Package ‘gMOIP’

May 26, 2023

Type Package

Title Tools for 2D and 3D Plots of Single and Multi-Objective Linear/Integer Programming Models

Version 1.5.0

URL https://relund.github.io/gMOIP/, https://github.com/relund/gMOIP/

BugReports https://github.com/relund/gMOIP/issues

Description Make 2D and 3D plots of linear programming (LP), integer linear programming (ILP), or mixed integer linear programming (MILP) models with up to three objectives. Plots of both the solution and criterion space are possible. For instance the non-dominated (Pareto) set for bi-objective LP/ILP/MILP programming models (see vignettes for an overview). The package also contains an function for checking if a point is inside the convex hull.

License GPL (>= 3.3.2)

Language en-US

Encoding UTF-8

RoxygenNote 7.2.3

Depends R (>= 3.5.0)

Imports ggrepel, geometry, ggplot2, rgl, MASS, Matrix, grDevices, stats, Rfast, plyr, tidyselect, tibble, purrr, dplyr, rlang, png, sp

addNDSet

Add discrete points to a non-dominated set and classify them into extreme supported, non-extreme supported, non-supported.

Description

Add discrete points to a non-dominated set and classify them into extreme supported, non-extreme supported, non-supported.

Usage

```
addNDSet(
  pts,
  nDSet = NULL,
  crit = "max",
  keepDom = FALSE,
  dubND = FALSE,
  classify = TRUE
)
```

Arguments

- **pts**: A data frame with points to add (a column for each objective).
- **nDSet**: A data frame with current non-dominated set (NULL is none yet). Column names of the p objectives must be z1, ..., zp.
- **crit**: A max or min vector. If length one assume all objectives are optimized in the same direction.
- **keepDom**: Keep dominated points in output.
- **dubND**: Duplicated non-dominated points are classified as non-dominated.
- **classify**: Non-dominated points are classified into supported extreme (se), supported non-extreme (sne) and unsupported (us)

Value

A data frame with a column for each objective (z columns) and nd (non-dominated). Moreover if classify then columns se, sne, us and cls.

Author(s)

Lars Relund <lars@relund.dk>
Examples

```r
nDSet <- data.frame(z1=c(12,14,16,18), z2=c(18,16,12,4))
pts <- data.frame(z1 = c(18,18,14,15,15), z2=c(2,6,14,14,16))
addNDSet(pts, nDSet, crit = "max")
addNDSet(pts, nDSet, crit = "max", keepDom = TRUE)
addNDSet(pts, nDSet, crit = "min")
addNDSet(c(2,2), nDSet, crit = "max")
addNDSet(c(2,2), nDSet, crit = "min")

addNDSet(c(2,2), crit = "min")

nDSet <- data.frame(z1=c(12,14,16,18), z2=c(18,16,12,4), z3 = c(1,7,0,6))
pts <- data.frame(z1=c(12,14,16,18), z2=c(18,16,12,4), z3 = c(2,2,2,6))
crit = c("min", "min", "max")
di <- c(1,1,-1)
li <- c(-1,20)
ini3D(argsPlot3d = list(xlim = li, ylim = li, zlim = li))
plotCones3D(nDSet, direction = di, argsPolygon3d = list(color = "green", alpha = 1),
drawPoint = FALSE)
plotHull3D(nDSet, addRays = TRUE, direction = di)
plotPoints3D(nDSet, argsPlot3d = list(col = "red"), addText = "coord")
plotPoints3D(pts, addText = "coord")
finalize3D()
addNDSet(pts, nDSet, crit, dubND = FALSE)
addNDSet(pts, nDSet, crit, dubND = TRUE)
addNDSet(pts, nDSet, crit, dubND = TRUE, keepDom = TRUE)
addNDSet(pts, nDSet, crit, dubND = TRUE, keepDom = TRUE, classify = FALSE)
```

---

**addRays**

*Add all points on the bounding box hit by the rays.*

**Description**

Add all points on the bounding box hit by the rays.

**Usage**

```r
addRays(
  pts,
  m = apply(pts, 2, min) - 5,
  M = apply(pts, 2, max) + 5,
  direction = 1
)
```
**binaryPoints**

**Arguments**

- **pts**: A data frame with all points
- **m**: Minimum values of the bounding box.
- **M**: Maximum values of the bounding box.
- **direction**: Ray direction. If i'th entry is positive, consider the i'th column of the `pts` plus a value greater than or equal to zero. If negative, consider the i'th column of the `pts` minus a value greater than or equal to zero.

**Value**

The points merged with the points on the bounding box. The column `pt` equals 1 if points from `pts` and zero otherwise.

**Note**

Assume that `pts` has been checked using `.checkPts()`.

**Examples**

```r
pts <- genNDSet(3,10)[,1:3]
addRays(pts)
addRays(pts, dir = c(1,-1,1))
addRays(pts, dir = c(-1,-1,1), m = c(0,0,0), M = c(100,100,100))
pts <- genSample(5,20)[,1:5]
addRays(pts)
```

---

**binaryPoints**  
*Binary (0-1) points in the feasible region (Ax<=b).*

**Description**

Binary (0-1) points in the feasible region (Ax<=b).

**Usage**

`binaryPoints(A, b)`

**Arguments**

- **A**: Constraint matrix.
- **b**: Right hand side.

**Value**

A data frame with all binary points inside the feasible region.
Note

Do a simple enumeration of all binary points. Will not work if ncol(A) large.

Author(s)

Lars Relund <lars@relund.dk>.

Examples

A <- matrix( c(3,-2, 1, 2, 4,-2,-3, 2, 1), nc = 3, byrow = TRUE)
b <- c(10, 12, 3)
binaryPoints(A, b)

A <- matrix(c(9, 10, 2, 4, -3, 2), ncol = 2, byrow = TRUE)
b <- c(90, 27, 3)
binaryPoints(A, b)

classifyNDSet

Classify a set of nondominated points

Description

The classification is supported (true/false), extreme (true/false), supported non-extreme (true/false)

Usage

classifyNDSet(pts, direction = 1)

Arguments

pts       A set of non-dominated points. It is assumed that ncol(pts) equals the number of objectives ($p$).
direction Ray direction. If i’th entry is positive, consider the i’th column of the pts plus a value greater than on equal zero (minimize objective $i$). If negative, consider the i’th column of the pts minus a value greater than on equal zero (maximize objective $i$).

Value

The ND set with classification columns.

Note

It is assumed that pts are nondominated.
convexHull

Examples

```r
classifyNDSet(pts[,1:3])
plotPoints3D(pts[pts$se,1:3], argsPlot3d = list(col = "red"))
plotPoints3D(pts[!pts$sne,1:3], argsPlot3d = list(col = "black"))
plotPoints3D(pts[!pts$us,1:3], argsPlot3d = list(col = "blue"))
plotCones3D(pts[,1:3], rectangle = TRUE, argsPolygon3d = list(alpha = 1))
finalize3D()
```

```r
classifyNDSet(pts)
plotPoints3D(pts[pts$se,1:3], argsPlot3d = list(col = "red"))
plotPoints3D(pts[!pts$sne,1:3], argsPlot3d = list(col = "black"))
plotPoints3D(pts[!pts$us,1:3], argsPlot3d = list(col = "blue"))
plotCones3D(pts[,1:3], rectangle = TRUE, argsPolygon3d = list(alpha = 1))
finalize3D()
```

```r
classifyNDSet(pts)
plotPoints3D(pts[pts$se,1:3], argsPlot3d = list(col = "red"))
plotPoints3D(pts[!pts$sne,1:3], argsPlot3d = list(col = "black"))
plotPoints3D(pts[!pts$us,1:3], argsPlot3d = list(col = "blue"))
plotCones3D(pts[,1:3], rectangle = TRUE, argsPolygon3d = list(alpha = 1))
finalize3D()
```

```r
classifyNDSet(pts)
```
convexHull

Description

Find the convex hull of a set of points.

Usage

convexHull(
  pts,
  addRays = FALSE,
  useRGLBBBox = FALSE,
  direction = 1,
  tol = mean(mean(abs(pts))) * sqrt(.Machine$double.eps) * 2,
  m = apply(pts, 2, min) - 5,
  M = apply(pts, 2, max) + 5
)

Arguments

- **pts**: A matrix with a point in each row.
- **addRays**: Add the ray defined by direction.
- **useRGLBBBox**: Use the RGL bounding box when add rays.
- **direction**: Ray direction. If i'th entry is positive, consider the i'th column of pts plus a value greater than on equal zero (minimize objective $i$). If negative, consider the i'th column of pts minus a value greater than on equal zero (maximize objective $i$).
- **tol**: Tolerance on standard deviation if using PCA.
- **m**: Minimum values of the bounding box.
- **M**: Maximum values of the bounding box.

Value

A list with hull equal a matrix with row indices of the vertices defining each facet in the hull and pts equal the input points (and dummy points) and columns: pt, true if a point in the original input; false if a dummy point (a point on a ray). vtx, TRUE if a vertex in the hull.

Examples

```r
## 1D
pts<-matrix(c(1,2,3), ncol = 1, byrow = TRUE)
dimFace(pts) # a line
convexHull(pts)
convexHull(pts, addRays = TRUE)

## 2D
pts<-matrix(c(1,1, 2,2), ncol = 2, byrow = TRUE)
dimFace(pts) # a line
convexHull(pts)
plotHull2D(pts, drawPoints = TRUE)
convexHull(pts, addRays = TRUE)
```
cornerPoints

Calculate the corner points for the polytope $Ax \leq b$.

Description

Calculate the corner points for the polytope $Ax \leq b$.

Usage

cornerPoints(A, b, type = rep("c", ncol(A)), nonneg = rep(TRUE, ncol(A)))
cornerPointsCont

Calculate the corner points for the polytope $Ax \leq b$ assuming all variables are continuous.

**Arguments**

- **A** Constraint matrix.
- **b** Right hand side.
- **type** A character vector of same length as number of variables. If entry $k$ is 'i' variable $k$ must be integer and if 'c' continuous.
- **nonneg** A boolean vector of same length as number of variables. If entry $k$ is TRUE then variable $k$ must be non-negative.

**Value**

A data frame with a corner point in each row.

**Author(s)**

Lars Relund <lars@relund.dk>

**Examples**

```r
A <- matrix(c(3,-2, 1, 2, 4,-2,-3, 2, 1), nc = 3, byrow = TRUE)
b <- c(10, 12, 3)
cornerPoints(A, b, type = c("c", "c", "c"))
cornerPoints(A, b, type = c("i", "i", "i"))
cornerPoints(A, b, type = c("i", "c", "c"))
```

---

cornerPointsCont

**Description**

Calculate the corner points for the polytope $Ax \leq b$ assuming all variables are continuous.

**Usage**

```r
cornerPointsCont(A, b, nonneg = rep(TRUE, ncol(A)))
```

**Arguments**

- **A** Constraint matrix.
- **b** Right hand side.
- **nonneg** A boolean vector of same length as number of variables. If entry $k$ is TRUE then variable $k$ must be non-negative.

**Value**

A data frame with a corner point in each row.
*criterionPoints*

**Author(s)**

Lars Relund <lars@relund.dk>

---

**criterionPoints**

*Calculate the criterion points of a set of points and ranges to find the set of non-dominated points (Pareto points) and classify them into extreme supported, non-extreme supported, non-supported.*

---

**Description**

Calculate the criterion points of a set of points and ranges to find the set of non-dominated points (Pareto points) and classify them into extreme supported, non-extreme supported, non-supported.

**Usage**

```r
criterionPoints(pts, obj, crit, labels = "coord")
```

**Arguments**

- **pts**: A data frame with a column for each variable in the solution space (can also be a `rangePoints`).
- **obj**: A p x n matrix (one row for each criterion).
- **crit**: Either `max` or `min`.
- **labels**: If `NULL` or "n" don't add any labels (empty string). If equals `coord`, labels are the solution space coordinates. Otherwise number all points from one based on the solution space points.

**Value**

A data frame with columns `x1, ..., xn, z1, ..., zp, lbl (label), nD (non-dominated), ext (extreme), nonExt (non-extreme supported)`.

**Author(s)**

Lars Relund <lars@relund.dk>

**Examples**

```r
A <- matrix( c(3, -2, 1, 2, 4, -2, -3, 2, 1), nc = 3, byrow = TRUE)
b <- c(10,12,3)
pts <- integerPoints(A, b)
obj <- matrix( c(1,-3,1,-1,1,-1), byrow = TRUE, ncol = 3 )
criterionPoints(pts, obj, crit = "max", labels = "numb")
```
### df2String

Convert each row to a string.

**Description**

Convert each row to a string.

**Usage**

```r
df2String(df, round = 2)
```

**Arguments**

- `df`  
  Data frame.

- `round`  
  How many digits to round

**Value**

A vector of strings.

### dimFace

Return the dimension of the convex hull of a set of points.

**Description**

Return the dimension of the convex hull of a set of points.

**Usage**

```r
dimFace(pts, dim = NULL)
```

**Arguments**

- `pts`  
  A matrix/data frame/vector that can be converted to a matrix with a row for each point.

- `dim`  
  The dimension of the points, i.e. assume that column 1-dim specify the points. If NULL assume that the dimension are the number of columns.

**Value**

The dimension of the object.
## finalize3D

**finalize3D** Finalize the RGL window.

### Description

Finalize the RGL window.

### Usage

finalize3D(...)

### Arguments

... Further arguments passed on the the RGL plotting functions. This must be done as lists. Currently the following arguments are supported:

- **argsAxes3d**: A list of arguments for **rgl::axes3d**.
- **argsTitle3d**: A list of arguments for **rgl::title3d**.
genNDSet

Generate a sample of nondominated points.

Description
Generate a sample of nondominated points.

Usage

```r
genNDSet(
  p,
  n,
  range = c(1, 100),
  random = FALSE,
  sphere = TRUE,
  box = FALSE,
  keep = FALSE,
  crit = "min",
  dubND = TRUE,
  ...
)
```

Arguments

- `p` Dimension of the points.
- `n` Number of samples generated (note only a subset of these will be non-dominated).
- `range` The range of the points in each dimension (a vector or matrix with p rows).
- `random` Random sampling.
- `sphere` Generate points on a sphere.
genNDSet

- **box**: Generate points in boxes.
- **keep**: Keep dominated points also.
- **crit**: Criteria used (a vector of min/max).
- **dubND**: Should duplicated non-dominated points be considered as non-dominated.
- **...**: Further arguments passed on to `genSample`.

**Value**

A data frame with $p+1$ columns (last one indicate if dominated or not).

**Examples**

```r
range <- matrix(c(1,100, 50,100, 10,50), ncol = 2, byrow = TRUE )
pts <- genNDSet(3, 50, range = range, random = TRUE, keep = TRUE)
head(pts)
Rfast::colMinsMaxs(as.matrix(pts))
ini3D(FALSE, argsPlot3d = list(xlim = c(min(pts[,1])-2,max(pts[,1])+10),
                              ylim = c(min(pts[,2])-2,max(pts[,2])+10),
                              zlim = c(min(pts[,3])-2,max(pts[,3])+10)))
plotPoints3D(pts[,1:3])
plotCones3D(pts[pts$nd,1:3], argsPolygon3d = list(alpha = 1))
finalize3D()

ini3D()
range <- c(1,100)
cent <- rep(range[1] + (range[2]-range[1])/2, 3)
pts <- genNDSet(3, 100, range = range, sphere = TRUE, keep = TRUE,
                argsSphere = list(center = cent))
rgl::spheres3d(cent, radius=49.5, color = "grey100", alpha=0.1)
plotPoints3D(pts)
plotPoints3D(pts[pts$nd,], argsPlot3d = list(col = "red", size = 10))
rgl::planes3d(cent[1],cent[2],cent[3],-sum(cent^2), alpha = 0.5, col = "red")
finalize3D()

ini3D()
cent <- c(100,100,100)
r <- 75
planeC <- c(cent+r/3)
planeC <- c(planeC, -sum(planeC^2))
pts <- genNDSet(3, 100, keep = TRUE,
                argsSphere = list(center = cent, radius = r, below = FALSE, plane = planeC, factor = 6))
rgl::spheres3d(cent, radius=r, color = "grey100", alpha=0.1)
plotPoints3D(pts)
plotPoints3D(pts[pts$nd,], argsPlot3d = list(col = "red", size = 10))
rgl::planes3d(planeC[1],planeC[2],planeC[3],planeC[4], alpha = 0.5, col = "red")
finalize3D()
```

genSample

Generate a sample of points in dimension $p$.

Description

Generate a sample of points in dimension $p$.

Usage

genSample(
  p,
  n,
  range = c(1, 100),
  random = FALSE,
  sphere = TRUE,
  box = FALSE,
  ...
)

Arguments

p       Dimension of the points.
n       Number of samples generated.
range   The range of the points in each dimension (a vector or matrix with $p$ rows).
random  Random sampling.
sphere  Generate points on a sphere.
box     Generate points in boxes.
...     Further arguments passed on to the method for generating points. This must be done as lists (see examples). Currently the following arguments are supported:

  • argsSphere: A list of arguments for generating points on a sphere:
    – radius: The radius of the sphere.
    – center: The center of the sphere.
    – plane: The plane used.
    – below: Either true (generate points below the plane), false (generate points above the plane) or NULL (generated on the whole sphere).
    – factor: If using a plane. Then the factor to multiply $n$ with, so generate enough points below/above the plane.
    – closeToPlane: If TRUE only return points close to the plane.

  • argsBox: A list of arguments for generating points inside boxes:
    – intervals: Number of intervals to split the length of the range into. That is, each range is divided into intervals (sub)intervals and only the lowest/highest subrange is used.
cor: How to correlate indices. If 'idxAlt' then alternate the intervals (high/low) for each dimension. For instance if \( p = 3 \) and the first dimension is in the high interval range then the second will be in the low interval range and third in the high interval range again. If idxRand then choose the low/high interval range for each dimension based on prHigh. If idxSplit then select \( \text{floor}(p/2):\text{ceiling}(p/2) \) dimensions for the high interval range and the other for the low interval range.

- prHigh: Probability for choosing the high interval range in each dimension.

Details

Note having ranges with different length when using the sphere method, doesn’t make sense. The best option is properly to use a center and radius here. Moreover, as for higher \( p \) you may have to use a larger radius than half of the desired interval range.

Value

A data frame with \( p \) columns

Examples

### Using random

```r
## p = 2
range <- matrix(c(1,100, 50,100), ncol = 2, byrow = TRUE )
pts <- genSample(2, 1000, range = range, random = TRUE)
head(pts)
Rfast::colMinsMaxs(as.matrix(pts))
plot(pts)
```

```r
## p = 3
range <- matrix(c(1,100, 50,100, 10,50), ncol = 2, byrow = TRUE )
ini3D()
pts <- genSample(3, 1000, range = range, random = TRUE)
head(pts)
Rfast::colMinsMaxs(as.matrix(pts))
plotPoints3D(pts)
finalize3D()
```

```r
## other p
p <- 10
range <- c(1,100)
pts <- genSample(p, 1000, range = range, random = TRUE)
head(pts)
Rfast::colMinsMaxs(as.matrix(pts))
```

### Using sphere

```r
## p = 2
range <- c(1,100)
```
cent <- rep(range[1] + (range[2]-range[1])/2, 2)
pts <- genSample(2, 1000, range = range)
dim(pts)
Rfast::colMinsMaxs(as.matrix(pts))
plot(pts, asp=1)
abline(sum(cent^2)/cent[1], -cent[2]/cent[1])

cent <- c(100,100)
r <- 75
planeC <- c(cent+r/3)
planeC <- c(planeC, -sum(planeC^2))
pts <- genSample(2, 100, 
  argsSphere = list(center = cent, radius = r, below = FALSE, plane = planeC, factor = 6))
dim(pts)
Rfast::colMinsMaxs(as.matrix(pts))
plot(pts, asp=1)
abline(-planeC[3]/planeC[1], -planeC[2]/planeC[1])

pts <- genSample(2, 100, argsSphere = list(center = cent, radius = r, below = NULL))
dim(pts)
Rfast::colMinsMaxs(as.matrix(pts))
plot(pts, asp=1)

## p = 3
ini3D()
range <- c(1,100)
cent <- rep(range[1] + (range[2]-range[1])/2, 3)
pts <- genSample(3, 1000, range = range)
dim(pts)
Rfast::colMinsMaxs(as.matrix(pts))
rgl::spheres3d(cent, radius=49.5, color = "grey100", alpha=0.1)
plotPoints3D(pts)
rgl::planes3d(cent[1],cent[2],cent[3],-sum(cent^2), alpha = 0.5, col = "red")
finalize3D()

ini3D()
cent <- c(100,100,100)
r <- 75
planeC <- c(cent+r/3)
planeC <- c(planeC, -sum(planeC^2))
pts <- genSample(3, 100, 
  argsSphere = list(center = cent, radius = r, below = FALSE, plane = planeC, factor = 6))
rgl::spheres3d(cent, radius=r, color = "grey100", alpha=0.1)
plotPoints3D(pts)
rgl::planes3d(cent[1],cent[2],cent[3],-sum(cent^2), alpha = 0.5, col = "red")
finalize3D()

ini3D()
pts <- genSample(3, 10000, argsSphere = list(center = cent, radius = r, below = NULL))
Rfast::colMinsMaxs(as.matrix(pts))
rgl::spheres3d(cent, radius=r, color = "grey100", alpha=0.1)
plotPoints3D(pts)
finalize3D()

## Other p
p <- 10
cent <- rep(0,p)
r <- 100
pts <- genSample(p, 100000, argsSphere = list(center = cent, radius = r, below = NULL))
head(pts)
Rfast::colMinsMaxs(as.matrix(pts))
apply(pts,1, function(x){sqrt(sum((x-cent)^2))}) # test should be approx. equal to radius

### Using box
## p = 2
range <- matrix(c(1,100, 50,100), ncol = 2, byrow = TRUE)
pts <- genSample(2, 1000, range = range, box = TRUE, argsBox = list(cor = "idxAlt"))
head(pts)
Rfast::colMinsMaxs(as.matrix(pts))
plot(pts)
pts <- genSample(2, 1000, range = range, box = TRUE, argsBox = list(cor = "idxAlt", intervals = 6))
plot(pts)
pts <- genSample(2, 1000, range = range, box = TRUE, argsBox = list(cor = "idxRand"))
plot(pts)

getTexture

*Save a point symbol as a temporary file.*

**Description**

Save a point symbol as a temporary file.

**Usage**

```r
getTexture(pch = 16, cex = 10, ...)
```

**Arguments**

- `pch`  
  Point number/symbol.
- `cex`  
  Point size
- `...`  
  Further arguments passed to `plot`.

**Value**

The file name.

**Examples**

```r
# Pch shapes
generateRPointShapes<-function(){
  oldPar<-.par()
  par(font=2, mar=c(0.5,0,0,0))
```
The ggplot theme for the package

Description
The ggplot theme for the package

Usage

gMOIPT::theme(...)

Arguments

... Further arguments parsed to `ggplot2::theme()`.

Value
The theme object.

Examples

    pts <- matrix(c(1,1), ncol = 2, byrow = TRUE)
    plotHull2D(pts)
    pts1 <- matrix(c(2,2, 3,3), ncol = 2, byrow = TRUE)
    pts2 <- matrix(c(1,1, 2,2, 0,1), ncol = 2, byrow = TRUE)
    ggplot2::ggplot() +
        plotHull2D(pts2, drawPoints = TRUE, addText = "coord", drawPlot = FALSE) +
        plotHull2D(pts1, drawPoints = TRUE, drawPlot = FALSE) +
        gMOIPT::theme() +
        ggplot2::xlab(expression(x[1])) +
        ggplot2::ylab(expression(x[2]))
hullSegment

Find segments (lines) of a face.

Description

Find segments (lines) of a face.

Usage

hullSegment(
  vertices,
  hull = geometry::convhulln(vertices),
  tol = mean(mean(abs(vertices))) * sqrt(.Machine$double.eps)
)

Arguments

vertices A m x p array of vertices of the convex hull, as used by geometry::convhulln().

hull Tessellation (or triangulation) generated by geometry::convhulln() If hull is left empty or not supplied, then it will be generated.

tol Tolerance on the tests for inclusion in the convex hull. You can think of tol as the distance a point may possibly lie outside the hull, and still be perceived as on the surface of the hull. Because of numerical slop nothing can ever be done exactly here. I might guess a semi-intelligent value of tol to be tol = 1.e-13*mean(abs(vertices(:)))

In higher dimensions, the numerical issues of floating point arithmetic will probably suggest a larger value of tol.

Value

A matrix with segments.

Author(s)

Lars Relund <lars@relund.dk>

inHull

Efficient test for points inside a convex hull in p dimensions.

Description

Efficient test for points inside a convex hull in p dimensions.
Usage

```r
inHull(
  pts,
  vertices,
  hull = NULL,
  tol = mean(mean(abs(as.matrix(vertices)))) * sqrt(.Machine$double.eps)
)
```

Arguments

- `pts` A \( n \times p \) array to test, \( n \) data points, in dimension \( p \). If you have many points to test, it is most efficient to call this function once with the entire set.
- `vertices` A \( m \times p \) array of vertices of the convex hull. May contain redundant (non-vertex) points.
- `hull` Tessellation (or triangulation) generated by `convhulln` (only works if the dimension of the hull is \( p \)). If hull is `NULL`, then it will be generated.
- `tol` Tolerance on the tests for inclusion in the convex hull. You can think of `tol` as the difference a point value may be different from the values of the hull, and still be perceived as on the surface of the hull. Because of numerical slop nothing can ever be done exactly here. In higher dimensions, the numerical issues of floating point arithmetic will probably suggest a larger value of `tol`. `tol` is not used if the dimension of the hull is larger than one and not equal \( p \).

Value

An integer vector of length \( n \) with values 1 (inside hull), -1 (outside hull) or 0 (on hull to precision indicated by `tol`).

Note

Some of the code are inspired by the Matlab code by John D’Errico and how to find a point inside a hull. If the dimension of the hull is below \( p \) then PCA may be used to check (a warning will be given).

Author(s)

Lars Relund <lars@relund.dk>

Examples

```r
## In 1D
vertices <- matrix(4, ncol = 1)
pt <- matrix(c(2,4), ncol = 1, byrow = TRUE)

ini3D **Initialize the RGL window.**

Description

Initialize the RGL window.
integerPoints

Usage

ini3D(new = TRUE, clear = FALSE, ...)

Arguments

new               A new window is opened (otherwise the current is cleared).
clear            Clear the current RGL window.
...               Further arguments passed on the the RGL plotting functions. This must be done
                  as lists. Currently the following arguments are supported:
                  • argsPlot3d: A list of arguments for rgl::plot3d.
                  • argsAspect3d: A list of arguments for rgl::aspect3d.

Value

NULL (invisible).

Examples

ini3D()
pts<-matrix(c(1,1,1,5,5,5), ncol = 3, byrow = TRUE)
plotPoints3D(pts)
finalize3D()

lim <- c(-1, 7)
ini3D(argsPlot3d = list(xlim = lim, ylim = lim, zlim = lim))
plotPoints3D(pts)
finalize3D()

---

integerPoints               Integer points in the feasible region (Ax<=b).

Description

Integer points in the feasible region (Ax<=b).

Usage

integerPoints(A, b, nonneg = rep(TRUE, ncol(A)))

Arguments

A               Constraint matrix.
b               Right hand side.
nonneg         A boolean vector of same length as number of variables. If entry k is TRUE
                  then variable k must be non-negative.
Value
A data frame with all integer points inside the feasible region.

Note
Do a simple enumeration of all integer points between min and max values found using the continuous polytope.

Author(s)
Lars Relund <lars@relund.dk>.

Examples
A <- matrix( c(3,-2, 1, 2, 4,-2,-3, 2, 1), nc = 3, byrow = TRUE)
b <- c(10, 12, 3)
integerPoints(A, b)

A <- matrix(c(9, 10, 2, 4, -3, 2), ncol = 2, byrow = TRUE)
b <- c(90, 27, 3)
integerPoints(A, b)

loadView

Help function to load the view angle for the RGL 3D plot from a file or matrix

Description
Help function to load the view angle for the RGL 3D plot from a file or matrix

Usage
loadView(
  fname = "view.RData",
  v = NULL,
  clear = TRUE,
  close = FALSE,
  zoom = 1,
  ...
)

Arguments
fname  The file name of the view.
v       The view matrix.
clear   Call rgl::clear3d().
close   Call rgl::close3d().
zoom    Zoom level.
...     Additional parameters passed to rgl::view3d().
Author(s)
Lars Relund <lars@relund.dk>

Examples

```r
view <- matrix(c(-0.412063330411911, -0.228006735444069, 0.882166087627411, 0,
0.910147845745087, -0.0574885793030262, 0.410274744033813, 0, -0.042830865830183,
0.97196090221405, 0.2312088890676498, 0, 0, 0, 1), nc = 4)

loadView(v = view)
A <- matrix(c(3, 2, 5, 2, 1, 1, 1, 3, 5, 2, 4), nc = 3, byrow = TRUE)
b <- c(55, 26, 30, 57)
obj <- c(20, 10, 15)
plotPolytope(A, b, plotOptimum = TRUE, obj = obj, labels = "coord")

# Try to modify the angle in the RGL window
saveView(print = TRUE) # get the view angle to insert into R code
```

---

**mergeLists**

*Merge two lists to one*

**Description**

Merge two lists to one

**Usage**

```r
mergeLists(a, b)
```

**Arguments**

- `a`  
  First list.
- `b`  
  Second list.

---

**plotCones2D**

*Plot a cone defined by a point in 2D.*

**Description**

The cones are defined as the point plus/minus rays of R2.
Usage

plotCones2D(
  pts,
  drawPoint = TRUE,
  drawLines = TRUE,
  drawPolygons = TRUE,
  direction = 1,
  rectangle = FALSE,
  drawPlot = TRUE,
  m = apply(pts, 2, min) - 5,
  M = apply(pts, 2, max) + 5,
  ...
)

Arguments

pts A matrix with a point in each row.
drawPoint Draw the points defining the cone.
drawLines Draw lines of the cone.
drawPolygons Draw polygons of the cone.
direction Ray direction. If i’th entry is positive, consider the i’th column of pts plus a value greater than on equal zero (minimize objective $i$). If negative, consider the i’th column of pts minus a value greater than on equal zero (maximize objective $i$).
rectangle Draw the cone as a rectangle.
drawPlot Draw the ggplot. Set to FALSE if you want to combine hulls in a single plot.
m Minimum values of the bounding box.
M Maximum values of the bounding box.
... Further arguments passed to plotHull2D

Value

A ggplot object

Examples

library(ggplot2)
plotCones2D(c(4,4), drawLines = FALSE, drawPoint = TRUE,
  argsGeom_point = list(col = "red", size = 10),
  argsGeom_polygon = list(alpha = 0.5), rectangle = TRUE)
plotCones2D(c(1,1), rectangle = FALSE)
plotCones2D(matrix(c(3,3,2,2), ncol = 2, byrow = TRUE))

## The Danish flag
lst <- list(argsGeom_polygon = list(alpha = 0.85, fill = "red"),
  drawPlot = FALSE, drawPoint = FALSE, drawLines = FALSE)
pl <- do.call(plotCones2D, args = c(list(c(2,4), direction = 1), lst))
p2 <- do.call(plotCones2D, args = c(list(c(1,2), direction = -1), lst))
p3 <- do.call(plotCones2D, args = c(list(c(2,2), direction = c(1,-1)), lst))
p4 <- do.call(plotCones2D, args = c(list(c(1,4), direction = c(-1,1)), lst))
ggplot() + p1 + p2 + p3 + p4 + theme_void()

plotCones3D

<table>
<thead>
<tr>
<th>Plot a cone defined by a point in 3D.</th>
</tr>
</thead>
</table>

Description

The cones are defined as the point plus R3+.

Usage

plotCones3D(
    pts,
    drawPoint = TRUE,
    drawLines = TRUE,
    drawPolygons = TRUE,
    direction = 1,
    rectangle = FALSE,
    useRGLBBox = TRUE,
    ...
)

Arguments

- **pts**: A matrix with a point in each row.
- **drawPoint**: Draw the points defining the cone.
- **drawLines**: Draw lines of the cone.
- **drawPolygons**: Draw polygons of the cone.
- **direction**: Ray direction. If i'th entry is positive, consider the i'th column of pts plus a value greater than or equal zero (minimize objective $i$). If negative, consider the i'th column of pts minus a value greater than equal zero (maximize objective $i$).
- **rectangle**: Draw the cone as a rectangle.
- **useRGLBBox**: Use the RGL bounding box as ray limits for the cone.
- **...**: Further arguments passed on the the RGL plotting functions. This must be done as lists (see examples). Currently the following arguments are supported:
  - **argsPlot3d**: A list of arguments for `rgl::plot3d`.
  - **argsSegments3d**: A list of arguments for `rgl::segments3d`.
  - **argsPolygon3d**: A list of arguments for `rgl::polygon3d`.

Value

Object ids (invisible).
Examples

ini3D(argsPlot3d = list(xlim = c(0,6), ylim = c(0,6), zlim = c(0,6)))
plotCones3D(c(4,4,4), drawLines = FALSE, drawPoint = TRUE,
    argsPlot3d = list(col = "red", size = 10),
    argsPolygon3d = list(alpha = 1), rectangle = TRUE)
plotCones3D(c(1,1,1), rectangle = FALSE)
plotCones3D(matrix(c(3,3,3,2,2,2), ncol = 3, byrow = TRUE))
finalize3D()

ini3D(argsPlot3d = list(xlim = c(0,6), ylim = c(0,6), zlim = c(0,6)))
plotCones3D(c(4,4,4), direction = 1)
plotCones3D(c(2,2,2), direction = -1)
plotCones3D(c(4,2,2), direction = c(1,-1,-1))
ids <- plotCones3D(c(2,2,4), direction = c(-1,-1,1))
finalize3D()
# pop3d(id = ids) # remove last cone

plotCriterion2D Create a plot of the criterion space of a bi-objective problem

Description

Create a plot of the criterion space of a bi-objective problem

Usage

plotCriterion2D(
    A,
    b,
    obj,
    type = rep("c", ncol(A)),
    nonneg = rep(TRUE, ncol(A)),
    crit = "max",
    addTriangles = FALSE,
    addHull = TRUE,
    plotFeasible = TRUE,
    latex = FALSE,
    labels = NULL
)

Arguments

A The constraint matrix.
b Right hand side.
obj A p x n matrix(one row for each criterion).
plotCriterion2D

```
type: A character vector of same length as number of variables. If entry k is 'i' variable k must be integer and if 'c' continuous.
nonneg: A boolean vector of same length as number of variables. If entry k is TRUE then variable k must be non-negative.
crit: Either max or min (only used if add the iso-profit line).
addTriangles: Add search triangles defined by the non-dominated extreme points.
addHull: Add the convex hull and the rays.
plotFeasible: If True then plot the criterion points/slices.
llatex: If true make latex math labels for TikZ.
lables: If NULL don't add any labels. If 'n' no labels but show the points. If equal coord add coordinates to the points. Otherwise number all points from one.

Value
The ggplot object.

Note
Currently only points are checked for dominance. That is, for MILP models some nondominated points may in fact be dominated by a segment.

plotHull2D

Plot the convex hull of a set of points in 2D.

Description

Plot the convex hull of a set of points in 2D.
plotHull2D(  pts,  
  drawPoints = FALSE,  
  drawLines = TRUE,  
  drawPolygons = TRUE,  
  addText = FALSE,  
  addRays = FALSE,  
  direction = 1,  
  drawPlot = TRUE,  
  drawBBoxHull = FALSE,  
  m = apply(pts, 2, min) - 5,  
  M = apply(pts, 2, max) + 5,  
  ...  
)

Arguments

<table>

</tbody>
</table>

Value

The ggplot object if drawPlot = TRUE; otherwise, a list of ggplot components.
Examples

```r
library(ggplot2)
pts <- matrix(c(1,1), ncol = 2, byrow = TRUE)
plotHull2D(pts)
pts1 <- matrix(c(2,2,3,3), ncol = 2, byrow = TRUE)
plotHull2D(pts1, drawPoints = TRUE)
plotHull2D(pts1, drawPoints = TRUE, addRays = TRUE, addText = "coord")
plotHull2D(pts1, drawPoints = TRUE, addRays = TRUE, addText = "coord", drawBBBoxHull = TRUE)
plotHull2D(pts1, drawPoints = TRUE, addRays = TRUE, direction = -1, addText = "coord")
pts2 <- matrix(c(1,1,2,2,0,1), ncol = 2, byrow = TRUE)
plotHull2D(pts2, drawPoints = TRUE, addText = "coord")
plotHull2D(pts2, drawPoints = TRUE, addRays = TRUE, addText = "coord")
plotHull2D(pts2, drawPoints = TRUE, addRays = TRUE, direction = -1, addText = "coord")
```

```r
## Combine hulls
ggplot() +
  plotHull2D(pts2, drawPoints = TRUE, addText = "coord", drawPlot = FALSE) +
  plotHull2D(pts1, drawPoints = TRUE, drawPlot = FALSE) +
  gMOIPTheme() +
  xlab(expression(x[1])) +
  ylab(expression(x[2]))
```

```r
# Plotting an LP
A <- matrix(c(-3,2,2,4,9,10), ncol = 2, byrow = TRUE)
b <- c(3,27,90)
obj <- c(7.75,10)
pts3 <- cornerPoints(A, b)
plotHull2D(pts3, drawPoints = TRUE, addText = "coord", argsGeom_polygon = list(fill = "red"))
```

---

**plotHull3D**

*Plot the convex hull of a set of points in 3D.*

**Description**

Plot the convex hull of a set of points in 3D.

**Usage**

```r
plotHull3D(
  pts,
  drawPoints = FALSE,
  drawLines = TRUE,
  drawPolygons = TRUE,
  addText = FALSE,
  addRays = FALSE,
  useRGLBBBox = FALSE,
  direction = 1,
  drawBBBoxHull = TRUE,
  ...
)
```
Arguments

- **pts**: A matrix with a point in each row.
- **drawPoints**: Draw the points.
- **drawLines**: Draw lines of the facets.
- **drawPolygons**: Fill the facets.
- **addText**: Add text to the points. Currently coord (coordinates), rownames (rownames) and both supported or a vector with text.
- **addRays**: Add the ray defined by direction.
- **useRGLBox**: Use the RGL bounding box when add rays.
- **direction**: Ray direction. If i’th entry is positive, consider the i’th column of pts plus a value greater than or equal zero (minimize objective $i$). If negative, consider the i’th column of pts minus a value greater than or equal zero (maximize objective $i$).
- **drawBoundingBox**: If addRays then draw the hull areas hitting the bounding box also.

Further arguments passed on the the RGL plotting functions. This must be done as lists (see examples). Currently the following arguments are supported:

- **argsPlot3d**: A list of arguments for rgl::plot3d.
- **argsSegments3d**: A list of arguments for rgl::segments3d.
- **argsPolygon3d**: A list of arguments for rgl::polygon3d.
- **argsShade3d**: A list of arguments for rgl::shade3d.
- **argsText3d**: A list of arguments for rgl::text3d.

Value

A list with hull, pts classified and object ids (invisible).

Examples

```r
ini3D()
pts<-matrix(c(0,0,0), ncol = 3, byrow = TRUE)
plotHull3D(pts) # a point
pts<-matrix(c(1,1,1,2,2,2,3,3,3), ncol = 3, byrow = TRUE)
plotHull3D(pts, drawPoints = TRUE) # a line
pts<-matrix(c(1,0,0,1,1,1,2,2,3,3,3,3), ncol = 3, byrow = TRUE)
plotHull3D(pts, drawLines = FALSE, argsPolygon3d = list(alpha=0.6)) # a polygon
pts<-matrix(c(5,5,5,10,10,5,10,5,5,5,5,10), ncol = 3, byrow = TRUE)
lst <- plotHull3D(pts, argsPolygon3d = list(alpha=0.9), argsSegments3d = list(color="red"))
finalize3D()
# pop3d(id = lst$ids) # remove last hull

## Using addRays

pts <- data.frame(x = c(1,3), y = c(1,3), z = c(1,3))
ini3D(argsPlot3d = list(xlim = c(0,max(pts$x)+10),
                           ylim = c(0,max(pts$y)+10),
                           zlim = c(0,max(pts$z)+10)))
```

finalize3D()
ini3D(argsPlot3d = list(
  xlim = c(0, max(pts[,1])+10),
  ylim = c(0, max(pts[,2])+10),
  zlim = c(0, max(pts[,3])+10))
plotHull3D(pts, drawPoints = TRUE, argsPolygon3d = list(color = "red"), addRays = TRUE)
plotCones3D(pts, argsPolygon3d = list(alpha = 1), rectangle = TRUE)
finalize3D()

plotLines2D

Plot the lines of a linear mathematical program (Ax = b)

Description
Plot the lines of a linear mathematical program (Ax = b)

Usage
plotLines2D(A, b, nonneg = rep(TRUE, ncol(A)), latex = FALSE, ...)

Arguments
- **A**: The constraint matrix.
- **b**: Right hand side.
- **nonneg**: A boolean vector of same length as number of variables. If entry k is TRUE then variable k must be non-negative and the line is plotted too.
- **latex**: If True make latex math labels for TikZ.
- **...**: Further arguments passed on the the ggplot plotting functions. This must be done as lists. Currently the following arguments are supported:
  - `argsTheme`: A list of arguments for `ggplot2::theme`.

Value
A ggplot object.

Note
In general you will properly use `plotPolytope()` instead of this function.

Author(s)
Lars Relund <lars@relund.dk>

See Also
`plotPolytope()`.
plotMTeX3D

Plot TeX in the margin

Description

Plot TeX in the margin

Usage

plotMTeX3D(tex, edge, line = 0, at = NULL, pos = NA, ...)

Arguments

tex
edge
line
at
pos
...

TeX string
The position at which to draw the axis or text.
The “line” of the plot margin to draw the label on.
The value of a coordinate at which to draw the axis.
The position at which to draw the axis or text.
Further arguments passed to plotTeX3D().

Value

The object IDs of objects added to the scene.

plotNDSet2D

Create a plot of a discrete non-dominated set.

Description

Create a plot of a discrete non-dominated set.

Usage

plotNDSet2D(
points,
crit,
addTriangles = FALSE,
addHull = TRUE,
latex = FALSE,
labels = NULL
)

plotPlane3D

Plot a plane in 3D.

Description

Plot a plane in 3D.

Arguments

points Data frame with non-dominated points.
crit Either max or min (only used if add the iso-profit line). A vector is currently not supported.
addTriangles Add search triangles defined by the non-dominated extreme points.
addHull Add the convex hull and the rays.
l新加 If true make latex math labels for TikZ.
l新加 If NULL don’t add any labels. If ‘n’ no labels but show the points. If equal coord add coordinates to the points. Otherwise number all points from one.

Value

The ggplot object.

Note

Currently only points are checked for dominance. That is, for MILP models some nondominated points may in fact be dominated by a segment.

Author(s)

Lars Relund <lars@relund.dk>

Examples

dat <- data.frame(z1=c(12,14,16,18,18,18,14,15,15), z2=c(18,16,12,4,2,6,14,14,16))
points <- addNDSet(dat, crit = "min", keepDom = TRUE)
plotNDSet2D(points, crit = "min", addTriangles = TRUE)
plotNDSet2D(points, crit = "min", addTriangles = FALSE)
plotNDSet2D(points, crit = "min", addTriangles = TRUE, addHull = FALSE)
points <- addNDSet(dat, crit = "max", keepDom = TRUE)
plotNDSet2D(points, crit = "max", addTriangles = TRUE)
plotNDSet2D(points, crit = "max", addHull = FALSE)
plotPlane3D

Usage

plotPlane3D(
  normal,
  point = NULL,
  offset = 0,
  useShade = TRUE,
  useLines = FALSE,
  usePoints = FALSE,
  ...
)

Arguments

normal Normal to the plane.
point A point on the plane.
offset The offset of the plane (only used if point = NULL).
useShade Plot shade of the plane.
useLines Plot lines inside the plane.
usePoints Plot point shapes inside the plane.
...
Further arguments passed on the the RGL plotting functions. This must be done as lists (see examples). Currently the following arguments are supported:

- `argsPlanes3d`: A list of arguments for `rgl::planes3d()` used when `useShade = TRUE`.
- `argsLines`: A list of arguments for `rgl::persp3d()` when `useLines = TRUE`. Moreover, the list may contain `lines`: number of lines.

Value

NULL (invisible)

Examples

ini3D(argsPlot3d = list(xlim = c(-1,10), ylim = c(-1,10), zlim = c(-1,10)) )
plotPlane3D(c(1,1,1), point = c(1,1,1))
plotPoints3D(c(1,1,1))
plotPlane3D(c(1,2,1), point = c(2,2,2), argsPlanes3d = list(color="red"))
plotPoints3D(c(2,2,2))
plotPlane3D(c(2,1,1), offset = -6, argsPlanes3d = list(color="blue"))
plotPlane3D(c(2,1,1), argsPlanes3d = list(color="green"))
finalize3D()

ini3D(argsPlot3d = list(xlim = c(-1,10), ylim = c(-1,10), zlim = c(-1,10)) )
plotPlane3D(c(1,1,1), point = c(1,1,1), useLines = TRUE, useShade = TRUE)
ids <- plotPlane3D(c(1,2,1), point = c(2,2,2), argsLines = list(col="blue", lines = 100),
  useLines = TRUE)
finalize3D()
# pop3d(id = ids) # remove last plane
plotPoints3D

Plot points in 3D.

Description

Plot points in 3D.

Usage

plotPoints3D(pts, addText = FALSE, ...)

Arguments

- **pts**
  - A vector or matrix with the points.
- **addText**
  - Add text to the points. Currently **coord** (coordinates), **rownames** (rownames) and both supported or a vector with the text.
- **...**
  - Further arguments passed on the the RGL plotting functions. This must be done as lists (see examples). Currently the following arguments are supported:
    - **argsPlot3d**: A list of arguments for `rgl::plot3d`.
    - **argsPch3d**: A list of arguments for `rgl::pch3d`.
    - **argsText3d**: A list of arguments for `rgl::text3d`.

Value

Object ids (invisible).

Examples

ini3D()
pts<-matrix(c(1,1,1,5,5,5), ncol = 3, byrow = TRUE)
plotPoints3D(pts)
plotPoints3D(c(2,3,3), argsPlot3d = list(col = "red", size = 10))
plotPoints3D(c(3,2,3), argsPlot3d = list(col = "blue", size = 10, type="p"))
plotPoints3D(c(1.5,1.5,1.5), argsPlot3d = list(col = "blue", size = 10, type="p"))
plotPoints3D(c(2,2,2, 1,1,1), addText = "coord")
ids <- plotPoints3D(c(3,3,3, 4,4,4), addText = "rownames")
finalize3D()
rgl::rglwidget()
# pop3d(ids) # remove the last again
plotPolygon3D

Plot a polygon.

Description

Plot a polygon.

Usage

plotPolygon3D(
  pts,
  useShade = TRUE,
  useLines = FALSE,
  usePoints = FALSE,
  useFrame = TRUE,
  ...
)

Arguments

pts       Vertices.
useShade  Plot shade of the polygon.
useLines  Plot lines inside the polygon.
usePoints Plot point shapes inside the polygon.
useFrame  Plot a frame around the polygon.
...

Further arguments passed on the RGL plotting functions. This must be done as lists (see examples). Currently the following arguments are supported:

• argsShade: A list of arguments for rgl::polygon3d (n > 4 vertices), rgl::triangles3d() (n = 3 vertices) and rgl::quads3d() (n = 4 vertices) if useShade = TRUE.
• argsFrame: A list of arguments for rgl::lines3d if useFrame = TRUE.
• argsPoints: A list of arguments for rgl::shade3d if usePoints = TRUE. It is important to give a texture using texture. A texture can be set using getTexture().
• argsLines: A list of arguments for rgl::persp3d() when useLines = TRUE. Moreover, the list may contain lines: number of lines.

Value

Object ids (invisible).
Examples

```r
pts <- data.frame(x = c(1, 0, 0, 0.4), y = c(0, 1, 0, 0.3), z = c(0, 0, 1, 0.3))
pts <- data.frame(x = c(1, 0, 0), y = c(0, 1, 0), z = c(0, 0, 1))

ini3D()
plotPolygon3D(pts)
finalize3D()

ini3D()
plotPolygon3D(pts, argsShade = list(color = "red", alpha = 1))
finalize3D()

ini3D()
plotPolygon3D(pts, useFrame = TRUE, argsShade = list(color = "red", alpha = 0.5),
              argsFrame = list(color = "green"))
finalize3D()

ini3D()
plotPolygon3D(pts, useFrame = TRUE, useLines = TRUE, useShade = TRUE,
              argsShade = list(color = "red", alpha = 0.2),
              argsLines = list(color = "blue"))
finalize3D()

ini3D()
ids <- plotPolygon3D(pts, usePoints = TRUE, useFrame = TRUE,
                      argsPoints = list(texture = getTexture(pch = 16, cex = 20)))
finalize3D()
# pop3d(id = ids) # remove object again

# In general you have to finetune size and numbers when you use textures
# Different pch
for (i in 0:3) {
  fname <- getTexture(pch = 15+i, cex = 30)
  ini3D(TRUE)
  plotPolygon3D(pts, usePoints = TRUE, argsPoints = list(texture = fname))
  finalize3D()
}

# Size of pch
for (i in 1:4) {
  fname <- getTexture(pch = 15+i, cex = 10 * i)
  ini3D(TRUE)
  plotPolygon3D(pts, usePoints = TRUE, argsPoints = list(texture = fname))
  finalize3D()
}

# Number of pch
fname <- getTexture(pch = 16, cex = 20)
for (i in 1:4) {
  ini3D(TRUE)
  plotPolygon3D(pts, usePoints = TRUE,
```
plotPolytope

Plot the polytope (bounded convex set) of a linear mathematical program (Ax <= b)

Description

This is a wrapper function calling plotPolytope2D() (2D graphics) and plotPolytope3D() (3D graphics).

Usage

plotPolytope(
  A,
  b,
  obj = NULL,
  type = rep("c", ncol(A)),
  nonneg = rep(TRUE, ncol(A)),
  crit = "max",
  faces = type,
  plotFaces = TRUE,
  plotFeasible = TRUE,
  plotOptimum = FALSE,
  latex = FALSE,
  labels = NULL,
  ...
)

Arguments

A  The constraint matrix.

b  Right hand side.

obj  A vector with objective coefficients.

type  A character vector of same length as number of variables. If entry k is ‘i’ variable k must be integer and if ‘c’ continuous.

nonneg  A boolean vector of same length as number of variables. If entry k is TRUE then variable k must be non-negative.

crit  Either max or min (only used if add the iso-profit line)

faces  A character vector of same length as number of variables. If entry k is ‘i’ variable k must be integer and if ‘c’ continuous. Useful if e.g. want to show the linear relaxation of an IP.
plotPolytope

plotFaces If True then plot the faces.
plotFeasible If True then plot the feasible points/segments (relevant for IPLP/MILP).
plotOptimum Show the optimum corner solution point (if alternative solutions only one is shown) and add the iso-profit line.
latex If True make latex math labels for TikZ.
labels If NULL don’t add any labels. If ‘n’ no labels but show the points. If equal coord add coordinates to the points. Otherwise number all points from one.

... If 2D, further arguments passed on the the ggplot plotting functions. This must be done as lists. Currently the following arguments are supported:
  • argsFaces: A list of arguments for plotHull2D.
  • argsFeasible: A list of arguments for ggplot2 functions:
    – geom_point: A list of arguments for ggplot2::geom_point.
    – geom_line: A list of arguments for ggplot2::geom_line.
  • argsLabels: A list of arguments for ggplot2 functions:
    – geom_text: A list of arguments for ggplot2::geom_text.
  • argsOptimum:
    – geom_point: A list of arguments for ggplot2::geom_point.
    – geom_abline: A list of arguments for ggplot2::geom_abline.
    – geom_label: A list of arguments for ggplot2::geom_label.
  • argsTheme: A list of arguments for ggplot2::theme.

If 3D further arguments passed on the the RGL plotting functions. This must be done as lists. Currently the following arguments are supported:
  • argsAxes3d: A list of arguments for rgl::axes3d.
  • argsPlot3d: A list of arguments for rgl::plot3d to open the RGL window.
  • argsTitle3d: A list of arguments for rgl::title3d.
  • argsFaces: A list of arguments for plotHull3D.
  • argsFeasible: A list of arguments for RGL functions:
    – points3d: A list of arguments for rgl::points3d.
    – segments3d: A list of arguments for rgl::segments3d.
    – triangles3d: A list of arguments for rgl::triangles3d.
  • argsLabels: A list of arguments for RGL functions:
    – points3d: A list of arguments for rgl::points3d.
    – text3d: A list of arguments for rgl::text3d.
  • argsOptimum: A list of arguments for RGL functions:
    – points3d: A list of arguments for rgl::points3d.

Value

If 2D a ggplot object. If 3D a RGL window with the 3D plot.

Note

The feasible region defined by the constraints must be bounded (i.e. no extreme rays) otherwise you may see strange results.
Examples

### 2D examples ###

# Define the model max/min coeff*x st. Ax<=b, x>=0

plotPolytope2D

Plot the polytope (bounded convex set) of a linear mathematical program

Description

Plot the polytope (bounded convex set) of a linear mathematical program

Usage

plotPolytope2D(
  A,
  b,
  obj = NULL,
  type = rep("c", ncol(A)),
  nonneg = rep(TRUE, ncol(A)),
  crit = "max",
  faces = rep("c", ncol(A)),
  plotFaces = TRUE,
  plotFeasible = TRUE,
  plotOptimum = FALSE,
  latex = FALSE,
  labels = NULL,
  ...
)

Arguments

A                   The constraint matrix.
b                   Right hand side.
obj                 A vector with objective coefficients.
type                A character vector of same length as number of variables. If entry $k$ is 'i' variable $k$ must be integer and if 'c' continuous.
nonneg              A boolean vector of same length as number of variables. If entry $k$ is TRUE then variable $k$ must be non-negative.
crit                Either max or min (only used if add the iso-profit line)
faces               A character vector of same length as number of variables. If entry $k$ is 'i' variable $k$ must be integer and if 'c' continuous. Useful if e.g. want to show the linear relaxation of an IP.
plotFaces           If True then plot the faces.
plotFeasible        If True then plot the feasible points/segments (relevant for ILP/MILP).
plotOptimum         Show the optimum corner solution point (if alternative solutions only one is shown) and add the iso-profit line.
llatex              If True make latex math labels for TikZ.
labels

If NULL don’t add any labels. If ‘n’ no labels but show the points. If equal coord add coordinates to the points. Otherwise number all points from one.

... Further arguments passed on the the ggplot plotting functions. This must be done as lists. Currently the following arguments are supported:

  • argsFaces: A list of arguments for plotHull2D.
  • argsFeasible: A list of arguments for ggplotl2 functions:
    – geom_point: A list of arguments for ggplot2::geom_point.
    – geom_line: A list of arguments for ggplot2::geom_line.
  • argsLabels: A list of arguments for ggplotl2 functions:
    – geom_text: A list of arguments for ggplot2::geom_text.
  • argsOptimum:
    – geom_point: A list of arguments for ggplot2::geom_point.
    – geom_abline: A list of arguments for ggplot2::geom_abline.
    – geom_label: A list of arguments for ggplot2::geom_label.
  • argsTheme: A list of arguments for ggplot2::theme.

Value

A ggplot object.

Note

In general use plotPolytope() instead of this function. The feasible region defined by the constraints must be bounded otherwise you may see strange results.

Author(s)

Lars Relund <lars@relund.dk>

See Also

plotPolytope() for examples.
Usage

`plotPolytope3D`:

```r
plotPolytope3D(
  A,
  b,
  obj = NULL,
  type = rep("c", ncol(A)),
  nonneg = rep(TRUE, ncol(A)),
  crit = "max",
  faces = rep("c", ncol(A)),
  plotFaces = TRUE,
  plotFeasible = TRUE,
  plotOptimum = FALSE,
  latex = FALSE,
  labels = NULL,
  ...
)
```

Arguments

- **A**: The constraint matrix.
- **b**: Right hand side.
- **obj**: A vector with objective coefficients.
- **type**: A character vector of same length as number of variables. If entry \( k \) is 'i' variable \( k \) must be integer and if 'c' continuous.
- **nonneg**: A boolean vector of same length as number of variables. If entry \( k \) is TRUE then variable \( k \) must be non-negative.
- **crit**: Either max or min (only used if add the iso-profit line)
- **faces**: A character vector of same length as number of variables. If entry \( k \) is 'i' variable \( k \) must be integer and if 'c' continuous. Useful if e.g. want to show the linear relaxation of an IP.
- **plotFaces**: If True then plot the faces.
- **plotFeasible**: If True then plot the feasible points/segments (relevant for ILP/MILP).
- **plotOptimum**: Show the optimum corner solution point (if alternative solutions only one is shown) and add the iso-profit line.
- **latex**: If True make latex math labels for TikZ.
- **labels**: If NULL don’t add any labels. If ’n’ no labels but show the points. If equal coord add coordinates to the points. Otherwise number all points from one.
- **...**: Further arguments passed on to the RGL plotting functions. This must be done as lists. Currently the following arguments are supported:
  - `argsAxes3d`: A list of arguments for `rgl::axes3d`.
  - `argsPlot3d`: A list of arguments for `rgl::plot3d` to open the RGL window.
  - `argsTitle3d`: A list of arguments for `rgl::title3d`.
  - `argsFaces`: A list of arguments for `plotHull3D`.

• argsFeasible: A list of arguments for RGL functions:
  – points3d: A list of arguments for \texttt{rgl::points3d}.
  – segments3d: A list of arguments for \texttt{rgl::segments3d}.
  – triangles3d: A list of arguments for \texttt{rgl::triangles3d}.
• argsLabels: A list of arguments for RGL functions:
  – points3d: A list of arguments for \texttt{rgl::points3d}.
  – text3d: A list of arguments for \texttt{rgl::text3d}.
• argsOptimum: A list of arguments for RGL functions:
  – points3d: A list of arguments for \texttt{rgl::points3d}.

Value
A RGL window with 3D plot.

Note
In general use \texttt{plotPolytope()} instead of this function. The feasible region defined by the constraints must be bounded otherwise you may see strange results.

Author(s)
Lars Relund <lars@relund.dk>

\texttt{plotPolytope()} for examples.

---

\textit{plotRectangle3D} \hspace{1cm} \textit{Plot a rectangle defined by two corner points.}

\textbf{Description}

The rectangle is defined by \( x_{\text{min}} \leq x \leq b \) where \( a \) is the minimum values and \( b \) is the maximum values.

\textbf{Usage}

\texttt{plotRectangle3D(a, b, ...)}

\textbf{Arguments}

\begin{itemize}
  \item \texttt{a} \hspace{1cm} A vector of length 3.
  \item \texttt{b} \hspace{1cm} A vector of length 3.
  \item \texttt{...} \hspace{1cm} Further arguments passed on the the RGL plotting functions. This must be done as lists (see examples). Currently the following arguments are supported:
    \begin{itemize}
      \item \texttt{argsPlot3d}: A list of arguments for \texttt{rgl::plot3d}.
    \end{itemize}
\end{itemize}
• argsSegments3d: A list of arguments for `rgl::segments3d`.
• argsPolygon3d: A list of arguments for `rgl::polygon3d`.
• argsShade3d: A list of arguments for `rgl::shade3d`.

Value

Object ids (invisible).

Examples

```r
ini3D()
plotRectangle3D(c(0,0,0), c(1,1,1))
plotRectangle3D(c(1,1,1), c(4,4,3), drawPoints = TRUE, drawLines = FALSE,
                argsPlot3d = list(size=2, type="s", alpha=0.3))
ids <- plotRectangle3D(c(2,2,2), c(3,3,2.5), argsPolygon3d = list(alpha = 1) )
finalize3D()
# `pop3d(id = ids)` remove last object
```

---

**plotTeX3D**

*Plot TeX at a position.*

Description

Plot TeX at a position.

Usage

```r
plotTeX3D(
  x,
  y,
  z,
  tex,
  cex = graphics::par("cex"),
  fixedSize = FALSE,
  size = 480,
  ...
)
```

Arguments

- `x` Coordinate.
- `y` Coordinate.
- `z` Coordinate.
- `tex` TeX string.
- `cex` Expansion factor (you properly have to fine tune it).
fixedSize  Fix the size of the object (no scaling when zoom).
size     Size of the generated png.
...     Arguments passed on to rgl::sprites3d() and texToPng().

Value

The shape ID of the displayed object is returned.

Examples

```r
## Not run:
tex0 <- "$\mathbb{R}_{\geqq}\$"
tex1 <- "\LaTeX"
tex2 <- "This is a title"
ini3D(argsPlot3d = list(xlim = c(0, 2), ylim = c(0, 2), zlim = c(0, 2)))
plotTeX3D(0.75,0.75,0.75, tex0)
plotTeX3D(0.5,0.5,0.5, tex0, cex = 2)
plotTeX3D(1,1,1, tex2)
finalize3D()

**plotTitleTeX3D**

*Draw boxes, axes and other text outside the data using TeX strings.*

**Description**

Draw boxes, axes and other text outside the data using TeX strings.

**Usage**

```r
plotTitleTeX3D(
  main = NULL,
  sub = NULL,
  xlab = NULL,
  ylab = NULL,
  zlab = NULL,
  line = NA,
  ...
)
```
Arguments

- **main**: The main title for the plot.
- **sub**: The subtitle for the plot.
- **xlab**: The axis labels for the plot.
- **ylab**: The axis labels for the plot.
- **zlab**: The axis labels for the plot.
- **line**: The “line” of the plot margin to draw the label on.
- ... Additional parameters which are passed to `plotMTeX3D`.

Details

The rectangular prism holding the 3D plot has 12 edges. They are identified using 3 character strings. The first character (x', y', or z') selects the direction of the axis. The next two characters are each - ' or + ', selecting the lower or upper end of one of the other coordinates. If only one or two characters are given, the remaining characters default to '. For example edge = 'x+' draws an x-axis at the high level of y and the low level of z.

By default, `axes3d` uses the `bbox3d` function to draw the axes. The labels will move so that they do not obscure the data. Alternatively, a vector of arguments as described above may be used, in which case fixed axes are drawn using `axis3d`.

If `pos` is a numeric vector of length 3, `edge` determines the direction of the axis and the tick marks, and the values of the other two coordinates in `pos` determine the position. See the examples.

Value

The object IDs of objects added to the scene.

Examples

```r
## Not run:
ini3D(argsPlot3d = list(xlim = c(0, 2), ylim = c(0, 2), zlim = c(0, 2)))
plotTitleTeX3D(main = "LaTeX", sub = "subtitle $\alpha$",
              xlab = "$x^1_2$$", ylab = "$\beta$$", zlab = "$x\cdot y$"
)
finalize3D()
## End(Not run)
```

Description

To size of the png file.

Usage

`pngSize(png)`
Arguments

  png                Png file name.

Value

  A list with width and height.

---

**saveView**

*Help function to save the view angle for the RGL 3D plot*

---

**Description**

Help function to save the view angle for the RGL 3D plot

**Usage**

```r
saveView(fname = "view.RData", overwrite = FALSE, print = FALSE)
```

**Arguments**

- **fname** The file name of the view.
- **overwrite** Overwrite existing file.
- **print** Print the view so can be copied to R code (no file is saved).

**Value**

NULL (invisible).

**Note**

Only save if the file name don’t exists.

**Author(s)**

Lars Relund <lars@relund.dk>

**Examples**

```r
view <- matrix( c(-0.412063330411911, -0.228006735444069, 0.882166087627411, 0,
                  0.910147845745087, -0.0574885793030262, 0.410274744033813, 0,
                  0.97196090221405, 0.231208890676498, 0, 0, 0, 0, 1), nc = 4)
loadView(v = view)
A <- matrix( c(3, 2, 5, 2, 1, 1, 1, 1, 3, 5, 2, 4), nc = 3, byrow = TRUE)
b <- c(55, 26, 30, 57)
obj <- c(20, 10, 15)
plotPolytope(A, b, plotOptimum = TRUE, obj = obj, labels = "coord")
```
# Try to modify the angle in the RGL window
saveView(print = TRUE)  # get the view angle to insert into R code

slices  

Find all corner points in the slices define for each fixed integer combination.

Usage

slices(
  A,
  b,
  type = rep("c", ncol(A)),
  nonneg = rep(TRUE, ncol(A)),
  collapse = FALSE
)

Arguments

A       The constraint matrix.
b       Right hand side.
type    A character vector of same length as number of variables. If entry k is 'i' variable k must be integer and if 'c' continuous.
nonneg  A boolean vector of same length as number of variables. If entry k is TRUE then variable k must be non-negative.
collapse Collapse list to a data frame with unique points.

Value

A list with the corner points (one entry for each slice).

Examples

A <- matrix( c(3, -2, 1, 2, 4, -2, -3, 2, 1), nc = 3, byrow = TRUE)
b <- c(10, 12, 3)
slices(A, b, type=c("i","c","i"))

A <- matrix(c(9,10,2,4,-3,2), ncol = 2, byrow = TRUE)
b <- c(90,27,3)
slices(A, b, type=c("c","i"), collapse = TRUE)
texToPng

Convert LaTeX to a png file

Description

Convert LaTeX to a png file

Usage

texToPng(
  tex,
  width = NULL,
  height = NULL,
  dpi = 72,
  viewPng = FALSE,
  fontsize = 12,
  calcM = FALSE,
  crop = FALSE
)

Arguments

tex TeX string. Remember to escape backslash with \.
width Width of the png.
height Height of the png (width are ignored).
dpi Dpi of the png. Not used if width or height are specified.
viewPng View the result in the plots window.
fontsize Front size used in the LaTeX document.
calcM Estimate 1 em in pixels in the resulting png.
crop Call command line program pdfcrop (must be installed).

Value

The filename of the png or a list if calcM = TRUE.

Examples

## Not run:
tex <- "$\mathbb{R}_{\geqq}$"
texToPng(tex, viewPng = TRUE)
texToPng(tex, fontsize = 20, viewPng = TRUE)
texToPng(tex, height = 50, fontsize = 10, viewPng = TRUE)
texToPng(tex, height = 50, fontsize = 50, viewPng = TRUE)
tex <- "MMM"
texToPng(tex, dpi=72, calcM = TRUE)
texToPng(tex, width = 100, calcM = TRUE)
f <- texToPng(tex, dpi=300)
pngSize(f)

## End(Not run)
