. One of "gravity", "tidal_potential", "tidal_tilt", "vertical_displacement", "horizontal_displacement", "n_s_displacement", "e_w_displacement", "vertical_strain", "areal_strain", "volume_strain", "horizontal_strain" or "ocean_tides".

- **astro_update**: For predict and analyze. Integer that determines how often to phases are updated in number of samples. Defaults to 1 (every sample), but speed gains are realized with larger values. Typically updating every hour will have speed gains and keep precision (ie 3600 for one second data, 60 for minute data, 1 for hourly data).

- **return_matrix**: For predict and analyze. Return a matrix of tidal values instead of data.frame. The datetime column will not be present in this case (logical).

### Details

- **new(utc, latitude, longitude, elevation, azimuth, gravity, earth_radius, earth_eccen, cutoff, wave_groups, catalog, ...)**
  create a new Earthtide object and initialize catalog, station and times.

- **predict(method, astro_argument, return_matrix) generate a combined synthetic Earth tide.**

- **analyze(method, astro_argument, return_matrix, scale) generate components of the Earth tide for analysis.**

- **lod_tide() generate components of the LOD (Length Of Day) tide.**

- **pole_tide() generate components of the pole tide.**

- **tide() get the tide data.frame.**

- **print() print the Earthtide object.**

### References

eterna_wavegroups

Examples

```r
et <- Earthtide$new(
  utc = as.POSIXct("2017-01-01", tz = "UTC") + 0:(24 * 7) * 3600,
  latitude = 52.3868,
  longitude = 9.7144,
  catalog = "ksm04",
  wave_groups = data.frame(start = 0.0, end = 6.0))

et$predict(method = "gravity", astro_update = 1)

plot(gravity~datetime, et$tide(), type='l')
```

eterna_wavegroups  Hartmann and Wenzel (1995) (ETERNA 3.4) wavegroups

Description

This data.frame contains wavegroups for different data time spans. The wavegroups should be subset prior to use and the 'time' column provides guidelines based on your input time span.

Usage

eterna_wavegroups

Format

A data.frame The columns are:

- name  wave group name
- start  lowest frequency of the wave group
- end  highest frequency of the wave group
- time  applicable to data of what length

Examples

```r
utils::data(eterna_wavegroups)
```
get_iers

Description

get_iers returns a data.frame of earth orientation parameters from (1962-present). This function requires an active internet connection. Bulletins A and B are combined giving precedence to B. Approximately (~ 7 MB) of data are downloaded. This function is brittle and may fail when data sources change.

Usage

get_iers(a_path = NULL, b_path = NULL, daily_path = NULL, tai_utc_path = NULL)

Arguments

  a_path ftp or http path to download IERS bulletin A
  b_path ftp or http path to download IERS bulletin B
  daily_path ftp or http path to download IERS daily data
  tai_utc_path ftp or http path to tai-utc data

Value

data.frame of earth orientation parameters with the following columns: datetime, ddt, ut1_utc, lod, x, y, dx, dy.

Examples

## Not run:
eop <- get_iers()
## End(Not run)

get_main_frequency

Description

Get the frequency of the wave with the maximum amplitude in a range.

Usage

get_main_frequency(start, end)
get_main_frequency

Arguments

start the starting frequency in cycles per day (numeric)
end the ending frequency in cycles per day (numeric)

Value

the main frequency between start and end
