Package ‘filesstrings’

June 27, 2019

Type Package
Title Handy File and String Manipulation
Version 3.1.5
Maintainer Rory Nolan <rorynolan@gmail.com>
Description This started out as a package for file and string manipulation. Since then, the ‘fs’ and ‘strex’ packages emerged, offering functionality previously given by this package (but it’s done better in these new ones). Those packages have hence almost pushed ‘filesstrings’ into extinction. However, it still has a small number of unique, handy file manipulation functions which can be seen in the vignette. One example is a function to remove spaces from all file names in a directory.
License GPL-3
Encoding UTF-8
LazyData true
Imports magrittr (>= 1.5), checkmate (>= 1.9.3), strex (>= 1.1.1),
         matrixStats (>= 0.50.0), tibble (>= 2.0.1), ore (>= 1.4.0),
         rlang (>= 0.3.3), stringi (>= 1.3.1), withr (>= 2.1.0)
RoxygenNote 6.1.1
Suggests testthat (>= 2.1.0), covr, knitr, rmarkdown, spelling, dplyr
Depends R (>= 3.1), stringr

all_equal

An alternative version of base::all.equal().
**Description**

This function will return TRUE whenever `base::all.equal()` would return TRUE, however it will also return TRUE in some other cases:

- If `a` is given and `b` is not, TRUE will be returned if all of the elements of `a` are the same.
- If `a` is a scalar and `b` is a vector or array, TRUE will be returned if every element in `b` is equal to `a`.
- If `a` is a vector or array and `b` is a scalar, TRUE will be returned if every element in `a` is equal to `b`.

This function ignores names and attributes (except for `dim`).

When this function does not return TRUE, it returns FALSE (unless it errors). This is unlike `base::all.equal()`.

**Usage**

```r
all_equal(a, b = NULL)
```

**Arguments**

- `a`: A vector, array or list.
- `b`:
  - Either NULL or a vector, array or list of length either 1 or `length(a)`.

**Value**

TRUE if "equality of all" is satisfied (as detailed in 'Description' above) and FALSE otherwise.

**Note**

- This behaviour is totally different from `base::all.equal()`.
- There’s also `dplyr::all_equal()`, which is different again. To avoid confusion, always use the full `filesstrings::all_equal()` and never `library(filesstrings)` followed by just `all_equal()`.

**Examples**

```r
all_equal(1, rep(1, 3))
all_equal(2, 1:3)
all_equal(1:4, 1:4)
all_equal(1:4, c(1, 2, 3, 3))
all_equal(rep(1, 10))
all_equal(c(1, 88))
all_equal(1:2)
all_equal(list(1:2))
all_equal(1:4, matrix(1:4, nrow = 2)) # note that this gives TRUE
```
before_last_dot  Get the part of a string before the last period.

Description

See strex::str_before_last_dot().

Usage

before_last_dot(string)

str_before_last_dot(string)

Arguments

string  A character vector.

can_be_numeric  Check if a string could be considered as numeric.

Description

See strex::str_can_be_numeric().

Usage

can_be_numeric(string)

str_can_be_numeric(string)

Arguments

string  A character vector.
create_dir  

Create directories if they don’t already exist

Description
Given the names of (potential) directories, create the ones that do not already exist.

Usage
create_dir(...)

Arguments
...

The names of the directories, specified via relative or absolute paths. Duplicates are ignored.

Value
Invisibly, a vector with a TRUE for each time a directory was actually created and a FALSE otherwise. This vector is named with the paths of the directories that were passed to the function.

Examples
## Not run:
create_dir(c("mydir", "yourdir"))
remove_dir(c("mydir", "yourdir"))
## End(Not run)

currency  

Get the currencies of numbers within a string.

Description
See strx::str_extract_currencies().

Usage
str_extract_currencies(string)
extract_currencies(string)
str_nth_currency(string, n)
nth_currency(string, n)
str_first_currency(string)
extend_char_vec

first_currency(string)
str_last_currency(string)
last_currency(string)

Arguments

string A character vector.
n A vector of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while n = 1 and n = 2 correspond to first and second, n = -1 and n = -2 correspond to last and second-last. n = 0 will return NA.

Description

Pad a character vector with empty strings.

Extend a character vector by appending empty strings at the end.

Usage

extend_char_vec(char_vec, extend_by = NA, length_out = NA)
str_extend_char_vec(char_vec, extend_by = NA, length_out = NA)

Arguments

char_vec A character vector. The thing you wish to expand.
extend_by A non-negative integer. By how much do you wish to extend the vector?
length_out A positive integer. How long do you want the output vector to be?

Value

A character vector.

Examples

extend_char_vec(1:5, extend_by = 2)
extend_char_vec(c("a", "b"), length_out = 10)
extract_non_numerics  Extract non-numbers from a string.

Description
See \texttt{str\textunderscore e\textunderscore xtract\textunderscore non\textunderscore numerics()}

Usage

\begin{verbatim}
extract_non_numerics(string, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE)
str_extract_non_numerics(string, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE)
nth_non_numeric(string, n, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE)
str_nth_non_numeric(string, n, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE)
first_non_numeric(string, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE)
str_first_non_numeric(string, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE)
last_non_numeric(string, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE)
str_last_non_numeric(string, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE)
\end{verbatim}

Arguments

\begin{itemize}
\item \texttt{string} \hspace{1cm} A string.
\item \texttt{decimals} \hspace{1cm} Do you want to include the possibility of decimal numbers (TRUE) or not (FALSE, the default).
\item \texttt{leading_decimals} \hspace{1cm} Do you want to allow a leading decimal point to be the start of a number?
\end{itemize}
negs  Do you want to allow negative numbers? Note that double negatives are not handled here (see the examples).
sci  Make the search aware of scientific notation e.g. 2e3 is the same as 2000.
comas  Allow comma separators in numbers (i.e. interpret 1,100 as a single number (one thousand one hundred) rather than two numbers (one and one hundred)).
n  A vector of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while \( n = 1 \) and \( n = 2 \) correspond to first and second, \( n = -1 \) and \( n = -2 \) correspond to last and second-last. \( n = 0 \) will return NA.

---

**extract_numbers**

*Extract numbers from a string.*

**Description**

See `strex::str_extract_numbers()`.

**Usage**

```r
extract_numbers(string, decimals = FALSE, leading_decimals = decimals,
               negs = FALSE, sci = FALSE, commas = FALSE,
               leave_as_string = FALSE)
```

```r
str_extract_numbers(string, decimals = FALSE,
                    leading_decimals = decimals, negs = FALSE, sci = FALSE,
                    commas = FALSE, leave_as_string = FALSE)
```

```r
nth_number(string, n, decimals = FALSE, leading_decimals = decimals,
            negs = FALSE, sci = FALSE, commas = FALSE,
            leave_as_string = FALSE)
```

```r
str_nth_number(string, n, decimals = FALSE,
                leading_decimals = decimals, negs = FALSE, sci = FALSE,
                commas = FALSE, leave_as_string = FALSE)
```

```r
first_number(string, decimals = FALSE, leading_decimals = decimals,
              negs = FALSE, sci = FALSE, commas = FALSE,
              leave_as_string = FALSE)
```

```r
str_first_number(string, decimals = FALSE, leading_decimals = decimals,
                 negs = FALSE, sci = FALSE, commas = FALSE,
                 leave_as_string = FALSE)
```

```r
last_number(string, decimals = FALSE, leading_decimals = decimals,
             negs = FALSE, sci = FALSE, commas = FALSE,
             leave_as_string = FALSE)
```
str_last_number(string, decimals = FALSE, leading_decimals = decimals, 
  negs = FALSE, sci = FALSE, commas = FALSE, 
  leave_as_string = FALSE)

Arguments

string    A string.
decimals  Do you want to include the possibility of decimal numbers (TRUE) or not (FALSE, the default).
leading_decimals    Do you want to allow a leading decimal point to be the start of a number?
negs    Do you want to allow negative numbers? Note that double negatives are not handled here (see the examples).
sci    Make the search aware of scientific notation e.g. 2e3 is the same as 2000.
commas    Allow comma separators in numbers (i.e. interpret 1,100 as a single number (one thousand one hundred) rather than two numbers (one and one hundred)).
leave_as_string    Do you want to return the number as a string (TRUE) or as numeric (FALSE, the default)?
n    A vector of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while n = 1 and n = 2 correspond to first and second, n = -1 and n = -2 correspond to last and second-last. n = 0 will return NA.

Description

This started out as a package for file and string manipulation. Since then, the fs file manipulation package and the `strex string manipulation package emerged, offering functionality previously given by this package (but slightly better). Those packages have hence almost pushed `filesstrings into extinction. However, it still has a small number of unique, handy file manipulation functions which can be seen in the vignette. One example is a function to remove spaces from all file names in a directory.

References

### give_ext

Ensure a file name has the intended extension.

**Description**

See `strex::str_give_ext()`.

**Usage**

```cpp
give_ext(string, ext, replace = false)
str_give_ext(string, ext, replace = false)
```

**Arguments**

- **string**: The intended file name.
- **ext**: The intended file extension (with or without the ".").
- **replace**: If the file has an extension already, replace it (or append the new extension name)?

### group_close

Group together close adjacent elements of a vector.

**Description**

Given a strictly increasing vector (each element is bigger than the last), group together stretches of the vector where adjacent elements are separated by at most some specified distance. Hence, each element in each group has at least one other element in that group that is close to it. See the examples.

**Usage**

```cpp
group_close(vec_ascending, max_gap = 1)
```

**Arguments**

- **vec_ascending**: A strictly increasing numeric vector.
- **max_gap**: The biggest allowable gap between adjacent elements for them to be considered part of the same group.

**Value**

A where each element is one group, as a numeric vector.
**locate_braces**

**Examples**

```r
group_close(1:10, 1)
group_close(1:10, 0.5)
group_close(c(1, 2, 4, 10, 11, 14, 20, 25, 27), 3)
```

---

**locate_braces**  
*Locate the braces in a string.*

**Description**

See `strex::str_locate_braces()`.

**Usage**

```r
locate_braces(string)
```

**Arguments**

- `string`  
  A character vector

---

**match_arg**  
*Argument Matching*

**Description**

See `strex::match_arg()`.

**Usage**

```r
match_arg(arg, choices = NULL, index = FALSE, several_ok = FALSE, ignore_case = FALSE)
```

```r
str_match_arg(arg, choices = NULL, index = FALSE, several_ok = FALSE, ignore_case = FALSE)
```

**Arguments**

- `arg`  
  A character vector (of length one unless `several_ok = TRUE`).
- `choices`  
  A character vector of candidate values.
- `index`  
  Return the index of the match rather than the match itself?
- `several_ok`  
  Allow `arg` to have length greater than one to match several arguments at once?
- `ignore_case`  
  Ignore case while matching. If this is `TRUE`, the returned value is the matched element of `choices` (with its original casing).
move_files

Move files around.

Description
Move specified files into specified directories

Usage
move_files(files, destinations, overwrite = FALSE)

file.move(files, destinations, overwrite = FALSE)

Arguments
files A character vector of files to move (relative or absolute paths).
destinations A character vector of the destination directories into which to move the files.
overwrite Allow overwriting of files? Default no.

Details
If there are \( n \) files, there must be either 1 or \( n \) directories. If there is one directory, then all \( n \) files are moved there. If there are \( n \) directories, then each file is put into its respective directory. This function also works to move directories.

If you try to move files to a directory that doesn’t exist, the directory is first created and then the files are put inside.

Value
Invisibly, a logical vector with a TRUE for each time the operation succeeded and a FALSE for every fail.

Examples

```r
## Not run:
dir.create("dir")
files <- c("1litres_1.txt", "1litres_30.txt", "3litres_5.txt")
file.create(files)
file.move(files, "dir")
## End(Not run)
```
nice_file_nums

Make file numbers comply with alphabetical order

Description

If files are numbered, their numbers may not comply with alphabetical order, i.e. "file2.ext" comes after "file10.ext" in alphabetical order. This function renames the files in the specified directory such that they comply with alphabetical order, so here "file2.ext" would be renamed to "file02.ext".

Usage

nice_file_nums(dir = ".", pattern = NA)

Arguments

dir Path (relative or absolute) to the directory in which to do the renaming (default is current working directory).

pattern A regular expression. If specified, files to be renamed are restricted to ones matching this pattern (in their name).

Details

It works on file names with more than one number in them e.g. "file01part3.ext" (a file with 2 numbers). All the file names that it works on must have the same number of numbers, and the non-number bits must be the same. One can limit the renaming to files matching a certain pattern. This function wraps nice_nums(), which does the string operations, but not the renaming. To see examples of how this function works, see the examples in that function’s documentation.

Value

A logical vector with a TRUE for each successful rename (should be all TRUEs) and a FALSE otherwise.

Examples

## Not run:
dir.create("NiceFileNums_test")
setwd("NiceFileNums_test")
files <- c("1litres_1.txt", "1litres_30.txt", "3litres_5.txt")
file.create(files)
nice_file_nums()
nice_file_nums(pattern = "\.	xt$")
setwd("..")
dir.remove("NiceFileNums_test")
## End(Not run)
nice_nums

Make string numbers comply with alphabetical order

Description

See strex::str_alphord_nums().

Usage

nice_nums(string)
str_nice_nums(string)
str_alphord_nums(string)
alphord_nums(string)

Arguments

string A character vector.

nth_number_after_mth

Find the nth number after the mth occurrence of a pattern.

Description

See strex::str_nth_number_after_mth().

Usage

nth_number_after_mth(string, pattern, n, m, decimals = FALSE,
leading_decimals = decimals, negs = FALSE, sci = FALSE,
comas = FALSE, leave_as_string = FALSE)

str_nth_number_after_mth(string, pattern, n, m, decimals = FALSE,
leading_decimals = decimals, negs = FALSE, sci = FALSE,
comas = FALSE, leave_as_string = FALSE)

nth_number_after_first(string, pattern, n, decimals = FALSE,
leading_decimals = decimals, negs = FALSE, sci = FALSE,
comas = FALSE, leave_as_string = FALSE)

nth_number_after_last(string, pattern, n, decimals = FALSE,
leading_decimals = decimals, negs = FALSE, sci = FALSE,
comas = FALSE, leave_as_string = FALSE)
first_number_after_mth(string, pattern, m, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

last_number_after_mth(string, pattern, m, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

first_number_after_first(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

first_number_after_last(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

last_number_after_first(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

last_number_after_last(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_nth_number_after_first(string, pattern, n, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_nth_number_after_last(string, pattern, n, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_first_number_after_mth(string, pattern, m, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_last_number_after_mth(string, pattern, m, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_first_number_after_first(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_first_number_after_last(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)
str_last_number_after_first(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_last_number_after_last(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

Arguments

string A character vector.

pattern The pattern to look for. The default interpretation is a regular expression, as described in stringi::stringi-search-regex. To match a without regular expression (i.e. as a human would), use coll(). For details see stringr::regex().

n Vectors of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while 1 and 2 correspond to first and second, -1 and -2 correspond to last and second-last. 0 will return NA.

m Vectors of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while 1 and 2 correspond to first and second, -1 and -2 correspond to last and second-last. 0 will return NA.

decimals Do you want to include the possibility of decimal numbers (TRUE) or not (FALSE, the default).

leading_decimals Do you want to allow a leading decimal point to be the start of a number?

negs Do you want to allow negative numbers? Note that double negatives are not handled here (see the examples).

sci Make the search aware of scientific notation e.g. 2e3 is the same as 2000.

commas Allow comma separators in numbers (i.e. interpret 1,100 as a single number (one thousand one hundred) rather than two numbers (one and one hundred)).

leave_as_string Do you want to return the number as a string (TRUE) or as numeric (FALSE, the default)?

nth_number_before_mth  Find the nth number before the mth occurrence of a pattern.

Description

See strex::str_nth_number_before_mth().
nth_number_before_mth

Usage

nth_number_before_mth(string, pattern, n, m, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

str_nth_number_before_mth(string, pattern, n, m, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

nth_number_before_first(string, pattern, n, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

nth_number_before_last(string, pattern, n, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

first_number_before_mth(string, pattern, m, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

last_number_before_mth(string, pattern, m, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

first_number_before_first(string, pattern, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

first_number_before_last(string, pattern, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

last_number_before_first(string, pattern, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

last_number_before_last(string, pattern, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

str_nth_number_before_first(string, pattern, n, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)

str_nth_number_before_last(string, pattern, n, decimals = FALSE, 
leading_decimals = decimals, negs = FALSE, sci = FALSE, 
commas = FALSE, leave_as_string = FALSE)
str_first_number_before_mth(string, pattern, m, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_last_number_before_mth(string, pattern, m, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_first_number_before_first(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_first_number_before_last(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_last_number_before_first(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

str_last_number_before_last(string, pattern, decimals = FALSE, leading_decimals = decimals, negs = FALSE, sci = FALSE, commas = FALSE, leave_as_string = FALSE)

Arguments

string A character vector.

pattern The pattern to look for. The default interpretation is a regular expression, as described in stringi::stringi-search-regex. To match a without regular expression (i.e. as a human would), use coll(). For details see stringr::regex().

n Vectors of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while 1 and 2 correspond to first and second, -1 and -2 correspond to last and second-last. 0 will return NA.

m Vectors of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while 1 and 2 correspond to first and second, -1 and -2 correspond to last and second-last. 0 will return NA.

decimals Do you want to include the possibility of decimal numbers (TRUE) or not (FALSE, the default).

leading_decimals Do you want to allow a leading decimal point to be the start of a number?

decs Do you want to allow negative numbers? Note that double negatives are not handled here (see the examples).
sci  Make the search aware of scientific notation e.g. 2e3 is the same as 2000.
commas  Allow comma separators in numbers (i.e. interpret 1,100 as a single number (one thousand one hundred) rather than two numbers (one and one hundred)).
leave_as_string  Do you want to return the number as a string (TRUE) or as numeric (FALSE, the default)?

Description
Create a character vector with a set of strings at specified positions in that character vector, with the rest of it taken up by empty strings.

Usage
```r
put_in_pos(strings, positions)
str_put_in_pos(strings, positions)
```

Arguments
- `strings`: A character vector of the strings to put in positions (coerced by `as.character` if not character already).
- `positions`: The indices of the character vector to be occupied by the elements of strings. Must be the same length as `strings` or of length 1.

Value
A character vector.

Examples
```r
put_in_pos(1:3, c(1, 8, 9))
put_in_pos(c("Apple", "Orange", "County"), c(5, 7, 8))
put_in_pos(1:2, 5)
```
remove_dir

Remove directories

Description
Delete directories and all of their contents.

Usage
remove_dir(...)  
dir.remove(...)  

Arguments
...                The names of the directories, specified via relative or absolute paths.

Value
Invisibly, a logical vector with TRUE for each success and FALSE for failures.

Examples
## Not run:  
sapply(c("mydir1", "mydir2"), dir.create)  
remove_dir(c("mydir1", "mydir2"))  
## End(Not run)

remove_filename_spaces

Remove spaces in file names

Description
Remove spaces in file names in a specified directory, replacing them with whatever you want, default nothing.

Usage
remove_filename_spaces(dir = ".", pattern = "", replacement = "")  

Arguments
dir             The directory in which to perform the operation.  
pattern         A regular expression. If specified, only files matching this pattern will be treated.  
replacement     What do you want to replace the spaces with? This defaults to nothing, another sensible choice would be an underscore.
Value
A logical vector indicating which operation succeeded for each of the files attempted. Using a missing value for a file or path name will always be regarded as a failure.

Examples

```r
## Not run:
dir.create("RemoveFileNameSpaces_test")
setwd("RemoveFileNameSpaces_test")
files <- c("1litres 1.txt", "1litres 30.txt", "3litres 5.txt")
file.create(files)
remove_filename_spaces()
list.files()
setwd("..")
dir.remove("RemoveFileNameSpaces_test")
## End(Not run)
```

---

**remove_quoted**

*Remove the quoted parts of a string.*

**Description**
See `strex::str_remove_quoted()`.

**Usage**

```r
remove_quoted(string)
str_remove_quoted(string)
```

**Arguments**

`string` A character vector.

---

**rename_with_nums**

*Replace file names with numbers*

**Description**
 Rename the files in the directory, replacing file names with numbers only.

**Usage**

```r
tername_with_nums(dir = ".", pattern = NULL)
```
Arguments

**dir**  The directory in which to rename the files (relative or absolute path). Defaults to current working directory.

**pattern**  A regular expression. If specified, only files with names matching this pattern will be treated.

Value

A logical vector with a TRUE for each successful renaming and a FALSE otherwise.

Examples

```r
## Not run:
dir.create("RenameWithNums_test")
setwd("RenameWithNums_test")
files <- c("1litres 1.txt", "1litres 30.txt", "3litres 5.txt")
file.create(files)
rename_with_nums()
list.files()
setwd("..")
dir.remove("RenameWithNums_test")
## End(Not run)
```

---

**singleize**  Remove back-to-back duplicates of a pattern in a string.

Description

See `strex::str_singleize()`.

Usage

```r
singleize(string, pattern)
str_singleize(string, pattern)
```

Arguments

**string**  A character vector.

**pattern**  The pattern to look for.

The default interpretation is a regular expression, as described in `stringi::stringi-search-regex`.

To match a without regular expression (i.e. as a human would), use `coll()`. For details see `stringr::regex()`.
str_after_nth

Description

See strex::str_after_nth().

Usage

str_after_nth(stringL patternL n)
after_nth(stringL patternL n)
str_after_first(stringL pattern)
after_first(stringL pattern)
str_after_last(stringL pattern)
after_last(stringL pattern)

Arguments

string A character vector.
pattern The pattern to look for.
The default interpretation is a regular expression, as described in stringi::stringi-search-regex.
To match a without regular expression (i.e. as a human would), use coll(). For details see stringr::regex().
n A vector of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while \( n = 1 \) and \( n = 2 \) correspond to first and second, \( n = -1 \) and \( n = -2 \) correspond to last and second-last. \( n = 0 \) will return NA.

str_before_nth

Description

See strex::str_before_nth().
Usage

str_before_nth(string, pattern, n)
before_nth(string, pattern, n)
str_before_first(string, pattern)
before_first(string, pattern)
str_before_last(string, pattern)
before_last(string, pattern)

Arguments

- **string**: A character vector.
- **pattern**: The pattern to look for.
  The default interpretation is a regular expression, as described in `stringi::stringi-search-regex`.
  To match a without regular expression (i.e. as a human would), use `coll()`. For details see `stringr::regex()`.
- **n**: A vector of integerish values. Must be either length 1 or have length equal to the length of `string`. Negative indices count from the back: while `n = 1` and `n = 2` correspond to first and second, `n = -1` and `n = -2` correspond to last and second-last. `n = 0` will return `NA`.

str_elem

Extract a single character from a string, using its index.

Description

See `strex::str_elem()`.

Usage

str_elem(string, index)
elem(string, index)

Arguments

- **string**: A character vector.
- **index**: An integer. Negative indexing is allowed as in `stringr::str_sub()`.
**str elems**

Extract several single elements from a string.

**Description**

See `strex::str elems()`.

**Usage**

```r
str elems(string, indices, byrow = TRUE)
```

**Arguments**

- **string**: A character vector.
- **indices**: A vector of integerish values. Negative indexing is allowed as in `stringr::str sub()`.
- **byrow**: Should the elements be organised in the matrix with one row per string (`byrow = TRUE`, the default) or one column per string (`byrow = FALSE`). See examples if you don’t understand.

---

**str locate_nth**

Get the indices of the n-th instance of a pattern.

**Description**

See `strex::str locate_nth()`.

**Usage**

```r
str locate_nth(string, pattern, n)
locate_nth(string, pattern, n)
str locate_first(string, pattern)
locate_first(string, pattern)
str locate_last(string, pattern)
locate_last(string, pattern)
```
str_split_by_nums

Arguments

string A character vector.

pattern The pattern to look for.

The default interpretation is a regular expression, as described in stringi::stringi-search-regex.

To match a without regular expression (i.e. as a human would), use coll(). For details see stringr::regex().

n A vector of integerish values. Must be either length 1 or have length equal to the length of string. Negative indices count from the back: while n = 1 and n = 2 correspond to first and second, n = -1 and n = -2 correspond to last and second-last. n = 0 will return NA.

str_paste elems Extract bits of a string and paste them together.

Description

See strex::str_paste elems().

Usage

str_paste elems(string, indices, sep = "")
paste elems(string, indices, sep = ")

Arguments

string A character vector.

indices A vector of integerish values. Negative indexing is allowed as in stringr::str_sub().

sep A string. The separator for pasting string elements together.

str_split_by_nums Split a string by its numeric characters.

Description

See strex::str_split_by_numbers().
str_split_camel_case

**Usage**

```r
str_split_by_nums(string, decimals = FALSE, leading_decimals = FALSE, negs = FALSE, sci = FALSE, commas = FALSE)
```

```r
split_by_nums(string, decimals = FALSE, leading_decimals = FALSE, negs = FALSE, sci = FALSE, commas = FALSE)
```

```r
split_by_numbers(string, decimals = FALSE, leading_decimals = FALSE, negs = FALSE, sci = FALSE, commas = FALSE)
```

```r
str_split_by_numbers(string, decimals = FALSE, leading_decimals = FALSE, negs = FALSE, sci = FALSE, commas = FALSE)
```

**Arguments**

- **string**: A string.
- **decimals**: Do you want to include the possibility of decimal numbers (TRUE) or not (FALSE, the default).
- **leading_decimals**: Do you want to allow a leading decimal point to be the start of a number?
- **negs**: Do you want to allow negative numbers? Note that double negatives are not handled here (see the examples).
- **sci**: Make the search aware of scientific notation e.g. 2e3 is the same as 2000.
- **commas**: Allow comma separators in numbers (i.e. interpret 1,100 as a single number (one thousand one hundred) rather than two numbers (one and one hundred)).

---

str_split_camel_case  
*Split a string based on CamelCase*

**Description**

See `strex::str_split_camel_case()`.

**Usage**

```r
str_split_camel_case(string, lower = FALSE)
```

```r
split_camel_case(string, lower = FALSE)
```

**Arguments**

- **string**: A character vector.
- **lower**: Do you want the output to be all lower case (or as is)?
**str_to_vec**  
Convert a string to a vector of characters

**Description**

See `strex::str_to_vec()`.

**Usage**

```
str_to_vec(string)
to_vec(string)
```

**Arguments**

- **string**: A character vector.

---

**trim_anything**  
Trim something other than whitespace

**Description**

See `strex::str_trim_anything()`.

**Usage**

```
trim_anything(string, pattern, side = "both")
str_trim_anything(string, pattern, side = "both")
```

**Arguments**

- **string**: A character vector.
- **pattern**: The pattern to look for.
  
The default interpretation is a regular expression, as described in `stringi::stringi-search-regex`.
  
To match a without regular expression (i.e. as a human would), use `coll()`. For details see `stringr::regex()`.
- **side**: Which side do you want to trim from? "both" is the default, but you can also have just either "left" or "right" (or optionally the shortened "b", "l" and "r").
unitize_dirs

Put files with the same unit measurements into directories

Description

Say you have a number of files with "5min" in their names, number with "10min" in the names, a number with "15min" in their names and so on, and you'd like to put them into directories named "5min", "10min", "15min" and so on. This function does this, but not just for the unit "min", for any unit.

Usage

unitize_dirs(unitL pattern = NULLL, dir = ".")

Arguments

unit The unit upon which to base the categorizing.
pattern If set, only files with names matching this pattern will be treated.
dir In which directory do you want to perform this action (defaults to current)?

Details

This function takes the number to be the last number (as defined in nth_number()) before the first occurrence of the unit name. There is the option to only treat files matching a certain pattern.

Value

Invisibly TRUE if the operation is successful, if not there will be an error.

Examples

## Not run:
dir.create("UnitDirs_test")
setwd("UnitDirs_test")
files <- c("1litres_1.txt", "1litres_2.txt", "3litres.txt", "5litres_1.txt")
file.create(files)
unitize_dirs("litres", "\.txt")
setwd("..")
dir.remove("UnitDirs_test")
## End(Not run)
