**aatemp**

Annual mean temperatures in Ann Arbor, Michigan

**Description**

The data comes from the U.S. Historical Climatology Network.

**Format**

A data frame with 115 observations on the following 2 variables.

- **year**  year from 1854 to 2000
- **temp**  annual mean temperatures in degrees F in Ann Arbor

**Source**

---

**abrasion**

Wear on materials according to type, run and position

**Description**

The abrasion data frame has 16 rows and 4 columns. Four materials were fed into a wear testing machine and the amount of wear recorded. Four samples could be processed at the same time and the position of these samples may be important. A Latin square design was used.

**Format**

This data frame contains the following columns:

- **run**  The run number 1-4
- **position**  The position number 1-4
- **material**  The material A-D
- **wear**  The wear measured loss of weight in 0.1mm over testing period

**Source**

The Design and Analysis of Industrial Experiments by O. Davies, 1954, published by Wiley
### aflatoxin

**Description**

Aflatoxin B1 was fed to lab animals at vary doses and the number responding with liver cancer recorded.

**Format**

A data frame with 6 observations on the following 3 variables.

- **dose** dose in ppb
- **total** number of test animals
- **tumor** number with liver cancer

**Source**

**Examples**

data(aflatoxin)

### africa

**Description**

Data is a subset of a larger study on factors affecting regime stability in Sub-Saharan Africa

**Format**

A data frame with 47 observations on the following 9 variables.

- **miltcoup** number of successful military coups from independence to 1989
- **oligarchy** number years country ruled by military oligarchy from independence to 1989
- **pollib** Political liberalization - 0 = no civil rights for political expression, 1 = limited civil rights for expression but right to form political parties, 2 = full civil rights
- **parties** Number of legal political parties in 1993
- **pctvote** Percent voting in last election
### Source

The *alfalfa* data frame has 25 rows and 4 columns. Data comes from an experiment to test the effects of seed inoculum, irrigation and shade on alfalfa yield. A latin square design has been used.

### Format

This data frame contains the following columns:

- **shade**  Distance of location from tree line divided into 5 shade areas
- **irrigation** Irrigation effect divided into 5 levels
- **inoculum** Four types of seed incolum, A-D with E as control.
- **yield** Dry matter yield of alfalfa

### Source

---

A matched case control study carried out to investigate the connection between X-ray usage and acute myeloid leukemia in childhood. The pairs are matched by age, race and county of residence.

### Format

A data frame with 238 observations on the following 11 variables.

- **ID** a factor denoting the matched pairs
- **disease** 0=control, 1=case
- **Sex** F or M
- **downs** Presence of Downs syndrome: no or yes
- **age** Age in years
- **Mray** Did the mother ever have an Xray: no or yes
- **MupRay** Did the mother have an Xray of the upper body during pregnancy: no or yes
- **MlowRay** Did the mother have an Xray of the lower body during pregnancy: no or yes
- **Fray** Did the father ever have an Xray: no or yes
- **Cray** Did the child ever have an Xray: no or yes
- **CnRay** Total number of Xrays of the child 1=none < 2=1 or 2 < 3=3 or 4 < 4= 5 or more
**anaesthetic**

**beetle**

*Beetles exposed to fumigant*

Description

Grain beetles were exposed to ethylene oxide

Format

A data frame with 10 observations on the following 3 variables.

- **conc** concentration of ethylene oxide in mg/l
- **affected** number affected
- **exposed** number exposed

Source

Busvine (1938)

---

### breaking

#### Description

An experiment was conducted to select the supplier of raw materials for production of a component. The breaking strength of the component was the objective of interest. Four suppliers were considered. The four operators can only produce one component each per day. A Latin square design was used.

#### Format

A data frame with 16 observations on the following 4 variables.

- **y** The breaking strength of the component
- **operator** the operator - a factor with levels op1 op2 op3 op4
- **day** the day of production - a factor with levels day1 day2 day3 day4
- **supplier** the supplier of the raw material - a factor with levels A B C D
**Source**

**broccoli**  
*Broccoli weight variation*

**Description**

A number of growers supply broccoli to a food processing plant. The plant instructs the growers to pack the broccoli into standard size boxes. There should be 18 clusters of broccoli per box and each cluster should weigh between 1.33 and 1.5 pounds. Because the growers use different varieties, methods of cultivation etc, there is some variation in the cluster weights. The plant manager selected 3 growers at random and then 4 boxes at random supplied by these growers. 3 clusters were selected from each box.

**Format**

A data frame with 36 observations on the following 4 variables.

- **wt** weight of broccoli
- **grower** the grower - a factor with levels 1 2 3
- **box** the box - a factor with levels 1 2 3 4
- **cluster** the cluster - a factor with levels 1 2 3

**Source**

Lentner M. and Bishop T. (1986) Experimental Design and Analysis, Valley Book Company

**butterfat**  
*Butterfat content of milk by breed*

**Description**

Average butterfat content (percentages) of milk for random samples of twenty cows (ten two-year old and ten mature (greater than four years old)) from each of five breeds. The data are from Canadian records of pure-bred dairy cattle.

**Format**

A data frame with 100 observations on the following 3 variables.

- **Butterfat** butter fat content by percentage
- **Breed** a factor with levels Ayrshire Canadian Guernsey Holstein-Fresian Jersey
- **Age** a factor with levels 2year Mature
**cathedral**

**Source**

**Examples**

```r
data(butterfat)
## maybe str(butterfat) ; plot(butterfat) ...
```

**chicago**  
*Chicago insurance redlining*

---

**Description**

Data from a 1970’s study on the relationship between insurance redlining in Chicago and racial composition, fire and theft rates, age of housing and income in 47 zip codes.

**Format**

This dataframe contains the following columns

- **race** racial composition in percent minority
- **fire** fires per 100 housing units
- **theft** theft per 1000 population
- **age** percent of housing units built before 1939
- **involact** new FAIR plan policies and renewals per 100 housing units
- **income** median family income in thousands of dollars
- **side** North or South side of Chicago

**Source**

Adapted from "Data : A Collection of Problems from Many Fields for the Student and Research Worker" by D. Andrews and A. Herzberg published by Springer-Verlag, in 1985
chiczip

<table>
<thead>
<tr>
<th>chiczip</th>
<th>Chicago zip codes north-south</th>
</tr>
</thead>
</table>

Description

Complements the chicago and chmiss datasets by dividing the zip codes into north and south.

Format

chiczip takes the values "n" (north) and "s" south.

### Description

An experiment was conducted to determine the effect of recipe and baking temperature on chocolate cake quality. 15 batches of cake mix for each recipe were prepared. Each batch was sufficient for six cakes. Each of the six cakes was baked at a different temperature which was randomly assigned. Several measures of cake quality were recorded of which breaking angle was just one.

### Format

A data frame with 270 observations on the following 4 variables.

- **recipe** Chocolate for recipe 1 was added at 40°C, Chocolate for recipe 2 was added at 60°C and recipe 3 had extra sugar
- **batch** batch number from 1 to 15
- **temp** temperature at which cake was baked: 175°C 185°C 195°C 205°C 215°C 225°C
- **breakang** the breaking angle of the cake

Malformations of the central nervous system

Description

Frequencies of various malformations of the central nervous system recorded on live births in South Wales, UK. Study was designed to determine the effect of water hardness on the incidence of such malformations.

Format

A data frame with 16 observations on the following 7 variables.

- **Area** a factor with levels Cardiff GlamorganC GlamorganE GlamorganW MonmouthOther MonmouthV Newport Swansea being areas of South Wales
- **NoCNS** count of births with no CNS problem
- **An** count of Anencephalus births
- **Sp** count of Spina Bifida births
- **Other** count of other CNS births
- **Water** water hardness
- **Work** a factor with levels Manual NonManual being the type of work done by the parents

coagulation

Blood coagulation times by diet

Description
Dataset comes from a study of blood coagulation times. 24 animals were randomly assigned to four different diets and the samples were taken in a random order.

Format
This dataframe contains the following columns

- **coag**: coagulation time in seconds
- **diet**: diet type - A, B, C or D

Source

---

composite

Strength of a thermoplastic composite depending on two factors

Description
The composite data frame has 9 rows and 3 columns. Data comes from an experiment to test the strength of a thermoplastic composite depending on the power of a laser and speed of a tape.

Format
This data frame contains the following columns:

- **strength**: interply bond strength of the composite
- **laser**: laser power at 40, 50 or 60W
- **tape**: tape speed, slow=6.42 m/s, medium=13 m/s and fast=27 m/s

Source
Corn yields from nitrogen application

Description

The relationship between corn yield (bushels per acre) and nitrogen (pounds per acre) fertilizer application were studied in Wisconsin.

Format

A data frame with 44 observations on the following 2 variables.

- **yield**: corn yield in bushels per acre
- **nitrogen**: pounds per acre

Source

Unknown

Corrosion loss in Cu-Ni alloys

Description

Data consist of thirteen specimens of 90/10 Cu-Ni alloys with varying iron content in percent. The specimens were submerged in sea water for 60 days and the weight loss due to corrosion was recorded in units of milligrams per square decimeter per day.

Format

This dataframe contains the following columns

- **Fe**: Iron content in percent
- **loss**: Weight loss in mg per square decimeter per day

Source

Description

Projected and actual sales of 20 consumer products. Data have been disguised from original form.

Format

A data frame with 20 observations on the following 2 variables.

- **projected**  projected sales in dollars
- **actual**  actual sales in dollars

Source

Cpplot

Description

Makes a Cp plot

Usage

```r
Cpplot(cp)
```

Arguments

- `cp`  A leaps object returned from leaps()

Details

Requires leaps package

Value

none

Author(s)

Julian Faraway

See Also

leaps()
Description

A study investigated whether babies take longer to learn to crawl in cold months when they are often bundled in clothes that restrict their movement, than in warmer months. The study sought an association between babies’ first crawling age and the average temperature during the month they first try to crawl (about 6 months after birth). Parents brought their babies into the University of Denver Infant Study Center between 1988-1991 for the study. The parents reported the birth month and age at which their child was first able to creep or crawl a distance of four feet in one minute. Data were collected on 208 boys and 206 girls (40 pairs of which were twins).

Format

A data frame with 12 observations on the following 4 variables.

- `crawling`: average crawling age in weeks
- `SD`: standard deviation of crawling age
- `n`: sample size
- `temperature`: average temperature(F) six months after birth

Source

Examples

```r
data(crawl)
## maybe str(crawl) ; plot(crawl) ...
```

describe

Description

An experiment was conducted to study the effects of surface and vision on balance. The balance of subjects were observed for two different surfaces and for restricted and unrestricted vision. Balance was assessed qualitatively on an ordinal four-point scale based on observation by the experimenter. Forty subjects were studied, twenty males and twenty females ranging in age from 18 to 38, with heights given in cm and weights in kg. The subjects were tested while standing on foam or a normal surface and with their eyes closed or open or with a dome placed over their head. Each subject was tested twice in each of the surface and eye combinations for a total of 12 measures per subject.

debt

Description
The data arise from a large postal survey on the psychology of debt.

Format
A data frame with 464 observations on the following 13 variables.

- **incomegp** income group (1=lowest, 5=highest)
- **house** security of housing tenure (1=rent, 2=mortgage, 3=owned outright)
- **children** number of children in household
- **singpar** is the respondent a single parent?
- **agegp** age group (1=youngest)
- **bankacc** does the respondent have a bank account?
- **bsocacc** does the respondent have a building society account?
- **manage** self-rating of money management skill (high values=high skill)
- **ccarduse** how often did s/he use credit cards (1=never... 3=regularly)
- **cigbuy** does s/he buy cigarettes?
- **xmasbuy** does s/he buy Christmas presents for children?
- **locintrn** score on a locus of control scale (high values=internal)
- **prodebt** score on a scale of attitudes to debt (high values=favourable to debt)

Details
All yes/no questions are coded 0=no, 1=yes. Locus of control is a personality measure introduced by Rotter, which claims to differentiate people according to how much they feel things that happen to them are as a result of processes within themselves (internal locus of control) or outside events (external locus of control).

Source
Description

Five suppliers cut denim material for a jeans manufacturer. An algorithm is used to estimate how much material will be wasted given the dimensions of the material supplied. Typically, a supplier wastes more material than the target based on the algorithm although occasionally they waste less. The percentage of waste relative to target was collected weekly for the 5 suppliers. In all, 95 observations were recorded.

Format

A data frame with 95 observations on the following 2 variables.

- **waste**  percentage wastage
- **supplier**  a factor with levels 1 2 3 4 5

This data frame contains the following columns:

- **treat**: Three treatments: O, E or F
- **block**: Four blocks labeled 1-4
- **eggs**: Number of eggs produced

Source

eggs

Nested data on lab testing of eggs

Description

Consistency between laboratory tests is important and yet the results may depend on who did the test and where the test was performed. In an experiment to test levels of consistency, a large jar of dried egg powder was divided up into a number of samples. Because the powder was homogenized, the fat content of the samples is the same, but this fact is withheld from the laboratories. Four samples were sent to each of six laboratories. Two of the samples were labeled as G and two as H, although in fact they were identical. The laboratories were instructed to give two samples to two different technicians. The technicians were then instructed to divide their samples into two parts and measure the fat content of each. So each laboratory reported eight measures, each technician four measures, that is, two replicated measures on each of two samples.

Format

A data frame with 48 observations on the following 4 variables.

- **Fat** a numeric vector
- **Lab** a factor with levels I II III IV V VI
- **Technician** a factor with levels one two
- **Sample** a factor with levels G H

fpe

1981 French Presidential Election

Description

Elections for the French presidency proceed in two rounds. In 1981, there were 10 candidates in the first round. The top two candidates then went on to the second round, which was won by Francois Mitterand over Valery Giscard-d’Estaing. The losers in the first round can gain political favors by urging their supporters to vote for one of the two final candidates. Since voting is private, we cannot know how these votes were transferred, we might hope to infer from the published vote totals how this might have happened. Data is given for vote totals in every fourth department of France:
**Format**

This dataframe contains the following columns (vote totals are in thousands)

- **EI**: Electeur Inscrits (registered voters)
- **A**: Voters for Mitterand in the first round
- **B**: Voters for Giscard in the first round
- **C**: Voters for Chirac in the first round
- **D**: Voters for Communists in the first round
- **E**: Voters for Ecology party in the first round
- **F**: Voters for party F in the first round
- **G**: Voters for party G in the first round
- **H**: Voters for party H in the first round
- **I**: Voters for party I in the first round
- **J**: Voters for party J in the first round
- **K**: Voters for party K in the first round
- **A2**: Voters for Mitterand in the second round
- **B2**: Voters for party Giscard in the second round
- **N**: Difference between the number of voters in the second round and in the first round

**Source**

---

```r
table(fruitfly)

<table>
<thead>
<tr>
<th></th>
<th>fruitfly</th>
<th>Longevity of fruitflies depending on sexual activity and thorax length</th>
</tr>
</thead>
</table>
```

Description

The `fruitfly` data frame has 9 rows and 3 columns. 125 fruitflies were divided randomly into 5 groups of 25 each. The response was the longevity of the fruitfly in days. One group was kept solitary, while another was kept individually with a virgin female each day. Another group was given 8 virgin females per day. As an additional control the fourth and fifth groups were kept with one or eight pregnant females per day. Pregnant fruitflies will not mate. The thorax length of each male was measured as this was known to affect longevity. One observation in the many group has been lost.

Format

This data frame contains the following columns:

- `thorax` Thorax length
- `longevity` Lifetime in days
- `activity` The group: isolated = fly kept solitary, one = fly kept with one pregnant fruitfly, many = fly kept with eight pregnant fruitflies, low= fly kept with one virgin fruitfly, high = fly kept with eight virgin fruitflies.

Species diversity on the Galapagos Islands

Description
There are 30 Galapagos islands and 7 variables in the dataset. The relationship between the number of plant species and several geographic variables is of interest. The original dataset contained several missing values which have been filled for convenience. See the galamiss dataset for the original version.

Format
The dataset contains the following variables

- **Species**  the number of plant species found on the island
- **Endemics**  the number of endemic species
- **Area**  the area of the island (km$^2$)
- **Elevation**  the highest elevation of the island (m)
- **Nearest**  the distance from the nearest island (km)
- **Scruz**  the distance from Santa Cruz island (km)
- **Adjacent**  the area of the adjacent island (square km)

Source

manilius

Mayer's 1750 data on the Manilius crater on the moon

---

Description

In 1750, Tobias Mayer collected data on various landmarks on the moon in order to determine its orbit. The data involving the position of the Manilius crater resulted in a least squares like problem. The example is discussed in Steven Stigler's History of Statistics.

Format

A data frame with 27 observations on the following 4 variables.

- **arc**: an angle known as \( h \) in Stigler's notation
- **sinang**: the \( \sin(g-k) \) where \( g \) and \( k \) are two angles in Stigler
- **cosang**: the \( \cos(g-k) \) where \( g \) and \( k \) are two angles in Stigler
- **group**: one of three groups determined by Mayer

Details

See Stigler for a detailed description.

**meatspec**

*Meat spectrometry to determine fat content*

**Description**

A Tecator Infratec Food and Feed Analyzer working in the wavelength range 850 - 1050 nm by the Near Infrared Transmission (NIT) principle was used to collect data on samples of finely chopped pure meat. 215 samples were measured. For each sample, the fat content was measured along with a 100 channel spectrum of absorbances. Since determining the fat content via analytical chemistry is time consuming we would like to build a model to predict the fat content of new samples using the 100 absorbances which can be measured more easily.
**Format**

Dataset contains the following variables

- **V1-V100** absorbances across a range of 100 wavelengths
- **fat** fat content

**Source**

### neighbor

**Description**

Subjects were asked questions in a study of neighborly help. Questions below are a subset of the full study.

**Format**

A data frame with 181 observations on the following 8 variables.

- **longlive**: About how long have you lived where you do now? Ans is a factor with levels <6mos 6-12mos 1-3yrs 3-10yrs 10yrs
- **wherebfr**: Where were you living before you moved to your present house? Ans is a factor with levels same Exeter Devon Britain Abroad
- **hownbly**: How neighborly do you think the area where you now live is? Ans is a factor with levels Vunfriendly NVfriendly Average FFriendly VFriendly
knowname Roughly how many people in your street, or in the streets just near you, do you know the names of? Ans is a factor with levels none 1–5 6–20 20+
callname How many of those people (not counting children) would you call by their first names? Ans is a factor with levels none 1–5 6–20 20+
age a factor with levels −18 18–30 31–50 51–65 65+
district a factor with levels 1 2 3 4
sex a factor with levels female male

Details
Exeter is a city in the county of Devon which is in Britain. The four districts can be briefly described as follows. District 1 was a long-established residential area near the city centre, with housing dating from the late nineteenth century. Originally working class, it now has a considerable middle class population with some student and other temporary accommodation. District 2 was a working-class housing estate dating from the 1930s, with mainly rented accommodation but some owner occupation. District 3 was the oldest part of a more recently developed, mainly middle-class, almost exclusively owner-occupied estate, dating from the 1960s. District 4 was the most recently developed part of a more sought-after middle-class residential area, with smaller but almost entirely owner-occupied properties dating from the 1970s and 1980s.

**Nepali child health study**

**Description**

The data are a subset from public health study on Nepalese children.

**Format**

A data frame with 1000 observations on the following 9 variables.

- **id** There is a six digit code for the child’s ID: 2 digits for the panchayat number; 2 digits for the ward within panchayat; 1 digits for the household; 1 digit for child within household.
- **sex** 1 = male; 2 = female
- **wt** Child’s weight measured in kilograms
- **ht** Child’s height measured in centimeters
- **mage** Mother’s age in years
- **lit** Indicator of mother’s literacy: 0 = no; 1 = yes
- **died** The number of children the mother has had that died.
- **alive** The number of children the mother has ever had born alive
- **age** age of child

US 1996 national election study

Description

10 variable subset of the 1996 American National Election Study. Missing values and "don't know" responses have been deleted. Respondents expressing a voting preference other than Clinton or Dole have been removed.

Format

A data frame with 944 observations on the following 10 variables.

- **popul** population of respondent’s location in 1000s of people
- **TVnews** days in the past week spent watching news on TV
- **selfLR** Left-Right self-placement of respondent: an ordered factor with levels extremely liberal, 
  - extLib < liberal, Lib < slightly liberal, sliLib < moderate, Mod < slightly conservative, 
  - sliCon < conservative, Con < extremely conservative, extCon
- **ClinLR** Left-Right placement of Bill Clinton (same scale as selfLR): an ordered factor with levels 
  - extLib < Lib < sliLib < Mod < sliCon < Con < extCon
- **DoleLR** Left-Right placement of Bob Dole (same scale as selfLR): an ordered factor with levels 
  - extLib < Lib < sliLib < Mod < sliCon < Con < extCon
- **PID** Party identification: an ordered factor with levels strong Democrat, 
  - strDem < weak Democrat, 
  - weakDem < independent Democrat, indDem < independent independentind < independent Republican, indRep < weak Republican, weakRep < strong Republican, strRep
- **age** Respondent’s age in years
- **educ** Respondent’s education: an ordered factor with levels 8 years or less, 
  - MS < high school dropout, HSdrop < high school diploma or GED, HS < some College, Coll < Community or junior College degree, Colldeg < BA degree, BAdeg < postgraduate degree, MAdeg
- **vote** Expected vote in 1996 presidential election: a factor with levels Clinton and Dole

Source

References

Description

Votes and other demographic information from 276 wards in the 2008 Democratic Party presidential primary.

Format

A data frame with 276 observations on the following 12 variables.

- **votesys**: The voting system used where H is counted by hand and D is counted by machine.
- **Obama**: The number of votes for Barack Obama.
- **Clinton**: The number of votes for Hillary Clinton.
- **dem**: The total number of votes cast in the Democratic primary (there were other candidates besides Clinton and Obama).
- **povrate**: The poverty rate as a proportion as determined by the 2000 census.
- **pci**: Per capita annual income in USD in 1999.
- **Dean**: The proportion of voters for Howard Dean in the 2004 Democratic primary.
- **Kerry**: The proportion of voters for John Kerry in the 2004 Democratic primary.
- **white**: The proportion of non-Hispanic whites according to the 2000 census.
- **absentee**: The proportion voting by absentee ballot.
- **population**: An estimate of the population from 2002.
- **pObama**: Proportion voting for Obama.

Details

On the 8th January 2008, primaries to select US presidential candidates were held in New Hampshire. In the Democratic party primary, Hillary Clinton defeated Barack Obama contrary to the expectations pre-election opinion polls. Essentially two different voting technologies were used in New Hampshire. Some wards used paper ballots, counted by hand while others used optically scanned ballots, counted by machine. Among the paper ballots, Obama had more votes than Clinton while Clinton defeated Obama on just the machine counted ballots. Since the method of voting should make no causal difference to the outcome, suspicions have been raised regarding the integrity of the election.

qqnorm1

qqnorm1 Labeled QQ plot

Description
Makes a labeled QQ plot

Usage
qqnorm1(
  y,
  main = "Normal Q-Q Plot",
  xlab = "Theoretical Quantiles",
  ylab = "Sample Quantiles",
  ...
)

**Arguments**

- `y`  A numeric vector
- `main`  main label
- `xlab`  x-axis label
- `ylab`  y-axis label
- ... arguments passed to plot()

**Value**

- none

**Author(s)**

- Julian Faraway

**See Also**

- `qqnorm`

**Examples**

```r
qqnorm(rnorm(16))
```

---

**rabbit**  

*Rabbit weight gain by diet and litter*

---

**Description**

A nutritionist studied the effects of six diets, on weight gain of domestic rabbits. From past experience with sizes of litters, it was felt that only 3 uniform rabbits could be selected from each available litter. There were ten litters available forming blocks of size three.

**Format**

The variables in the dataset were

- `treat`  Diet a through f
- `gain`  Weight gain
- `block`  Block (10 litters)

**Source**

"Experimental Design and Analysis" by M. Lentner and T. Bishop, Valley Book Company, 1986
ratdrink  
*Rat growth weights affected by additives*

**Description**

The data consist of 5 weekly measurements of body weight for 27 rats. The first 10 rats are on a control treatment while 7 rats have thyroxine added to their drinking water. 10 Rats have thiouracil added to their water.

**Format**

A data frame with 135 observations on the following 4 variables.

- **wt**  Weight of the rat
- **weeks**  Week of the study from 0 to 4
- **subject**  the rat code number
- **treat**  treatment applied to the rat drinking water - a factor with levels control thiouracil thyroxine

**Source**

Unknown

rats  
*Effect of toxic agents on rats*

**Description**

An experiment was conducted as part of an investigation to combat the effects of certain toxic agents.

**Format**

A data frame with 48 observations on the following 3 variables.

- **time**  survival time in tens of hours
- **poison**  the poison type - a factor with levels I II III
- **treat**  the treatment - a factor with levels A B C D

**Source**

**resceram**  
*Shape and plate effects on current noise in resistors*

**Description**

The resceram data frame has 12 rows and 3 columns. Shape and plate effects on current noise in resistors

**Format**

This data frame contains the following columns:

- **noise** current noise
- **shape** the geometrical shape of the resistor, A, B, C or D
- **plate** the ceramic plate on which the resistor was mounted. Only three resistors will fit on one plate.

**salmonella**  
*Salmonella reverse mutagenicity assay*

**Description**

The data was collected in a salmonella reverse mutagenicity assay where the numbers of revertant colonies of TA98 Salmonella observed on each of three replicate plates for different doses of quinoline

**Format**

A data frame with 18 observations on the following 2 variables.

- **colonies** numbers of revertant colonies of TA98 Salmonella
- **dose** dose level of quinoline

**Source**

**sat**  *School expenditure and test scores from USA in 1994-95*

**Description**

The sat data frame has 50 rows and 7 columns. Data were collected to study the relationship between expenditures on public education and test results.

**Format**

This data frame contains the following columns:

- **expend**: Current expenditure per pupil in average daily attendance in public elementary and secondary schools, 1994-95 (in thousands of dollars)
- **ratio**: Average pupil/teacher ratio in public elementary and secondary schools, Fall 1994
- **salary**: Estimated average annual salary of teachers in public elementary and secondary schools, 1994-95 (in thousands of dollars)
- **takers**: Percentage of all eligible students taking the SAT, 1994-95
- **verbal**: Average verbal SAT score, 1994-95
- **math**: Average math SAT score, 1994-95
- **total**: Average total score on the SAT, 1994-95

LifeCycleSavings

Description

Car drivers like to adjust the seat position for their own comfort. Car designers would find it helpful to know where different drivers will position the seat depending on their size and age. Researchers at the HuMoSim laboratory at the University of Michigan collected data on 38 drivers.

Format

The dataset contains the following variables

- **Age** Age in years
- **Weight** Weight in lbs
- **HtShoes** Height in shoes in cm
- **Ht** Height bare foot in cm
- **Seated** Seated height in cm
- **Arm** lower arm length in cm
- **Thigh** Thigh length in cm
- **Leg** Lower leg length in cm
- **hipcenter** horizontal distance of the midpoint of the hips from a fixed location in the car in mm

sexab Post traumatic stress disorder in abused adult females

Description
The data for this example come from a study of the effects of childhood sexual abuse on adult females. 45 women being treated at a clinic, who reported childhood sexual abuse, were measured for post traumatic stress disorder and childhood physical abuse both on standardized scales. 31 women also being treated at the same clinic, who did not report childhood sexual abuse were also measured. The full study was more complex than reported here and so readers interested in the subject matter should refer to the original article.

Format
The variables in the dataset are

- cpa Childhood physical abuse on standard scale
- ptsd Post-traumatic stress disorder on standard scale
- csa Childhood sexual abuse - abused or not abused

Source

sexfun Marital sex ratings

Description
Data from a questionnaire from 91 couples in the Tucson, Arizona area. Subjects answered the question "Sex is fun for me and my partner". The possible answers were "never or occasionally", "fairly often", "very often" and "almost always"
Format

A data frame with 16 observations on the following 3 variables.

- **y** the count
- **husband** a factor with levels never fairly very always
- **wife** a factor with levels never fairly very always

sono  

Sonoluminescence

Description

The sono data frame has 16 rows and 8 columns. Sonoluminescence is the process of turning sound energy into light. An experiment was conducted to study factors affecting this process.
Format

This data frame contains the following columns:

- **Intensity**  Sonoluminescent light intensity
- **Molarity**  Amount of Solute. The coding is "low" for 0.10 mol and "high" for 0.33 mol.
- **Solute**  Solute type. The coding is "low" for sugar and "high" for glycerol.
- **pH**  The coding is "low" for 3 and "high" for 11.
- **Gas**  Gas type in water. The coding is "low" for helium and "high" for air.
- **Water**  Water depth. The coding is "low" for half and "high" for full.
- **Horn**  Horn depth. The coding is "low" for 5 mm and "high" for 10 mm.
- **Flask**  Flask clamping. The coding is "low" for unclamped and "high" for clamped.

suicide

Suicide method data from the UK

Description
One year of suicide data from the United Kingdom crossclassified by sex, age and method.

Format
A data frame with 36 observations on the following 4 variables.

- **y**: number of people
- **cause**: method used - a factor with levels drug (suicide by solid or liquid matter), gas, gun (guns, knives or explosives), hang (hanging, strangling, suffocating or drowning), jump other
- **age**: a factor with levels m (middle-aged), o (old), y (young)
- **sex**: a factor with levels f, m

Source

sumary
Abbreviated Regression Summary

Description
Generic summaries for lm, glm and mer objects

Usage
sumary(object, ...)

Arguments
- **object**: An lm, glm or mer object returned from lm(), glm() or lmer() respectively
- **...**: further arguments passed to or from other methods.

Details
This generic function provides an abbreviated regression output containing the more useful information. Users wanting to see more are advised to use summary()

Value
returns the same as summary()
Author(s)

Julian Faraway

References

This function is adapted from the `display()` function in the `arm` package.

### toenail

**Toenail infection treatment study**

**Description**

The data come from a Multicenter study comparing two oral treatments for toenail infection. Patients were evaluated for the degree of separation of the nail. Patients were randomized into two treatments and were followed over seven visits - four in the first year and yearly thereafter. The patients have not been treated prior to the first visit so this should be regarded as the baseline.

**Format**

A data frame with 1908 observations on the following 5 variables.

- **ID**  ID of patient
- **outcome**  0=none or mild separation, 1=moderate or severe
- **treatment**  the treatment A=0 or B=1
- **month**  time of the visit (not exactly monthly intervals hence not round numbers)
- **visit**  the number of the visit

**Source**

wavesolder  Defects in a wave soldering process

---

Description

Components are attached to an electronic circuit card assembly by a wave-soldering process. The soldering process involves baking and preheating the circuit card and then passing it through a solder wave by conveyor. Defect arise during the process. Design is $2^7-3$ with 3 replicates.

Format

A data frame with 16 observations on the following 10 variables.

- **y1**  Number of defects in the first replicate
- **y2**  Number of defects in the second replicate
- **y3**  Number of defects in the third replicate
- **prebake**  prebake condition - a factor with levels 1 2
- **flux**  flux density - a factor with levels 1 2
- **speed**  conveyor speed - a factor with levels 1 2
- **preheat**  preheat condition - a factor with levels 1 2
- **cooling**  cooling time - a factor with levels 1 2
- **agitator**  ultrasonic solder agitator - a factor with levels 1 2
- **temp**  solder temperature - factor with levels 1 2

Source

L. Condra (1993) Reliability improvement with design of experiments. Marcel Dekker, NY.

References

Description

Data come from a study of breast cancer in Wisconsin. There are 681 cases of potentially cancerous tumors of which 238 are actually malignant. Determining whether a tumor is really malignant is traditionally determined by an invasive surgical procedure. The purpose of this study was to determine whether a new procedure called fine needle aspiration which draws only a small sample of tissue could be effective in determining tumor status.

Format

A data frame with 681 observations on the following 10 variables.

- **Class**  0 if malignant, 1 if benign
- **Adhes**  marginal adhesion
- **BNucl**  bare nuclei
- **Chrom**  bland chromatin
- **Epith**  epithelial cell size
- **Mitos**  mitoses
- **NNucl**  normal nucleoli
- **Thick**  clump thickness
- **UShap**  cell shape uniformity
- **USize**  cell size uniformity

Details

The predictor values are determined by a doctor observing the cells and rating them on a scale from 1 (normal) to 10 (most abnormal) with respect to the particular characteristic.

Source

Description

3154 healthy young men aged 39-59 from the San Francisco area were assessed for their personality type. All were free from coronary heart disease at the start of the research. Eight and a half years later change in this situation was recorded.

Format

A data frame with 3154 observations on the following 13 variables.

- **age**: age in years
- **height**: height in inches
- **weight**: weight in pounds
- **sdp**: systolic blood pressure in mm Hg
- **dbp**: diastolic blood pressure in mm Hg
- **chol**: Fasting serum cholesterol in mm %
- **behave**: behavior type which is a factor with levels A1 A2 B3 B4
- **cigs**: number of cigarettes smoked per day
- **dibep**: behavior type a factor with levels A (Aggressive) B (Passive)
- **chd**: coronary heart disease developed is a factor with levels no yes
- **typechd**: type of coronary heart disease is a factor with levels angina infdeath none silent
- **timechd**: Time of CHD event or end of follow-up
- **arcus**: arcus senilis is a factor with levels absent present

Details

The WCGS began in 1960 with 3,524 male volunteers who were employed by 11 California companies. Subjects were 39 to 59 years old and free of heart disease as determined by electrocardiogram. After the initial screening, the study population dropped to 3,154 and the number of companies to 10 because of various exclusions. The cohort comprised both blue- and white-collar employees. At baseline the following information was collected: socio-demographic including age, education, marital status, income, occupation; physical and physiological including height, weight, blood pressure, electrocardiogram, and corneal arcus; biochemical including cholesterol and lipoprotein fractions; medical and family history and use of medications; behavioral data including Type A interview, smoking, exercise, and alcohol use. Later surveys added data on anthropometry, triglycerides, Jenkins Activity Survey, and caffeine use. Average follow-up continued for 8.5 years with repeat examinations.
