Package ‘flatr’

October 13, 2022

Type Package

Title Transforms Contingency Tables to Data Frames, and Analyses Them

Version 0.1.1

Author Scott D. Graham

Maintainer Scott D. Graham <scott.grah95@gmail.com>

Description Contingency Tables are a pain to work with when you want to run regressions. This package takes them, flattens them into a long data frame, so you can more easily analyse them!

As well, you can calculate other related statistics. All of this is done so in a 'tidy' manner, so it should tie in nicely with 'tidyverse' series of packages.

Depends R(>= 3.4.2), stats, dplyr, tibble, magrittr

Suggests testthat

Index 5
### flatten_ct

**Flatten i*j*k contingency tables into tidy data.**

**Description**

`flatten_ct()` takes a i*j*k array, and turns it into a tibble.

**Usage**

```r
flatten_ct(data)
```

**Arguments**

- `data` An i*j*k array.

**Value**

A tibble with 3 columns.

**Examples**

```r
flatten_ct(lung_cancer)
```

### goodness_of_fit

**Calculate the Chi^2 and G^2 Statistics**

**Description**

Calculates the goodness of fit test statistics for contingency tables.

**Usage**

```r
goodness_of_fit(model, type = "Chisq", ...)
```

**Arguments**

- `model` a GLM regression model.
- `type` either "Chisq" or "Gsq", which determines the type of goodness of fit test that is ran. Defaults to "Chisq".
- `...` Further arguments passed to or from other methods.
Value

A list with class "ct_goodness_of_fit" containing the following components:

test the type of test used.
model the name of the inputted model.
statistic The value of the test statistic as determined by the type parameter
df The number of degrees of freedom. This equals the number of combinations for explanatory variables less the number of parameters in the model
p.value The p-value calculated under a Chi-Squared distribution.

Examples

lung_logit <-
  lung_cancer %>%
  flatten_ct() %>%
  glm(
    Lung ~ Smoking
    ,family = binomial
    ,data = .
  )

goodness_of_fit(model = lung_logit, type = "Chisq")

lung_logit %>%
  goodness_of_fit(type = "Gsq")

lung_cancer %>%
  flatten_ct() %>%
  glm(
    Lung ~ City + Smoking
    ,family = binomial
    ,data = .
  ) %>%
  goodness_of_fit()

Description

Lung Cancer by whether or not a person smokes and City.

Usage

lung_cancer
Format
An Array with 2*2*8 dimensions

**Smoking**  Whether or not a person smokes.
**Lung**  Whether or not a person has lung cancer.
**City**  Name of the city a person lives in.

Examples
lung_cancer

```
print.ct_goodness_of_fit
```

Description
Creates a nice looking output for the goodness_of_fit() function

Usage
```r
## S3 method for class 'ct_goodness_of_fit'
print(x, ...)
```
