</tr>
<tr>
<td>Description</td>
<td>The core of this package is a function eDT() which enhances DT::datatable() such that it can be used to interactively modify data in 'shiny'. By the use of generic 'dplyr' methods it supports many types of data storage, with relational databases ('dbplyr') being the main use case.</td>

addButtons

Add modification buttons as a column

Description

Add modification buttons as a column

Usage

```r
addButtons(df, columnName, ns)
```

Arguments

- **df**  
  data.frame
- **columnName**  
  character(1)
- **ns**  
  namespace function

Value

df with extra column containing buttons

Author(s)

Jasper Schelfhout
beginTransaction

Start a transaction for a tibble

Description
Start a transaction for a tibble

Usage
beginTransaction(tbl)

Arguments

  tbl tbl

Author(s)
Jasper Schelfhout

castForDisplay

Cast columns in data.frame to editable types in datatable

Description
Cast columns in data.frame to editable types in datatable

Usage
castForDisplay(data, cols = colnames(data))

Arguments

data data.frame

cols character columns to perform casting on.

Value
data.frame with some columns cast to another type

Author(s)
Jasper Schelfhout
**castFromTbl**

*Cast tbl to class of template*

**Description**

Cast tbl to class of template

**Usage**

```
castFromTbl(tbl, template)
```

**Arguments**

- `tbl` tbl
- `template` tabular object like `data.frame` or `data.table` or tbl.

**Value**

tbl cast to the type of template

**Author(s)**

Jasper Schelfhout

---

**castToFactor**

*Cast all columns that exist in a foreignTbl to factor*

**Description**

Cast all columns that exist in a foreignTbl to factor

**Usage**

```
castToFactor(data, foreignTbls)
```

**Arguments**

- `data` data.frame
- `foreignTbls` list of foreign tbls as created by `foreignTbl`

**Details**

Can be used to fixate possible options when editing.
**castToSQLSupportedType**

*Cast the data type to something supported by SQL.*

**Description**

Cast the data type to something supported by SQL.

**Usage**

```r
castToSQLSupportedType(x)
```

**Arguments**

- `x` single value or vector of values

**Value**

- `x`, possibly cast to different type

**Author(s)**

Jasper Schelfhout

---

**castToTbl**

*Cast data to tbl*

**Description**

Cast data to tbl

**Usage**

```r
castToTbl(data)
```

**Arguments**

- `data` object
castToTemplate

**Value**

tbl

**Author(s)**

Jasper Schelfhout

---

**Description**

Cast tbl or data.frame x to the types of the template

**Usage**

```r
castToTemplate(x, template)
```

**Arguments**

- **x**  
  data.frame, tbl or data.table

- **template**  
  data.frame, tbl or data.table

**Details**

If template is a tbl with database source, convert to an in-memory tibble with same data types instead.

Rownames might differ or get lost.

**Value**

object containing data of x in the class and structure of the template.

**Author(s)**

Jasper Schelfhout
checkForeignTbls

**Description**
Check if all rows in tbl fulfill foreignTbl constraints

**Usage**
checkForeignTbls(tbl, foreignTbls)

**Arguments**
- `tbl` tbl
- `foreignTbls` list of foreign tbls as created by `foreignTbl`

**Value**
logical stating if tbl fulfills all constraints imposed by all foreign tbls.

**Author(s)**
Jasper Schelfhout

---

coaalesce

**Description**
Return first non NULL argument

**Usage**
coalesce(...)

**Arguments**
... set of arguments

**Author(s)**
Jasper Schelfhout
**coerceColumns**

**Cast columns to the type of the template**

**Description**

Cast columns to the type of the template

**Usage**

```r
coerceColumns(template, x)
```

**Arguments**

- `template` : data.frame
- `x` : data.frame

**Details**

only affects columns in both the template and x

---

**coerceValue**

**DT::coerceValue with better POSIXct support**

**Description**

DT::coerceValue with better POSIXct support

**Usage**

```r
coerceValue(val, old)
```

**Arguments**

- `val` : A character string.
- `old` : An old value, whose type is the target type of `val`.

**Details**

Will assume UTC in case no timezone is specified.

**Author(s)**

Jasper Schelfhout
commitTransaction  
Start a transaction for a tibble

Description
Start a transaction for a tibble

Usage
commitTransaction(tbl)

Arguments
  tbl tbl

Author(s)
Jasper Schelfhout

connectDB  
Connect to a database.

Description
Connect to a database.

Usage
connectDB(
  dbname = system.file("extdata", "chinook.sqlite", package = utils::packageName()),
  drv = RSQLite::SQLite(),
  ...
)

Arguments
  dbname character(0)
  drv database driver
  ... arguments passed to DBI::dbConnect

Details
Connects by default to a test SQLite database originally obtained here: chinook_git
createButtons

Value

database connection

Examples

conn <- connectDB()
DBI::dbDisconnect(conn)

createButtons

Create buttons to modify the row. See createButtonsHTML

Description

Create buttons to modify the row. See createButtonsHTML

Usage

createButtons(suffix, ns)

Arguments

suffix character(1)
ns character(1) namespace

Details

buttons used per row in the app.

Value

character HTML

createButtonsHTML

Helper function to write HTML

Description

Helper function to write HTML

Usage

createButtonsHTML(suffix = "%1$s", ns = "%2$s")
Arguments

- **suffix** character(1) sprintf placeholder for suffix
- **ns** character(1) sprintf placeholder for ns

Details

generate HTML as character once and reuse. Since buttons have to be generated a lot, this otherwise slows down the app.

Value

character(1) HTML to be filled in with sprintf

customButton

Generate a custom button for eDT

description

Generate a custom button for eDT

Usage

customButton(id, label, icon = "", disabled = FALSE)

Arguments

- **id** character(1), namespaced id
- **label** character(1)
- **icon** shiny::icon
- **disabled** logical. Whether or not the button should start in a disabled state.

Details

Combines elements of shiny::actionButton and datatable options

Value

list to be used in eDT(options = list(buttons = xxx))

Author(s)

Jasper Schelfhout
**Examples**

```r
if(interactive()){
    ui <- eDTOutput("data")
    server <- function(input, output, session){
        b <- customButton("print", label = "print")
        eDT_result <- eDT(id = "data", mtcars, options = list(buttons = list("save", b)))
        observeEvent(input$print,
            print(eDT_result$state())
        )
    }
    shinyApp(ui, server)
}
```

---

**demoServer_custom**  
Server of the mtcars demo app

**Description**

Server of the mtcars demo app

**Usage**

`demoServer_custom(id, x)`

**Arguments**

- `id`  
  character(1)
- `x`  
  tbl

**Value**

NULL, just executes the module server.

**Author(s)**

Jasper Schelfhout
demoServer_DB  Server of the DB demo app

Description
Server of the DB demo app

Usage
demoServer_DB(id, conn)

Arguments
id character(1)
conn database connection object as given by \texttt{dbConnect}.

Value
NULL, just executes the module server.

Author(s)
Jasper Schelfhout

demoServer_mtcars  Server of the mtcars demo app

Description
Server of the mtcars demo app

Usage
demoServer_mtcars(id)

Arguments
id character(1)

Value
NULL, just executes the module server.

Author(s)
Jasper Schelfhout
demoUI_custom

UI of the demo mtcars app

Description
UI of the demo mtcars app

Usage
demoUI_custom(id)

Arguments
id character(1)

Value
HTML

Author(s)
Jasper Schelfhout

demoUI_DB

UI of the DB demo app

Description
UI of the DB demo app

Usage
demoUI_DB(id, conn)

Arguments
id character(1)
conn database connection object as given by dbConnect.

Value
HTML

Author(s)
Jasper Schelfhout
---

### `demoUI_mtcars`

**UI of the demo mtcars app**

#### Description

UI of the demo mtcars app

#### Usage

`demoUI_mtcars(id)`

#### Arguments

- **id** character(1)

#### Value

HTML

#### Author(s)

Jasper Schelfhout

---

### `devServer`

**Server of the development app**

#### Description

Server of the development app

#### Usage

`devServer(id, conn)`

#### Arguments

- **id** character(1)
- **conn** database connection object as given by `dbConnect`.

#### Value

NULL, just executes the module server.

#### Author(s)

Jasper Schelfhout
**devUI**

UI of the development app

**Usage**

devUI(id, conn)

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>character(1)</td>
</tr>
<tr>
<td>conn</td>
<td>database connection object as given by dbConnect</td>
</tr>
</tbody>
</table>

**Value**

HTML

**Author(s)**

Jasper Schelfhout

---

**disableDoubleClickButtonCss**

*Function to generate CSS to disable clicking events on a column*

**Description**

Function to generate CSS to disable clicking events on a column

**Usage**

disableDoubleClickButtonCss(id)

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>character(1) namespaced id of the datatable</td>
</tr>
</tbody>
</table>

**Details**

https://stackoverflow.com/questions/75406546/apply-css-styling-to-a-single-dt-datatable

**Value**

character CSS
Create a modifiable datatable.

### Description

Create a modifiable datatable.

### Usage

```r
eDT(
    data,
    options = list(dom = "Bfrtlip", keys = TRUE, ordering = FALSE, autoFill = list(update = FALSE, focus = "focus"), buttons = list("add", "undo", "redo", "save")),
    class = "display",
    callback = NULL,
    rownames = FALSE,
    colnames = NULL,
    container,
    caption = NULL,
    filter = c("none", "bottom", "top"),
    escape = TRUE,
    style = "auto",
    width = NULL,
    height = NULL,
    elementId = NULL,
    fillContainer = NULL,
    autoHideNavigation = getOption("DT.autoHideNavigation", NULL),
    selection = "none",
    extensions = c("KeyTable", "AutoFill", "Buttons"),
    plugins = NULL,
    editable = list(target = "cell"),
    id,
    keys = NULL,
    in_place = FALSE,
    format = function(x) {
        x
    },
    foreignTbls = list(),
    statusColor = c(insert = "#e6e6e6", update = "#32a6d3", delete = "#e52323"),
    inputUI = editbl::inputUI,
    defaults = tibble(),
    env = environment()
)
```

### Arguments

- **data**: tbl. The function will automatically cast to tbl if needed.
### DT options

- **options**: a list of initialization options (see [https://datatables.net/reference/option/](https://datatables.net/reference/option/)); the character options wrapped in `JS()` will be treated as literal JavaScript code instead of normal character strings; you can also set options globally via `options(DT.options = list(...))`, and global options will be merged into this options argument if set.

- **class**: the CSS class(es) of the table; see [https://datatables.net/manual/styling/classes](https://datatables.net/manual/styling/classes).

- **callback**: the body of a JavaScript callback function with the argument `table` to be applied to the DataTables instance (i.e. `table`).

- **rownames**: TRUE (show row names) or FALSE (hide row names) or a character vector of row names; by default, the row names are displayed in the first column of the table if exist (not `NULL`).

- **colnames**: if missing, the column names of the data; otherwise it can be an unnamed character vector of names you want to show in the table header instead of the default data column names; alternatively, you can provide a named numeric or character vector of the form `c('newName1' = i1, 'newName2' = i2)` or `c('newName1' = 'oldName1', 'newName2' = 'oldName2', ...)`, where `newName` is the new name you want to show in the table, and `i` or `oldName` is the index of the current column name.

- **container**: a sketch of the HTML table to be filled with data cells; by default, it is generated from `htmltools::tags$table()` with a table header consisting of the column names of the data.

- **caption**: the table caption; a character vector or a tag object generated from `htmltools::tags$caption()`.

- **filter**: whether/where to use column filters; `none`: no filters; `bottom/top`: put column filters at the bottom/top of the table; range sliders are used to filter numeric/date/time columns, select lists are used for factor columns, and text input boxes are used for character columns; if you want more control over the styles of filters, you can provide a list to this argument of the form `list(position = 'top', clear = TRUE, plain = FALSE)`, where `clear` indicates whether you want the clear buttons in the input boxes, and `plain` means if you want to use Bootstrap form styles or plain text input styles for the text input boxes.

- **escape**: whether to escape HTML entities in the table: TRUE means to escape the whole table, and FALSE means not to escape it; alternatively, you can specify numeric column indices or column names to indicate which columns to escape, e.g. `c(1, 3, 4)` or `c(-1, -3)` (all columns except the first and third), or `c('Species', 'Sepal.Length')`; since the row names take the first column to display, you should add the numeric column indices by one when using `rownames`.

- **style**: either `auto`, `default`, `bootstrap`, or `bootstrap4`. If `auto`, and a **bslib** theme is currently active, then bootstrap styling is used in a way that "just works" for the active theme. Otherwise, **DataTables 'default'** styling is used. If set explicitly to `bootstrap` or `bootstrap4`, one must take care to ensure Bootstrap's HTML dependencies (as well as Bootswatch themes, if desired) are included on the page. Note, when set explicitly, it's the user's responsibility to ensure that only one unique 'style' value is used on the same page, if multiple DT tables exist, as different styling resources may conflict with each other.
width, height  Width/Height in pixels (optional, defaults to automatic sizing)
elementId  An id for the widget (a random string by default).
fillContainer  TRUE to configure the table to automatically fill it’s containing element. If the table can’t fit fully into it’s container then vertical and/or horizontal scrolling of the table cells will occur.
autoHideNavigation  TRUE to automatically hide navigational UI (only display the table body) when the number of total records is less than the page size. Note, it only works on the client-side processing mode and the ‘pageLength’ option should be provided explicitly.
selection  the row/column selection mode (single or multiple selection or disable selection) when a table widget is rendered in a Shiny app; alternatively, you can use a list of the form list(mode = 'multiple', selected = c(1, 3, 8), target = 'row', selectable = c(-2, -3)) to pre-select rows and control the selectable range; the element target in the list can be 'column' to enable column selection, or 'row+column' to make it possible to select both rows and columns (click on the footer to select columns), or 'cell' to select cells. See details section for more info.
extensions  a character vector of the names of the DataTables extensions (https://datatables.net/extensions/index)
plugins  a character vector of the names of DataTables plug-ins (https://rstudio.github.io/DT/plugins.html). Note that only those plugins supported by the DT package can be used here. You can see the available plugins by calling DT:::available_plugins()
editable  FALSE to disable the table editor, or TRUE (or "cell") to enable editing a single cell. Alternatively, you can set it to "row" to be able to edit a row, or "column" to edit a column, or "all" to edit all cells on the current page of the table. In all modes, start editing by doubleclicking on a cell. This argument can also be a list of the form list(target = TARGET, disable = list(columns = INDICES)), where TARGET can be "cell", "row", "column", or "all", and INDICES is an integer vector of column indices. Use the list form if you want to disable editing certain columns. You can also restrict the editing to accept only numbers by setting this argument to a list of the form list(target = TARGET, numeric = INDICES) where INDICES can be the vector of the indices of the columns for which you want the numeric editing for some columns and the text areas for some other columns by setting editable to a list of the form list(target = TARGET, numeric = INDICES1, area = INDICES2). Finally, you can edit date cells with a calendar with list(target = TARGET, date = INDICES); the target columns must have
the Date type. If you don’t set date in the editable list, the editing with the calendar is automatically set for all Date columns.

### id
character(1) module id

### keys
character. Defaults to all columns under the assumption that at least every row is unique.

### in_place
logical. Whether to modify the data object in place or to return a modified copy.

### format
function accepting and returning a datatable

### foreignTbss
list. List of objects created by foreignTbl

### statusColor
named character. Colors to indicate status of the row.

### inputUI
function. UI function of a shiny module with at least arguments id data and .... # elements with inputIds identical to one of the column names are used to update the data.

### defaults
expression that evaluates to a tibble with (a subset of) columns of the data. It will be evaluated for each new row in the environment defined by ‘env’. This allows for defaults like Sys.time() or uuid::UUIDgenerate() as well as dynamic inputs.

### env
environment in which the server function is running. Should normally not be modified.

### Details

Works the same as datatable. This function is however a shiny module and comes with additional arguments and different defaults. Instead of having output$id = renderDT(DT::datatable(iris)), eDT(id = 'id', data = iris) should be used on the server side. On the UI side eDTOoutput should be used instead of DTOutput.

Can also be used as standalone app when not ran in reactive context.

All arguments except ‘id’ and ‘env’ can be normal objects or reactive objects.

### Value

list

- result reactive modified version of data (saved)
- state reactive current state of the data (unsaved)
- selected reactive selected rows of the data (unsaved)

### Author(s)

Jasper Schelfhout
Examples

```r
## Only run this example in interactive R sessions
if(interactive()){
  # tibble support
  modifiedData <- editbl::eDT(tibble::as_tibble(mtcars))

  # data.table support
  modifiedData <- editbl::eDT(dtplyr::lazy_dt(data.table::data.table(mtcars)))

  # database support
  tmpFile <- tempfile(fileext = ".sqlite")
  file.copy(system.file("extdata", "chinook.sqlite", package = 'editbl'), tmpFile)
  conn <- editbl::connectDB(dbname = tmpFile)
  modifiedData <- editbl::eDT(dplyr::tbl(conn, "Artist"), in_place = TRUE)
  DBI::dbDisconnect(conn)
  unlink(tmpFile)

  # Within shiny
  library(shiny)
  library(editbl)
  shinyApp(
    ui = fluidPage(fluidRow(column(12, eDTOutput("tbl"))))),
    server = function(input, output) {
      eDT("tbl", iris,)
    }
  )

  # Custom inputUI
  editbl::eDT(mtcars, inputUI = function(id, data){
    ns <- NS(id)
    textInput(
      ns("mpg"),
      label = "mpg",
      value = data$mpg)
  })
}
```

---

eDTOutput

### UI part of eDT

#### Description

UI part of eDT

#### Usage

```r
eDTOutput(id, ...)
```
Arguments
id character(1)
... arguments passed to DTOutput

Details
Works exactly like DTOutput apart from the fact that instead of the outputId argument, id is requested. Reason being that this function is a UI to a shiny module. This means that the datatable can be found under the id '{namespace}-{id}-DT' instead of '{namespace}-{outputId}'.
Also some minor CSS and javascript is executed for functional purposes.

Value
HTML

Author(s)
Jasper Schelfhout

Examples
## Only run this example in interactive R sessions
if(interactive()){
  # tibble support
  modifiedData <- editbl::eDT(tibble::as_tibble(mtcars))

  # data.table support
  modifiedData <- editbl::eDT(dplyr::lazy_dt(data.table::data.table(mtcars)))

  # database support
  tmpFile <- tempfile(fileext = ".sqlite")
  file.copy(system.file("extdata", "chinook.sqlite", package = 'editbl'), tmpFile)
  conn <- editbl::connectDB(dbname = tmpFile)
  modifiedData <- editbl::eDT(dplyr::tbl(conn, "Artist"), in_place = TRUE)
  DBI::dbDisconnect(conn)
  unlink(tmpFile)

  # Within shiny
  library(shiny)
  library(editbl)
  shinyApp(
    ui = fluidPage(fluidRow(column(12, eDTOutput('tbl')))),
    server = function(input, output) {
      eDT('tbl',iris,)
    }
  )

  # Custom inputUI
  editbl::eDT(mtcars, inputUI = function(id, data){
eDT_app_server

Description
Open interactive app to explore and modify data

Usage
eDT_app(...)

Arguments
... arguments past to eDT

Details
When eDT is not used within the server of a shiny app, it will call this function to start up a shiny app itself. Just as DT::datatable() displays a table in the browser when called upon interactively.

Value
data (or a modified version thereof) once you click 'close'

eDT_app_server

Description
Server of eDT_app

Usage
eDT_app_server(moduleId = "nevergonnagiveyouup", ...)

Arguments
moduleId character(1) id to connect with eDT_app_server
... arguments passed to eDT
\textbf{Value}
moduleServer which on application stop returns version of x with made changes

\textbf{Author(s)}
Jasper Schelfhout

\begin{Shaded}
\begin{verbatim}
eDT_app_ui

\end{verbatim}
\end{Shaded}

\textit{UI of eDT_app}

\textbf{Description}
UI of eDT_app

\textbf{Usage}
eDT_app_ui(moduleId = "nevergonnagiveyouup", eDTId = "nevergonnaletyoudown")

\textbf{Arguments}

\begin{itemize}
  \item \texttt{moduleId} character(1) id to connect with eDT_app_server
  \item \texttt{eDTId} character(1) id to connect eDTOutput to eDT within the module.
\end{itemize}

\textbf{Value}
HTML

\textbf{Author(s)}
Jasper Schelfhout

\begin{Shaded}
\begin{verbatim}
e_rows_insert

\end{verbatim}
\end{Shaded}

\textit{Insert rows into a tibble}

\textbf{Description}
Insert rows into a tibble

\textbf{Usage}
e_rows_insert(
  x,
  y,
  by = NULL,
  \ldots,
  conflict = c("error", "ignore"),
  copy = FALSE,
  in_place = FALSE
)
Arguments

\( x, y \)

A pair of data frames or data frame extensions (e.g. a tibble). \( y \) must have the same columns of \( x \) or a subset.

by

An unnamed character vector giving the key columns. The key columns must exist in both \( x \) and \( y \). Keys typically uniquely identify each row, but this is only enforced for the key values of \( y \) when \( \text{rows_update()} \), \( \text{rows_patch()} \), or \( \text{rows_upsert()} \) are used.

By default, we use the first column in \( y \), since the first column is a reasonable place to put an identifier variable.

... Other parameters passed onto methods.

conflict

For \( \text{rows_insert()} \), how should keys in \( y \) that conflict with keys in \( x \) be handled? A conflict arises if there is a key in \( y \) that already exists in \( x \).

One of:

- "error", the default, will error if there are any keys in \( y \) that conflict with keys in \( x \).
- "ignore" will ignore rows in \( y \) with keys that conflict with keys in \( x \).

copy

If \( x \) and \( y \) are not from the same data source, and \( \text{copy} \) is \( \text{TRUE} \), then \( y \) will be copied into the same src as \( x \). This allows you to join tables across srcs, but it is a potentially expensive operation so you must opt into it.

in_place

Should \( x \) be modified in place? This argument is only relevant for mutable backends (e.g. databases, data.tables).

When \( \text{TRUE} \), a modified version of \( x \) is returned invisibly; when \( \text{FALSE} \), a new object representing the resulting changes is returned.

Details

Mainly a wrapper around \( \text{rows_insert} \). Allows for specific implementations should the behavior differ from what's needed by \( \text{editbl} \). Reason for separate method is to avoid conflicts on package loading.

Value

An object of the same type as \( x \). The order of the rows and columns of \( x \) is preserved as much as possible. The output has the following properties:

- \( \text{rows_update()} \) and \( \text{rows_patch()} \) preserve the number of rows; \( \text{rows_insert()} \), \( \text{rows_append()} \), and \( \text{rows_upsert()} \) return all existing rows and potentially new rows; \( \text{rows_delete()} \) returns a subset of the rows.
- Columns are not added, removed, or relocated, though the data may be updated.
- Groups are taken from \( x \).
- Data frame attributes are taken from \( x \).

If \( \text{in\_place} = \text{TRUE} \), the result will be returned invisibly.
## Default S3 method:

e_rows_insert(
  x, y,
  by = NULL,
  ..., conflict = c("error", "ignore"),
  copy = FALSE,
  in_place = FALSE
)

### Arguments

- **x, y**
  A pair of data frames or data frame extensions (e.g. a tibble). y must have the same columns of x or a subset.

- **by**
  An unnamed character vector giving the key columns. The key columns must exist in both x and y. Keys typically uniquely identify each row, but this is only enforced for the key values of y when rows_update(), rows_patch(), or rows_upsert() are used.

  By default, we use the first column in y, since the first column is a reasonable place to put an identifier variable.

- **...**
  Other parameters passed onto methods.

- **conflict**
  For rows_insert(), how should keys in y that conflict with keys in x be handled? A conflict arises if there is a key in y that already exists in x.

  One of:

  - "error", the default, will error if there are any keys in y that conflict with keys in x.
  - "ignore" will ignore rows in y with keys that conflict with keys in x.

- **copy**
  If x and y are not from the same data source, and copy is TRUE, then y will be copied into the same src as x. This allows you to join tables across srcs, but it is a potentially expensive operation so you must opt into it.

- **in_place**
  Should x be modified in place? This argument is only relevant for mutable backends (e.g. databases, data.tables).

  When TRUE, a modified version of x is returned invisibly; when FALSE, a new object representing the resulting changes is returned.
Details

Mainly a wrapper around `rows_insert`. Allows for specific implementations should the behavior differ from what’s needed by `editbl`. Reason for separate method is to avoid conflicts on package loading.

Value

An object of the same type as `x`. The order of the rows and columns of `x` is preserved as much as possible. The output has the following properties:

- `rows_update()` and `rows_patch()` preserve the number of rows; `rows_insert()`, `rows_append()`, and `rows_upsert()` return all existing rows and potentially new rows; `rows_delete()` returns a subset of the rows.
- Columns are not added, removed, or relocated, though the data may be updated.
- Groups are taken from `x`.
- Data frame attributes are taken from `x`.

If `in_place = TRUE`, the result will be returned invisibly.

---

e_rows_insert.dtplyr_step

`rows_insert` implementation for `data.table` backends.

Description

`rows_insert` implementation for `data.table` backends.

Usage

```r
## S3 method for class 'dtplyr_step'
e_rows_insert(x, y, by = NULL, ..., copy = FALSE, in_place = FALSE)
```

Arguments

- `x, y` A pair of data frames or data frame extensions (e.g. a tibble). `y` must have the same columns of `x` or a subset.
- `by` An unnamed character vector giving the key columns. The key columns must exist in both `x` and `y`. Keys typically uniquely identify each row, but this is only enforced for the key values of `y` when `rows_update()`, `rows_patch()`, or `rows_upsert()` are used.
  - By default, we use the first column in `y`, since the first column is a reasonable place to put an identifier variable.
- `...` Other parameters passed onto methods.
- `copy` If `x` and `y` are not from the same data source, and `copy` is `TRUE`, then `y` will be copied into the same src as `x`. This allows you to join tables across srcs, but it is a potentially expensive operation so you must opt into it.
Should x be modified in place? This argument is only relevant for mutable backends (e.g. databases, data.tables). When TRUE, a modified version of x is returned invisibly; when FALSE, a new object representing the resulting changes is returned.

Details

Mainly a wrapper around rows_insert. Allows for specific implementations should the behavior differ from what's needed by editbl. Reason for separate method is to avoid conflicts on package loading.

Value

An object of the same type as x. The order of the rows and columns of x is preserved as much as possible. The output has the following properties:

- rows_update() and rows_patch() preserve the number of rows; rows_insert(), rows_append(), and rows_upsert() return all existing rows and potentially new rows; rows_delete() returns a subset of the rows.
- Columns are not added, removed, or relocated, though the data may be updated.
- Groups are taken from x.
- Data frame attributes are taken from x.

If in_place = TRUE, the result will be returned invisibly.

**e_rows_update**

Update rows of a tibble

**Description**

Update rows of a tibble

**Usage**

```r
e_rows_update(
  x,
  y,
  by = NULL,
  ..., 
  match,
  unmatched = c("error", "ignore"),
  copy = FALSE,
  in_place = FALSE
)
```

**Arguments**

- **x, y**
  A pair of data frames or data frame extensions (e.g. a tibble). `y` must have the same columns of `x` or a subset.

- **by**
  An unnamed character vector giving the key columns. The key columns must exist in both `x` and `y`. Keys typically uniquely identify each row, but this is only enforced for the key values of `y` when `rows_update()`, `rows_patch()`, or `rows_upsert()` are used.

  By default, we use the first column in `y`, since the first column is a reasonable place to put an identifier variable.
... Other parameters passed onto methods.

match named list consisting out of two equal length data.frame’s with columns defined in by. This allows for updates of columns defined in by.

unmatched For rows_update(), rows_patch(), and rows_delete(), how should keys in y that are unmatched by the keys in x be handled?

One of:

- "error", the default, will error if there are any keys in y that are unmatched by the keys in x.
- "ignore" will ignore rows in y with keys that are unmatched by the keys in x.

copy If x and y are not from the same data source, and copy is TRUE, then y will be copied into the same src as x. This allows you to join tables across srcs, but it is a potentially expensive operation so you must opt into it.

in_place Should x be modified in place? This argument is only relevant for mutable backends (e.g. databases, data.tables).

When TRUE, a modified version of x is returned invisibly; when FALSE, a new object representing the resulting changes is returned.

DBI::dbDisconnect(conn)
```

---

**fillDeductedColumns** *Fill data columns based on foreignTbls*

**Description**

Fill data columns based on foreignTbls

**Usage**

```r
fillDeductedColumns(tbl, foreignTbls)
```

**Arguments**

- **tbl** `tbl`
- **foreignTbls** list of foreign tbls as created by `foreignTbl`

**Details**

When a combination of columns is not found in the foreignTbl, fill the deductedColumns with NA. On foreignTbls suggesting conflicting data, an arbitrary choice is made. It is best to afterwards check with checkForeignTbls to see if a valid result is obtained.
Value

tbl

fixInteger64  
Replace instances of integer64 with actual NA values instead of weird default 9218868437227407266

---

Description

Replace instances of integer64 with actual NA values instead of weird default 9218868437227407266

Usage

fixInteger64(x)

Arguments

x  data.frame

Details

github issue

Value

x with integer64 columns set to bit64::as.integer64(NA)

Author(s)

Jasper Schelfhout
Create a foreign tibble

Usage

```r
foreignTbl(
  x,
  y,
  by = intersect(dplyr::tbl_vars(x), dplyr::tbl_vars(y)),
  naturalKey = dplyr::tbl_vars(y),
  allowNew = FALSE
)
```

Arguments

- **x** tbl. The referencing table.
- **y** tbl. The referenced table.
- **by** character. Column names to match on. Note that you should rename and/or typecast the columns in y should they not exactly match the columns in x.
- **naturalKey** character. The columns that form the natural key in y. These are the only ones that can actually get modified in eDT when changing cells in the table. Reasoning being that these columns should be sufficient to uniquely identify a row in the referenced table. All other columns will be automatically fetched and filled in.
- **allowNew** logical. Whether or not new values are allowed. If TRUE, the rows in the foreignTbl will only be used as suggestions, not restrictions.

Details

This is a tibble that can be passed onto eDT as a referenced table.

It is the equivalent of a database table to which the data tbl of eDT has a foreign key.

It will be merged with the tbl passed onto the data argument allowing to provide restrictions for certain columns.

Note that row uniqueness for the columns used in by and naturalKey is assumed. This assumption will however not be checked since it is an expensive operation on big datasets. However, if violated, it might give errors or unexpected results during usage of the eDT module.
**Value**

List with unmodified arguments. However, they have now been checked for validity.

- \( y \), see argument \( y \).
- \( by \), see argument \( by \).
- \( naturalKey \), see argument \( naturalKey \).
- \( allowNew \), see argument \( allowNew \)

**Author(s)**

Jasper Schelfhout

**Examples**

```r
a <- tibble::tibble(
  first_name = c("Albert", "Donald", "Mickey"),
  last_name_id = c(1,2,2)
)

b <- foreignTbl(
  a, 
  tibble::tibble(
    last_name = c("Einstein", "Duck", "Mouse"),
    last_name_id = c(1,2,3)
  ),
  by = "last_name_id",
  naturalKey = "last_name"
)
```

```r
## Only run this in interactive R sessions
if(interactive()){
  eDT(a,
    foreignTbls = list(b),
    options = list(columnDefs = list(list(visible=FALSE, targets="last_name_id")))
  )
}
```

---

**getColumnTypeSums**

*Get types of columns in a tbl*

**Description**

Get types of columns in a tbl

**Usage**

```r
getColumnTypeSums(tbl)
```
**getNonNaturalKeyCols**

**Arguments**

- tbl tbl

**Value**

named list with types of the columns

**Author(s)**

Jasper Schelfhout

---

**getNonNaturalKeyCols**  *Get all columns that are not natural keys*

---

**Description**

Get all columns that are not natural keys

**Usage**

```r
getNonNaturalKeyCols(foreignTbls)
```

**Arguments**

- foreignTbls list of foreign tbls as created by `foreignTbl`

**Value**

character

**Author(s)**

Jasper Schelfhout
**get_db_table_name**  
*Get name of the tbl in the database*

**Description**  
Get name of the tbl in the database

**Usage**  
get_db_table_name(x)

**Arguments**

- **x**  
tbl_dbi

**Value**  
SQL, the table name as used in the database

---

**initData**  
*Add some extra columns to data to allow for / keep track of modifications*

**Description**  
Add some extra columns to data to allow for / keep track of modifications

**Usage**  
initData(
  data,
  ns,
  buttonCol = "buttons",
  statusCol = "status",
  deleteCol = "deleted",
  iCol = "i"
)

**Arguments**

- **data**  
data.frame
- **ns**  
namespace function
- **buttonCol**  
character(1) name of column with buttons
- **statusCol**  
character(1) name of column with general status (e.g. modified or not).
- **deleteCol**  
character(1) name of the column with deletion status.
- **iCol**  
character(1) name of column containing a unique identifier.
### Description

An input server for a `data.frame`

### Usage

```r
inputServer(id, data, ...)  
```

### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>character(1) module id</td>
</tr>
<tr>
<td>data</td>
<td>single row <code>data.frame</code></td>
</tr>
<tr>
<td>...</td>
<td>further arguments for methods</td>
</tr>
</tbody>
</table>

### Details

A new method for this can be added if you wish to alter the default behavior of the pop-up modals in `eDT`.

### Value

modified version of data

### Author(s)

Jasper Schelfhout

### Examples

```r
if(interactive()){  
  library(shiny)  
  ui <- inputUI('id')  
  server <- function(input, output, session){  
    input <- inputServer("id", mtcars[1,])  
    observe({print(input())})  
  }  
  shinyApp(ui, server)  
}
```
inputServer.default  An input server for a data.frame

Description

An input server for a data.frame

Usage

## Default S3 method:
inputServer(id, data, colnames, notEditable, foreignTbls, ...)

Arguments

- id character(1) module id
- data single row data.frame
- colnames named character
- notEditable character columns that should not be edited
- foreignTbls list of foreignTbls. See foreignTbl
- ... for compatibility with other methods

Details

Reads all inputs ids that are identical to column names of the data and updates the data.

Value

reactive modified version of data

Author(s)

Jasper Schelfhout

inputUI  An input UI for a data.frame

Description

An input UI for a data.frame

Usage

inputUI(id, ...)
**Arguments**

id  
character(1) module id

...  
arguments passed onto methods

**Details**

A new method for this can be added if you wish to alter the default behavior of the pop-up modals in *eDT*.

**Value**

HTML. A set of input fields corresponding to the given row.

**Author(s)**

Jasper Schelfhout

**Examples**

```r
if(interactive()){
  library(shiny)
  ui <- inputUI('id')
  server <- function(input, output, session){
    input <- inputServer('id', mtcars[1,])
    observe({print(input())})
  }
  shinyApp(ui, server)
}
```

---

**Description**

UI part for modal with input fields for editing

**Usage**

```r
## Default S3 method:
inputUI(id, ...)
```

**Arguments**

id  
character module id

...  
for compatibility with method
joinForeignTbl

Details

The UI elements that have an id identical to a column name are used for updating the data.

Value

HTML. A set of input fields corresponding to the given row.

Author(s)

Jasper Schelfhout

joinForeignTbl  Merge a tbl with a foreignTbl

Description

Merge a tbl with a foreignTbl

Usage

joinForeignTbl(  
  tbl,  
  foreignTbl,  
  keepNA = TRUE,  
  by = foreignTbl$by,  
  copy = TRUE,  
  type = c("inner", "left")[1]  
)

Arguments

tbl tbl
foreignTbl list as created by foreignTbl
keepNA logical keep rows from tbl with NA keys.
by named character, columns to join on.
copy logical, whether or not to copy the foreignTbl to the source of argument tbl for joining.
type character(1), type of joint to perform. Can be 'inner' or 'left'.

Details

see also dplyr join functions, for example dplyr::left_join.

Value

tbl, containing both columns from argument tbl and argument foreignTbl.
rollbackTransaction

Description
Start a transaction for a tibble

Usage
rollbackTransaction(tbl)

Arguments
- tbl tbl

Author(s)
Jasper Schelfhout

rowInsert

Description
Add a row to a table in the database.

Usage
rowInsert(conn, table, values)

Arguments
- conn database connection object as given by dbConnect.
- table character
- values named list, row to add. Names are database column names. Unspecified columns will get database defaults.

Value
integer number of affected rows.
Description

rows_delete implementation for data.table backends.

Usage

```r
## S3 method for class 'dtplyr_step'
rows_delete(x, y, by = NULL, ..., unmatched, copy = FALSE, in_place = FALSE)
```

Arguments

- `x, y` A pair of data frames or data frame extensions (e.g. a tibble). `y` must have the same columns of `x` or a subset.
- `by` An unnamed character vector giving the key columns. The key columns must exist in both `x` and `y`. Keys typically uniquely identify each row, but this is only enforced for the key values of `y` when `rows_update()`, `rows_patch()`, or `rows_upsert()` are used.
  By default, we use the first column in `y`, since the first column is a reasonable place to put an identifier variable.
- `...` Other parameters passed onto methods.
- `unmatched` For `rows_update()`, `rows_patch()`, and `rows_delete()`, how should keys in `y` that are unmatched by the keys in `x` be handled?
  One of:
  - "error", the default, will error if there are any keys in `y` that are unmatched by the keys in `x`.
  - "ignore" will ignore rows in `y` with keys that are unmatched by the keys in `x`.
- `copy` If `x` and `y` are not from the same data source, and `copy` is TRUE, then `y` will be copied into the same src as `x`. This allows you to join tables across srcs, but it is a potentially expensive operation so you must opt into it.
- `in_place` Should `x` be modified in place? This argument is only relevant for mutable backends (e.g. databases, data.tables).
  When TRUE, a modified version of `x` is returned invisibly; when FALSE, a new object representing the resulting changes is returned.

Value

An object of the same type as `x`. The order of the rows and columns of `x` is preserved as much as possible. The output has the following properties:
- `rows_update()` and `rows_patch()` preserve the number of rows; `rows_insert()`, `rows_append()`, and `rows_upsert()` return all existing rows and potentially new rows; `rows_delete()` returns a subset of the rows.
- Columns are not added, removed, or relocated, though the data may be updated.
- Groups are taken from `x`.
- Data frame attributes are taken from `x`.

If `in_place = TRUE`, the result will be returned invisibly.

**Author(s)**

Jasper Schelfhout

---

**rowUpdate**

**Update rows in the database.**

**Description**

Update rows in the database.

**Usage**

`rowUpdate(conn, table, values, where)`

**Arguments**

- `conn` database connection object as given by `dbConnect`.
- `table` character
- `values` named list, values to be set. Names are database column names.
- `where` named list, values to filter on. Names are database column names. If NULL no filter is applied.

**Value**

integer number of affected rows.
runDemoApp  

Run a demo app

Description
Run a demo app

Usage
runDemoApp(app = "database", ...)

Arguments
app demoApp to run. Options: database / mtcars / custom
... arguments passed onto the demoApp

Details
These apps are for illustrative purposes.

Value
An object that represents the app. Printing the object or passing it to runApp() will run the app.

Examples
## Only run this example in interactive R sessions
if(interactive()){
  # Database
tmpFile <- tempfile(fileext = ".sqlite")
file.copy(system.file("extdata", "chinook.sqlite", package = 'editbl'), tmpFile)
conn <- connectDB(dbname = tmpFile)
runDemoApp(app = "database", conn = conn)
DBI::dbDisconnect(conn)
unlink(tmpFile)

  # mtcars
runDemoApp(app = "mtcars")

  # Any tibble of your liking
runDemoApp(app = "custom", dplyr::tibble(iris))
}
runDemoApp_custom  

Run a custom demo app

Description

Run a custom demo app

Usage

runDemoApp_custom(x)

Arguments

x tbl

Value

An object that represents the app. Printing the object or passing it to runApp() will run the app.

runDemoApp_DB  

Run a demo app

Description

Run a demo app

Usage

runDemoApp_DB()

Value

An object that represents the app. Printing the object or passing it to runApp() will run the app.
runDevApp

runDemoApp_mtcars  Run a demo app

Description

Run a demo app

Usage

runDemoApp_mtcars()

Value

An object that represents the app. Printing the object or passing it to runApp() will run the app.

runDevApp  Run a development app

Description

Run a development app

Usage

runDevApp()

Details

This app prints some of the server objects and has a button to interactively browse the code. This is useful for debugging and experimenting with new features.

Value

An object that represents the app. Printing the object or passing it to runApp() will run the app.
selectInputDT_Server  Server part to use a datatable as select input

Description

Server part to use a `datatable` as select input

Usage

```r
selectInputDT_Server(
  id,
  label = "",  
  choices,           
  selected = NULL,  
  multiple = FALSE
)
```

Arguments

- `id` character(1) same one as used in `selectInputDT_UI`
- `label` character(1)
- `choices` data.frame
- `selected` data.frame with rows available in `choices`.
- `multiple` logical. Whether or not multiple row selection is allowed

Value

A selection of rows from the `data.frame` provided under choices.

Author(s)

Jasper Schelfhout

See Also

`shiny::selectInput`. This function can be more convenient for selecting rows with multiple columns.

Examples

```r
## Only run this example in interactive R sessions
if(interactive()){
  ui <- selectInputDT_UI('id')
  data <- data.frame(id = 1:3, name = letters[1:3])
  server <- function(input, output, session){
    selected = selectInputDT_Server('id', choices = data, selected = data[1,])
    observe({print(selected())})
  }
}
```
selectInputDT_UI

UI part of a DT select input

Description

UI part of a DT select input

Usage

selectInputDT_UI(id)

Arguments

id character(1) same one as used in selectInputDT_Server

Value

HTML

Author(s)

Jasper Schelfhout

Examples

## Only run this example in interactive R sessions
if(interactive()){
  ui <- selectInputDT_UI('id')
  data <- data.frame(id = 1:3, name = letters[1:3])
  server <- function(input, output, session){
    selected = selectInputDT_Server('id', choices = data, selected = data[1,] )
    observe({print(selected())})
  }
  shiny::shinyApp(ui, server)
}
shinyInput

*Get a shiny input for a column of a tbl*

**Description**

Get a shiny input for a column of a tbl

**Usage**

```r
shinyInput(x, inputId, label, selected)
```

**Arguments**

- `x`: column
- `inputId`: shiny input Id
- `label`: character(1)
- `selected`: object of class of `x`

**Value**

shiny input

**Author(s)**

Jasper Schelfhout

---

**standardizeArgument_colnames**

*Standardize colnames argument to the format of named character vector*

**Description**

Standardize colnames argument to the format of named character vector

**Usage**

```r
standardizeArgument_colnames(colnames, data)
```
Arguments

`colnames`  
if missing, the column names of the data; otherwise it can be an unnamed character vector of names you want to show in the table header instead of the default data column names; alternatively, you can provide a named numeric or character vector of the form `'newName1' = i1, 'newName2' = i2 or c('newName1' = 'oldName1', 'newName2' = 'oldName2', ...)`, where `newName` is the new name you want to show in the table, and `i` or `oldName` is the index of the current column name

`data`  
tbl. The function will automatically cast to tbl if needed.

Value

named character vector

Author(s)

Jasper Schelfhout
list of the form list(target = TARGET, area = INDICES) where INDICES can be the vector of the indices of the columns for which you want the text areas, or "all" if you want the text areas for all columns. Of course, you can request the numeric editing for some columns and the text areas for some other columns by setting editable to a list of the form list(target = TARGET, numeric = INDICES1, area = INDICES2). Finally, you can edit date cells with a calendar with list(target = TARGET, date = INDICES); the target columns must have the Date type. If you don’t set date in the editable list, the editing with the calendar is automatically set for all Date columns.

data tbl. The function will automatically cast to tbl if needed.

Value

list of the form list(target = foo, ...)

Author(s)

Jasper Schelfhout

Description

Generate where sql

Usage

whereSQL(conn, table, column, operator = "in", values = NULL)

Arguments

conn database connection object as given by dbConnect.
table character table name (or alias used in query)
column character column of table
operator character
values character vector of values

Value

character sql
