Package ‘gdalcubes’

February 2, 2020

Title Earth Observation Data Cubes from Satellite Image Collections
Version 0.2.4
Date 2020-02-02
Description Processing collections of Earth observation images as on-demand multispectral, multitemporal raster data cubes. Users define cubes by spatiotemporal extent, resolution, and spatial reference system and let 'gdalcubes' automatically apply cropping, reprojection, and resampling using the 'Geospatial Data Abstraction Library' ('GDAL'). Implemented functions on data cubes include reduction over space and time, applying arithmetic expressions on pixel band values, moving window aggregates over time, filtering by space, time, bands, and predicates on pixel values, exporting data cubes as 'netCDF' or 'GeoTIFF' files, and plotting. The package implements lazy evaluation and multithreading. All computational parts are implemented in C++, linking to the 'GDAL', 'netCDF', 'CURL', and 'SQLite' libraries.

add_collection_format

Download and install an image collection format from a URL

Description

Download and install an image collection format from a URL.
add_collection_format(url, name = NULL)

Arguments

url URL pointing to the collection format JSON file
name optional name used to refer to the collection format

Details

By default, the collection format name will be derived from the basename of the URL.

Examples

add_collection_format(  
  "https://raw.githubusercontent.com/appelmar/gdalcubes/dev/formats/Sentinel1_IW_GRD.json")

add_images

Add images to an existing image collection

Description

This function adds provided files or GDAL dataset identifiers and to an existing image collection by extracting datetime, image identifiers, and band information according to the collection’s format.

Usage

add_images(image_collection, files, unroll_archives = TRUE,  
out_file = "", quiet = FALSE)

Arguments

image_collection image_collection object or path to an existing collection file
files character vector with paths to image files on disk or any GDAL dataset identifiers (including virtual file systems and higher level drivers or GDAL sub-datasets)
unroll_archives automatically convert .zip, .tar archives and .gz compressed files to GDAL virtual file system dataset identifiers (e.g. by prepending /vsizip/) and add contained files to the list of considered files
out_file path to output file, an empty string (the default) will update the collection in-place, whereas images will be added to a new copy of the image collection at the given location otherwise.
quiet logical; if TRUE, do not print resulting image collection if return value is not assigned to a variable
Value

image collection proxy object, which can be used to create a data cube using `raster_cube`

Examples

```r
L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
  ".TIF", recursive = TRUE, full.names = TRUE)
L8_col = create_image_collection(L8_files[1:12], "L8_L1TP")
add_images(L8_col, L8_files[13:24])
```

animate

Animate a data cube as an image time series

Description

Animate a data cube as an image time series

Usage

```r
animate(x, ..., fps = 1, loop = 0, width = dev.size(units = "px")[1],
  height = dev.size(units = "px")[2], save_as = NULL, plot = TRUE)
```

Arguments

- `x` a data cube proxy object (class cube)
- `...` parameters passed to `plot.cube`
- `fps` frames per second of the animation
- `loop` how many iterations, 0 = infinite
- `width` width (in pixels) of the animation
- `height` height (in pixels) of the animation
- `save_as` character path where the animation shall be stored as a gif file
- `plot` logical; plot the animation (default is TRUE)

Details

Animations can be created for single band data cubes or RGB plots of multi-band data cubes (by providing the argument `rgb`) only.

See Also

- `image_animate`
- `plot.cube`
Examples

```r
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                        ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4, 
                        bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"), 
                        srs="EPSG:32618", nx = 497, ny=526, dt="P16D")
animate(select_bands(raster_cube(L8.col, v), c("B02", "B03", "B04")), rgb=3:1, 
        zlim=c(0,20000), fps=1, loop=1)
animate(select_bands(raster_cube(L8.col, v), c("B05")), col=terrain.colors, key.pos=1)
```

---

### apply_pixel

**Apply a function over (multi-band) pixels**

**Description**

This generic function applies a function on pixels of a data cube, an R array, or other classes if implemented.

**Usage**

```r
apply_pixel(x, ...)
```

**Arguments**

- `x` input data
- `...` additional arguments passed to method implementations

**Value**

return value and type depend on the class of `x`

**See Also**

- `apply_pixel.cube`
- `apply_pixel.array`
**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

v = cube_view(extent=list(left=388941.2, right=766552.4,
                          bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
              srs="EPSG:32618", nx = 497, ny=526, dt="P1M")

L8.col = image_collection(file.path(tempdir(), "L8.db"))
apply_pixel(raster_cube(L8.col, v), 
            "(B05-B04)/(B05+B04)", "NDVI")
```

```r
d = c(4,16,128,128)
x <- array(rnorm(prod(d)), d)
y <- apply_pixel(x, function(v) {
})
```

---

### apply_pixel.array

Apply a function over pixels in a four-dimensional (band, time, y, x) array

**Description**

Apply a function over pixels in a four-dimensional (band, time, y, x) array

**Usage**

```r
## S3 method for class 'array'
apply_pixel(x, FUN, ...)
```

**Arguments**

- `x` four-dimensional input array with dimensions band, time, y, x (in this order)
- `FUN` function that receives a vector of band values in a one-dimensional array
- `...` further arguments passed to `FUN`

**Details**

`FUN` is expected to produce a numeric vector (or scalar) where elements are interpreted as new bands in the result.
apply_pixel.cube

Note
This is a helper function that uses the same dimension ordering as gdalcubes. It can be used to simplify the application of R functions e.g. over time series in a data cube.

Examples

```r
d <- c(4,16,32,32)
x <- array(rnorm(prod(d)), d)
y <- apply_pixel(x, function(v) {
})
dim(y)
```

apply_pixel.cube  Apply arithmetic expressions over all pixels of a data cube

Description
Create a proxy data cube, which applies arithmetic expressions over all pixels of a data cube. Expressions may access band values by name.

Usage

```r
## S3 method for class 'cube'
apply_pixel(x, expr, names = NULL, keep_bands = FALSE, 
..., FUN)
```

Arguments

- `x`  source data cube
- `expr`  character vector with one or more arithmetic expressions (see Details)
- `names`  optional character vector with the same length as expr to specify band names for the output cube
- `keep_bands`  logical; keep bands of input data cube, defaults to FALSE, i.e. original bands will be dropped
- `...`  not used
- `FUN`  user-defined R function that is applied on all pixels (see Details)

Details
The function can either apply simple arithmetic C expressions given as a character vector (expr argument), or apply a custom R reducer function if FUN is provided.

In the former case, gdalcubes uses the tinyexpr library to evaluate expressions in C / C++, you can look at the library documentation to see what kind of expressions you can execute. Pixel band values can be accessed by name.

FUN receives values of the bands from one pixel as a (named) vector and should return a numeric vector with identical length for all pixels. Elements of the result vectors will be interpreted as bands in the result data cube.
as_array

Value

a proxy data cube object

Note

This function returns a proxy object, i.e., it will not start any computations besides deriving the
shape of the result.

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

# 1. Apply a C expression
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                          bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
              srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.cube = select_bands(L8.cube, c("B04", "B05"))
L8.ndvi = apply_pixel(L8.cube, 
                      "(B05-B04)/(B05+B04)", "NDVI")
L8.ndvi

# 2. Apply a user defined R function
L8.ndvi.noisy = apply_pixel(L8.cube, names="NDVI_noisy",
                          FUN=function(x) {
                            rnorm(1, 0, 0.1) + (x["B05"]-x["B04"])/(x["B05"]+x["B04"])
                          })
L8.ndvi.noisy

as_array

Convert a data cube to an in-memory R array

Description

Convert a data cube to an in-memory R array

Usage

as_array(x)

Arguments

x data cube
**Value**

Four dimensional array with dimensions band, t, y, x

**Note**

Depending on the data cube size, this function may require substantial amounts of main memory, i.e. it makes sense for small data cubes only.

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
    ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
  
  bottom=4345299, top=4744931, t0="2018-04", t1="2018-05"),
  srs="EPSG:32618", nx = 100, ny=100, dt="P1M")
as_array(select_bands(raster_cube(L8.col, v), c("B04", "B05")))
```

---

**as_json**  
**Query data cube properties**

**Description**

gdalcubes uses a graph (currently a tree) to serialize data cubes (including chains of cubes). This function gives a JSON representation, which will be communicated to gdalcubes_server instances to create identical cube instances remotely.

**Usage**

```
as_json(obj)
```

**Arguments**

- `obj` a data cube proxy object (class cube)

**Value**

A JSON string representing a graph (currently a tree) that can be used to create the same chain of gdalcubes operations.
as_stars

**Description**

The function materializes a data cube as a temporary netCDF file and loads the file with the stars package.

**Usage**

```r
as_stars(from)
```

**Arguments**

- **from** data cube object to coerce

**Value**

stars object

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))

v = cube_view(extent=list(left=388941.2, right=766552.4,
                          bottom=4345299, top=4744931, t0="2018-04", t1="2018-04"),
               srs="EPSG:32618", nx = 497, ny=526, dt="P1M")

cat(as_json(select_bands(raster_cube(L8.col, v), c("B04", "B05"))))
```
bands

as_stars(select_bands(raster_cube(L8.col, v), c("B04", "B05")))

---

bands (query data cube properties)

**Description**

Query data cube properties

**Usage**

bands(obj)

**Arguments**

- obj: a data cube proxy object (class cube)

**Value**

A data.frame with rows representing the bands and columns representing properties of a band (name, type, scale, offset, unit)

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4, 
  bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
  srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
bands(raster_cube(L8.col, v))
```
chunk_apply

Apply an R function on chunks of a data cube

Description

Apply an R function on chunks of a data cube

Usage

chunk_apply(cube, f)

Arguments

cube source data cube
f R function to apply over all chunks

Details

This function internally creates a gdalcubes stream data cube, which streams data of a chunk to a new R process. For reading data, the function typically calls \( x \leftarrow \text{read\_chunk\_as\_array()} \) which then results in a 4 dimensional (band, time, y, x) array. Similarly \( \text{write\_chunk\_from\_array}(x) \) will write a result array as a chunk in the resulting data cube. The chunk size of the input cube is important to control how the function will be exposed to the data cube. For example, if you want to apply an R function over complete pixel time series, you must define the chunk size argument in \text{raster\_cube} to make sure that chunk contain the correct parts of the data.

Value

a proxy data cube object

Note

This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.

Examples

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
L8.cube = raster_cube(L8.col, v)
L8.cube = select_bands(L8.cube, c("B04", "B05"))
f <- function() {
  x <- read_chunk_as_array()
  out <- reduce_time(x, function(x) {
    cor(x[1,], x[2,], use="na.or.complete", method = "kendall")
  })
  write_chunk_from_array(out)
}
L8.cor = chunk_apply(L8.cube, f)

---

### collection_formats

#### List predefined image collection formats

**Description**

gdalcubes comes with some predefined collection formats e.g. to scan Sentinel 2 data. This function lists available formats including brief descriptions.

**Usage**

collection_formats(print = TRUE)

**Arguments**

- **print**
  
  logical: should available formats and their descriptions be printed nicely, defaults to **TRUE**

**Details**

Image collection formats define how individual files / GDAL datasets relate to an image collection, i.e., which bands they contain, to which image they belong, and how to derive acquisition date/time. They are described as a set of regular expressions in a JSON file and used by gdalcubes to extract this information from the paths and/or filenames.

**Value**

data.frame with columns `name` and `description` where the former describes the unique identifier that can be used in `create_image_collection` and the latter gives a brief description of the format.

**Examples**

collection_formats()
create_image_collection

Create an image collection from a set of GDAL datasets or files

Description
This function iterates over files or GDAL dataset identifiers and extracts datetime, image identifiers, and band information according to a given collection format.

Usage
create_image_collection(files, format, out_file = tempfile(fileext = ".sqlite"), unroll_archives = TRUE, quiet = FALSE)

Arguments
files character vector with paths to image files on disk or any GDAL dataset identifiers (including virtual file systems and higher level drivers or GDAL sub-datasets)
format collection format, can be either a name to use predefined formats (as output from collection_formats) or a path to a custom JSON format description file
out_file optional name of the output SQLite database file, defaults to a temporary file
unroll_archives automatically convert .zip, .tar archives and .gz compressed files to GDAL virtual file system dataset identifiers (e.g. by prepending /vsizip/) and add contained files to the list of considered files
quiet logical; if TRUE, do not print resulting image collection if return value is not assigned to a variable

Details
An image collection is a simple SQLite database file that indexes and references existing image files / GDAL dataset identifiers.

Value
image collection proxy object, which can be used to create a data cube using raster_cube

Examples
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
Create, update, or query a spatiotemporal data cube view

Description

Data cube views define the shape of a cube, i.e., the spatiotemporal extent, resolution, and spatial reference system (srs) how to look at the data. They are used to access image collections as on-demand data cubes. The data cube will filter images based on the view’s extent, read image data at the defined resolution, and warp / reproject images to the target srs automatically.

Usage

cube_view(cube, view, extent, srs, nx, ny, nt, dx, dy, dt, aggregation, resampling, keep.asp = TRUE)

Arguments

cube data cube object; if provided, return the view of this data cube and ignore other arguments
view if provided, update this cube_view object instead of creating a new data cube view where fields that are already set will be overwritten
extent spatioptemporal extent as a list e.g. from extent or an image collection object, see Details
srs target spatial reference system as a string; can be a proj4 definition, WKT, or in the form "EPSG:XXXX"
mx number of pixels in x-direction (longitude / easting)
ny number of pixels in y-direction (latitude / northing)
nt number of pixels in t-direction
dx size of pixels in x-direction (longitude / easting)
dy size of pixels in y-direction (latitude / northing)
dt size of pixels in time-direction, expressed as ISO8601 period string (only 1 number and unit is allowed) such as "P16D"
aggregation aggregation method as string, defining how to deal with pixels containing data from multiple images, can be "min", "max", "mean", "median", or "first"
resampling resampling method used in gdalwarp when images are read, can be "near", "bilinear", "bicubic" or others as supported by gdalwarp (see https://www.gdal.org/gdalwarp.html)
keep.asp if TRUE, derive ny or dy automatically from nx or dx (or vice versa) based on the aspect ratio of the spatial extent
The extent argument expects a simple list with elements left, right, bottom, top, t0 (start date/time), t1 (end date/time) or an image collection object. In the latter case, the extent function is automatically called on the image collection object to get the full spatiotemporal extent of the collection. In the former case, datetimes are expressed as ISO8601 datetime strings.

The function can be used in three different ways. First, if the cube argument is given, the function simply returns the data cube view of the provided cube and ignores any other values. Second, the function can be used to create data cube views from scratch by defining the extent, the spatial reference system, and for each dimension either the cell size (dx, dy, dt) or the total number of cells (nx, ny, nt). Third, the function can update an existing data cube view by overwriting specific fields. In this case, the extent or some elements of the extent may be missing.

In some cases, the extent of the view is automatically extended if the provided resolution would end within a pixel. For example, if the spatial extent covers an area of 1km x 1km and dx = dy = 300m, the extent would be enlarged to 1.2 km x 1.2km. The alignment will be reported to the user in a diagnostic message.

Value
A list with data cube view properties

Examples

```r
L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
  ".TIF", recursive = TRUE, full.names = TRUE)
L8.col = create_image_collection(L8_files, "L8_L1TP")

# 1. Create a new data cube view specification
cube_view(extent=extent(L8.col,"EPSG:4326"), srs="EPSG:4326", dt="P1M",
  nx=1000, ny=500, aggregation = "mean", resampling="bilinear")

# 2. read existing data cube
v = cube_view(raster_cube(L8.col))

# 3. overwrite parts of an existing data cube view
vnew = cube_view(view = v, dt="P1M")
```

Description
Query data cube properties

Usage
```r
## S3 method for class 'cube'
dim(x)
```
**dimensions**

Query data cube properties

**Description**

Query data cube properties

**Usage**

`dimensions(obj)`

**Arguments**

`obj` a data cube proxy object (class cube)

**Details**

Elements of the returned list represent individual dimensions with properties such as dimension boundaries, names, and chunk size stored as inner lists.

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                          bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
              srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
dim(raster_cube(L8.col, v))
```
**Value**

Dimension information as a list

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                           bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
               srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
dimensions(raster_cube(L8.col, v))
```

---

**dimension_values**

*Query coordinate values for all dimensions of a data cube*

**Description**

Dimension values give the coordinates along the spatial and temporal axes of a data cube.

**Usage**

```r
dimension_values(obj, datetime_unit = NULL)
```

**Arguments**

- **obj**: a data cube proxy (class cube), or a data cube view object
- **datetime_unit**: unit used to format values in the datetime dimension, one of "Y", "m", "d", "H", "M", "S", defaults to the unit of the cube.

**Value**

list with elements t,y,x

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
```
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
dimension_values(raster_cube(L8.col, v))

---

Derive the spatiotemporal extent of an image collection

**Description**

Derive the spatiotemporal extent of an image collection

**Usage**

`extent(x, srs = "EPSG:4326")`

**Arguments**

- `x` image collection proxy object
- `srs` target spatial reference system

**Value**

A list with elements `left`, `right`, `bottom`, `top`, `t0` (start date/time), and `t1` (end date/time)

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
extent(L8.col,"EPSG:32618")
cube_view(extent=extent(L8.col,"EPSG:32618"),
srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
```
fill_time

Fill NA data cube pixels by simple time series interpolation

Description
Create a proxy data cube, which fills NA pixels of a data cube by nearest neighbor or linear time series interpolation.

Usage
fill_time(cube, method = "near")

Arguments
- cube: source data cube
- method: interpolation method, can be "near" (nearest neighbor), "linear" (linear interpolation), "locf" (last observation carried forward), or "nocb" (next observation carried backward)

Details
Please notice that completely empty (NA) time series will not be filled, i.e. the result cube might still contain NA values.

Value
a proxy data cube object

Note
This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.

Examples
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                        ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4, 
bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"), 
srs="EPSG:32618", nx = 497, ny=526, dt="P3M", aggregation = "median")
L8.cube = raster_cube(L8.col, v, mask=image_mask("BQA", bits=4, values=16))
L8.rgb = select_bands(L8.cube, c("B02", "B03", "B04"))
L8.filled = fill_time(L8.rgb, "linear")
filter_pixel

Filter data cube pixels by a user-defined predicate on band values

Description
Create a proxy data cube, which evaluates a predicate over all pixels of a data cube. For all pixels
that fulfill the predicate, the original band values are returned. Other pixels are simply filled with
NANs. The predicate may access band values by name.

Usage
filter_pixel(cube, pred)

Arguments
cube source data cube
pred predicate to be evaluated over all pixels

Details
gdal cub es uses and extends the tinyexpr library to evaluate expressions in C / C++, you can look at
the library documentation to see what kind of expressions you can execute. Pixel band values can
be accessed by name.

Value
a proxy data cube object

Note
This function returns a proxy object, i.e., it will not start any computations besides deriving the
shape of the result.

Examples
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
    ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
bottom=4345299, top=4744931, t0="2018-01", t1="2018-06"),
srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.cube = select_bands(L8.cube, c("B04", "B05"))
L8.ndvi = apply_pixel(L8.cube, "(B05-B04)/(B05+B04)", "NDVI")
L8.ndvi.filtered = filter_pixel(L8.ndvi, "NDVI > 0.5")
L8.ndvi.filtered

gdal

gdal: Earth Observation Data Cubes from Satellite Image Collections

Description
Processing collections of Earth observation images as on-demand multispectral, multitemporal raster data cubes. Users define cubes by spatiotemporal extent, resolution, and spatial reference system and let 'gdalcubes' automatically apply cropping, reprojection, and resampling using the 'Geospatial Data Abstraction Library' (GDAL). Implemented functions on data cubes include reduction over space and time, applying arithmetic expressions on pixel band values, moving window aggregates over time, filtering by space, time, bands, and predicates on pixel values, exporting data cubes as 'netCDF' or 'GeoTIFF' files, and plotting. The package implements lazy evaluation and multithreading. All computational parts are implemented in C++, linking to the 'GDAL', 'netCDF', 'CURL', and 'SQLite' libraries. See Appel and Pebesma (2019) <doi:10.3390/data4030092> for further details.

gdal.debug_output

Enable or disable debug output from the gdalcubes C++ library

Description
Enable or disable debug output from the gdalcubes C++ library

Usage
gdal.debug_output(debug = TRUE)

Arguments
ddebug logical, TRUE if you want debug messages

Note
THIS FUNCTION IS DEPRECATED AND IS GOING TO BE REPLACED BY gdalcubes_options.
Examples

gdalcubes_debug_output(TRUE)
gdalcubes_debug_output(FALSE)

---

**gdalcubes_gdalformats**  *Get available GDAL drivers*

---

**Description**

Get available GDAL drivers

**Usage**

gdalcubes_gdalformats()

**Examples**

gdalcubes_gdalformats()

---

**gdalcubes_gdalversion**  *Get the GDAL version used by gdalcubes*

---

**Description**

Get the GDAL version used by gdalcubes

**Usage**

gdalcubes_gdalversion()

**Examples**

gdalcubes_gdalversion()
gdalcubes_options

Set or read global options of the gdalcubes package

Description

Set global package options to change the default behavior of gdalcubes. These include how many threads are used to process data cubes, how created netCDF files are compressed, and whether or not debug messages should be printed.

Usage

gdalcubes_options(..., threads, ncdf_compression_level, debug, cache, ncdf_write_bounds)

Arguments

... not used
threads number of threads used to process data cubes
ncdf_compression_level integer; compression level for created netCDF files, 0=no compression, 1=fast compression, 9=small compression
debug logical; print debug messages
cache logical; TRUE if temporary data cubes should be cached to support fast reprocessing of the same cubes
ncdf_write_bounds logical; write dimension bounds as additional variables in netCDF files

Details

Data cubes can be processed in parallel where one thread processes one chunk at a time. Setting more threads than the number of chunks of a cube thus has no effect and will not further reduce computation times.

Caching has no effect on disk or memory consumption, it simply tries to reuse existing temporary files where possible. For example, changing only parameters to plot will not require rerunning the full data cube operation chain.

Passing no arguments will return the current options as a list.

Examples

gdalcubes_options(threads=4) # set the number of threads
gdalcubes_options() # print current options
**gdalcubes_server_status**

*Status report of gdalcubes_server instances*

**Description**

Summarizes the status of all gdalcubes_server processes that have been started in the current R session.

**Usage**

```
gdalcubes_server_status()
```

**Value**

A data frame with detailed status information where each row corresponds to one gdalcubes_server process.

**Examples**

```
gdalcubes_server_status()
```

---

**gdalcubes_set_ncdf_compression**

*Set compression level for netCDF files produced by gdalcubes*

**Description**

Set compression level for netCDF files produced by gdalcubes.

**Usage**

```
gdalcubes_set_ncdf_compression(level = 2)
```

**Arguments**

- `level` integer; compression level, 0 = no compression, 1=fast compression, 9=small compression

**Note**

THIS FUNCTION IS DEPRECATED AND IS GOING TO BE REPLACED BY `gdalcubes_options`.

**Examples**

```
gdalcubes_set_ncdf_compression(9)  # maximum compression
gdalcubes_set_ncdf_compression(0)  # no compression
```
**gdalcubes_set_threads**  
*Set the number of threads for parallel data cube processing*

### Description
Data cubes can be processed in parallel where one thread processes one chunk at a time. Setting more threads than the number of chunks of a cube thus has no effect and will not further reduce computation times.

### Usage
```
gdalcubes_set_threads(n = 1)
```

### Arguments
- `n`  
  number of threads

### Note
THIS FUNCTION IS DEPRECATED AND IS GOING TO BE REPLACED BY `gdalcubes_options`.

### Examples
```
gdalcubes_set_threads(1)
```

---

**gdalcubes_start_server**  
*Start one or more gdalcubes_server background processes*

### Description
Starts one or more gdalcubes_server instance on this machine. Created processes are added to a global list of gdalcubes_server processes. Simultaneously running processes must use different ports.

### Usage
```
gdalcubes_start_server(port = 1111, endpoint = "/gdalcubes/api",  
                         whitelist = NULL, threads = 1, n = 1)
```
Arguments

- **port**: port number(s) where gdalcubes server(s) will listen for incoming requests
- **endpoint**: base path where the API sets up its endpoints
- **whitelist**: character vector with hosts that are allowed to connect to the server, if NULL (the default), all incoming requests will be accepted
- **threads**: number of threads running to process parallel chunk read requests
- **n**: number of servers to start, if \( n > 1 \) and ports has length 1, port numbers will be increased automatically by one

**Note**

This function runs the gdalcubes_server executable which must have been installed at a findable location (listed in the PATH environment variable) before.

**Examples**

```r
## Not run:
gdalcubes_start_server() # single server process with default settings
gdalcubes_stop_server()

## End(Not run)
```

---

**gdalcubes_stop_server**    *Stop all gdalcubes_server processes*

**Description**

Stops all gdalcubes_server processes that have been started within the current R session.

**Usage**

```r
gdalcubes_stop_server()
```

**Examples**

```r
gdalcubes_stop_server()
```
gdalcubes_use_cache
Enable or disable caching of cubes.

Description
Enable or disable caching of cubes.

Usage
gdalcubes_use_cache(enable = TRUE)

Arguments
enable logical, TRUE if you want to use the data cube cache

Details
Caching has no effect on disk or memory consumption, it simply tries to reuse existing temporary files where possible. For example, changing only parameters to plot will not require rerunning the full data cube operation chain.

Note
THIS FUNCTION IS DEPRECATED AND IS GOING TO BE REPLACED BY gdalcubes_options.

Examples
gdalcubes_use_cache(FALSE)

---

gdalcubes_version
Query gdalcubes version information

Description
Query gdalcubes version information

Usage
gdalccubes_version()

Value
List with gdalcubes library version information

Examples
gdalccubes_version()
## image_collection

Load an existing image collection from a file

### Description

This function will load an image collection from an SQLite file. Image collection files index and reference existing imagery. To create a collection from files on disk, use `create_image_collection`.

### Usage

```r
image_collection(path)
```

### Arguments

- `path`  
  path to an existing image collection file

### Value

an image collection proxy object, which can be used to create a data cube using `raster_cube`

### Examples

```r
# create image collection from example Landsat data only  
# if not already done in other examples  
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                        ".TIF", recursive = TRUE, full.names = TRUE)

  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
```

## image_mask

Create a mask for images in a raster data cube

### Description

Create an image mask based on a band and provided values to filter pixels of images read by `raster_cube`

### Usage

```r
image_mask(band, min = NULL, max = NULL, values = NULL, 
           bits = NULL, invert = FALSE)
```
Arguments

- **band**: name of the mask band
- **min**: minimum value, values between min and max will be masked
- **max**: maximum value, values between min and max will be masked
- **values**: numeric vector; specific values that will be masked.
- **bits**: for bitmasks, extract the given bits (integer vector) with a bitwise AND before filtering the mask values, bit indexes are zero-based
- **invert**: logical; invert mask

Details

Values of the selected mask band can be based on a range (by passing min and max) or on a set of values (by passing values). By default pixels with mask values contained in the range or in the values are masked out, i.e. set to NA. Setting invert = TRUE will invert the masking behavior. Passing values will override min and max.

Note

Notice that masks are applied per image while reading images as a raster cube. They can be useful to eliminate e.g. cloudy pixels before applying the temporal aggregation to merge multiple values for the same data cube pixel.

Examples

- `image_mask("SCL", values = c(3,8,9))` # Sentinel 2 L2A: mask cloud and cloud shadows
- `image_mask("BQA", bits=4, values=16)` # Landsat 8: mask clouds
- `image_mask("B10", min = 8000, max=65000)`

join_bands

Join bands of two identically shaped data cubes

Description

Create a proxy data cube, which joins the bands of two identically shaped data cubes. The resulting cube will have bands from both input cubes.

Usage

`join_bands(X, Y)`

Arguments

- **X**: first source data cube
- **Y**: second source data cube
Details

Names of bands will be taken from the input cubes. If both cubes, however, have bands with identical name, prefixes are added to all band names. Prefixes are tried to derive from names of provided X and Y arguments (derived with substitute) or simply set to "X." and "Y.".

Value

proxy data cube object

Note

This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.

Examples

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
    ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))

v = cube_view(extent=list(left=388941.2, right=766552.4, 
  bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"), 
  srs="EPSG:32618", nx = 497, ny=526, dt="P1M")

L8.cube = raster_cube(L8.col, v)
L8.cube.b04 = select_bands(raster_cube(L8.col, v), c("B04"))
L8.cube.b05 = select_bands(raster_cube(L8.col, v), c("B05"))
join_bands(L8.cube.b04,L8.cube.b05)
```

memsize

Query data cube properties

Description

Query data cube properties

Usage

```r
data_cube_properties(obj, unit = "MiB")
```

Arguments

- obj: a data cube proxy object (class cube)
- unit: Unit of data size, can be "B", "KB", "KiB", "MB", "MiB", "GB", "GiB", "TB", "TiB", "PB", "PiB"
names.cube

**Value**

Total data size of data cube values expressed in the given unit

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
    L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                           ".TIF", recursive = TRUE, full.names = TRUE)
    create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))

v = cube_view(extent=list(left=388941.2, right=766552.4,
                           bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
               srs="EPSG:32618", nx = 497, ny=526, dt="P1M")

memsize(raster_cube(L8.col, v))
```

---

**names.cube**

*Query data cube properties*

**Description**

Query data cube properties

**Usage**

```r
## S3 method for class 'cube'
names(x)
```

**Arguments**

- `x` a data cube proxy object (class cube)

**Value**

Band names as character vector

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
    L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                           ".TIF", recursive = TRUE, full.names = TRUE)
    create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
```
nbands

Query data cube properties

Description

Query data cube properties

Usage

nbands(obj)

Arguments

obj a data cube proxy object (class cube)

Value

Number of bands

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                        ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
nbands(raster_cube(L8.col, v))
nt

Query data cube properties

Description
Query data cube properties

Usage
nt(obj)

Arguments
obj a data cube proxy object (class cube)

Value
Number of pixels in the time dimension

Examples
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                         bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
               srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
nt(raster_cube(L8.col, v))

nx

Query data cube properties

Description
Query data cube properties

Usage
nx(obj)
Arguments

obj  a data cube proxy object (class cube)

Value

Number of pixels in the x dimension

Examples

```
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         "*.TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                         bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
               srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
nx(raster_cube(L8.col, v))
```

---

**ny**

*Query data cube properties*

Description

Query data cube properties

Usage

```
ny(obj)
```

Arguments

```
obj  a data cube proxy object (class cube)
```

Value

Number of pixels in the y dimension
Examples

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
    L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
        ".TIF", recursive = TRUE, full.names = TRUE)
    create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))

v = cube_view(extent=list(left=388941.2, right=766552.4, 
bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"), 
srs="EPSG:32618", nx = 497, ny=526, dt="P1M")

ny(raster_cube(L8.col, v))
```

---

**pack_minmax**

*Helper function to define packed data exports by min / max values*

**Description**

This function can be used to define packed exports in `write.ncdf` and `write.tif`. It will generate scale and offset values with maximum precision (unless `simplify=TRUE`).

**Usage**

```r
pack_minmax(type = "int16", min, max, simplify = FALSE)
```

**Arguments**

- **type**: target data type of packed values (one of "uint8", "uint16", "uint32", "int16", or "int32")
- **min**: numeric; minimum value(s) of original values, will be packed to the 2nd lowest value of the target data type
- **max**: numeric; maximum value(s) in original scale, will be packed to the highest value of the target data type
- **simplify**: logical; round resulting scale and offset to power of 10 values

**Details**

Nodata values will be mapped to the lowest value of the target data type.

Arguments `min` and `max` must have length 1 or length equal to the number of bands of the data cube to be exported. In the former case, the same values are used for all bands of the exported target cube, whereas the latter case allows to use different ranges for different bands.

**Note**

Using `simplify=TRUE` will round scale values to the next smaller power of 10.
Examples

```r
ndvi_packing = pack_minmax(type = "int16", min=-1, max=1)
ndvi_packing
```

---

**plot.cube**

*Plot a gdalcubes data cube*

---

**Description**

Plot a gdalcubes data cube

**Usage**

```r
## S3 method for class 'cube'
plot(x, y, ..., nbreaks = 11, breaks = NULL,
col = grey(1:(nbreaks - 1)/nbreaks), key.pos = NULL, bands = NULL,
t = NULL, rgb = NULL, zlim = NULL, periods.in.title = TRUE,
join.timeseries = FALSE, axes = TRUE, ncol = NULL, nrow = NULL)
```

**Arguments**

- `x`: a data cube proxy object (class cube)
- `y`: `__not used__`
- `...`: further arguments passed to `image.default`
- `nbreaks`: number of breaks, should be one more than the number of colors given
- `breaks`: actual breaks used to assign colors to values; if missing, the function subsamples values and uses equally sized intervals between min and max or `zlim[0]` and `zlim[1]` if defined
- `col`: color definition, can be a character vector with `nbreaks` - 1 elements or a function such as `heat.colors`
- `key.pos`: position for the legend, 1 (bottom), 2 (left), 3 (top), or 4 (right). If NULL (the default), do not plot a legend.
- `bands`: integer vector with band numbers to plot (this must be band numbers, not band names)
- `t`: integer vector with time indexes to plot (this must be time indexes, not date / time)
- `rgb`: bands used to assign RGB color channels, vector of length 3 (this must be band numbers, not band names)
- `zlim`: vector of length 2, defining the minimum and maximum values to either derive breaks, or define black and white values in RGB plots
- `periods.in.title`: logical value, if TRUE, the title of plots includes the datetime period length as ISO 8601 string
join.timeseries

logical, for pure time-series plots, shall time series of multiple bands be plotted in a single plot (with different colors)?

axes

logical, if TRUE, plots include axes

ncol

number of columns for arranging plots with layout(), see Details

nrow

number of rows for arranging plots with layout(), see Details

Details

The style of the plot depends on provided parameters and on the shape of the cube, i.e., whether it is a pure time series and whether it contains multiple bands or not. Multi-band, multi-temporal images will be arranged with layout() such that bands are represented by the x axis and time is represented by the y axis. Time series plots can be combined to a single plot by setting join.timeseries = TRUE. For other cases, a default arrangement of the plots is derived, trying to reach a square overall plot. The layout can be controlled with ncol and nrow, which define the number of rows and columns in the plot layout. Typically, only one of ncol and nrow is provided. For multi-band, multi-temporal plots, the actual number of rows or columns can be less if the input cube has less bands or time slices.

Note

If caching is enabled for the package (see `gdalcubes_use_cache`), repeated calls of plot for the same data cube will not reevaluate the cube. Instead, the temporary result file will be reused, if possible.

Some parts of the function have been copied from the stars package (c) Edzer Pebesma

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4, 
                        bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"), 
                      srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
plot(select_bands(raster_cube(L8.col, v), c("B02", "B03", "B04")), rgb=3:1)

L8.cube = select_bands(raster_cube(L8.col, v), c("B04", "B05"))
L8.ndvi = apply_pixel(L8.cube, "(B05-B04)/(B05+B04)", "NDVI")
plot(reduce_time(L8.ndvi, "median(NDVI)"), key.pos=1, zlim=c(0,1))
print.cube  
Print data cube information

Description
Prints information about the dimensions and bands of a data cube.

Usage
```r
## S3 method for class 'cube'
print(x, ...)
```

Arguments
- `x`: Object of class "cube"
- `...`: Further arguments passed to the generic print function

Examples
```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                         bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"),
               srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
print(raster_cube(L8.col, v))
```

print.cube_view  
Print data cube view information

Description
Prints information about a data cube view, including its dimensions, spatial reference, aggregation method, and resampling method.

Usage
```r
## S3 method for class 'cube_view'
print(x, ...)
```
Arguments

x  Object of class "cube_view"
...

Further arguments passed to the generic print function

Examples

v = cube_view(extent=list(left=388941.2, right=766552.4, 
bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"), 
srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
print(v)

print.image_collection

Print image collection information

Description

Prints information about images in an image collection.

Usage

## S3 method for class 'image_collection'
print(x, ..., n = 6)

Arguments

x  Object of class "image_collection"
...

Further arguments passed to the generic print function

n  Number of images for which details are printed

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
print(L8.col)
proj4

Query data cube properties

Description
Query data cube properties

Usage
proj4(obj)

Arguments

obj      a data cube proxy object (class cube)

Value
The spatial reference system expressed as proj4 string

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
    L8_files <- list.files(system.file("L8NY18"), package = "gdalcubes", 
                          ".TIF", recursive = TRUE, full.names = TRUE)
    create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4, 
                          bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"), 
                          srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
proj4(raster_cube(L8.col, v))

query_points

Query data cube values at irregular spatiotemporal points

Description
This function will overlay provided spatiotemporal points with a data cube and return all band values of the cells for each query point, as a data.frame where rows correspond to points and columns represent bands. If needed, point coordinates are automatically transformed to the SRS of the data cube.

Usage
query_points(x, px, py, pt, srs)
raster_cube

Arguments

- **x**  
  source data cube
- **px**  
  vector of x coordinates
- **py**  
  vector of y coordinates
- **pt**  
  vector of date/time coordinates
- **srs**  
  spatial reference system string identifier (as GDAL understands)

Details

Date and time of the query points can be provided as vector of class character, Date, or POSIXct.

Value

a data.frame with one row per point and one column per data cube band or variable

Examples

```r
# create image collection from example Landsat data only  
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),  
                        ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))  
v = cube_view(extent=list(left=388941.2, right=766552.4,  
                          bottom=4345299, top=4744931, t0="2018-01-01", t1="2018-12-02"),  
              srs="EPSG:32618", nx = 497, ny=526, dt="P14D")
L8.cube = raster_cube(L8.col, v)  
L8.rgb = select_bands(L8.cube, c("B02", "B03", "B04"))

x = seq(from = 388941.2, to = 766552.4, length.out = 10)  
y = seq(from = 4345299, to = 4744931, length.out = 10)  
t = seq(as.Date("2018-01-01"), as.Date("2018-12-02"), length.out = 10 )

query_points(L8.rgb, x, y, t, srs=L8.rgb))
```

raster_cube

Create a data cube from an image collection

Description

Create a proxy data cube, which loads data from a given image collection according to a data cube view
raster_cube

Usage

raster_cube(image_collection, view, mask = NULL, chunking = c(16, 256, 256))

Arguments

image_collection Source image collection as from image_collection or create_image_collection
view A data cube view defining the shape (spatiotemporal extent, resolution, and spatial reference), if missing, a default overview is used
mask mask pixels of images based on band values, see image_mask
chunking Vector of length 3 defining the size of data cube chunks in the order time, y, x.

Details

The following steps will be performed when the data cube is requested to read data of a chunk:
1. Find images from the input collection that intersect with the spatiotemporal extent of the chunk
2. For all resulting images, apply gdalwarp to reproject, resize, and resample to an in-memory GDAL dataset
3. Read the resulting data to the chunk buffer and optionally apply a mask on the result
4. Update pixel-wise aggregator (as defined in the data cube view) to combine values of multiple images within the same data cube pixels

Value

A proxy data cube object

Note

This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))

v = cube_view(extent=list(left=388941.2, right=766552.4, 
                         bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"),
              srs="EPSG:32618", nx = 497, ny=526, dt="P1M")

raster_cube(L8.col, v)

# using a mask on the Landsat quality bit band to filter out clouds
raster_cube(L8.col, v, mask=image_mask("BQA", bits=4, values=16))
Create a dummy data cube with a fill value

Description

Create a data cube with a constant fill value for one or more bands from a data cube view. Use this cube for testing.

Usage

```
raster_cube_dummy(view, nbands = 1, fill = 1, chunking = c(16, 256, 256))
```

Arguments

- **view**: a data cube view defining the shape (spatiotemporal extent, resolution, and spatial reference)
- **nbands**: number of bands
- **fill**: fill value
- **chunking**: vector of length 3 defining the size of data cube chunks in the order time, y, x.

Value

a proxy data cube object

Note

This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.

Examples

```
v = cube_view(extent=list(left=388941.2, right=766552.4, bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"), srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube_dummy(v, 1, 2.345)
```
**read_chunk_as_array**  
*Read chunk data of a data cube from stdin or a file*

**Description**

This function can be used within function passed to `chunk_apply` in order to read a data cube chunk as a four-dimensional R array. It works only for R processes, which have been started from the gdalcubes C++ library. The resulting array has dimensions band, time, y, x (in this order).

**Usage**

```r
read_chunk_as_array(with.dimnames = TRUE)
```

**Arguments**

- `with.dimnames`  
  if TRUE, the resulting array will contain dimnames with coordinates, datetime, and band names

**Value**

four-dimensional array

**Note**

Call this function ONLY from a function passed to `chunk_apply`.

This function only works in R sessions started from gdalcubes streaming.

**Examples**

```r
# create image collection from example Landsat data only  
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                        ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4, 
                        bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"), 
              srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.cube = select_bands(L8.cube, c("B04", "B05"))
f <- function() {
  x <- read_chunk_as_array()
  out <- reduce_time(x, function(x) {
    cor(x[1,], x[2,], use="na.or.complete", method = "kendall")
  })
}
```
reduce

Reduce all bands of a data cube over the time dimension with a single reducer function

Description

Create a proxy data cube, which applies a single reducer function over per-band pixel time series of a data cube

Usage

reduce(cube, reducer = c("mean", "median", "min", "max"))

Arguments

cube source data cube
reducer reducer function, currently "min", "max", "median", "mean", "count", "sd", "var", or "sum"

Value

proxy data cube object

Note

Implemented reducers will ignore any NAN values (as na.rm=TRUE does).
This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.
This function is deprecated and will be replaced by the more flexible reduce_time.

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
reduce_space

Reduce multidimensional data over space

Description

This generic function applies a reducer function over a data cube, an R array, or other classes if implemented.

Usage

reduce_space(x, ...)

Arguments

x  
object to be reduced

...  
further arguments passed to specific implementations

Value

return value and type depend on the class of x

See Also

reduce_space.cube
reduce_space.array

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                        ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
  v = cube_view(extent=list(left=388941.2, right=766552.4, 
            bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"), 
            srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.rgb = select_bands(L8.cube, c("B02", "B03", "B04"))
L8.rgb.median = reduce(L8.rgb, "median")
L8.rgb.median

reduce_space
d <- c(4, 16, 32, 32)
x <- array(rnorm(prod(d)), d)
y <- reduce_space(x, function(v) {
  apply(v, 1, mean)
})

reduce_space.array

Apply a function over space and bands in a four-dimensional (band, time, y, x) array

Description

Apply a function over space and bands in a four-dimensional (band, time, y, x) array

Usage

## S3 method for class 'array'
reduce_space(x, FUN, ...)

Arguments

x four-dimensional input array with dimensions band, time, y, x (in this order)
FUN function which receives one spatial slice in a three-dimensional array with dimensions bands, y, x as input
... further arguments passed to FUN

Details

FUN is expected to produce a numeric vector (or scalar) where elements are interpreted as new bands in the result.

Note

This is a helper function that uses the same dimension ordering as gdalcubes streaming. It can be used to simplify the application of R functions e.g. over spatial slices in a data cube.

Examples

d <- c(4, 16, 32, 32)
x <- array(rnorm(prod(d)), d)
# reduce individual bands over spatial slices
y <- reduce_space(x, function(v) {
  apply(v, 1, mean)
})
dim(y)
Description

Create a proxy data cube, which applies one or more reducer functions to selected bands over spatial slices of a data cube

Usage

```r
## S3 method for class 'cube'
reduce_space(x, expr, ...)
```

Arguments

- **x**: source data cube
- **expr**: either a single string, or a vector of strings defining which reducers will be applied over which bands of the input cube
- **...**: optional additional expressions (if `expr` is not a vector)

Details

Notice that expressions have a very simple format: the reducer is followed by the name of a band in parantheses. You cannot add more complex functions or arguments.

Possible reducers currently are "min", "max", "sum", "prod", "count", "mean", "median", "var", "sd".

Value

proxy data cube object

Note

Implemented reducers will ignore any NAN values (as `na.rm=TRUE` does).

This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.

Examples

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
```
reduce_time

```
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"),
srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.b02 = select_bands(L8.cube, c("B02"))
L8.b02.median = reduce_space(L8.b02, "median(B02)")
```

---

**reduce_time**  
*Reduce multidimensional data over time*

**Description**

This generic function applies a reducer function over a data cube, an R array, or other classes if implemented.

**Usage**

```r
reduce_time(x, ...)
```

**Arguments**

- `x` object to be reduced
- `...` further arguments passed to specific implementations

**Value**

return value and type depend on the class of `x`

**See Also**

- `reduce_time.cube`
- `reduce_time.array`

**Examples**

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
```

```
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
bottom=4345299, top=4744931, t0="2018-01", t1="2018-06"),
srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
```
reduce_time(raster_cube(L8.col, v), "median(B02)", "median(B03)", "median(B04)")

d <- c(4,16,32,32)
x <- array(rnorm(prod(d)), d)
y <- reduce_time(x, function(v) {
  apply(v, 1, mean)
})

reduce_time.array  Apply a function over time and bands in a four-dimensional (band, time, y, x) array

Description
Apply a function over time and bands in a four-dimensional (band, time, y, x) array

Usage
## S3 method for class 'array'
reduce_time(x, FUN, ...)

Arguments
x  four-dimensional input array with dimensions band, time, y, x (in this order)
FUN  function which receives one time series in a two-dimensional array with dimensions bands, time as input
...  further arguments passed to FUN

Details
FUN is expected to produce a numeric vector (or scalar) where elements are interpreted as new bands in the result.

Note
This is a helper function that uses the same dimension ordering as gdalcubes streaming. It can be used to simplify the application of R functions e.g. over time series in a data cube.

Examples
d <- c(4,16,32,32)
x <- array(rnorm(prod(d)), d)
# reduce individual bands over pixel time series
y <- reduce_time(x, function(v) {
  apply(v, 1, mean)
})
dim(y)
**reduce_time.cube**

*Reduce a data cube over the time dimension*

**Description**

Create a proxy data cube, which applies one or more reducer functions to selected bands over pixel time series of a data cube.

**Usage**

```r
## S3 method for class 'cube'
reduce_time(x, expr, ..., FUN, names = NULL)
```

**Arguments**

- `x` source data cube
- `expr` either a single string, or a vector of strings defining which reducers will be applied over which bands of the input cube
- `...` optional additional expressions (if `expr` is not a vector)
- `FUN` a user-defined R function applied over pixel time series (see Details)
- `names` character vector; if `FUN` is provided, names can be used to define the number and name of output bands

**Details**

The function can either apply a built-in reducer if `expr` is given, or apply a custom R reducer function if `FUN` is provided.

In the former case, notice that expressions have a very simple format: the reducer is followed by the name of a band in parentheses. You cannot add more complex functions or arguments. Possible reducers currently are "min", "max", "sum", "prod", "count", "mean", "median", "var", "sd", "which_min", and "which_max".

User-defined R reducer functions receive a two-dimensional array as input where rows correspond to the band and columns represent the time dimension. For example, one row is the time series of a specific band. `FUN` should always return a numeric vector with the same number of elements, which will be interpreted as bands in the result cube. Notice that it is recommended to specify the names of the output bands as a character vector. If names are missing, the number and names of output bands is tried to be derived automatically, which may fail in some cases.

**Value**

proxy data cube object

**Note**

Implemented reducers will ignore any NAN values (as `na.rm=TRUE` does)

This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.
Examples

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"), 
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4, 
                         bottom=4345299, top=4744931, t0="2018-01", t1="2018-06"), 
             srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.rgb = select_bands(L8.cube, c("B02", "B03", "B04"))
L8.rgb.median = reduce_time(L8.rgb, "median(B02)", "median(B03)", "median(B04)"
L8.rgb.median

# user defined reducer calculating interquartile ranges
L8.rgb.iqr = reduce_time(L8.rgb, names=c("iqr_R", "iqr_G","iqr_B"), FUN = function(x) {
  c(diff(quantile(x["B04"],c(0.25,0.75), na.rm=TRUE)), 
     diff(quantile(x["B03"],c(0.25,0.75), na.rm=TRUE)),
     diff(quantile(x["B02"],c(0.25,0.75), na.rm=TRUE)))
})
L8.rgb.iqr
```

select_bands

Select bands of a data cube

Description

Create a proxy data cube, which selects specific bands of a data cube. The resulting cube will drop any other bands.

Usage

```r
select_bands(cube, bands)
```

Arguments

- `cube` source data cube
- `bands` character vector with band names

Value

proxy data cube object
size

Note

This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.

For performance reasons, select_bands should always be called directly on a cube created with raster_cube and drop all unneded bands. This allows to reduce RasterIO and warp operations in GDAL.

Examples

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                         bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"),
                         srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.rgb = select_bands(L8.cube, c("B02", "B03", "B04"))
L8.rgb
```

size

Query data cube properties

Description

Query data cube properties

Usage

size(obj)

Arguments

obj a data cube proxy object (class cube)

Value

size of a data cube (number of cells) as integer vector in the order t, y, x

See Also

dim.cube
Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
    ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
    bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
    srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
size(raster_cube(L8.col, v))

---

**srs**

Query data cube properties

**Description**

Query data cube properties

**Usage**

`srs(obj)`

**Arguments**

- `obj` a data cube proxy object (class cube)

**Value**

The spatial reference system expressed as a string readable by GDAL

**Examples**

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
    ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
    bottom=4345299, top=4744931, t0="2018-04", t1="2018-06"),
    srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
srs(raster_cube(L8.col, v))
Apply a moving window operation over time

Description

This generic function applies a reducer function over a moving window over the time dimension of a data cube, an R array, or other classes if implemented.

Usage

window_time(x, ...)

Arguments

x object to be reduced

... further arguments passed to specific implementations

Value

value and type depend on the class of x

See Also

window_time.cube

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                       ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                           bottom=4345299, top=4744931, t0="2018-01", t1="2018-07"),
               srs="EPSG:32618", nx = 400, dt="P1M")

L8.cube = raster_cube(L8.col, v)
L8.nir = select_bands(L8.cube, c("B05"))
window_time(L8.nir, window = c(2,2), "min(B05)"
window_time(L8.nir, kernel=c(-1,1), window=c(1,0))
Apply a moving window function over the time dimension of a data cube

Description

Create a proxy data cube, which applies one or more moving window functions to selected bands over pixel time series of a data cube. The function can either use a predefined aggregation function or apply a custom convolution kernel.

Usage

```r
## S3 method for class 'cube'
window_time(x, expr, ..., kernel, window)
```

Arguments

- `x`: source data cube
- `expr`: either a single string, or a vector of strings defining which reducers will be applied over which bands of the input cube
- `...`: optional additional expressions (if `expr` is not a vector)
- `kernel`: numeric vector with elements of the kernel
- `window`: integer vector with two elements defining the size of the window before and after a cell, the total size of the window is `window[1] + 1 + window[2]`

Details

The function either applies a kernel convolution (if the `kernel` argument is provided) or a general reducer function over moving temporal windows. In the former case, the kernel convolution will be applied over all bands of the input cube, i.e., the output cube will have the same number of bands as the input cubes. If a kernel is given and the `window` argument is missing, the window will be symmetric to the center pixel with the size of the provided kernel. For general reducer functions, the `window` argument must be provided and several expressions can be used to create multiple bands in the output cube.

Notice that expressions have a very simple format: the reducer is followed by the name of a band in parentheses. You cannot add more complex functions or arguments.

Possible reducers currently are "min", "max", "sum", "prod", "count", "mean", "median".

Value

proxy data cube object

Note

Implemented reducers will ignore any NAN values (as `na.rm=TRUE` does).

This function returns a proxy object, i.e., it will not start any computations besides deriving the shape of the result.
Examples

```r
# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                          bottom=4345299, top=4744931, t0="2018-01", t1="2018-07"),
               srs="EPSG:32618", nx = 400, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.nir = select_bands(L8.cube, c("B05"))
L8.nir.min = window_time(L8.nir, window = c(2,2), "min(B05)"
L8.nir.min
L8.nir.kernel = window_time(L8.nir, kernel=c(-1,1), window=c(1,0))
L8.nir.kernel
```

---

**write_chunk_from_array**

*Write chunk data of a cube to stdout or a file*

**Description**

This function can be used within function passed to `chunk_apply` in order to pass four-dimensional R arrays as a data cube chunk to the gdalcubes C++ library. It works only for R processes, which have been started from the gdalcubes C++ library. The input array must have dimensions band, time, y, x (in this order).

**Usage**

```r
write_chunk_from_array(v)
```

**Arguments**

- `v` four-dimensional array with dimensions band, time, y, and x

**Note**

Call this function ONLY from a function passed to `chunk_apply`.

This function only works in R sessions started from gdalcubes streaming.
Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         ".TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}
L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                         bottom=4345299, top=4744931, t0="2018-01", t1="2018-12"),
                         srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
L8.cube = raster_cube(L8.col, v)
L8.cube = select_bands(L8.cube, c("B04", "B05"))
f <- function() {
  x <- read_chunk_as_array()
  out <- reduce_time(x, function(x) {
    cor(x[1,], x[2,], use="na.or.complete", method = "kendall")
  })
  write_chunk_from_array(out)
}
L8.cor = chunk_apply(L8.cube, f)
plot(L8.cor, zlim=c(0,1), key.pos=1)

write_ncdf

Export a data cube as a netCDF file

Description

This function will read chunks of a data cube and write them to a single netCDF file. The resulting file uses the enhanced netCDF-4 format (for chunking and compression).

Usage

write_ncdf(x,fname = tempfile(pattern = "gdalcubes", fileext = ".nc"),
            overwrite = FALSE, write_json_descr = FALSE, with_VRT = FALSE,
            pack = NULL)

Arguments

x a data cube proxy object (class cube)
fname output file name
overwrite logical; overwrite output file if it already exists
write_json_descr logical; write a JSON description of x as additional file
write_ncdf

with_VRT logical; write additional VRT datasets (one per time slice)
pack reduce output file size by packing values (see Details), defaults to no packing

Details

The resulting netCDF file contains three dimensions (t, y, x) and bands as variables.

If write_json_descr is TRUE, the function will write an addition file with the same name as the NetCDF file but "json" suffix. This file includes a serialized description of the input data cube, including all chained data cube operations.

To reduce the size of created files, values can be packed by applying a scale factor and an offset value and using a smaller integer data type for storage. The pack argument can be either NULL (the default), or a list with elements type, scale, offset, and nodata. type can be any of "uint8", "uint16", "uint32", "int16", or "int32". scale, offset, and nodata must be numeric vectors with length one or length equal to the number of data cube bands (to use different values for different bands). The helper function pack_minmax can be used to derive offset and scale values with maximum precision from minimum and maximum data values on original scale.

Value

returns (invisibly) the path of the created netCDF file

pack_minmax

Examples

# create image collection from example Landsat data only
# if not already done in other examples
if (!file.exists(file.path(tempdir(), "L8.db"))) {
  L8_files <- list.files(system.file("L8NY18", package = "gdalcubes"),
                         "*.TIF", recursive = TRUE, full.names = TRUE)
  create_image_collection(L8_files, "L8_L1TP", file.path(tempdir(), "L8.db"))
}

L8.col = image_collection(file.path(tempdir(), "L8.db"))
v = cube_view(extent=list(left=388941.2, right=766552.4,
                          bottom=4345299, top=4744931, t0="2018-04", t1="2018-04"),
                    srs="EPSG:32618", nx = 497, ny=526, dt="P1M")
write_ncdf(select_bands(raster_cube(L8.col, v), c("B04", "B05")), fname=tempfile(fileext = ".nc"))
Export a data cube as a collection of GeoTIFF files

Description

This function will time slices of a data cube as GeoTIFF files in a given directory.

Usage

```r
write_tif(x, dir = tempfile(pattern = ""),
  prefix = basename(tempfile(pattern = "cube_")), overviews = FALSE,
  COG = FALSE, rsmpl_overview = "nearest", creation_options = NULL,
  write_json_descr = FALSE, pack = NULL)
```

Arguments

- `x`: a data cube proxy object (class `cube`)
- `dir`: destination directory
- `prefix`: output file name
- `overviews`: logical; generate overview images
- `COG`: logical; create cloud-optimized GeoTIFF files (forces overviews=TRUE)
- `rsmpl_overview`: resampling method for overviews (image pyramid) generation (see `https://gdal.org/programs/gdaladdo.html` for available methods)
- `creation_options`: additional creation options for resulting GeoTIFF files, e.g. to define compression (see `https://gdal.org/drivers/raster/gtiff.html#creation-options`)
- `write_json_descr`: logical; write a JSON description of `x` as additional file
- `pack`: reduce output file size by packing values (see Details), defaults to no packing

Details

If `write_json_descr` is TRUE, the function will write an additional file with name according to `prefix` (if not missing) or simply `cube.json`. This file includes a serialized description of the input data cube, including all chained data cube operations.

Additional GDAL creation options for resulting GeoTIFF files must be passed as a named list of simple strings, where element names refer to the key. For example, `creation_options = list("COMPRESS" = "DEFLATE","ZLEVEL" = "5")` would enable deflate compression at level 5.

To reduce the size of created files, values can be packed by applying a scale factor and an offset value and using a smaller integer data type for storage. The `pack` argument can be either NULL (the default), or a list with elements `type`, `scale`, `offset`, and `nodata`. `type` can be any of "uint8", "uint16", "uint32", "int16", or "int32". `scale`, `offset`, and `nodata` must be numeric vectors with length one or length equal to the number of data cube bands (to use different values for different bands). The helper function `pack_minmax` can be used to derive offset and scale values with maximum precision from minimum and maximum data values on original scale.
If `overviews=TRUE`, the numbers of pixels are halved until the longer spatial dimensions counts less than 256 pixels. Setting `C0G=TRUE` automatically sets `overviews=TRUE`.

Value

returns (invisibly) a vector of paths pointing to the created GeoTIFF files
