Package ‘flexdashboard’

June 24, 2020

**Type** Package

**Title** R Markdown Format for Flexible Dashboards

**Version** 0.5.2

**Description** Format for converting an R Markdown document to a grid oriented dashboard. The dashboard flexibly adapts the size of it's components to the containing web page.

**URL** [http://rmarkdown.rstudio.com/flexdashboard](http://rmarkdown.rstudio.com/flexdashboard)

**BugReports** [https://github.com/rstudio/flexdashboard/issues](https://github.com/rstudio/flexdashboard/issues)

**Encoding** UTF-8

**Depends** R (>= 3.0.2)

**Imports** tools, jsonlite, htmltools, knitr (>= 1.13), htmlwidgets (>= 0.6), rmarkdown (>= 1.10.3), shiny (>= 0.13)

**Suggests** testthat

**LazyData** TRUE

**License** MIT + file LICENSE

**RoxygenNote** 7.1.0.9000

**NeedsCompilation** no

**Author** Richard Iannone [aut, cre] (<https://orcid.org/0000-0003-3925-190X>),

flexdashboard

flexdashboard: Interactive dashboards for R

Description

Create interactive dashboards using **rmarkdown**.

Details

- Use R Markdown to publish a group of related data visualizations as a dashboard.
- Ideal for publishing interactive JavaScript visualizations based on htmlwidgets (also works with standard base, lattice, and grid graphics).
- Flexible and easy to specify layouts. Charts are intelligently re-sized to fill the browser and adapted for display on mobile devices.
- Optionally use Shiny to drive visualizations dynamically.

See the flexdashboard website for additional documentation: http://rmarkdown.rstudio.com/flexdashboard/
flex_dashboard

Description

Format for converting an R Markdown document to a grid oriented dashboard layout. The dashboard flexibly adapts the size of it’s plots and htmlwidgets to its containing web page.

Usage

```r
flex_dashboard(
  fig_width = 6,
  fig_height = 4.8,
  fig_retina = 2,
  fig_mobile = TRUE,
  dev = "png",
  smart = TRUE,
  self_contained = TRUE,
  favicon = NULL,
  logo = NULL,
  social = NULL,
  source_code = NULL,
  navbar = NULL,
  orientation = c("columns", "rows"),
  vertical_layout = c("fill", "scroll"),
  storyboard = FALSE,
  theme = "default",
  highlight = "default",
  mathjax = "default",
  extra_dependencies = NULL,
  css = NULL,
  includes = NULL,
  lib_dir = NULL,
  md_extensions = NULL,
  pandoc_args = NULL,
  devel = FALSE,
  resize_reload = TRUE,
  ...
)
```

Arguments

- `fig_width`  Default width (in inches) for figures
- `fig_height` Default height (in inches) for figures
- `fig_retina` Scaling to perform for retina displays (defaults to 2). Note that for flexdashboard enabling retina scaling provides for both crisper graphics on retina screens but
also much higher quality auto-scaling of R graphics within flexdashboard containers.

`fig_mobile` Create an additional rendering of each R graphics figure optimized for rendering on mobile devices oriented in portrait mode. If `TRUE`, creates a figure which is 3.75 x 4.80 inches wide; if `FALSE`, create no additional figure for mobile devices; if a numeric vector of length 2, creates a mobile figure with the specified width and height.

`dev` Graphics device to use for figure output (defaults to png)

`smart` Produce typographically correct output, converting straight quotes to curly quotes, ```---``` to em-dashes, ```--``` to en-dashes, and ```...``` to ellipses.

`self_contained` Produce a standalone HTML file with no external dependencies, using data: URIs to incorporate the contents of linked scripts, stylesheets, images, and videos. Note that even for self contained documents MathJax is still loaded externally (this is necessary because of its size).

`favicon` Path to graphic to be used as a favicon for the dashboard. Pass `NULL` to use no favicon.

`logo` Path to graphic to be used as a logo for the dashboard. Pass `NULL` to not include a logo. Note that no scaling is performed on the logo image, so it should fit exactly within the dimensions of the navigation bar (48 pixels high for the default "cosmo" theme, other themes may have slightly different navigation bar heights).

`social` Specify a character vector of social sharing services to automatically add sharing links for them on the navbar. Valid values are "twitter", "facebook", "google-plus", "linkedin", and "pinterest" (more than one service can be specified).

`source_code` URL for source code of dashboard (used primarily for publishing flexdashboard examples). Automatically creates a navbar item which links to the source code.

`navbar` Optional list of elements to be placed on the flexdashboard navigation bar. Each element should be a list containing a `title` and/or `icon` field, an `href` field. Optional fields `target` (e.g. "_blank") and `align` ("left" or "right") are also supported.

`orientation` Determines whether level 2 headings are treated as dashboard rows or dashboard columns.

`vertical_layout` Vertical layout behavior: "fill" to vertically resize charts so they completely fill the page; "scroll" to layout charts at their natural height, scrolling the page if necessary.

`storyboard` `TRUE` to use a storyboard layout scheme that places each dashboard component in a navigable storyboard frame. When a storyboard layout is used the `orientation` and `vertical_layout` arguments are ignored. When creating a dashboard with multiple pages you should apply the `.storyboard` attribute to individual pages rather than using the global `storyboard` option.

`theme` Visual theme ("default", "bootstrap", "cerulean", "journal", "flatly", "readable", "spaceclub", "united", "cosmo", "lumen", "paper", "sandstone", "simplex", or "yeti"). The "cosmo" theme is used when "default" is specified.
flex_dashboard

`mathjax` Include mathjax. The "default" option uses an https URL from a MathJax CDN. The "local" option uses a local version of MathJax (which is copied into the output directory). You can pass an alternate URL or pass NULL to exclude MathJax entirely.

`extra_dependencies` Additional function arguments to pass to the base R Markdown HTML output formatter `html_document_base`

`css` One or more css files to include

`includes` Named list of additional content to include within the document (typically created using the `includes` function).

`lib_dir` Directory to copy dependent HTML libraries (e.g. jquery, bootstrap, etc.) into. By default this will be the name of the document with _files appended to it.

`md_extensions` Markdown extensions to be added or removed from the default definition or R Markdown. See the `rmarkdown_format` for additional details.

`pandoc_args` Additional command line options to pass to pandoc

`devel` Enable development mode (used for development of the format itself, not useful for users of the format).

`resize_reload` Disable the auto-reloading behavior when the window is resized. Useful when debugging large flexdashboard applications and this functionality is not needed.

`...` Unused

**Details**

See the flexdashboard website for additional documentation: [http://rmarkdown.rstudio.com/flexdashboard/](http://rmarkdown.rstudio.com/flexdashboard/)

**Examples**

```r
## Not run:

library(rmarkdown)
library(flexdashboard)

# simple invocation
render("dashboard.Rmd", flex_dashboard())

# specify the theme option
render("pres.Rmd", flex_dashboard(theme = "yeti"))

## End(Not run)
```
gauge  Create a gauge component for a dashboard.

Description

A gauge displays a numeric value on a meter that runs between specified minimum and maximum values.

Usage

gauge(
  value,
  min,
  max,
  sectors = gaugeSectors(),
  symbol = NULL,
  label = NULL,
  abbreviate = TRUE,
  abbreviateDecimals = 1,
  href = NULL
)

gaugeSectors(
  success = NULL,
  warning = NULL,
  danger = NULL,
  colors = c("success", "warning", "danger")
)

Arguments

value    Numeric value to display
min      Minimum numeric value
max      Maximum numeric value
sectors  Custom colored sectors (e.g. "success", "warning", "danger"). By default all values are colored using the "success" theme color
symbol   Optional symbol to show next to value (e.g. 'kg')
label    Optional label to display beneath the value
abbreviate Abbreviate large numbers for min, max, and value (e.g. 1234567 -> 1.23M). Defaults to TRUE.
abbreviateDecimals Number of decimal places for abbreviated numbers to contain (defaults to 1).
href     An optional URL to link to. Note that this can be an anchor of another dashboard page (e.g. "#details").
success  Two-element numeric vector defining the range of values to color as "success" (specific color provided by theme or custom colors)
warning  Two-element numeric vector defining the range of values to color as "warning" (specific color provided by theme or custom colors)
danger   Two-element numeric vector defining the range of values to color as "danger" (specific color provided by theme or custom colors)
colors    Vector of colors to use for the success, warning, and danger ranges. Colors can be standard theme colors ("success", "warning", "danger", "primary", and "info") or any other valid CSS color specifier. Note that if no custom sector ranges are defined, this parameter can be a single color value rather than a vector of three values

details
See the flexdashboard website for additional documentation: http://rmarkdown.rstudio.com/flexdashboard/using.html#gauges

eXamples
library(flexdashboard)

gauge(42, min = 0, max = 100, symbol = '\ Var', gaugeSectors(
  success = c(80, 100), warning = c(40, 79), danger = c(0, 39)
))

Description
Output and render functions for using gauge within Shiny applications and interactive Rmd documents.

Usage
gaugeOutput(outputId, width = "100\%", height = "200px")

renderGauge(expr, env = parent.frame(), quoted = FALSE)

Arguments
outputId   output variable to read from
width, height  Must be a valid CSS unit (like '100%', '400px', 'auto') or a number, which will be coerced to a string and have 'px' appended.
expr      An expression that generates a gauge
env       The environment in which to evaluate expr.
quoted    Is expr a quoted expression (with quote())? This is useful if you want to save an expression in a variable.
Create a value box component for a dashboard.

Description

A value box displays a value (usually a number) in large text, with a smaller caption beneath, and a large icon on the right side.

Usage

valueBox(value, caption = NULL, icon = NULL, color = NULL, href = NULL)

Arguments

value The value to display in the box. Usually a number or short text.
caption The caption to display beneath the value.
icon An icon for the box (e.g. "fa-comments")
color Background color for the box. This can be one of the built-in background colors ("primary", "info", "success", "warning", "danger") or any valid CSS color value.
href An optional URL to link to. Note that this can be an anchor of another dashboard page (e.g. ">#details").

Details

See the flexdashboard website for additional documentation: [http://rmarkdown.rstudio.com/flexdashboard/using.html#value_boxes](http://rmarkdown.rstudio.com/flexdashboard/using.html#value_boxes)

Examples

```r
library(flexdashboard)

valueBox(42, caption = "Errors", icon="fa-thumbs-down")
valueBox(107, caption = "Trials", icon="fa-tag")
valueBox(247, caption = "Connections", icon="fa-random")
```

Shiny bindings for valueBox

Description

Output and render functions for using valueBox within Shiny applications and interactive Rmd documents.
valueBox-shiny

Usage

valueBoxOutput(outputId, width = "100\%", height = "160px")

renderValueBox(expr, env = parent.frame(), quoted = FALSE)

Arguments

outputId output variable to read from
width, height Must be a valid CSS unit (like '100\%', '400px', 'auto') or a number, which will be coerced to a string and have 'px' appended.
expr An expression that generates a gauge
env The environment in which to evaluate expr.
quoted Is expr a quoted expression (with quote())? This is useful if you want to save an expression in a variable.
