Package ‘fhircrackr’

July 14, 2022

Type  Package
Title  Handling HL7 FHIR Resources in R
Version 2.0.0
Date 2022-07-13
Description Useful tools for conveniently downloading FHIR resources in xml format and converting them to R data.frames. The package uses FHIR-search to download bundles from a FHIR server, provides functions to save and read xml-files containing such bundles and allows flattening the bundles to data.frames using XPath expressions.

BugReports https://github.com/POLAR-fhiR/fhircrackr/issues
License GPL-3
Encoding UTF-8
LazyData true
RoxygenNote  7.2.0
Imports xml2, stringr, httr, utils, data.table, methods, parallel, lifecycle
Suggests knitr, rmarkdown

example_bundles1

Toy example bundles for multiple entries

Description

These data examples are bundles that contain very few very simple Patient resources that have multiple entries and can be used for demonstration purposes. See Source for how the xml versions look.

Usage

example_bundles1

example_bundles2

example_bundles3

example_bundles4
Format

An object of class fhir_bundle_list of length 1.
An object of class fhir_bundle_list of length 1.
An object of class fhir_bundle_list of length 1.
An object of class fhir_bundle_list of length 1.

Details

e.example_bundles1 contains 1 bundle with 2 Patient resources.
e.example_bundles2 contains 1 bundle with 3 Patient resources.
e.example_bundles3 contains 1 bundle with 3 Patient resources and 1 Observation resource.
e.example_bundles4 contains 1 bundle with 2 Medication resources, one of which has some @id xml attributes

fhir_authenticate

Examples

#unserialize xml objects before doing anything else with them!
fhir_unserialize(bundles = example_bundles1)
#unserialize xml objects before doing anything else with them!
fhir_unserialize(example_bundles2)
#unserialize xml objects before doing anything else with them!
fhir_unserialize(bundles = example_bundles3)
#unserialize xml objects before doing anything else with them!
fhir_unserialize(bundles = example_bundles4)

fhir_authenticate Create token for Authentication

Description

This function is a wrapper to create an http::Token object for authentication with OAuth2/OpenID Connect. Internally, it calls http::oauth_app(), http::oauth_endpoint() and http::oauth2.0_token() to create a token that can then be used in fhir_search.

Usage

fhir_authenticate(
    secret,
    key,
    base_url,
    access,
    authorize,
    query_authorize_extra = list()
)

Arguments

secret The consumer/client secret, belonging to key.
key Consumer key, also called client ID. For Keycloak this would for instance be the Keycloak client, e.g. "postman".
base_url The URL the user will be redirected to after authorization is complete. This will usually be the base url of you FHIR server.
access The url used to exchange unauthenticated for authenticated token. This can be identical to authorize.
authorize The url to send the client for authorization.
query_authorize_extra

A named list holding query parameters to append to initial auth page query. Could hold info about user identity and scope for keycloak like this:

```r
list(scope = "openid",
     grant_type = "password",
     username = "fhir-user",
     password = "fhirtest")
```

---

**fhir_body**  
Create fhir_body object

**Usage**

```r
fhir_body(content, type)
```

- **## S4 method for signature 'list,missing'**
  ```r
  fhir_body(content)
  ```

- **## S4 method for signature 'list,character'**
  ```r
  fhir_body(content, type)
  ```

- **## S4 method for signature 'character,character'**
  ```r
  fhir_body(content, type)
  ```

**Arguments**

- **content**  
  A character vector of length one representing the body for the post in the format specified in `type`. If you provide a named list here, it will be taken as key value pairs of FHIR search parameters and will be concatenated appropriately. In this case the `type` will automatically be set to "application/x-www-form-urlencoded". See examples.

- **type**  
  A string defining the type of the body e.g. "application/x-www-form-urlencoded" or "xml".

**Value**

An object of type **fhir_body**.

**Examples**

A body that could be used in a FHIR search request POSTed to an URL like baseurl/Patient/_search

```r
fhir_body(content = "gender=female&_summary=count", type="application/x-www-form-urlencoded")
fhir_body(content = list("gender" = "female", "_summary" = "count"))
```
**fhir_body-class**  
An S4 class to represent a body for a POST to a FHIR server

**Description**  
Objects of this class should always be created with a call to the function `fhir_body()`.

**Slots**  
- **content**: A vector of length one representing the body for the post.
- **type**: A vector of length one defining the type of the body e.g. "application/x-www-form-urlencoded" or "xml".

**fhir_build_bundle**  
Build a FHIR bundle

**Description**  
This function takes a table as produced by `fhir_crack()` with `format="wide"` and builds a `fhir_bundle_xml` object from it. It is primarily used to create transaction/batch bundles to POST back to a FHIR server. The column names of the table must represent the XPath expression of the respective element with indices for repeating items. A table like this is produced when FHIR resources have been cracked with `fhir_crack()` without assigning explicit column names in the `fhir_design/fhir_table_description` and the format has been set to "wide".

**Usage**

```r
fhir_build_bundle(
  table,
  brackets,
  resource_type,
  bundle_type = "transaction",
  verbose = 1
)
```

```r
## S4 method for signature 'data.frame'

fhir_build_bundle(
  table,
  brackets,
  resource_type,
  bundle_type = "transaction",
  verbose = 1
)
```

```r
## S4 method for signature 'list'

fhir_build_bundle(table, brackets, bundle_type = "transaction", verbose = 1)
```
Arguments

- **table**: A wide table as produced by `fhir_crack()`, possibly modified (see details) or a named list of wide tables, if different resource types have to be included in the same bundle. In this case the names of the list elements must correspond to the resource type represented in the table!

- **brackets**: A character vector of length one. The brackets used for cracking.

- **resource_type**: A character vector of length one or `fhir_resource_type` object indicating which resource type is represented in the table, if a single table is provided. This argument is ignored when `table` is a named list of tables.

- **bundle_type**: A character vector of length one defining the bundle type. Will usually be either "transaction" (the default) or "batch".

- **verbose**: An integer vector of length one. If 0, nothing is printed, if > 0 progress message is printed. Defaults to 1.

Details

The typical use case would look like this:

1. Download resources from a server with `fhir_search()`
2. Crack to wide format them with `fhir_crack()`
3. Do something to values (e.g. some kind of anonymization)
4. Translate the data back into FHIR resources with `fhir_build_bundle()`
5. Post the resources to a server

A FHIR bundle that can be POSTed to a server is usually of type transaction or batch. Each entry of these bundles consists of the resource itself as well as an instruction for the server of what to do with the resource. A very simple example looks like this:

```xml
<Bundle>
  <type value="transaction"/>
  <entry>
    <resource>
      <Patient>
        <id value="id1"/>
        <address>
          <city value="Amsterdam"/>
          <country value="Netherlands"/>
        </address>
        <name>
          <given value="Marie"/>
        </name>
      </Patient>
    </resource>
    <request>
      <method value="POST"/>
      <url value="Patient"/>
    </request>
  </entry>
</Bundle>
```
<request>
  <entry>
    <resource>
      <Patient>
        <id value="id2"/>
        <address>
          <city value="Paris"/>
          <country value="France"/>
        </address>
        <name>
          <given value="Anne"/>
        </name>
      </Patient>
    </resource>
  </entry>
</request>

In this example the bundle contains two Patient resources that are sent to server with a POST. For more information the structure of transaction/batch bundles, please see the FHIR documentation at https://www.hl7.org/fhir/http.html and https://www.hl7.org/fhir/bundle.html.

In the table, each row corresponds to one resource that is created. To add the information for the request element of the bundle, this table has to be augmented with two columns named request.method and request.url, which contain the respective HTTP verb and URL for the resource. If these columns are not added to the table, `fhir_build_bundle()` still builds bundles from it, but those bundles will not be POSTable to a server. See examples.

Value

A `fhir_bundle_xml` object.

See Also

`fhir_crack()`, `fhir_cast()`, `fhir_build_resource()`, `fhir_post()`

Examples

```r
#unserialize example
bundles <- fhir_unserialize(bundles = example_bundles1)

#crack fhir resources
table_desc_pat <- fhir_table_description(
  resource = "Patient",
  brackets = c("[", "]"),
  sep    = " ",
```
df <- fhir_crack(bundles = bundles, design = table_desc_pat)

#add request info to table
request <- data.frame(
  request.method = c("POST", "PUT"),
  request.url = c("Patient", "Patient/id3")
)

request_df <- cbind(df, request)

#build bundle
bundle <- fhir_build_bundle(table = request_df,
  brackets = table_desc_pat@brackets,
  resource_type = "Patient",
  bundle_type = "transaction")

#print to console
cat(toString(bundle))

---

**fhir_build_resource**  
*Build a single FHIR resource*

**Description**

This function takes a single row from a wide table as produced by `fhir_crack()` and builds a `fhir_resource_xml` object from it. The column names of the table must represent the XPath expression of the respective element with indices for repeating items. A table like this is produced when FHIR resources have been cracked with `fhir_crack()` without assigning explicit column names in the `fhir_design/fhir_table_description` and with format set to "wide".

**Usage**

`fhir_build_resource(row, brackets, resource_type)`

**Arguments**

- **row**  
  Single row from a wide table as produced by `fhir_crack()` with format="wide"

- **brackets**  
  A character vector of length one. The brackets used for cracking.

- **resource_type**  
  A character vector of length one or `fhir_resource_type` object indicating which resource type the table is build from.

**Value**

A `fhir_resource_xml` object.
See Also

fhir_cast(), fhir_crack(), fhir_build_bundle(), fhir_post(), fhir_put()

Examples

# unserialize example
bundles <- fhir_unserialize(bundles = example_bundles)

# crack fhir resources
Pat <- fhir_table_description(
  resource = "Patient",
  brackets = c("
     ", "
     
   "),
  sep      = " ",
  format   = "wide"
)

df <- fhir_crack(bundles = bundles, design = Pat)

# build resource
resource <- fhir_build_resource(
  row       = df[1,],
  brackets  = c("[", "]"),
  resource_type = "Patient"
)

# print to console
resource

---

fhir_bundle-class  
An S4 class to represent FHIR bundles

Description

An S4 class to represent FHIR bundles

---

fhir_bundle_list  
Create fhir_bundle_list object

Description

A fhir_bundle_list is a list of fhir_bundle_xml or fhir_bundle_serialized objects. It is usually returned by a call to fhir_search().

Usage

fhir_bundle_list(bundles)
Arguments

bundles A list of xml_nodes/fhir_bundle_xml objects or of raw/fhir_bundle_serialized objects

Details

The only scenario where one would use this constructor function is when several fhir_bundle or fhir_bundle_list objects should be merged into one big fhir_bundle_list before cracking (see examples).

Examples

#unserialize example bundles
bundles1 <- fhir_unserialize(example_bundles1)
bundles2 <- fhir_unserialize(example_bundles2)

#bind them together in one fhir_bundle_list
bound_bundles <- fhir_bundle_list(c(bundles1, bundles2))
class(bound_bundles)

#bound list contains bundles from both original lists
length(bundles1)
length(bundles2)
length(bound_bundles)

#Create fhir_bundle list from xml objects
b1 <- xml2::read_xml("<Bundle><Resource><item value='1'/></Resource></Bundle>")
b2 <- xml2::read_xml("<Bundle><Resource><item value='2'/></Resource></Bundle>")

fhir_bundle_list(bundles = list(b1, b2))
fhir_bundle_list(bundles = list(fhir_bundle_xml(b1), fhir_bundle_xml(b2)))

r1 <- xml2::xml_serialize(object = b1, connection= NULL)
r2 <- xml2::xml_serialize(object = b2, connection= NULL)

fhir_bundle_list(bundles = list(r1, r2))
**fhir_bundle_serialized-class**

An S4 class to represent a FHIR bundle in serialized form

Description

A `fhir_bundle_serialized` is a `fhir_bundle_xml` that has been serialized using `fhir_serialize()`. In this form, the bundle cannot be used in any meaningful way, but it can be saved and loaded as an `.RData` or `.rds` object without breaking the external pointers in the xml. See `?fhir_serialize` and `?fhir_unserialize`.

---

**fhir_bundle_xml**

Create `fhir_bundle_xml` object

Description

This should only be used if you want to create small examples. Usually, a `fhir_bundle_xml` will be returned by `fhir_search()`.

Usage

`fhir_bundle_xml(bundle)`

Arguments

- `bundle` A xml-object representing a FHIR bundle

Examples

```r
fhir_bundle_xml(bundle = xml2::xml_unserialize(patient_bundles[[1]]))
```

---

**fhir_bundle_xml-class**

An S4 class to represent a FHIR bundle in xml form

Description

A `fhir_bundle_xml` is an xml representation of a FHIR bundle (https://www.hl7.org/fhir/bundle.html). It is usually found inside a `fhir_bundle_list` which is returned by a call to `fhir_search()`.

Slots

- `next_link` A `fhir_url` pointing to the next bundle on the server.
- `self_link` A `fhir_url` pointing to this bundle on the server.
**fhir_canonical_design**

Retrieves the design of the last call to `fhir_crack()`.

**Usage**

```r
fhir_canonical_design()
```

**See Also**

`fhir_design()`, `fhir_table_description()`

**Examples**

```r
# load example bundles
bundles <- fhir_unserialize(bundles = patient_bundles)

# define design
patients <- fhir_table_description(resource = 'Patient')

design <- fhir_design(patients)

result <- fhir_crack(bundles = bundles, design = design)

fhir_canonical_design()
```

---

**fhir_capability_statement**

*Get capability statement*

**Description**

Get the capability statement of a FHIR server.

This function downloads a capability statement and creates three data.frames from it:

- **Meta** contains general information on the server
- **Rest** contains information on the Rest operations the server supports
- **Resources** contains information on the supported resource types

When there is more than one piece of information regarding a variable in these data.frames, they are divided by the string specified in `sep`. If `brackets` is not NULL, those entries will also be assigned indices so you can melt them using `fhir_melt()`.
Usage

```r
fhir_capability_statement(
    url = "https://hapi.fhir.org/baseR4",
    username = NULL,
    password = NULL,
    token = NULL,
    brackets = NULL,
    sep = " ::: ",
    log_errors = NULL,
    verbose = deprecated()
)
```

Arguments

- **url**: The base URL of the FHIR server.
- **username**: A character vector of length one containing the username for basic authentication. Defaults to NULL, meaning no authentication.
- **password**: A character vector of length one containing the password for basic authentication. Defaults to NULL, meaning no authentication.
- **token**: A character vector of length one or object of class `httr::Token`, for bearer token authentication (e.g. OAuth2). See `fhir_authenticate()` for how to create this.
- **brackets**: A character vector of length two defining the brackets surrounding indices for multiple entries, e.g. `c("[", "]")`. Defaults to NULL. If NULL, no indices will be added to multiple entries.
- **sep**: A character vector of length one to separate pasted multiple entries.
- **log_errors**: Either NULL or a character vector of length one indicating the name of a file in which to save the http errors. NULL means no error logging. When a file name is provided, the errors are saved in the specified file. Defaults to NULL.
- **verbose**: [Deprecated]

Value

A list of data frames containing the information from the statement

Examples

```r
## Not run:
#without indices
cap <- fhir_capability_statement(url = "https://server.fire.ly")

#with indices
cap <- fhir_capability_statement(url = "https://server.fire.ly",
                                  brackets = c("[","]"),
                                  sep = " || ")

#melt searchInclude variable
```
resources <- fhir_melt(cap$Resources, 
columns = "searchInclude",
brackets = c("[", "]"), 
sep = " || ", 
all_columns = FALSE)

#remove indices
resources <- fhir_rm_indices(resources, brackets = c("[", "]"))

head(resources)

## End(Not run)

fhir_cast

Cast table with multiple entries This function divides multiple entries in a compact indexed table as produced by fhir_crack() into separate columns.

Description

This function turns a table from compact format into wide format. Every column containing multiple entries will be turned into multiple columns. The number of columns created from a single column in the original table is determined by the maximum number of multiple entries occurring in this column. Rows with less than the maximally occurring number of entries will be filled with NA values.

Usage

fhir_cast(indexed_df, brackets, sep, verbose = 1)

Arguments

indexed_df A compact data.frame/data.table with indexed multiple entries. Column names should reflect the XPath expression of the respective element.
brackets A character vector of length two, defining the brackets used for the indices.
sep A character vector of length one defining the separator that was used when pasting together multiple entries in fhir_crack().
verbose An integer vector of length one. If 0, nothing is printed, if 1, only general progress is printed, if > 1, progress for each variable is printed. Defaults to 1.

Details

For fhir_cast() to work properly, column names of the input data must reflect the Xpath to the corresponding resource element with . as a separator, e.g. code.coding.system. These names are produced automatically by fhir_crack() when the names are not explicitly set in the cols element of the fhir_table_description()/fhir_design().

In the names of the newly created columns the indices will be added in front of the column names, similar to the result of fhir_crack() with format="wide". See examples and the corresponding package vignette for a more detailed description.
See Also

fhir_crack(), fhir_melt(), fhir_build_bundle()

Examples

# unserialize example
bundles <- fhir_unserialize(bundles = example_bundles1)

# crack fhir resources
table_desc <- fhir_table_description(
    resource = "Patient",
    brackets = c(('[', '])',
    sep = "",
    keep_attr=TRUE
)
df <- fhir_crack(bundles = bundles, design = table_desc)

# original df
df

# cast
fhir_cast(df, brackets=c('[', '])', sep = ' ', verbose = 0)

---

fhir_columns

Create fhir_columns object

Description

An object of class fhir_columns is part of a fhir_table_description in a fhir_design and holds information on the elements that should be extracted from the FHIR resources, as well as the column names of the resulting data.frame. The elements to be extracted are indicated by XPath xpaths. If no column names are provided, they are generated automatically and reflect the elements position in the resource.

Usage

fhir_columns(xpaths, colnames)

## S4 method for signature 'missing,missing'
fhir_columns()

## S4 method for signature 'NULL,missing'
fhir_columns(xpaths)

## S4 method for signature 'character,character'
fhir_columns(xpaths, colnames)
## S4 method for signature 'character,missing'
fhir_columns(xpaths)

## S4 method for signature 'list,missing'
fhir_columns(xpaths)

### Arguments

- **xpaths**: A (named) character vector or (named) list containing xpath xpaths, or a `fhir_xpath_expression` object.
- **colnames**: The names of the columns to create. If no colnames are provided and the list or vector in xpaths has names, those names are taken as the colnames. If no colnames are provided and xpaths is unnamed too, the colnames are generated automatically from the xpath xpaths. See examples.

### Examples

#provide colnames explicitly
fhir_columns(xpaths = c("name/given", "code/coding/code"),
             colnames = c("name", "code"))

# colnames are taken from xpaths argument
fhir_columns(xpaths = c(name = "name/given", code = "code/coding/code"))

# colnames are generated automatically
fhir_columns(xpaths = c("name/given", "code/coding/code"))

---

**fhir_columns-class**: A S4 class to represent columns in a `fhir_table_description`

### Description

An object of class `fhir_columns` is part of a `fhir_table_description` in a `fhir_design` and holds information on the elements that should be extracted from the FHIR resources, as well as the column names of the resulting data.frame. The elements to be extracted are indicated by XPath xpaths.

### Slots

- **names**: The column names
Description
This is a convenience function to find all column names in a data frame starting with the same string that can then be used for `fhir_melt()`.

Usage

```r
fhir_common_columns(data_frame, column_names_prefix)
```

Arguments

- `data_frame`: A data.frame/data.table with automatically named columns as produced by `fhir_crack()`.
- `column_names_prefix`: A string containing the common prefix of the desired columns.

Details
It is intended for use on data frames with column names that have been automatically produced by `fhir_design()`/`fhir_crack()` and follow the form `level1.level2.level3` such as `name.given` or `code.coding.system`. Note that this function will only work on column names following exactly this scheme.

The resulting character vector can be used for melting all columns belonging to the same attribute in an indexed data frame, see `?fhir_melt`.

Value
A character vector with the names of all columns matching `column_names_prefix`.

See Also

`fhir_melt()`, `fhir_rm_indices()`

Examples

```r
# unserialize example bundles
bundles <- fhir_unserialize(bundles = medication_bundles)

# crack Patient Resources
pats <- fhir_table_description(resource = "Patient")

df <- fhir_crack(bundles = bundles, design = pats)

# look at automatically generated names
names(df)
```
Description

Downloads a count of resources matching the resource type and search parameters specified in `resource` and `parameters`. This function makes use of the `_summary=count` parameter of FHIR search and is therefore able to count resources on the server without actually downloading them.

Usage

```r
fhir_count_resource(
  base_url, 
  resource, 
  parameters = NULL,
  username = NULL,
  password = NULL,
  token = NULL
)
```

Arguments

- `base_url` A character vector of length one specifying the base URL of the FHIR server, e.g. "http://hapi.fhir.org/baseR4".
- `resource` A character vector of length one or `fhir_resource_type` object with the resource type to be searched, e.g. "Patient".
- `parameters` Optional. Either a length 1 character vector containing properly formatted FHIR search parameters, e.g. "gender=male&_summary=count" or a named list or named character vector e.g. `list(gender="male", "_summary"="count")` or `c(gender="male", "_summary"="count")`. Note that parameter names beginning with _ have to be put in quotation marks!
- `username` A character vector of length one containing the username for basic authentication.
- `password` A character vector of length one containing the password for basic authentication.
- `token` A character vector of length one or object of class `httr::Token`, for bearer token authentication (e.g. OAuth2). See `fhir_authenticate()` for how to create this.

Details

For more information on authentication options, please see the help page of `fhir_search()`
Value

An integer of length 1 containing the number of resources matching the type and search parameters specified in resource and parameters.

Examples

```r
# number of female Patient resources on the server
fhir_count_resource(
  base_url = 'https://vonk.fire.ly/R4',
  resource = "Patient",
  parameters = c(gender = "female"))
```

### fhir_crack

#### Flatten list of FHIR bundles

**Description**

Converts a fhir_bundle_list (the result of fhir_search()) to a list of data.frames/data.tables, i.e. a fhir_df_list/fhir_dt_list if a fhir_design is given in the argument design. Creates a single data.frame/data.table, if only a fhir_table_description is given in the argument design.

There are two main output formats for the table: compact and wide. They differ regarding their handling of multiple entries for the same FHIR element (e.g. Patient.adress). In the compact format multiple entries are pasted together into one cell/column, in the wide format multiple entries are distributed over several (indexed) columns. If none of the resources contains any multiple values on the extracted elements, the two formats will result in the same basic structure.

To increase speed with larger amounts of data the cracking process can be parallelised over a number of cores defined in the ncores argument.

**Usage**

```r
fhir_crack(
  bundles,
  design,
  sep = NULL,
  brackets = NULL,
  rm_empty_cols = NULL,
  verbose = 2,
  data.table = FALSE,
  format = NULL,
  keep_attr = NULL,
  ncores = 1,
  remove_empty_columns = deprecated()
)
```
## S4 method for signature 'ANY,fhir_table_description'

fhir_crack(
  bundles,
  design,
  sep = NULL,
  brackets = NULL,
  rm_empty_cols = NULL,
  verbose = 2,
  data.table = FALSE,
  format = NULL,
  keep_attr = NULL,
  ncores = 1,
  remove_empty_columns = deprecated()
)

## S4 method for signature 'ANY,fhir_design'

fhir_crack(
  bundles,
  design,
  sep = NULL,
  brackets = NULL,
  rm_empty_cols = NULL,
  verbose = 2,
  data.table = FALSE,
  format = NULL,
  keep_attr = NULL,
  ncores = 1,
  remove_empty_columns = deprecated()
)

### Arguments

**bundles**
A FHIR search result as returned by `fhir_search()`.

**design**
A `fhir_design` or `fhir_table_description` object. See `fhir_design()`/`fhir_table_description()` and the corresponding vignette (vignette("flattenResources", package="fhircrackr")) for a more detailed explanation and comprehensive examples of both.

**sep**
Optional. A character of length one containing the separator string used for separating multiple entries in cells when `format = "compact"`. Will overwrite the `sep` defined in `design`. If `sep = NULL`, it is looked up in `design`, where the default is ":::".

**brackets**
Optional. A character of length one or two used for the indices of multiple entries, which will overwrite the brackets defined in `design`. If `brackets = NULL`, it is looked up in `design`, where the default is character(0), i.e. no indices are added to multiple entries. Empty strings ("") are not allowed.

**rm_empty_cols**
Optional. Remove empty columns? Logical scalar which will overwrite the `rm_empty_cols` defined in `design`. If `rm_empty_cols = NULL`, it is looked up in `design`, where the default is FALSE.
verbose  An integer vector of length one. If 0, nothing is printed, if 1, only finishing message is printed, if > 1, extraction progress will be printed. Defaults to 2.
data.table  A logical vector of length one. If it is set to TRUE the fhir_crack-function returns a data.table, otherwise a data.frame. Defaults to FALSE.
format  Optional. A character of length one indicating whether the resulting table should be cracked to a wide or compact format. Will overwrite the format defined in design which defaults to compact. wide means multiple entries will be distributed over several columns with indexed names. compact means multiple entries will be pasted into one cell/column separated by sep.
keep_attr  Optional. A logical of length one indicating whether the attribute name of the respective element (@value in most cases) should be attached to the name of the variable in the resulting table. Will overwrite keep_attr in design which defaults to FALSE.
ncores  Either NULL (no parallelisation) or an integer of length 1 containing the number of cpu cores that should be used for parallelised cracking. Defaults to NULL.
remove_empty_columns  [Deprecated] Use argument rm_empty_cols instead.

Value

If a fhir_design was used, the result is a list of data.frames, i.e. a fhir_df_list object, or a list of data.tables, i.e. a fhir_dt_list object. If a fhir_table_description was used, the result is a single data.frame/data.table.

See Also

• Downloading bundles from a FHIR server: fhir_search()
• Creating designs/table_descriptions: fhir_table_description() and fhir_design()
• Dealing with multiple entries: fhir_melt(), fhir_cast(), fhir_rm_indices()

Examples

#unserialize example bundle
bundles <- fhir_unserialize(medication_bundles)

###Example 1###
#Extract just one resource type

#define attributes to extract
medications <- fhir_table_description(
  resource = "MedicationStatement",
  cols = c(
    MS.ID = "id",
    STATUS.TEXT = "text/status",
    STATUS = "status",
    MEDICATION.SYSTEM = "medicationCodeableConcept/coding/system",
    MEDICATION.CODE = "medicationCodeableConcept/coding/code",
    MEDICATION.DISPLAY = "medicationCodeableConcept/coding/display",
  ),
  format = "compact",
  ncores = 1
)
fhir_current_request

Return FHIR search request used in last call to fhir_search() or fhir_url()

Description

Return FHIR search request used in last call to fhir_search() or fhir_url()

Usage

fhir_current_request()

Value

An object of class fhir_url()
Examples

```r
request <- fhir_url(url = "https://server.fire.ly", resource = "Patient")
  fhir_current_request()

fhir_search("https://server.fire.ly/Medication", max_bundles = 1)
  fhir_current_request()
```

**fhir_design**

Create a `fhir_design` object

**Description**

A `fhir_design` is a named list of `fhir_table_description` objects (see `fhir_table_description()`) and should be created using the function described here. The design is used in `fhir_crack()` to tell the function how to flatten each resource type.

**Usage**

```r
fhir_design(...)
```

## S4 method for signature `'fhir_table_description'`

```r
fhir_design(...)
```

## S4 method for signature `'list'`

```r
fhir_design(...)
```

## S4 method for signature `'fhir_table_list'`

```r
fhir_design(...)
```

**Arguments**

... One or more `fhir_table_description` objects or a named list containing `fhir_table_description` objects, or an object of class `fhir_df_list/fhir_dt_list`. See `fhir_table_description()`.

**Details**

A `fhir_design` looks for example like this:

A `fhir_design` with 2 `table_descriptions`:
A `fhir_table_description` with the following elements:

- `fhir_resource_type`: Patient
A fhir_table_description with the following elements:

fhir_resource_type: MedicationAdministration

column name | xpath expression
------------ -----------------
id | id
name | name/family
gender | gender

sep: '||'
brackets: '[: ,:]
rm_empty_cols: FALSE
format: 'compact'
keep_attr: TRUE

The names of the table_descriptions are taken from the names of the arguments. If the table_descriptions are created within the call to fhir_design and therefore have no names, the names will be created from the respective resource type. See examples.

For backwards compatibility it is for the moment also possible to build it from an old-style design as used in fhircrackr (< 1.0.0). See examples.

If this function is given an object of class fhir_df_list or fhir_dt_list, it will extract the design that was used to create the respective list.

Examples

####Example 1####

###create fhir_table_descriptions first
#see ?fhir_table_description for explanation

pat <- fhir_table_description(

---

fhir_columns:
------------ -----------------
column name | xpath expression
------------ -----------------
id | id
name | name/family
gender | gender

sep: '||'
brackets: '[: ,:]
rm_empty_cols: FALSE
format: 'compact'
keep_attr: TRUE
resource = "Patient",
cols = c(
  id = "id",
  name = "name/family",
  gender = "gender"
),
sep = "||",
brackets = c("[", "]"),
rm_empty_cols = FALSE
)

meds <- fhir_table_description(resource = "MedicationAdministration")

###create design
#First option: Explicitly define names

design1 <- fhir_design(Pats = pat, Medics = meds)
print(design1)

#Second option: Names are taken from the object names

design2 <- fhir_design(pat, meds)
print(design2)

#Third option: Create table_description within fhir_design

design3 <- fhir_design(fhir_table_description(resource = "MedicationAdministration"))
print(design3)

#Fourth option: Names are taken from named list

design3 <- fhir_design(list(Patients = pat, Medications = meds))
print(design3)

###Example 2###
###Extract design from fhir_df_list/fhir_dt_list

#unserialize and crack example bundles
med_bundles <- fhir_unserialize(bundles = medication_bundles)
dfs <- fhir_crack(bundles = med_bundles, design = design1)

#extract design

fhir_design(dfs)
A S4 class containing a design for \texttt{fhir\_crack()}

### Description

A \texttt{fhir\_design} is a named list of \texttt{fhir\_table\_description} objects. Each \texttt{table\_description} contains information on how to flatten one resource type which will result in one data.frame. The \texttt{fhir\_design} is passed to the function \texttt{fhir\_crack()} along with a list of bundles containing FHIR resources.

### Slots

- \texttt{.Data} The list of \texttt{fhir\_table\_description} objects.
- \texttt{names} The names of the \texttt{table\_description}s. Those will also be the names of the resulting data.frames.

### See Also

\texttt{fhir\_table\_description()}, \texttt{fhir\_crack()}

List of data.frames as returned by \texttt{fhir\_crack()}

### Description

Objects of this class are returned by \texttt{fhir\_crack()} when \texttt{data.table=FALSE} (the default). They behave like an ordinary named list of data.frames but have some additional information in the slot \texttt{design}.

### Slots

- \texttt{names} Character vector containing the names of the data.frames.
- \texttt{design} An object of class \texttt{fhir\_design} that was used to create the \texttt{df\_list}.

List of data.tables as returned by \texttt{fhir\_crack()}

### Description

Objects of this class are returned by \texttt{fhir\_crack()} when \texttt{data.table=TRUE}. They behave like an ordinary named list of data.tables but have some additional information in the slot \texttt{design}.

### Slots

- \texttt{names} A character vector containing the names of the data.tables.
- \texttt{design} An object of class \texttt{fhir\_design} that was used to create the \texttt{dt\_list}. 
fhir_get_resources_by_ids

Get Resources by their IDs

Description

Downloads FHIR resources represented by a vector of resource IDs.

Usage

```r
fhir_get_resources_by_ids(
  base_url, resource, ids,
  id_param = "_id",
  parameters = NULL,
  username = NULL,
  password = NULL,
  token = NULL,
  verbose = 0
)
```

Arguments

- **base_url**: A character vector of length one specifying the base URL of the FHIR server, e.g. "http://hapi.fhir.org/baseR4".
- **resource**: A character vector of length one or `fhir_resource_type` object with the resource type to be searched, e.g. "Patient".
- **ids**: A character vector containing the IDs of the resources that should be downloaded. In the default setting these should be resource (aka logical) IDs.
- **id_param**: A character vector of length one containing the FHIR Search parameter belonging to the ids in `ids`. Defaults to "_id" meaning `ids` is interpreted as containing resource (aka logical) IDs. Could be changed to "identifier" if `ids` contains a vector of identifier values instead.
- **parameters**: FHIR Search parameters to further restrict the set of resources that is returned, e.g. `gender=male` to only download the resources from the `ids` list that correspond to males. Can be either a length 1 character containing properly formatted FHIR search parameters, e.g. "gender=male" or a named list or named character vector e.g. `list(gender="male")` or `c(gender="male")`. Defaults to `NULL` meaning no restriction on the IDs provided in `ids`.
- **username**: A character vector of length one containing the username for basic authentication.
- **password**: A character vector of length one containing the password for basic authentication.
token A character vector of length one or object of class httr::Token, for bearer token authentication (e.g. OAuth2). See fhir_authenticate() for how to create this.

verbose An integer vector of length 1 containing the level of verbosity. Defaults to 0.

Details

This function takes a character vector `ids` containing logical Ids of resources of a given type (specified in `resource`) on a FHIR server (specified in `base_url`) and downloads the corresponding resources from the server. The function will attempt to download the resources using a FHIR search request via POST where the IDs are part of the body. See fhir_search() for details. If this fails (e.g. because the server doesn't allow POST operations), the function falls back on a GET request. If the set of ids is too long to fit into one GET request (i.e. if the request gets longer than 2083 characters), it will be spread across several requests.

For more information on authentication options, please see the help page of fhir_search()

Value

A fhir_bundle_list containing the downloaded resources.

See Also

fhir_search(), fhir_get_resource_ids()

Examples

#find IDs of Patient resources representing Homer Simpson
ids <- fhir_get_resource_ids(
  base_url = 'https://hapi.fhir.org/baseR4',
  resource = "Patient",
  parameters = "name=Homer&name=Simpson")

#Download all corresponding resources
bundles <- fhir_get_resources_by_ids(
  base_url = 'https://hapi.fhir.org/baseR4',
  resource = "Patient",
  ids = ids)

#have a look at the resources
fhir_crack(
  bundles,
  fhir_table_description(
    resource = "Patient",
    cols = list(
      ID = "id",
      given = "name/given",
      family = "name/family"))))
**fhir_get_resource_ids**  
*Get Resources' IDs*

**Description**

Download the resource (aka logical) IDs of all resources matching the FHIR search request build from the resource type and search parameters specified in `resource` and `parameters`. This function does not download the entire resources, but only extracts their IDs using the `_elements` parameter of FHIR Search.

**Usage**

```r
def fhir_get_resource_ids(
    base_url,
    resource,
    parameters = NULL,
    username = NULL,
    password = NULL,
    token = NULL,
    verbose = 0
)
```

**Arguments**

- `base_url`: A character vector of length one specifying the base URL of the FHIR server, e.g. "http://hapi.fhir.org/baseR4".
- `resource`: A character vector of length one or `fhir_resource_type` object with the resource type to be searched, e.g. "Patient".
- `parameters`: Optional. Either a length 1 character vector containing properly formatted FHIR search parameters, e.g. "gender=male&_summary=count" or a named list or named character vector e.g. list(gender="male", "_summary"="count") or c(gender="male", "_summary"="count"). Note that parameter names beginning with `_` have to be put in quotation marks!
- `username`: A character vector of length one containing the username for basic authentication.
- `password`: A character vector of length one containing the password for basic authentication.
- `token`: A character vector of length one or object of class `http::Token`, for bearer token authentication (e.g. OAuth2). See `fhir_authenticate()` for how to create this.
- `verbose`: An integer of length 1 containing the level of verbosity. Defaults to 0.

**Details**

For more information on authentication options, please see the help page of `fhir_search()`.
Value

A character vector containing the resource (aka logical) IDs of all requested resources.

See Also

fhir_search(), fhir_get_resources_by_ids()

Examples

```r
fhir_get_resource_ids(
  base_url = 'https://vonk.fire.ly/R4',
  resource = "Patient",
  parameters = "gender=female", verbose=1)
```

---

**fhir_load**  
Load bundles from xml-files

Description

Reads all bundles stored as xml files from a directory.

Usage

fhir_load(directory, indices = NULL)

Arguments

directory  
A character vector of length one containing the path to the folder were the files are stored.

indices  
A numeric vector of integers indicating which bundles from the specified directory should be loaded. Defaults to NULL meaning all bundles from the directory are loaded.

Value

A fhir_bundle_list.

Examples

```r
#unserialize example bundle
bundles <- fhir_unserialize(medication_bundles)
length(bundles)

#save to temporary directory
dir <- tempdir()
fhir_save(bundles, directory = dir)
```
#load from temporary directory
loaded_bundles <- fhir_load(dir)
length(loaded_bundles)

#load only two, the second and the third bundle
loaded_bundles <- fhir_load(dir, indices = c(2,3))
length(loaded_bundles)

---

**fhir_load_design**  
*Load design from xml*

**Description**

Loads a `fhir_design` for use with `fhir_crack()` from an xml file into R.

**Usage**

`fhir_load_design(file)`

**Arguments**

- **file**  
  A string specifying the file from which to read.

**Value**

A `fhir_design` object. See `?fhir_design`.

**See Also**

`fhir_design()`, `fhir_table_description()`, `fhir_save_design()`

**Examples**

```r

table_desc1 <- fhir_table_description(
  resource = 'Patient',
  cols = c(
    id = 'id',
    name = 'name/family',
    gender = 'gender'
  ),
  sep = ':::',
  brackets = c('[', ']'),
  rm_empty_cols = FALSE,
  format = 'compact',
  keep_attr = FALSE
)

table_desc2 <- fhir_table_description(
```

```r
```
```r
resource = 'Observation',
cols = c(
  'code/coding/system',
  'code/coding/code'
)
)

design <- fhir_design(
  Patients = table_desc1,
  Observations = table_desc2
)

temp <- tempfile()

fhir_save_design(design = design, file = temp)

design <- fhir_load_design(file = temp)
```

---

### fhir_melt

**Melt multiple entries**

**Description**

This function divides multiple entries in an indexed data frame as produced by `fhir_crack()` into separate rows.

**Usage**

```r
fhir_melt(
  indexed_data_frame,
  columns,
  brackets = c("<", ">"),
  sep = " ",
  id_name = "resource_identifier",
  all_columns = FALSE
)
```

**Arguments**

- `indexed_data_frame` - A data.frame/data.table with indexed multiple entries.
- `columns` - A character vector specifying the names of all columns that should be molten simultaneously. It is advisable to only melt columns simultaneously that belong to the same (repeating) attribute!
- `brackets` - A character vector of length two, defining the brackets used for the indices.
- `sep` - A character vector of length one defining the separator that was used when pasting together multiple entries in `fhir_crack()`.
- `id_name` - A character string defining the name of the attribute that contains the unique identifier for each entry.
- `all_columns` - A logical value indicating whether all columns should be molten or only specified columns.

---

fhir_melt
id_name  
A character vector of length one, the name of the column that will hold the 
identification of the origin of the new rows.

all_columns  
Return all columns? Defaults to FALSE, meaning only those specified in columns 
are returned.

Details

Every row containing values that consist of multiple entries on the variables specified by the argument 
columns will be turned into multiple rows, one for each entry. Values on other variables will 
be repeated in all the new rows.

The new data.frame will contain only the molten variables (if all_columns = FALSE) or all variables 
(if all_columns = TRUE) as well as an additional variable resource_identifier that maps which 
rows came from the same origin. The name of this column can be changed in the argument id_name.

For a more detailed description on how to use this function please see the corresponding package 
vignette.

Value

A data.frame/data.table where each entry from the variables in columns appears in a separate row.

See Also

fhir_common_columns(), fhir_rm_indices()

Examples

#unserialize example
bundles <- fhir_unserialize(bundles = example_bundles1)

#crack fhir resources
table_desc <- fhir_table_description(
  resource = "Patient",
  brackets = c("[", "]"),
  sep = " "
)
df <- fhir_crack(bundles = bundles, design = table_desc)

#find all column names associated with attribute address
col_names <- fhir_common_columns(df, "address")

#original data frame
df

df

#only keep address columns
fhir_melt(
  indexed_data_frame = df,
  columns = col_names,
  brackets = c("[", "]"),
  sep = " "
)
fhir_next_bundle_url

# keep all columns
fhir_melt(indexed_data_frame = df, columns = col_names,
          brackets = c("[", "]"), sep = " ", all_columns = TRUE)

fhir_next_bundle_url  Next Bundle’s URL

Description

fhir_next_bundle_url() gives the link to the next available bundle, either of the bundle you provided
in the argument bundle or of the last call to fhir_search(), if bundle=NULL (the default).

This function is useful when you don’t have a lot of memory available or when a download of bundles
was interrupted for some reason. In case of small memory, you can use fhir_next_bundle_url
together with the max_bundle argument from fhir_search() to download bundles in smaller
batches in a loop. See details in the example.

Usage

fhir_next_bundle_url(bundle = NULL)

Arguments

bundle       The bundle from which you wish to extract the next link. If this is NULL (the
default), the function will extract the next link from the last bundle that was
downloaded in the most recent call to fhir_search().

Value

A fhir_url object referencing next bundle available on the FHIR server. Empty fhir_url / character
vector, if no further bundle is available.

Examples

# workflow for small memory environments, downloading small batches of bundles
# for really small memory environments consider also using the `\_count` option in
# your FHIR search request.
# You can iteratively download, crack and save the bundles until all bundles are processed or the
# desired number of bundles is reached.
url <- fhir_url("https://server.fire.ly/Patient")
count <- 0
obs <- fhir_table_description(resource = "Patient")
design <- fhir_design(obs)
while(length(url)>0 & count < 5){
  bundles <- fhir_search(url, max_bundles = 2)
  tables <- fhir_crack(bundles, design)
  save(tables, file = paste0(tempdir(), "/table\_", count, ".RData"))
count <- count + 1
url <- fhir_next_bundle_url()
}
#you can see the saved tables here:
dir(tempdir())

---

### fhir_post

**POST to a FHIR server**

**Description**

This function is a convenience wrapper around `httr::POST()`.

**Usage**

```r
fhir_post(
  url,
  body,
  username = NULL,
  password = NULL,
  token = NULL,
  verbose = 1,
  log_errors = NULL
)
```

```r
## S4 method for signature 'ANY,fhir_resource'
fhir_post(
  url,
  body,
  username = NULL,
  password = NULL,
  token = NULL,
  verbose = 1,
  log_errors = NULL
)
```

```r
## S4 method for signature 'ANY,fhir_bundle_xml'
fhir_post(
  url,
  body,
  username = NULL,
  password = NULL,
  token = NULL,
  verbose = 1,
  log_errors = NULL
)
```
## S4 method for signature 'ANY,fhir_body'

`fhir_post`

```r
url,
body,
username = NULL,
password = NULL,
token = NULL,
verbose = 1,
log_errors = NULL
```

### Arguments

- **url**
  
  An object of class `fhir_url` or a character vector of length one containing the url to POST to.

- **body**
  
  An object of class `fhir_resource`, `fhir_bundle_xml` or `fhir_body`. See details for how to generate them.

- **username**
  
  A character vector of length one containing the username for basic authentication.

- **password**
  
  A character vector of length one containing the password for basic authentication.

- **token**
  
  A character vector of length one or object of class `httr::Token`, for bearer token authentication (e.g. OAuth2). See `fhir_authenticate()` for how to create this.

- **verbose**
  
  An integer vector of length one. If 0, nothing is printed, if > 0 success message is printed. Defaults to 1.

- **log_errors**
  
  Either `NULL` or a character vector of length one indicating the name of a file in which to save http errors. `NULL` means no error logging. When a file name is provided, the errors are saved in the specified file. Defaults to `NULL`. Regardless of the value of `log_errors` the most recent http error message within the current R session is saved internally and can be accessed with `fhir_recent_http_error()`.

### Details

`fhir_post()` accepts four classes for the body:

1. A `fhir_resource` as created by `fhir_build_resource()`. This is used when just a single resource should be POSTed to the server. In this case `url` must contain the base url plus the resource type, e.g. `http://hapi.fhir.org/baseR4/Patient`.

2. A `fhir_bundle_xml` representing a transaction or batch bundle as created by `fhir_build_bundle()`.

3. A `fhir_body` as created by `fhir_body()`. This is the most flexible approach, because within the `fhir_body` object you can represent any kind of content as a string and set the type accordingly. See examples.

For examples of how to create the different body types see the respective help pages. For an example of the entire workflow around creating and POSTing resources, see the package vignette on recreating resources.
Examples

## Not run:
### 1. POST transaction bundle
#unserialize example bundles
bundle <- fhir_unserialize(transaction_bundle_example)

#have a look at the bundle
cat(toString(bundle))

#post
fhir_post(url = "http://hapi.fhir.org/baseR4", body = bundle)

### 2. POST single resource
#unserialize example resource
resource <- fhir_unserialize(example_resource1)

#have a look at the resource
resource

#post
url <- fhir_url(url = "http://hapi.fhir.org/baseR4", resource = "Patient")
fhir_post(url = url, body = resource)

### 3. POST arbitrary body
#define body
body <- fhir_body(content = "<Patient> <gender value='female'/> </Patient>", type = "xml")

#post
url <- fhir_url(url = "http://hapi.fhir.org/baseR4", resource = "Patient")
fhir_post(url = url, body = body)

## End(Not run)

---

**fhir_put**

**PUT to a FHIR server**

**Description**

This function is a convenience wrapper around `httr::PUT()`.

**Usage**

```r
fhir_put(
  url, 
  body, 
  username = NULL, 
  password = NULL,
)```

token = NULL,
verbose = 1,
log_errors = NULL
)

Arguments

url An object of class fhir_url or a character vector of length one containing the url to PUT to.

body An object of class fhir_resource or fhir_body. See details for how to generate them.

username A character vector of length one containing the username for basic authentication.

password A character vector of length one containing the password for basic authentication.

token A character vector of length one or object of class http::Token, for bearer token authentication (e.g. OAuth2). See fhir_authenticate() for how to create this.

verbose An integer vector of length one. If 0, nothing is printed, if > 0 success message is printed. Defaults to 1.

log_errors Either NULL or a character vector of length one indicating the name of a file in which to save http errors. NULL means no error logging. When a file name is provided, the errors are saved in the specified file. Defaults to NULL. Regardless of the value of log_errors the most recent http error message within the current R session is saved internally and can be accessed with fhir_recent_http_error().

Details

fhir_put() accepts two classes for the body:

1. A fhir_resource as created by fhir_build_resource(). This is used when just a single resource should be PUT to the server. In this case url must contain the base url plus the resource type and the resource id, e.g. http://hapi.fhir.org/baseR4/Patient/1a2b3c.

2. A fhir_body as created by fhir_body(). This is the most flexible approach, because within the fhir_body object you can represent any kind of content as a string and set the type accordingly. See examples.

For examples of how to create the different body types see the respective help pages. For an example of the entire workflow around creating and PUTing resources, see the package vignette on recreating resources.

Examples

## Not run:
### 1. PUT fhir__resource object
#unserialize example resource
resource <- fhir_unserialize(example_resource2)
#have a look at the resource
resource

#put
fhir_put(url = "http://hapi.fhir.org/baseR4/Patient/1a2b3c", body = resource)

### 2. PUT fhir_body object
#define body
body <- fhir_body(content = "<Patient> <id value='x1y2'/> <gender value='female'/> </Patient>",
    type = "xml")

#put
fhir_put(url = "http://hapi.fhir.org/baseR4/Patient/x1y2", body = body)

## End(Not run)

---

fhir_recent_http_error

Return most recent http error from fhir_search()

---

Description

Whenever a call to fhir_search() produces any http error, the error information is saved internally until the next http error occurs (or the R session ends). The error information can be accessed with fhir_recent_http_error. If you want to log that information outside of your R session, set the argument log_errors of fhir_search().

Usage

fhir_recent_http_error()

Value

A string containing the error message

See Also

fhir_search()

Examples

## Not run:
fhir_search("https://server.fire.ly/Medicatio", max_bundles = 1)
cat(fhir_recent_http_error())

## End(Not run)
Description

A Wrapper for fhir_url

Usage

```
fhir_request(url, resource = NULL, parameters = NULL, url_enc = TRUE)
```

Arguments

- `url` The same as for `fhir_url()`.
- `resource` The same as for `fhir_url()`. Defaults to NULL.
- `parameters` The same as for `fhir_url()`. Defaults to NULL.
- `url_enc` The same as for `fhir_url()`. Defaults to TRUE.

Value

The same as for `fhir_url()`.

Examples

```
# provide full FHIR search request
fhir_request(url = "http://hapi.fhir.org/baseR4/Patient?gender=male&_summary=count")

# provide base url and resource type
fhir_request(
  url = "http://hapi.fhir.org/baseR4",
  resource = "Patient"
)

# parameters in one string
fhir_request(
  url = "http://hapi.fhir.org/baseR4",
  resource = "Patient",
  parameters = "gender=male&_summary=count"
)

# parameters as a named character
fhir_request(
  url = "http://hapi.fhir.org/baseR4",
  resource = "Patient",
  parameters = c("gender" = "male", "_summary" = "count")
)

# parameters as a named list
fhir_request

```r
fhir_request(
  url = "http://hapi.fhir.org/baseR4",
  resource = "Patient",
  parameters = list("gender" = "male", "]summary" = "count")
)
```

### fhir_resource-class

An S4 class to represent FHIR resources

### Description

An S4 class to represent FHIR resources

### fhir_resource_serialized-class

An S4 class to represent a FHIR resource in serialized form

### Description

A `fhir_resource_serialized` is a `fhir_resource_xml` that has been serialized using `fhir_serialize()`. In this form, the resource cannot be used in any meaningful way, but it can be saved and loaded as an `.RData` or `.rds` object without breaking the external pointers in the xml. See `?fhir_serialize` and `?fhir_unserialize`.

### fhir_resource_type

Create `fhir_resource_type` object

### Description

This function creates an object of class `fhir_resource_type`. It checks the resource type against the list of resource types provided at `https://hl7.org/FHIR/resourcelist.html`, corrects wrong cases (which can be disabled with `fix_capitalization = FALSE`) and throws a warning if the resource cannot be found at `hl7.org`.

### Usage

```r
fhir_resource_type(string, fix_capitalization = TRUE)
```

### Arguments

- **string** A length one character vector containing the resource type. Will usually be one of the official FHIR resource types listed at `https://hl7.org/FHIR/resourcelist.html`
- **fix_capitalization** Correct wrong capitalization for known resource types? E.g. patients -> Patients or medicationstatement -> MedicationStatement. Defaults to TRUE.
Valuetype

An fhir_resource_type object

Examples

```r
fhir_resource_type(string = "Patient")
fhir_resource_type(string = "medicationadministration")
```

---

Description

An object of class fhir_resource_type is a string containing a FHIR resource type. It is part of a
fhir_table_description which in turn is part of a fhir_design and used in fhir_crack().

---

Create fhir_resource_xml object

Description

Create fhir_resource_xml object

Usage

```r
fhir_resource_xml(resource)
```

## S4 method for signature 'xml_document'

```r
fhir_resource_xml(resource)
```

## S4 method for signature 'xml_node'

```r
fhir_resource_xml(resource)
```

## S4 method for signature 'character'

```r
fhir_resource_xml(resource)
```

Arguments

- resource: A xml-object representing a FHIR resource

Examples

```r
fhir_resource_xml(resource = xml2::read_xml("<Patient><id value = '1'/></Patient>"))
```
An S4 class to represent a FHIR resource in xml form

Description

A fhir_resource_xml is an xml representation of a FHIR resource (https://www.hl7.org/fhir/resourcelist.html).

Remove html elements

Description

This function is a convenience wrapper for fhir_rm_tag() that removes all <div> </div> elements from an xml. div tags in FHIR resources contain html code, which is often server generated and in most cases neither relevant nor usable for data analysis.

Usage

fhir_rm_div(x)

Arguments

x A fhir_bundle_xml or fhir_bundle_list object or a character vector containing xml objects.

Value

An object of the same class as x where all tags matching the tag argument are removed.

See Also

fhir_rm_tag()

Examples

#Example 1: Remove div tags from xmls in a character vector
string <- c("Hallo<div>Please</div><p>Remove Me</p></div> World!", "A<div><div><p>B</p></div>C</div>D")

fhir_rm_div(x = string)

#Example 2: Remove div tags in a single fhir bundle
bundle <- fhir_unserialize(patient_bundles)[[1]]

# example bundle contains html parts in div tags:
cat(toString(bundle))

# remove html parts
bundle_cleaned <- fhir_rm_div(x = bundle)

# have a look at the result
cat(toString(bundle_cleaned))

# Example 3: Remove div tags in a list of fhir bundles
bundle_list <- fhir_unserialize(patient_bundles)

# remove html parts
bundle_list_cleaned <- fhir_rm_div(x = bundle_list)

# check out how much the size of the bundle list is reduced by removing html
size_with_html <- sum(sapply(bundle_list, function(x)object.size(toString(x))))
size_without_html <- sum(sapply(bundle_list_cleaned, function(x)object.size(toString(x))))

size_without_html/size_with_html

---

**fhir_rm_indices**

*Remove indices from data.frame/data.table*

**Description**

Removes the indices in front of multiple entries as produced by `fhir_crack()` when brackets are provided in the design.

**Usage**

```r
fhir_rm_indices(
  indexed_data_frame,
  brackets = c("<", ">"),
  columns = names(indexed_data_frame)
)
```

**Arguments**

- **indexed_data_frame**
  
  A data frame with indices for multiple entries as produced by `fhir_crack()`
brackets A character vector of length two defining the brackets that were used in \texttt{fhir\_crack()}
columns A character vector of column names, indicating from which columns indices should be removed. Defaults to all columns.

Value
A data frame without indices.

See Also
\texttt{fhir\_melt()}

Examples

```r
#unserialize example
bundles <- fhir_unserialize(bundles = example_bundles1)

patients <- fhir_table_description(resource = "Patient")

df <- fhir_crack(bundles = bundles,
    design = patients,
    brackets = c("[", "]"))

df_indices_removed <- fhir_rm_indices(indexed_data_frame = df, brackets=c("[", "]"))
```

\begin{knitrout}
\definecolor{shadecolor}{rgb}{0.969, 0.969, 0.969}
\begin{alltt}
\hlkwd{df\_indices\_removed} <- \hlkwd{fhir\_rm\_indices}(\hlstd{indexed\_data\_frame} = \hlstd{df}, \hlstd{brackets} = c(\hlstr{"["}, \hlstr{"\]"}))
\end{alltt}
\end{knitrout}

\section*{fhir\_rm\_tag}

\textit{Remove a certain xml tag}

\subsection*{Description}
Removes a given xml tag from xml objects represented in a \texttt{fhir\_bundle\_xml}, \texttt{fhir\_bundle\_list} or character vector.

\subsection*{Usage}

\begin{verbatim}
fhir_rm_tag(x, tag)

## S4 method for signature 'character'
fhir_rm_tag(x, tag)

## S4 method for signature 'fhir\_bundle\_xml'
fhir_rm_tag(x, tag)

## S4 method for signature 'fhir\_bundle\_list'
fhir_rm_tag(x, tag)
\end{verbatim}
Arguments

- **x**: A `fhir_bundle_xml` or `fhir_bundle_list` object or a character vector containing XML objects.
- **tag**: A character vector of length 1 containing the tag that should be removed, e.g. "div".

Details

In the example `Hello<div>Please</p><p>Remove Me</p></div> World!` one could for example remove the tag `p`, resulting in `Hello<div>Please</div>World!` or remove the `div` tag resulting in `Hello World!`.

Value

An object of the same class as `x` where all tags matching the `tag` argument are removed.

See Also

- `fhir_rm_div()`

Examples

```r
# Example 1: Remove tag from XMLs in a character vector
string <- c("Hello<div>Please</p><p>Remove Me</p></div> World!",
           "A<div><div><p>B</p></div>C</div>D")

fhir_rm_tag(x = string, tag = "p")

# Example 2: Remove div tags in a single FHIR bundle
bundle <- fhir_unserialize(patient_bundles)[[1]]
# example bundle contains HTML parts in div tags:
cat(toString(bundle))

# remove HTML parts
bundle_cleaned <- fhir_rm_tag(x = bundle, tag = "div")
# have a look at the result
cat(toString(bundle_cleaned))

# Example 3: Remove div tags in a list of FHIR bundles
bundle_list <- fhir_unserialize(patient_bundles)
```
#remove html parts
bundle_list_cleaned <- fhir_rm_tag(x = bundle_list, tag = "div")

#check out how much the size of the bundle list is reduced by removing html
size_with_html <- sum(sapply(bundle_list, function(x)object.size(toString(x))))
size_without_html <- sum(sapply(bundle_list_cleaned, function(x)object.size(toString(x))))
size_without_html/size_with_html

---

**fhir_sample_resources**  *Randomly sample resources from a FHIR server*

**Description**

Downloads a random sample of resources of a given resource type from a FHIR server. The resources can be further constrained using FHIR search parameters.

**Usage**

```r
fhir_sample_resources(
  base_url, resource, parameters = NULL, username = NULL, password = NULL, token = NULL, sample_size = 20, seed = 1, verbose = 1)
```

**Arguments**

- **base_url**  
  A character vector of length one specifying the base URL of the FHIR server, e.g. "http://hapi.fhir.org/baseR4".

- **resource**  
  A character vector of length one or `fhir_resource_type` object with the resource type to be downloaded, e.g. "Patient".

- **parameters**  
  Optional. Either a length 1 character vector containing properly formatted FHIR search parameters, e.g. "gender=male&_summary=count" or a named list or named character vector e.g. list(gender="male", "_summary"="count") or c(gender="male", "_summary"="count"). Note that parameter names beginning with _ have to be put in quotation marks!

- **username**  
  A character vector of length one containing the username for basic authentication.
password  A character vector of length one containing the password for basic authentication.

token  A character vector of length one or object of class http::Token, for bearer token authentication (e.g. OAuth2). See fhir_authenticate() for how to create this.

sample_size  A integer of length 1 containing the number of resources to sample.

seed  A integer of length 1 containing the seed for the random generator.

verbose  An integer of length 1 containing the level of verbosity. Defaults to 1.

Details

This function performs three steps to draw a random sample of resources from a FHIR server:

1. Count how many resources matching the type resource and the search parameters in parameters are found on the server. This is done to assert that the desired sample_size is bigger than the number of resources it is drawn from. This step can also be performed individually using fhir_count_resource().

2. Extract the resource (aka logical) IDs of all requested resources (without downloading the resources completely). This step can be also be performed individually using fhir_get_resource_ids().

3. Draw a random sample of size sample_size from the vector of resource IDs and download the corresponding set of resources from the server. This can also be done individually using fhir_sample_resources_by_ids().

The actual download of the resources is done by fhir_get_resources_by_ids(). This function will attempt to download the resources using a FHIR search request via POST where the IDs are part of the body. See fhir_search() for details. If this fails (e.g. because the server doesn’t allow POST operations), the function falls back on a GET request. If the set of IDs is too long to fit into one GET request (i.e. if the request gets longer than 2083 characters), it will be spread across several requests.

For more information on authentication options, please see the help page of fhir_search().

Value

A fhir_bundle_list containing randomly sampled resources.

See Also

fhir_search(), fhir_sample_resources_by_ids(), fhir_get_resources_by_ids(), fhir_count_resource()

Examples

#how many resources are on the server?
count <- fhir_count_resource(
  base_url = 'https://hapi.fhir.org/baseR4',
  resource = "Patient",
  parameters = "gender=female")

#randomly sample 30 of them
bundles <- fhir_sample_resources(
  base_url = 'https://hapi.fhir.org/baseR4',
  resource = "Patient",
  parameters = "gender=female",
  sample_size = 30,
  seed = 1)

bundles

---

fhir_sample_resources_by_ids

*Download a random sample of resources from a vector of resource IDs.*

### Description

Download a random sample of resources from a vector of resource IDs.

### Usage

```r
fhir_sample_resources_by_ids(
  base_url, resource, ids,
  id_param = "_id",
  username = NULL, password = NULL, token = NULL,
  sample_size = 20, seed = 1, verbose = 1)
```

### Arguments

- **base_url**: A character vector of length one specifying the base URL of the FHIR server, e.g. "http://hapi.fhir.org/baseR4".
- **resource**: A character vector of length one or `fhir_resource_type` object with the resource type to be downloaded e.g. "Patient".
- **ids**: A character vector containing the IDs from which to sample.
- **id_param**: A character vector of length one containing the FHIR Search parameter belonging to the ids in `ids`. Defaults to "_id" meaning `ids` is interpreted as containing resource (aka logical) ids. Could be changed to "identifier" if `ids` contains a vector of identifier values instead.
- **username**: A character vector of length one containing the username for basic authentication.
fhir_sample_resources_by_ids

password  A character vector of length one containing the password for basic authentication.

token  A character vector of length one or object of class http::Token, for bearer token authentication (e.g. OAuth2). See fhir_authenticate() for how to create this.

sample_size  A integer of length 1 containing the number of resources to sample.

seed  A integer of length 1 containing the seed for the random generator.

verbose  An integer of length 1 containing the level of verbosity. Defaults to 1.

Details

This function takes a character vector ids containing logical Ids of resources of a given type (specified in resource) on a FHIR server (specified in base_url) and downloads a random sample of size sample_size of the corresponding resources from the server.

Internally, the download of the resources is done by fhir_get_resources_by_ids(). This function will attempt to download the resources using a FHIR search request via POST where the IDs are part of the body. See fhir_search() for details. If this fails (e.g. because the server doesn’t allow POST operations), the function falls back on a GET request. If the set of IDs is too long to fit into one GET request (i.e. if the request gets longer than 2083 characters), it will be spread across several requests.

For more information on authentication options, please see the help page of ‘fhir_search()

Value

A list of bundles containing sampled resources.

See Also

fhir_search(), fhir_sample_resources(), fhir_get_resources_by_ids(), fhir_count_resource()

Examples

#find IDs of all resources representing Homer Simpson
ids <- fhir_get_resource_ids(
  base_url = 'https://hapi.fhir.org/baseR4',
  resource = "Patient",
  parameters = "name=Homer&name=Simpson")

#Sample 10 of them
bundles <- fhir_sample_resources_by_ids(
  base_url = 'https://hapi.fhir.org/baseR4',
  resource = "Patient",
  ids = ids,
  sample_size = 10,
  seed = 1)

#Have a look at the samples
fhir_crack(
fhir_save

Save FHIR bundles as xml-files

Description

Writes a list of FHIR bundles as numbered xml files into a directory.

Usage

fhir_save(bundles, directory)

Arguments

bundles A list of xml objects representing the FHIR bundles.
directory A character vector of length one containing the path to the folder to store the data in.

Examples

#unserialize example bundle
bundles <- fhir_unserialize(medication_bundles)

#save all bundles to temporary directory
fhir_save(bundles, directory = tempdir())

#save only two bundles (the second and the third) to temporary directory
fhir_save(bundles[c(2,3)], directory = tempdir())

fhir_save_design

Write design to xml

Description

Writes a fhir_design for use with fhir_crack() to an xml file.

Usage

fhir_save_design/design, file = "design.xml"
Arguments

- **design**
  A `fhir_design` object. See `fhir_design()`.

- **file**
  A string specifying the file to write to, defaults to writing 'design.xml' into the current working directory.

See Also

- `fhir_design()`, `fhir_table_description()`, `fhir_load_design()`

Examples

```r
# create and save design

table_desc1 <- fhir_table_description(
  resource = 'Patient',
  cols = c(
    id = 'id',
    name = 'name/family',
    gender = 'gender'
  ),
  sep = ':::',
  brackets = c('[', ']'),
  rm_empty_cols = FALSE,
  format = 'compact',
  keep_attr = FALSE
)

table_desc2 <- fhir_table_description(
  resource = 'Observation',
  cols = c(
    'code/coding/system',
    'code/coding/code'
  )
)

design <- fhir_design(
  Patients = table_desc1,
  Observations = table_desc2
)

fhir_save_design(design = design, file = tempfile())
```

Description

Downloads all FHIR bundles of a FHIR search request from a FHIR server by iterating through the bundles. Search via GET and POST is possible, see Details.
Usage

```r
fhir_search(
  request = fhir_current_request(),
  body = NULL,
  username = NULL,
  password = NULL,
  token = NULL,
  max_bundles = Inf,
  verbose = 1,
  delay_between_attempts = c(1, 3, 9, 27, 81),
  log_errors = NULL,
  save_to_disc = NULL,
  delay_between_bundles = 0,
  rm_tag = "div",
  max_attempts = deprecated()
)
```

Arguments

- **request**: An object of class `fhir_url` or a character vector of length one containing the full FHIR search request. It is recommended to explicitly create the request via `fhir_url()` as this will do some validity checks and format the url properly. Defaults to `fhir_current_request()`.

- **body**: A character vector of length one or object of class `fhir_body` with type "application/x-www-form-urlencoded". A body should be provided when the FHIR search request is too long and might exceed the maximal allowed length of the URL when send to the server. In this case a search via POST (see https://www.hl7.org/fhir/search.html#Introduction) can be used. The body should contain all the parameters that follow after the ? in the FHIR search request. When a body is provided, the required _search is automatically added to the url in request. See examples and ?fhir_body.

- **username**: A character vector of length one containing the username for basic authentication.

- **password**: A character vector of length one containing the password for basic authentication.

- **token**: A character vector of length one or object of class `httr::Token`, for bearer token authentication (e.g. OAuth2). See `fhir_authenticate()` for how to create this.

- **max_bundles**: Maximal number of bundles to get. Defaults to Inf meaning all available bundles are downloaded.

- **verbose**: An integer vector of length one. If 0, nothing is printed, if 1, only finishing message is printed, if > 1, downloading progress will be printed. Defaults to 1.

- **delay_between_attempts**: A numeric vector specifying the delay in seconds between attempts of reaching the server that `fhir_search()` will make. The length of this vector determines the number of attempts that will be made before stopping with an error. Defaults to `c(1, 3, 9, 27, 81)`.
log_errors

Either NULL or a character vector of length one indicating the name of a file in which to save the http errors. NULL means no error logging. When a file name is provided, the errors are saved in the specified file. Defaults to NULL. Regardless of the value of log_errors the most recent http error message within the current R session is saved internally and can be accessed with fhir_recent_http_error().

save_to_disc

Either NULL or a character vector of length one indicating the name of a directory in which to save the bundles. If a directory name is provided, the bundles are saved as numerated xml-files into the directory specified and not returned as a bundle list in the R session. This is useful when a lot of bundles are to be downloaded and keeping them all in one R session might overburden working memory. When the download is complete, the bundles can be loaded into R using fhir_load(). Defaults to NULL, i.e. bundles are returned as a list within the R session.

delay_between_bundles

A numeric scalar specifying a time in seconds to wait between pages of the search result, i.e. between downloading the current bundle and the next bundle. This can be used to avoid choking a weak server with too many requests to quickly. Defaults to zero.

rm_tag

Character vector of length 1 defining an xml tag of elements that will removed from the bundle automatically. Defaults to "div", leading to the removal of all html parts (see Details). Set to NULL to keep the bundles untouched. See fhir_rm_div() and fhir_rm_tag() for more info.

max_attempts

[Deprecated] The number of maximal attempts is now determined by the length of delay_between_attempts.

Details

Request type:

fhir_search allows for two types of search request:

1. FHIR search via GET: This is the more common approach. All information on which resources to download is contained in the URL that is send to the server (request argument). This encompasses the base url of the server, the resource type and possible search parameters to further qualify the search (see fhir_url()). The search via GET is the default and performed whenever the argument body is NULL.

2. FHIR search via POST: This option should only be used when the parameters make the search URL so long the server might deny it because it exceeds the allowed length. In this case the search parameters (everything that would usually follow the resource type after the ?) can be transferred to a body of type "application/x-www-form-urlencoded" and send via POST. If you provide a body in fhir_search(), the url in request should only contain the base URL and the resource type. The function will automatically amend it with _search and perform a POST.

Authentication:

There are several ways of authentication implemented in fhir_search(). If you don’t need any authentication, just leave the arguments described in the following at their default values of NULL.

1. Basic Authentication: Provide the username and the password for basic authentication in the respective arguments.
2. Token Authentication: Provide a token in the argument token, either as a character vector of length one or as an object of class `httr::Token`. You can use the function `fhir_authenticate()` to create this object.

**HTML removal:**

FHIR resources can contain a considerable amount of html code (e.g. in a narrative object), which is often created by the server for example to provide a human-readable summary of the resource. This data is usually not the aim of structured statistical analysis, so in the default setting `fhir_search()` will remove the html parts immediately after download to reduce memory usage (on a hapi server typically by around 30%, see `fhir_rm_div()`). The memory gain is payed with a runtime increase of 10%-20%. The html removal can be disabled by setting `rm_tag = NULL` to increase speed at the cost of increased memory usage.

**Value**

A `fhir_bundle_list` when `save_to_disc = NULL` (the default), else NULL.

**See Also**

- Creating a FHIR search request: `fhir_url()` and `fhir_body()` (for POST based search)
- OAuth2 Authentication: `fhir_authenticate()`
- Saving/reading bundles from disc: `fhir_save()` and `fhir_load()`
- Flattening the bundles: `fhir_crack()`

**Examples**

```r
# Search with GET
# create fhir search url
request <- fhir_url(url = "https://server.fire.ly",
                    resource = "Patient",
                    parameters = c(gender="female"))

# download bundles
bundles <- fhir_search(request, max_bundles = 5)

# Search with POST (should actually be used for longer requests)
request <- fhir_url(url = "https://server.fire.ly",
                    resource = "Patient")

body <- fhir_body(content = list(gender = "female"))

bundles <- fhir_search(request = request,
                        body = body,
                        max_bundles = 5)
```
fhir_serialize

Serialize a fhir_bundle, fhir_bundle_list or fhir_resource

Description

Serializes FHIR bundles or resources to allow for saving in .rda or .RData format without losing integrity of pointers i.e. it turns a fhir_bundle_xml/fhir_resource_xml object into an fhir_bundle_serialized/fhir_resource_serialized object.

Usage

fhir_serialize(bundles)

## S4 method for signature 'fhir_bundle_xml'
fhir_serialize(bundles)

## S4 method for signature 'fhir_bundle_serialized'
fhir_serialize(bundles)

## S4 method for signature 'fhir_bundle_list'
fhir_serialize(bundles)

## S4 method for signature 'fhir_resource_xml'
fhir_serialize(bundles)

## S4 method for signature 'fhir_resource_serialized'
fhir_serialize(bundles)

Arguments

bundles A fhir_bundle, fhir_bundle_list or fhir_resource object.

Value

A fhir_bundle_xml, fhir_bundle_list or fhir_resource_xml object.

Examples

#example bundles are serialized, unserialize like this:
bundles <- fhir_unserialize(medication_bundles)

#Serialize like this:
bundles_for_saving <- fhir_serialize(bundles)

#works also on single bundles
fhir_serialize(bundles[[1]])
Create `fhir_table_description` object

**Description**

A `fhir_table_description` holds the information `fhir_crack()` needs to flatten (aka crack) FHIR resources from a FHIR bundle. There should be one `fhir_table_description` per resource type as `fhir_crack()` will create one data.frame/data.table per resource type in a bundle. See Details.

**Usage**

```r
fhir_table_description(
  resource,
  cols = fhir_columns(),
  sep = ":::",
  brackets = character(),
  rm_empty_cols = FALSE,
  format = "compact",
  keep_attr = FALSE,
  style = deprecated()
)
```

**Arguments**

- `resource` A character vector of length one or `fhir_resource_type` object indicating which resource type should be extracted.
- `cols` Optional. A `fhir_columns` object or something that can be coerced to one, like a (named) character vector, a (named) list containing xpath expressions, or a `fhir_xpath_expression` object. See `fhir_columns()` and the examples. If this argument is omitted, an empty `fhir_columns` object will be supplied. This means that in the call to `fhir_crack()`, all available elements are extracted in put in automatically named columns.
- `sep` A character of length one containing the separator string used for separating multiple entries in cells when `format = "compact"`. ignored when `format = "wide"`. Defaults to ":::".
- `brackets` A character of length one or two used for the indices of multiple entries. The first one is the opening bracket and the second one the closing bracket. Vectors of length one will be recycled. Defaults to `character(0)`, i.e. no brackets, meaning that multiple entries won't be indexed.
- `rm_empty_cols` A logical of length one indicating whether empty columns should be removed from the resulting table or not. Defaults to `FALSE`.

- `keep_attr` A logical of length one indicating whether attributes should be kept or dropped. Defaults to `FALSE`.
- `style` A character of length one indicating the format of `fhir_table_description`. Defaults to `"data.frame"`.

- `format` A logical of length one indicating whether the table should be returned in `"data.frame"` or `"data.table"`. Defaults to `"data.frame"`.

- `sep` A character of length one containing the separator string used for separating multiple entries in cells when `format = "compact"`. ignored when `format = "wide"`. Defaults to ":::".

- `brackets` A character of length one or two used for the indices of multiple entries. The first one is the opening bracket and the second one the closing bracket. Vectors of length one will be recycled. Defaults to `character(0)`, i.e. no brackets, meaning that multiple entries won't be indexed.

- `rm_empty_cols` A logical of length one indicating whether empty columns should be removed from the resulting table or not. Defaults to `FALSE`.

- `keep_attr` A logical of length one indicating whether attributes should be kept or dropped. Defaults to `FALSE`.

- `style` A character of length one indicating the format of `fhir_table_description`. Defaults to `"data.frame"`.

- `format` A logical of length one indicating whether the table should be returned in `"data.frame"` or `"data.table"`. Defaults to `"data.frame"`.

- `sep` A character of length one containing the separator string used for separating multiple entries in cells when `format = "compact"`. ignored when `format = "wide"`. Defaults to ":::".

- `brackets` A character of length one or two used for the indices of multiple entries. The first one is the opening bracket and the second one the closing bracket. Vectors of length one will be recycled. Defaults to `character(0)`, i.e. no brackets, meaning that multiple entries won't be indexed.

- `rm_empty_cols` A logical of length one indicating whether empty columns should be removed from the resulting table or not. Defaults to `FALSE`.

- `keep_attr` A logical of length one indicating whether attributes should be kept or dropped. Defaults to `FALSE`.

- `style` A character of length one indicating the format of `fhir_table_description`. Defaults to `"data.frame"`.

- `format` A logical of length one indicating whether the table should be returned in `"data.frame"` or `"data.table"`. Defaults to `"data.frame"`.

- `sep` A character of length one containing the separator string used for separating multiple entries in cells when `format = "compact"`. ignored when `format = "wide"`. Defaults to ":::".

- `brackets` A character of length one or two used for the indices of multiple entries. The first one is the opening bracket and the second one the closing bracket. Vectors of length one will be recycled. Defaults to `character(0)`, i.e. no brackets, meaning that multiple entries won't be indexed.

- `rm_empty_cols` A logical of length one indicating whether empty columns should be removed from the resulting table or not. Defaults to `FALSE`.

- `keep_attr` A logical of length one indicating whether attributes should be kept or dropped. Defaults to `FALSE`.

- `style` A character of length one indicating the format of `fhir_table_description`. Defaults to `"data.frame"`.

- `format` A logical of length one indicating whether the table should be returned in `"data.frame"` or `"data.table"`. Defaults to `"data.frame"`.

- `sep` A character of length one containing the separator string used for separating multiple entries in cells when `format = "compact"`. ignored when `format = "wide"`. Defaults to ":::".

- `brackets` A character of length one or two used for the indices of multiple entries. The first one is the opening bracket and the second one the closing bracket. Vectors of length one will be recycled. Defaults to `character(0)`, i.e. no brackets, meaning that multiple entries won't be indexed.

- `rm_empty_cols` A logical of length one indicating whether empty columns should be removed from the resulting table or not. Defaults to `FALSE`.

- `keep_attr` A logical of length one indicating whether attributes should be kept or dropped. Defaults to `FALSE`.

- `style` A character of length one indicating the format of `fhir_table_description`. Defaults to `"data.frame"`.
A character of length one indicating whether the resulting table should be cracked to a "wide" or "compact" format. "wide" means multiple entries will be distributed over several columns with indexed names. "compact" means multiple entries will be pasted into one cell/column separated by sep. Defaults to "compact".

A logical of length one indicating whether the attribute name of the respective element (@value in most cases) should be attached to the name of the variable in the resulting table. Defaults to FALSE.

[Deprecated]

A fhir_table_description consists of the following elements:

- The resource element: Defines the resource type (e.g. Patient or Observation). See fhir_resource_type().
- The cols element: Contains the column names and XPath expressions defining the columns to extract. If this element is empty, fhir_crack() will extract all available elements of the resource and name the columns automatically. See fhir_columns().
- The sep element: A character of length one containing the separator string used for separating multiple entries in cells.
- The brackets element: A character of length one or two used for the indices of multiple entries. The first one is the opening bracket and the second one the closing bracket. Vectors of length one will be recycled. Defaults to character(0), i.e. no brackets, meaning that multiple entries won’t be indexed.
- The rm_empty_cols element: A logical of length one indicating whether empty columns should be removed in the resulting table or not. Defaults to FALSE.
- The format element: A character of length one indicating whether the resulting table should be cracked to a wide or compact format. wide means multiple entries will be distributed over several columns with indexed names. compact means multiple entries will be pasted into one cell/column separated by sep. Defaults to compact.
- The keep_attr element: A logical of length one indicating whether the attribute name of the respective element (@value in most cases) should be attached to the name of the variable in the resulting table. Defaults to FALSE.

A full fhir_table_description looks for example like this:

  fhir_resource_type: Patient

  fhir_columns:
  column name | xpath expression
  ------------------------
  name | name/family
  gender | gender
  id | id

  sep: ':::'
Value

An object of class `fhir_table_description`.

Examples

```r
# a minimal table description
fhir_table_description(
    resource = "Patient"
)

# named list for cols
fhir_table_description(
    resource = "Patient",
    cols = list(
        id = "id",
        name = "name/family",
        gender = "gender"
    )
)

# unnamed character for cols, colnames are generated automatically
fhir_table_description(
    resource = "Patient",
    cols = c(
        "id",
        "name/family",
        "gender"
    )
)

# named character for cols, and overwritten default for other arguments
fhir_table_description(
    resource = "Patient",
    cols = c(
        id = "id",
        name = "name/family",
        gender = "gender"
    ),
    brackets = c("[", "]"),
    rm_empty_cols = TRUE,
    format = "wide"
)

# no column arguments is given -> creates a column for all available elements
fhir_table_description(
    resource = "Patient",
    brackets: '[', ']
    rm_empty_cols: FALSE
    format: 'compact'
    keep_attr: FALSE
```
Description

A `fhir_table_description` holds the information `fhir_crack()` needs to flatten (aka crack) FHIR resources from a FHIR bundle and is created with its constructor function `fhir_table_description()`. Each `fhir_table_description` describes a table for a specific resource type as `fhir_crack()` will create one data.frame/data.table per resource type. See Details.

Details

A `fhir_table_description` consists of the following elements:

- The resource element: Defines the resource type (e.g. Patient or Observation). See `fhir_resource_type()`.
- The cols element: Contains the column names and XPath expressions defining the columns to extract. If this element is empty, `fhir_crack()` will extract all available elements of the resource and name the columns automatically. See `fhir_columns()`.
- The sep element: A character of length one containing the separator string used for separating multiple entries in cells.
- The brackets element: A character of length one or two used for the indices of multiple entries. The first one is the opening bracket and the second one the closing bracket. Vectors of length one will be recycled. Defaults to character(0), i.e. no brackets, meaning that multiple entries won't be indexed.
- The rm_empty_cols element: A logical of length one indicating whether empty columns should be removed in the resulting table or not. Defaults to FALSE.
- The format element: A character of length one indicating whether the resulting table should be cracked to a wide or compact format. wide means multiple entries will be distributed over several columns with indexed names. compact means multiple entries will be pasted into one cell/column separated by sep. Defaults to compact.
- The keep_attr element: A logical of length one indicating whether the attribute name of the respective element (@value in most cases) should be attached to the name of the variable in the resulting table. Defaults to FALSE.

A full `fhir_table_description` looks for example like this:
fhir_resource_type: Patient

fhir_columns:
column name | xpath expression
------------------------
name | name/family
gender | gender
id | id

sep: ':::'
brackets: ['[', ']']
rm_empty_cols: FALSE
format: 'compact'
keep_attr: FALSE

Slots

resource An object of class fhir_resource_type defining the resource type that should be extracted.
cols An object of class fhir_columns describing which columns should be created and how. If this is an empty fhir_columns object, the call to fhir_crack() will extract all available elements and put them in automatically named columns.
sep A character of length one containing the separator string used for separating multiple entries in cells when format = "compact". ignored when format = "wide".
brackets A character of length one or two used for the indices of multiple entries. The first one is the opening bracket and the second one the closing bracket. Vectors of length one will be recycled. Defaults to character(0), i.e. no brackets, meaning that multiple entries won’t be indexed.
rm_empty_cols A logical of length one indicating whether empty columns should be removed from the resulting table or not. Defaults to FALSE.
format A character of length one indicating whether the resulting table should be cracked to a wide or compact format. wide means multiple entries will be distributed over several columns with indexed names. compact means multiple entries will be pasted into one cell/column separated by sep. Defaults to compact.
keep_attr A logical of length one indicating whether the attribute name of the respective element (@value in most cases) should be attached to the name of the variable in the resulting table. Defaults to FALSE

See Also

fhir_resource_type(), fhir_columns(), fhir_design(), fhir_crack()
Represent a wide cast table as a tree

Description

This function takes a wide table as created by `fhir_crack()` with format="wide" and creates the tree structure implicit in the column names of the tables. It is useful to get an overview over the implied structure when planning to create FHIR bundles from this table using `fhir_build_bundle()`.

Usage

```r
fhir_tree(
  table,
  brackets,
  resource = "Resource",
  keep_attr = FALSE,
  keep_ids = FALSE,
  skip_one = FALSE,
  format = "plain",
  prompt = "::"
)
```

Arguments

- `table`: A data.frame or data.table as produced by `fhir_crack()` with format="wide" or `fhir_cast()`.
- `brackets`: A character vector of length two. The brackets used in the table.
- `resource`: A character vector of length one or `fhir_resource_type` object indicating which resource type the table is build from.
- `keep_attr`: A logical vector of length one indicating whether attributes should be displayed or not. Only used for formats "plain" and "fancy".
- `keep_ids`: A logical vector of length one indicating whether indices should be displayed or not. Only used for formats "plain" and "fancy".
- `skip_one`: A logical vector of length one indicating whether first index 1 should be displayed or not. Only used for formats "plain" and "fancy".
- `format`: The format of the tree. One of "plain", "fancy" or "xml".
- `prompt`: A character vector of length one use as prompt Only used for formats "plain" and "fancy".

Value

A string that can be used with `cat()` or can be written to a text file.

See Also

- `fhir_cast()`, `fhir_build_bundle()`
Examples

```r
# Unserialize example
bundles <- fhir_unserialize(bundles = example_bundles)

table_desc <- fhir_table_description(
  resource = "Patient",
  brackets = c("[", "]"),
  sep = " ",
  format = "wide"
)

fhir_crack(bundles = bundles, design = table_desc)

# Show tree

# Plain format
cat(fhir_tree(
  table = df,
  brackets = c("[", "]"),
  resource = "Patient"
))

# Fancy format with indices
cat(fhir_tree(
  table = df,
  brackets = c("[", "]"),
  resource = "Patient",
  format = "fancy",
  keep_ids = TRUE
))

# XML format
cat(fhir_tree(
  table = df,
  brackets = c("[", "]"),
  resource = "Patient",
  format = "xml"
))
```

**fhir_unserialize**  
Unserialize a `fhir_bundle`, `fhir_bundle_list` or `fhir_resource`

**Description**

Unserializes FHIR resources or bundles that have been serialized to allow for saving in .rda or .RData format, i.e. it turns a `fhir_bundle_serialized/fhir_resource_serialized` object into an `fhir_bundle_xml/fhir_resource_xml`.
fhir_url

    object.

Usage

    fhir_unserialize(bundles)

    ## S4 method for signature 'fhir_bundle_xml'
    fhir_unserialize(bundles)

    ## S4 method for signature 'fhir_bundle_serialized'
    fhir_unserialize(bundles)

    ## S4 method for signature 'fhir_resource_xml'
    fhir_unserialize(bundles)

    ## S4 method for signature 'fhir_resource_serialized'
    fhir_unserialize(bundles)

    ## S4 method for signature 'fhir_bundle_list'
    fhir_unserialize(bundles)

Arguments

    bundles            A fhir_bundle, fhir_bundle_list or fhir_resource object.

Value

    A fhir_bundle_serialized, fhir_bundle_list or fhir_resource_serialized object.

Examples

    #unserialize bundle list
    fhir_unserialize(patient_bundles)

    #unserialize single bundle
    fhir_unserialize(patient_bundles[[1]])

fhir_url Create FHIR URL

Description

This function creates an object of class fhir_url which mostly represents a URL-encoded URL for a FHIR search request. A valid Search URL contains a base URL and a resource type and may contain additional search parameters. For more info on FHIR search see https://www.hl7.org/fhir/search.html.
Usage

fhir_url(url, resource, parameters, url_enc = TRUE)

## S4 method for signature 'character,missing,missing'
fhir_url(url, url_enc = TRUE)

## S4 method for signature 'character,character,missing'
fhir_url(url, resource, url_enc = TRUE)

## S4 method for signature 'character,character,character'
fhir_url(url, resource, parameters, url_enc = TRUE)

## S4 method for signature 'character,character,list'
fhir_url(url, resource, parameters, url_enc = TRUE)

Arguments

url A character of length one specifying either the full search request, e.g. "http://hapi.fhir.org/baseR4/Patient?gender=male&_summary=count", or the base URL to the FHIR server, e.g. "http://hapi.fhir.org/baseR4".

resource A character of length one or fhir_resource_type object with the resource type to be searched, e.g. "Patient".

parameters Optional. Either a length 1 character containing properly formatted FHIR search parameters, e.g. "gender=male&_summary=count" or a named list or named character vector e.g. list(gender="male", "_summary"="count") or c(gender="male", "_summary"="count"). Note that parameter names beginning with _ have to be put in quotation marks!

url_enc Should the url be URL-encoded? Defaults to TRUE.

Details

You can use this function in two ways. If you provide just one string in the argument url with the full FHIR search request, this string will be taken as a full FHIR search request. If you also provide the arguments resource and/or parameters, the string in url will be taken as the base url of your FHIR server and the arguments will be concatenated appropriately to form the full request. See examples.

Note that only the latter approach does a validity check on the resource type!

You can disable URL-encoding by setting url_enc=FALSE.

Value

An object of class fhir_url

Examples

#provide full FHIR search request
fhir_url(url = "http://hapi.fhir.org/baseR4/Patient?gender=male&_summary=count")
#provide base url and resource type
fhir_url(
    url = "http://hapi.fhir.org/baseR4",
    resource = "Patient"
)

#parameters in one string
fhir_url(
    url = "http://hapi.fhir.org/baseR4",
    resource = "Patient",
    parameters = "gender=male&_summary=count"
)

#parameters as a named character
fhir_url(
    url = "http://hapi.fhir.org/baseR4",
    resource = "Patient",
    parameters = c("gender" = "male", "_summary" = "count")
)

#parameters as a named list
fhir_url(
    url = "http://hapi.fhir.org/baseR4",
    resource = "Patient",
    parameters = list("gender" = "male", "_summary" = "count")
)

---

**fhir_url-class**  
**An S4 object to represent a URL for a FHIR server**

**Description**

Objects of this class are basically strings (character vectors of length one) representing a URL. They are usually url encoded. See `fhir_url()` for how to build them.

---

**fhir_xpath_expression**  
**Create fhir_xpath_expression**

**Description**

This function takes a character vector, checks whether it contains valid XPath (1.0) expressions and returns it as an fhir_xpath_expression object. These objects are used in fhir_parameters objects.

**Usage**

fhir_xpath_expression(expression)
Arguments

expression A character vector of the XPath expressions

Value

A XPath expression object

Examples

fhir_xpath_expression(c("//Patient", "name/given"))

Description

An S4 class for xpath_expressions. Objects of this class are essentially character vectors, but can only be valid XPath (1.0) expressions. They are mostly used in the fhir_columns class.

medication_bundles Exemplary FHIR bundles

Description

These data examples can be used to explore some of the functions from the fhircrackr package when direct access to a FHIR server is not possible.

All example data sets are fhir_bundle_lists containing fhir_bundle_serialized objects representing FHIR bundles as returned by fhir_search(). They have to be unserialized (once per R session), before you can work with them!

Usage

medication_bundles

patient_bundles

Format

An object of class fhir_bundle_list of length 3.
An object of class fhir_bundle_list of length 2.
Details

medication_bundles contains 3 bundles with MedicationStatement resources representing Medications with Snomed CT code 429374003 and the respective Patient resources that are linked to these MedicationStatements.

patient_bundles contains 2 bundles with Patient resources.

Source

The data sets are generated by the following code:

medication_bundles (Downloaded 10-05-21)

search_request <- fhir_url(url = "https://hapi.fhir.org/baseR4",
resource = "MedicationStatement",
parameters = c("code" = "http://snomed.info/ct|429374003",
"_include" = "MedicationStatement:subject"))

bundles <- fhir_search(request = search_request, max_bundles = 3)

coding <- fhir_serialize(bundles = bundles)

patient_bundles (Downloaded 10-05-21)

bundles <- fhir_search(request="https://hapi.fhir.org/baseR4/Patient",
                        max_bundles=2,
                        verbose = 0)

patient_bundles <- fhir_serialize(bundles = bundles)

Examples

#unserialize xml objects before doing anything else with them!

fhir_unserialize(bundles = medication_bundles)

fhir_unserialize(bundles = patient_bundles)

---

**Description**

Concatenates two or more strings to a path string correctly.

**Usage**

```
pastep(..., list_of_paths = NULL, ext = NULL)
```
Arguments

... A Set of Path Strings. Only works if list_of_paths is NULL
list_of_paths Either a vector or a list of paths strings
ext An Extension to add at the end of the path

Value

A Character of length one, the combined path.

Examples

pastep('a', 'b', 'c', 'd')
pastep(list_of_paths = list(paste0('/', letters, '/'), as.character(1:13)))
pastep(list_of_paths = c(letters, as.character(1:13)), ext = '.txt')
pastep(list_of_paths = c(letters, as.character(1:13)), ext = '_dat.txt')

Description

Concatenates two strings to a path string correctly.

Usage

paste_paths(path1 = "w", path2 = "d", os = "LiNuX")

Arguments

path1 A a character vector of length one specifying the left hand part of the resulting path.
path2 A a character vector of length one specifying the right hand part of the resulting path.
os A a character vector of length one specifying the operating system you’re operating on: windows or linux.

Value

A a character vector of length one containing the concatenated path.

Examples

paste_paths(path1 = "data", path2 = "patients")
paste_paths(path1 = "/data", path2 = "patients")
paste_paths(path1 = "/data/", path2 = "patients")
paste_paths(path1 = "/data", path2 = "/patients")
paste_paths(path1 = "/data/", path2 = "/patients/"
paste_paths(path1 = "data", path2 = "patients", os = "windows")
Toy examples to POST/PUT on a server

Description
These data examples are simple examples to try out POSTing/PUTting resources to a server. See Source for how the xml versions look.

Usage
transaction_bundle_example
description_resource1
description_resource2
description_resource3

Format
An object of class fhir_bundle_serialized of length 1277.
An object of class fhir_resource_serialized of length 267.
An object of class fhir_resource_serialized of length 290.
An object of class fhir_resource_serialized of length 608.

Details
transaction_bundle_example contains 1 transaction bundle with 2 Patient resources.
description_resource1 contains 1 patient resource without id for POSTing
description_resource2 contains 1 patient resource with id for PUTing
description_resource3 contains 1 Medication resource with an id xml attribute

Source
transaction_bundle_example

```xml
<Bundle>
  <type value='transaction'/>
  <entry>
    <resource>
      <Patient>
        <id value='id1'/>
        <address>
          <use value='home'/>
        </address>
      </Patient>
    </resource>
  </entry>
```

```xml
</Bundle>
```
<city value='Amsterdam'/>
<type value='physical'/>
<country value='Netherlands'/>
</address>
<name>
  <given value='Marie'/>
</name>
</Patient>
</resource>
<request>
