Package ‘flexpolyline’

February 12, 2023

Type Package

Title Flexible Polyline Encoding

Version 0.3.0

Description Binding to the C++ implementation of the flexible polyline encoding by HERE <https://github.com/heremaps/flexible-polyline>. The flexible polyline encoding is a lossy compressed representation of a list of coordinate pairs or coordinate triples. The encoding is achieved by:
1. Reducing the decimal digits of each value;
2. Encoding only the offset from the previous point;
3. Using variable length for each coordinate delta; and
4. Using 64 URL-safe characters to display the result.

---

**Description**

This function calls `hf::polyline_decode` and `hf::get_third_dimension` of the C++ implementation of the flexible polyline encoding by HERE. Depending on the dimensions of the encoded line, a two or three dimensional line is decoded.

**Usage**

```r
decode(encoded)
```

**Arguments**

`encoded` character, encoded flexible polyline string.

**Value**

A matrix containing the coordinates of the decoded line.

**Examples**

```r
# 2d line
decode("BFoz5xJ67i1B1B7PzIhaxL7Y")

# 3d line
decode("BlBoz5xJ67i1B1B7PUzIhaUXxL7YU")
```
**decode_sf**

*Wrapper function for decoding to simple features*

**Description**

A wrapper function for `decode` that converts the input polylines, encoded in the flexible polyline encoding, to simple feature geometries of the sf package.

**Usage**

```
decode_sf(encoded, crs = sf::NA_crs_)
```

**Arguments**

- `encoded`: character, encoded flexible polyline string.
- `crs`: integer or character, coordinate reference system to assign to the sf object (default = `sf::NA_crs_`).

**Value**

An sf object, containing the geometries of the decoded lines (Geometry type: "LINESTRING").

**Note**

The function returns an sf object, therefore the input set of encoded polylines must be of consistent dimension (e.g. "XY", "XYM" or "XYZ") to meet the requirements of the constructor of sf objects. For mixed dimensions use the `decode` function directly.

**Examples**

```
decode_sf("B1Voz5xJ67i1Bgkh9B")
decode_sf("BFoz5xJ67i1B1B7PlU9yB")
decode_sf("BlXoz5xJ67i1Bgkh9B1B7Pgkh9BzIhagkh9BqK-pB_ni6D")
```

---

**encode**

*Encode a line in the flexible polyline encoding format*

**Description**

This function calls `hf::polyline_encode` of the C++ implementation of the flexible polyline encoding by HERE. Depending on the dimensions of the input coordinates, a two or three dimensional line is encoded.

**Usage**

```
encode(line, precision = 5L, third_dim = 3L, third_dim_precision = 5L)
```
Arguments

- **line**: matrix, coordinates of the line in 2d or 3d (column order: LNG, LAT, DIM3).
- **precision**: integer, precision to use in encoding (between 0 and 15, default=5).
- **third_dim**: integer, type of the third dimension (0: ABSENT, 1: LEVEL, 2: ALTITUDE, 3: ELEVATION, 4, 6: CUSTOM1, 7: CUSTOM2, default=3).
- **third_dim_precision**: integer, precision to use in encoding for the third dimension (between 1 and 15, default=5).

Value

The line as string in the flexible polyline encoding format.

Examples

```r
# 2D
line2d <- matrix(
  c(8.69821, 50.10228,
    8.69567, 50.10201,
    8.69150, 50.10063,
    8.68752, 50.09878),
  ncol = 2, byrow = TRUE
)
encode(line2d)

# 3D
line3d <- matrix(
  c(8.69821, 50.10228, 10,
    8.69567, 50.10201, 20,
    8.69150, 50.10063, 30,
    8.68752, 50.09878, 40),
  ncol = 3, byrow = TRUE
)
encode(line3d)
```

---

**Description**

A wrapper function for `encode` that converts simple feature geometries of the sf package to flexible polyline encoded strings.
Usage

```r
encode_sf(
  geom,
  precision = 5,
  third_dim = NULL,
  third_dim_precision = precision
)
```

Arguments

- `geom`: simple feature, sf, sfc or sfg object with geometry type "POINT", "LINESTRING" or "POLYGON".
- `precision`: integer, precision to use in encoding (between 0 and 15, default=5).
- `third_dim`: integer, type of the third dimension (0: ABSENT, 1: LEVEL, 2: ALTITUDE, 3: ELEVATION, 4, 6: CUSTOM1, 7: CUSTOM2, default=NULL).
- `third_dim_precision`: integer, precision to use in encoding for the third dimension (between 1 and 15, default=precision).

Value

The line as string in the flexible polyline encoding format.

Examples

```r
# 3D point
point3d <- sf::st_point(
  matrix(c(8.69821, 50.10228, 10), ncol = 3, byrow = TRUE),
  dim = "XYZ"
)
encode_sf(point3d)

# 2D linestring
line2d <- sf::st_linestring(
  matrix(c(8.69821, 50.10228, 8.69567, 50.10201, 8.68752, 50.09878), ncol = 2, byrow = TRUE)
)
encode_sf(line2d)

# 3D polygon
poly3d <- sf::st_polygon(list(
  matrix(c(8.69821, 50.10228, 10, 8.69567, 50.10201, 8.69150, 50.10063, 30, 8.69821, 50.10228, 10),
    ncol = 3, byrow = TRUE)
})
encode_sf(poly3d)
```
get_third_dimension \quad Get third dimension of a flexible polyline encoded string

Description

This function calls hf::get_third_dimension of the C++ implementation of the flexible polyline encoding by HERE and return the type of the third dimension.

Usage

get_third_dimension(encoded)

Arguments

encoded \quad character, encoded flexible polyline string.

Value

A string describing the third dimension.

Examples

# 2d line
get_third_dimension("BFoz5xJ67i1B1B7PzIhaxL7Y")

# 3d line
get_third_dimension("BlBoz5xJ67i1B1B7PUzIhaUxL7Y")

set_third_dimension \quad Set third dimension of a flexible polyline encoded string

Description

This function decodes the flexible polyline encoded line, changes the third dimension and encodes the line again.

Usage

set_third_dimension(
   encoded,
   third_dim_name,
   precision = 5L,
   third_dim_precision = 5L
)
set_third_dimension

**Arguments**

- **encoded** character, encoded flexible polyline string.
- **third_dim_name** character, name of the third dimension to set (ABSENT, LEVEL, ALTITUDE, ELEVATION, CUSTOM1, CUSTOM2).
- **precision** integer, precision to use in encoding (between 0 and 15, default=5).
- **third_dim_precision** integer, precision to use in encoding for the third dimension (between 1 and 15, default=5).

**Value**

The line with the new third dimension as string in the flexible polyline encoding format.

**Note**

The precision is not read from the header of the encoded line. Therefore it must be provided as a parameter for re-encoding.

**Examples**

# 2d line (nothing happens...)
set_third_dimension("BFoz5xJ67i1B1B7PzIhaxL7Y", "ELEVATION")

# 3d line
set_third_dimension("BlBoz5xJ67i1BU1B7PUzIhaUXL7YU", "ELEVATION")
