Package ‘geojsonio’

October 13, 2022

Title Convert Data from and to 'GeoJSON' or 'TopoJSON'

Version 0.10.0

Description Convert data to 'GeoJSON' or 'TopoJSON' from various R classes, including vectors, lists, data frames, shape files, and spatial classes. 'geojsonio' does not aim to replace packages like 'sp', 'rgdal', 'rgeos', but rather aims to be a high level client to simplify conversions of data from and to 'GeoJSON' and 'TopoJSON'.

as.json

Convert inputs to JSON

Description
Convert inputs to JSON

Usage
as.json(x, ...)

Arguments
x
Input
...
Further args passed on to jsonlite::toJSON()

Details
when the output of topojson_list() is given to this function we use a special internal fxn astjl() to parse the object - see that fxn and let us know if any problems you run in to

Examples
## Not run:
(res <- geojson_list(us_cities[1:2, ], lat = "lat", lon = "long"))
as.json(res)
as.json(res, pretty = TRUE)

vec <- c(-99.74, 32.45)
as.json(geojson_list(vec))
as.json(geojson_list(vec), pretty = TRUE)

## End(Not run)

as.location
Convert a path or URL to a location object.

Description
Convert a path or URL to a location object.

Usage
as.location(x, ...)
bounds

Get bounds for a list or geo_list

Description

Get bounds for a list or geo_list

Usage

bounds(x, ...)

Arguments

x An object of class list or geo_list

... Ignored

Value

A vector of the form min longitude, min latitude, max longitude, max latitude

Examples

# numeric
vec <- c(-99.74, 32.45)
x <- geojson_list(vec)
bounds(x)

# list
mylist <- list(
  list(latitude = 30, longitude = 120, marker = "red"),
  list(latitude = 30, longitude = 130, marker = "blue")
)
canada_cities

This is the same data set from the maps library, named differently.

Description
This database is of Canadian cities of population greater than about 1,000. Also included are province capitals of any population size.

Format
A list with 6 components, namely "name", "country.etc", "pop", "lat", "long", and "capital", containing the city name, the province abbreviation, approximate population (as at January 2006), latitude, longitude and capital status indication (0 for non-capital, 1 for capital, 2 for provincial).

centroid
Get centroid for a geo_list

Description
Get centroid for a geo_list

Usage
centroid(x, ...)

Arguments
x An object of class geo_list
... Ignored

Value
A vector of the form longitude, latitude
Examples

```r
# numeric
vec <- c(-99.74, 32.45)
x <- geojson_list(vec)
centroid(x)

# list
mylist <- list(
  list(latitude = 30, longitude = 120, marker = "red"),
  list(latitude = 30, longitude = 130, marker = "blue")
)
x <- geojson_list(mylist)
centroid(x)

# data.frame
x <- geojson_list(states[1:20, ])
centroid(x)
```

---

**file_to_geojson**  
*Convert spatial data files to GeoJSON from various formats.*

**Description**

You can use a web interface called Ogre, or do conversions locally using the `sf` package.

**Usage**

```r
file_to_geojson(
  input, 
  method = "web", 
  output = ".", 
  parse = FALSE, 
  encoding = "CP1250", 
  verbose = FALSE, 
  ...
)
```

**Arguments**

- **input**  
The file being uploaded, path to the file on your machine.
- **method**  
(character) One of "web" (default) or "local". Matches on partial strings. This parameter determines how the data is read. "web" means we use the Ogre web service, and "local" means we use `sf`. See Details for more.
- **output**  
Destination for output geojson file. Defaults to current working directory, and gives a random alphanumeric file name.
- **parse**  
(logical) To parse geojson to data.frame like structures if possible. Default: FALSE
file_to_geojson

encoding (character) The encoding passed to sf::st_read(). Default: CP1250
verbose (logical) Printing of sf::st_read() progress. Default: FALSE

Value

path for the geojson file

Method parameter

The web option uses the Ogre web API. Ogre currently has an output size limit of 15MB. See here http://ogre.adc4gis.com/ for info on the Ogre web API. The local option uses the function st_write from the package rgdal.

Ogre

Note that for Shapefiles, GML, MapInfo, and VRT, you need to send zip files to Ogre. For other file types (.bna, .csv, .dgn, .dxf, .gxt, .txt, .json, .geojson, .rss, .georss, .xml, .gmt, .kml, .kmz) you send the actual file with that file extension.

Linting GeoJSON

If you’re having trouble rendering GeoJSON files, ensure you have a valid GeoJSON file by running it through the package geojsonlint, which has a variety of different GeoJSON linters.

File size

When using method=“web”, be aware of file sizes. https://ogre.adc4gis.com that we use for this option does not document what file size is too large, but you should get an error message like "maximum file length exceeded" when that happens. method=“local” shouldn’t be sensitive to file sizes.

Examples

## Not run:
file <- system.file("examples", "norway_maple.kml", package = "geojsonio")

# KML type file - using the web method
file_to_geojson(input = file, method = "web", output = "kml_web")
## read into memory
file_to_geojson(input = file, method = "web", output = ":memory:")
file_to_geojson(input = file, method = "local", output = ":memory:")

# KML type file - using the local method
file_to_geojson(input = file, method = "local", output = "kml_local")

# Shp type file - using the web method - input is a zipped shp bundle
file <- system.file("examples", "bison.zip", package = "geojsonio")
file_to_geojson(file, method = "web", output = "shp_web")

# Shp type file - using the local method - input is the actual .shp file
file <- system.file("examples", "bison.zip", package = "geojsonio")
dir <- tempdir()
unzip(file, exdir = dir)
list.files(dir)
shpfile <- file.path(dir, "bison-Bison_bison-20130704-120856.shp")
file_to_geojson(shpfile, method = "local", output = "shp_local")

# geojson with .json extension
## this doesn't work anymore, hmmm
# x <- gsub("\n", "", paste0('https://gist.githubusercontent.com/hunterowens/
# 25ea24e198c80c9fbcc7/raw/7fd3efda9009f02b5a991a506ceae52db19ba143/
# wards2014.json', collapse = ""))
# res <- file_to_geojson(x)
# jsonlite::fromJSON(res)
# res <- file_to_geojson(x, method = "local")
# jsonlite::fromJSON(res)

## End(Not run)

---

geo2topo

**GeoJSON to TopoJSON and back**

Description

GeoJSON to TopoJSON and back

Usage

geo2topo(x, object_name = "foo", quantization = 0, ...)

topo2geo(x, ...)

Arguments

- **x**
  - GeoJSON or TopoJSON as a character string, json, a file path, or url
- **object_name**
  - (character) name to give to the TopoJSON object created. Default: "foo"
- **quantization**
  - (numeric) quantization parameter, use this to quantize geometry prior to computing topology. Typical values are powers of ten (1e4, 1e5, ...), default is 0 to not perform quantization. For more information about quantization, see this by Mike Bostock https://stackoverflow.com/questions/18900022/topojson-quantization-vs-simplification/18921214

... for geo2topo args passed on to jsonlite::fromJSON(), and for topo2geo args passed on to sf::st_read()

Value

An object of class json, of either GeoJSON or TopoJSON
geojson-add

See Also
topojson_write(), topojson_read()

Examples

# geojson to topojson
x <- '{"type": "LineString", "coordinates": [ [100.0, 0.0], [101.0, 1.0] ]}'
z <- geo2topo(x)
jsonlite::prettify(z)

## Not run:
library(leaflet)
leaflet() %>%
  addProviderTiles(provider = "Stamen.Terrain") %>%
  addTopoJSON(z)

## End(Not run)

# geojson to topojson as a list
x <- list(
  '{"type": "LineString", "coordinates": [ [100, 0], [101, 1] ]}',
  '{"type": "LineString", "coordinates": [ [110, 0], [110, 1] ]}',
  '{"type": "LineString", "coordinates": [ [120, 0], [121, 1] ]}'
)
geo2topo(x)

# change the object name created
x <- '{"type": "LineString", "coordinates": [ [100.0, 0.0], [101.0, 1.0] ]}'
geo2topo(x, object_name = "HelloWorld")
geo2topo(x, object_name = "4")

x <- list(
  '{"type": "LineString", "coordinates": [ [100, 0], [101, 1] ]}',
  '{"type": "LineString", "coordinates": [ [110, 0], [110, 1] ]}',
  '{"type": "LineString", "coordinates": [ [120, 0], [121, 1] ]}'
)
geo2topo(x, "HelloWorld")
geo2topo(x, c("A", "B", "C"))

# topojson to geojson
w <- topo2geo(z)
jsonlite::prettify(w)

## larger examples
file <- system.file("examples", "us_states.topojson", package = "geojsonio")
topo2geo(file)
Description
Add together geo_list or json objects

Usage
## S3 method for class 'geo_list'
x1 + x2

## S3 method for class 'json'
x1 + x2

Arguments
x1 An object of class geo_list or json
x2 A component to add to x1, of class geo_list or json

Details
If the first object is an object of class geo_list, you can add another object of class geo_list or
of class json, and will result in a geo_list object.

If the first object is an object of class json, you can add another object of class json or of class
geo_list, and will result in a json object.

See Also
 geojson_list(), geojson_json()

Examples
## Not run:
# geo_list + geo_list
# Note: geo_list is the output type from geojson_list, it’s just a list with
# a class attached so we know it’s geojson :)  
vec <- c(-99.74, 32.45)
a <- geojson_list(vec)
vects <- list(  c(100.0, 0.0), c(101.0, 0.0), c(101.0, 1.0),
               c(100.0, 1.0), c(100.0, 0.0)
)
b <- geojson_list(vects, geometry = "polygon")
a + b

# json + json

c <- geojson_json(c(-99.74, 32.45))
vects <- list(  c(100.0, 0.0), c(101.0, 0.0), c(101.0, 1.0),
               c(100.0, 1.0), c(100.0, 0.0)
)
d <- geojson_json(vects, geometry = "polygon")
c + d
geojsonio

(c + d) %>% pretty()

## End(Not run)

---

**geojsonio**

### I/O for GeoJSON

**Description**

Convert various data formats to/from GeoJSON or TopoJSON. This package focuses mostly on converting lists, data.frame's, numeric, SpatialPolygons, SpatialPolygonsDataFrame, and more to GeoJSON with the help of sf. You can currently read TopoJSON - writing TopoJSON will come in a future version of this package.

**Package organization**

The core functions in this package are organized first around what you’re working with or want to get, GeoJSON or TopoJSON, then convert to or read from various formats:

- `geojson_list()` / `topojson_list()` - convert to GeoJSON or TopoJSON as R list format
- `geojson_json()` / `topojson_json()` - convert to GeoJSON or TopoJSON as JSON
- `geojson_sp()` - convert to a spatial object from `geojson_list` or `geojson_json`
- `geojson_sf()` - convert to an sf object from `geojson_list` or `geojson_json`
- `geojson_read()` / `topojson_read()` - read a GeoJSON/TopoJSON file from file path or URL
- `geojson_write()` / `topojson_write()` - write a GeoJSON file locally (TopoJSON coming later)

Other interesting functions:

- `map_gist()` - Create a GitHub gist (renders as an interactive map)
- `map_leaf()` - Create a local interactive map using the leaflet package
- `geo2topo()` - Convert GeoJSON to TopoJSON
- `topo2geo()` - Convert TopoJSON to GeoJSON

All of the above functions have methods for various classes, including numeric vectors, data.frame, list, SpatialPolygons, SpatialLines, SpatialPoints, and many more - which will try to do the right thing based on the data you give as input.

---

**geojson_atomize**

**Atomize**

**Description**

Atomize

**Usage**

```
geojson_atomize(x, combine = TRUE)
```

**Arguments**

- **x** (geo_list/geo_json/json/character) input object, either geo_json, geo_list, json, or character class. If character, must be valid JSON
- **combine** (logical) only applies to geo_json/json type inputs. combine valid JSON objects into a single valid JSON object. Default: TRUE

**Details**

A FeatureCollection is split into many Feature’s, and a GeometryCollection is split into many geometries

Internally we use **jqr** for JSON parsing

**Value**

same class as input object, but modified

**Examples**

```
# lists
# featurecollection -> features
mylist <- list(
  list(latitude = 30, longitude = 120, marker = “red”),
  list(latitude = 30, longitude = 130, marker = “blue”)
)
(x <- geojson_list(mylist))
geojson_atomize(x)
```
# geometrycollection -> geometries
mylist <- list(  
  list(latitude = 30, longitude = 120, marker = "red"),  
  list(latitude = 30, longitude = 130, marker = "blue")  
)
(x <- geojson_list(mylist, type = "GeometryCollection"))
geojson_atomize(x)

# sf class
library(sf)
p1 <- rbind(c(0, 0), c(1, 0), c(3, 2), c(2, 4), c(1, 4), c(0, 0))
poly <- rbind(c(1, 1), c(1, 2), c(2, 2), c(1, 1))
poly_sfg <- st_polygon(list(p1))
(x <- geojson_list(poly_sfg))
geojson_atomize(x)

########## json
# featurecollection -> features
mylist <- list(  
  list(latitude = 30, longitude = 120, marker = "red"),  
  list(latitude = 30, longitude = 130, marker = "blue")  
)
(x <- geojson_json(mylist))
geojson_atomize(x)
geojson_atomize(x, FALSE)

# geometrycollection -> geometries
mylist <- list(  
  list(latitude = 30, longitude = 120, marker = "red"),  
  list(latitude = 30, longitude = 130, marker = "blue")  
)
(x <- geojson_json(mylist, type = "GeometryCollection"))
geojson_atomize(x)
geojson_atomize(x, FALSE)

# sf class
library(sf)
nc <- st_read(system.file("shape/nc.shp", package = "sf"), quiet = TRUE)
(x <- geojson_json(nc))
geojson_atomize(x)
geojson_atomize(x, FALSE)

########### character
# featurecollection -> features
mylist <- list(  
  list(latitude = 30, longitude = 120, marker = "red"),  
  list(latitude = 30, longitude = 130, marker = "blue")  
)
(x <- geojson_json(mylist))
geojson_atomize(unclass(x))
geojson_json

Convert many input types with spatial data to geojson specified as a json string

Description

Convert many input types with spatial data to geojson specified as a json string

Usage

geojson_json(
  input,
  lat = NULL,
  lon = NULL,
  group = NULL,
  geometry = "point",
  type = "FeatureCollection",
  convert_wgs84 = FALSE,
  crs = NULL,
  precision = NULL,
  ...
)

Arguments

input Input list, data.frame, spatial class, or sf class. Inputs can also be dplyr tbl_df class since it inherits from data.frame.
lat (character) Latitude name. The default is NULL, and we attempt to guess.
lon (character) Longitude name. The default is NULL, and we attempt to guess.
group (character) A grouping variable to perform grouping for polygons - doesn't apply for points
geometry (character) One of point (Default) or polygon.
type (character) The type of collection. One of 'auto' (default for 'sf' objects), 'FeatureCollection' (default for everything else), or 'GeometryCollection'. "skip" skips the coercion with package geojson functions; skipping can save significant run time on larger geojson objects. Spatial objects can only accept "FeatureCollection" or "skip". "skip" is not available as an option for numeric, list, and data.frame classes
convert_wgs84 Should the input be converted to the standard CRS system for GeoJSON (https://tools.ietf.org/html/rfc7946) (geographic coordinate reference system, using the WGS84 datum, with longitude and latitude units of decimal degrees; EPSG: 4326). Default is FALSE though this may change in a future package version. This will only work for sf or Spatial objects with a CRS already defined. If one is not defined but you know what it is, you may define it in the crs argument below.
The CRS of the input if it is not already defined. This can be an epsg code as a four or five digit integer or a valid proj4 string. This argument will be ignored if convert_wgs84 is FALSE or the object already has a CRS.

(integer) desired number of decimal places for coordinates. Using fewer decimal places decreases object sizes (at the cost of precision). This changes the underlying precision stored in the data. options(digits = <some number>) changes the maximum number of digits displayed (to find out what yours is set at see getline("digits"); the value of this parameter will change what’s displayed in your console up to the value of getline("digits"). See Precision section for more.

Further args passed on to internal functions. For Spatial* classes, it is passed through to sf::st_write(). For sf classes, data.frames, lists, numerics, and geo_lists, it is passed through to jsonlite::toJSON().

Details

This function creates a geojson structure as a json character string; it does not write a file - see geojson_write() for that

Note that all sp class objects will output as FeatureCollection objects, while other classes (numeric, list, data.frame) can be output as FeatureCollection or GeometryCollection objects. We’re working on allowing GeometryCollection option for sp class objects.

Also note that with sp classes we do make a round-trip, using sf::st_write() to write GeoJSON to disk, then read it back in. This is fast and we don’t have to think about it too much, but this disk round-trip is not ideal.

For sf classes (sf, sfc, sfg), the following conversions are made:

- sfg: the appropriate geometry Point, LineString, Polygon, MultiPoint, MultiLineString, MultiPolygon, Geometry
- sfc: GeometryCollection, unless the sfc is length 1, then the geometry as above
- sf: FeatureCollection

Value

An object of class geo_json (and json)

Precision

Precision is handled in different ways depending on the class.

The digits parameter of jsonlite::toJSON controls precision for classes numeric, list, data.frame, and geo_list.

For sp classes, precision is controlled by sf::st_write, being passed down through geojson_write(), then through internal function write_geojson(), then another internal function write_ogr_sf().

For sf classes, precision isn’t quite working yet.
Examples

```r
## Not run:
# From a numeric vector of length 2, making a point type
geojson_json(c(-99.74134244, 32.451323223))
geojson_json(c(-99.74134244, 32.451323223))[[1]]
geojson_json(c(-99.74134244, 32.451323223), precision = 2)[[1]]
geojson_json(c(-99.74, 32.45), type = "GeometryCollection")

## polygon type
### this requires numeric class input, so inputting a list will dispatch
### on the list method
poly <- c(
  c(-114.345703125, 39.436192999314095),
  c(-114.345703125, 43.45291889355468),
  c(-106.61132812499999, 43.45291889355468),
  c(-106.61132812499999, 39.436192999314095),
  c(-114.345703125, 39.436192999314095)
)
geojson_json(poly, geometry = "polygon")

# Lists
## From a list of numeric vectors to a polygon
vecs <- list(
  c(100.0, 0.0), c(101.0, 0.0), c(101.0, 1.0), c(100.0, 1.0),
  c(100.0, 0.0)
)
geojson_json(vecs, geometry = "polygon")

## from a named list
mylist <- list(
  list(latitude = 30, longitude = 120, marker = "red"),
  list(latitude = 30, longitude = 130, marker = "blue")
)
geojson_json(mylist, lat = "latitude", lon = "longitude")

# From a data.frame to points
geojson_json(us_cities[1:2, ], lat = "lat", lon = "long")
geojson_json(us_cities[1:2, ],
  lat = "lat", lon = "long",
  type = "GeometryCollection"
)

# from data.frame to polygons
head(states)
## make list for input to e.g., rMaps
geojson_json(states[1:351, ],
  lat = "lat", lon = "long", geometry = "polygon",
  group = "group"
)

# from a geo_list
a <- geojson_list(us_cities[1:2, ], lat = "lat", lon = "long")
```
geojson_json(a)

# sp classes

## From SpatialPolygons class
library("sp")

poly1 <- Polygons(list(Polygon(cbind(
c(-100, -90, -85, -100),
c(40, 50, 45, 40)
))), "1")
poly2 <- Polygons(list(Polygon(cbind(
c(-90, -80, -75, -90),
c(30, 40, 35, 30)
))), "2")

sp_poly <- SpatialPolygons(list(poly1, poly2), 1:2)
geojson_json(sp_poly)

## Another SpatialPolygons
library("sp")
library("rgeos")

pt <- SpatialPoints(coordinates(list(x = 0, y = 0)),
CRS("+proj=longlat +datum=WGS84")
)

## transform to web mercator because geos needs project coords

crs <- gsub("\n", ",",
paste0("+proj=merc +a=6378137 +b=6378137 +lat_ts=0.0 +lon_0=0.0 +x_0=0.0
+y_0=0 +k=1.0 +units=m +nadgrids=@null +wktext +no_defs", collapse = "")
)

pt <- spTransform(pt, CRS(crs))

## buffer
pt <- gBuffer(pt, width = 100)
pt <- spTransform(pt, CRS("+proj=longlat +datum=WGS84"))

geojson_json(pt)

## data.frame to geojson
geojson_write(us_cities[1:2, ], lat = "lat", lon = "long") %>% as.json()

## From SpatialPoints class

## End(Not run)

geojson_list

Convert many input types with spatial data to geojson specified as a list

Description

Convert many input types with spatial data to geojson specified as a list

Usage

geojson_list(
  input,
  lat = NULL,
  lon = NULL,
  group = NULL,
  geometry = "point",
  type = "FeatureCollection",
  convert_wgs84 = FALSE,
  crs = NULL,
  precision = NULL,
  ...
)

Arguments

input  Input list, data.frame, spatial class, or sf class. Inputs can also be dplyr tbl_df class since it inherits from data.frame
lat (character) Latitude name. The default is NULL, and we attempt to guess.
lon (character) Longitude name. The default is NULL, and we attempt to guess.
group (character) A grouping variable to perform grouping for polygons - doesn’t apply for points
geometry (character) One of point (Default) or polygon.
type (character) The type of collection. One of FeatureCollection (default) or GeometryCollection.
convert_wgs84 Should the input be converted to the standard CRS for GeoJSON (https://tools.ietf.org/html/rfc7946) (geographic coordinate reference system, using the WGS84 datum, with longitude and latitude units of decimal degrees; EPSG: 4326). Default is FALSE though this may change in a future package version. This will only work for sf or Spatial objects with a CRS already defined. If one is not defined but you know what it is, you may define it in the crs argument below.
geojson_list

The CRS of the input if it is not already defined. This can be an epsg code as a four or five digit integer or a valid proj4 string. This argument will be ignored if convert_wgs84 is FALSE or the object already has a CRS.

precision (integer) desired number of decimal places for coordinates. Only used with classes from spgeos classes; ignored for other classes. Using fewer decimal places decreases object sizes (at the cost of precision). This changes the underlying precision stored in the data. options(digits = <some number>) changes the maximum number of digits displayed (to find out what yours is set at see getOption("digits"); the value of this parameter will change what's displayed in your console up to the value of getOption("digits")

... Ignored

Details

This function creates a geojson structure as an R list; it does not write a file - see geojson_write() for that.

Note that all sp class objects will output as FeatureCollection objects, while other classes (numeric, list, data.frame) can be output as FeatureCollection or GeometryCollection objects. We're working on allowing GeometryCollection option for sp class objects.

Also note that with sp classes we do make a round-trip, using sf::st_write() to write GeoJSON to disk, then read it back in. This is fast and we don't have to think about it too much, but this disk round-trip is not ideal.

For sf classes (sf, sfc, sfg), the following conversions are made:

- sfg: the appropriate geometry Point, LineString, Polygon, MultiPoint, MultiLineString, MultiPolygon, GeometryCollection
- sfc: GeometryCollection, unless the sfc is length 1, then the geometry as above
- sf: FeatureCollection

For list and data.frame objects, you don't have to pass in lat and lon parameters if they are named appropriately (e.g., lat/latitude, lon/long/longitude), as they will be auto-detected. If they can not be found, the function will stop and warn you to specify the parameters specifically.

Examples

```r
## Not run:
# From a numeric vector of length 2 to a point
vec <- c(-99.74, 32.45)
geojson_list(vec)

# Lists
## From a list
mylist <- list(
  list(latitude = 30, longitude = 120, marker = "red"),
  list(latitude = 30, longitude = 130, marker = "blue")
)
geojson_list(mylist)

## From a list of numeric vectors to a polygon
vecs <- list(
```

```r
geojson_list(vecs, geometry = "polygon")

# from data.frame to points
(res <- geojson_list(us_cities[1:2, ], lat = "lat", lon = "long"))
as.json(res)
## guess lat/long columns
geojson_list(us_cities[1:2, ])
geojson_list(states[1:3, ])
geojson_list(states[1:351, ], geometry = "polygon", group = "group")
geojson_list(canada_cities[1:30, ])
## a data.frame with columns not named appropriately, but you can
## specify them
# dat <- data.frame(a = c(31, 41), b = c(-120, -110))
# geojson_list(dat)
# geojson_list(dat, lat="a", lon="b")

guess lat/long columns
geojson_list(states[1:351, ], lat = "lat", lon = "long",
            geometry = "polygon", group = "group")

# From SpatialPolygons class
library("sp")
poly1 <- Polygons(list(Polygon(cbind(
  c(-100, -90, -85, -100),
  c(40, 50, 45, 40)
))), "1")

---

**geojson_read**

*Read geojson or other formats from a local file or a URL*

**Description**

Read geojson or other formats from a local file or a URL

**Usage**

```
geojson_read(
  x,
  parse = FALSE,
  what = "list",
  stringsAsFactors = FALSE,
  query = NULL,
  ...
)
```

**Arguments**

- `x` (character) Path to a local file or a URL.
- `parse` (logical) To parse geojson to data.frame like structures if possible. Default: FALSE.
what (character) What to return. One of "list", "sp" (for Spatial class), or "json". Default: "list". "list" "and" sp run through package sf. if "json", returns json as character class

stringsAsFactors
Convert strings to Factors? Default FALSE.

query (character) A SQL query, see also postgis

... Further args passed on to sf::st_read()

Details
This function supports various geospatial file formats from a URL, as well as local kml, shp, and geojson file formats.

Value
various, depending on what’s chosen in what parameter

• list: geojson as a list using jsonlite::fromJSON()
• sp: geojson as an sp class object using sf::st_read()
• json: geojson as character string, to parse downstream as you wish

Linting GeoJSON
If you’re having trouble rendering GeoJSON files, ensure you have a valid GeoJSON file by running it through the package geojsonlint, which has a variety of different GeoJSON linters.

File size
We previously used file_to_geojson() in this function, leading to file size problems; this should no longer be a concern, but let us know if you run into file size problems

See Also
topojson_read(), geojson_write() postgis

Examples
## Not run:
# From a file
file <- system.file("examples", "california.geojson", package = "geojsonio")
(out <- geojson_read(file))
geojson_read(file)

map_leaf(json)
  }
}

## End(Not run)

**geojson_sf**

Convert objects to an sf class
Description

Convert objects to an sf class

Usage

geojson_sf(x, stringsAsFactors = FALSE, ...) 

Arguments

x

Object of class geo_list, geo_json, string, or json

stringsAsFactors

Convert strings to Factors? Default FALSE.

... 

Further args passed on to `sf::st_read()`

Details

The type of sf object returned will depend on the input GeoJSON. Sometimes you will get back a POINTS class, and sometimes a POLYGON class, etc., depending on what the structure of the GeoJSON.

The reading and writing of the CRS to/from geojson is inconsistent. You can directly set the CRS by passing a valid PROJ4 string or epsg code to the crs argument in `sf::st_read()`

Value

An sf class object, see Details.

Examples

```r
## Not run:
library(sf)

# geo_list ---------------
## From a numeric vector of length 2 to a point
vec <- c(-99.74, 32.45)
geojson_list(vec) %>% geojson_sf()

## Lists
## From a list
mylist <- list( 
  list(latitude = 30, longitude = 120, marker = "red"),
  list(latitude = 30, longitude = 130, marker = "blue")
)
geojson_list(mylist) %>% geojson_sf()
geojson_list(mylist) %>%
  geojson_sf() %>%
  plot()

## From a list of numeric vectors to a polygon
vecs <- list(c(100.0, 0.0), c(101.0, 0.0), c(101.0, 1.0), c(100.0, 1.0), c(100.0, 0.0))
geojson_list(vecs, geometry = "polygon") %>% geojson_sf()
```
geojson_sp

Convert objects to spatial classes

Description

Convert objects to spatial classes

Usage

geojson_sp(x, disambiguateFIDs = FALSE, stringsAsFactors = FALSE, ...)

Arguments

x
/Object of class geo_list, geo_json, string, or json

disambiguateFIDs

Ignored, and will be removed in a future version. Previously was passed to
rgdal::readOGR(), which is no longer used.

stringsAsFactors

Convert strings to Factors? Default FALSE.

...  

Further args passed on to sf::st_read()
Details

The spatial class object returned will depend on the input GeoJSON. Sometimes you will get back a SpatialPoints class, and sometimes a SpatialPolygonsDataFrame class, etc., depending on what the structure of the GeoJSON.

The reading and writing of the CRS to/from geojson is inconsistent. You can directly set the CRS by passing a valid PROJ4 string or epsg code to the crs argument in `sf::st_read()`

Value

A spatial class object, see Details.

Examples

```r
## Not run:
library(sp)

# geo_list ------------------
## From a numeric vector of length 2 to a point
vec <- c(-99.74, 32.45)
geojson_list(vec) %>% geojson_sp()

## Lists
## From a list
mylist <- list(
  list(latitude = 30, longitude = 120, marker = "red"),
  list(latitude = 30, longitude = 130, marker = "blue")
)
geojson_list(mylist) %>% geojson_sp()
geojson_list(mylist) %>%
  geojson_sp() %>%
  plot()

## From a list of numeric vectors to a polygon
vecs <- list(c(100.0, 0.0), c(101.0, 0.0), c(101.0, 1.0), c(100.0, 1.0), c(100.0, 0.0))
geojson_list(vecs, geometry = "polygon") %>% geojson_sp()
geojson_list(vecs, geometry = "polygon") %>%
  geojson_sp() %>%
  plot()

# geo_json ------------------
## from point
geojson_json(c(-99.74, 32.45)) %>% geojson_sp()
geojson_json(c(-99.74, 32.45)) %>%
  geojson_sp() %>%
  plot()

# from featurecollection of points
geojson_json(us_cities[1:2, ], lat = "lat", lon = "long") %>% geojson_sp()
geojson_json(us_cities[1:2, ], lat = "lat", lon = "long") %>%
  geojson_sp() %>%
  plot()
```
# Set the CRS via the crs argument
geojson_json(us_cities[1:2, ], lat = "lat", lon = "long") %>%
  geojson_sp(crs = "+init=epsg:4326")

# json ----------------------
x <- geojson_json(us_cities[1:2, ], lat = "lat", lon = "long")
geojson_sp(x)

# character string ----------------------
x <- unclass(geojson_json(c(-99.74, 32.45)))
geojson_sp(x)

## End(Not run)

---

**geojson_style**  
*Style a data.frame or list prior to converting to geojson*

**Description**  
This helps you add styling following the Simplestyle Spec. See Details

**Usage**  

```r
geojson_style(
  input,
  var = NULL,
  var_col = NULL,
  var_sym = NULL,
  var_size = NULL,
  var_stroke = NULL,
  var_stroke_width = NULL,
  var_stroke_opacity = NULL,
  var_fill = NULL,
  var_fill_opacity = NULL,
  color = NULL,
  symbol = NULL,
  size = NULL,
  stroke = NULL,
  stroke_width = NULL,
  stroke_opacity = NULL,
  fill = NULL,
  fill_opacity = NULL
)
```

**Arguments**  

- `input` A data.frame or a list
var (character) A single variable to map colors, symbols, and/or sizes to
var_col (character) A single variable to map colors to.
var_sym (character) A single variable to map symbols to.
var_size (character) A single variable to map size to.
var_stroke (character) A single variable to map stroke to.
var_stroke_width (character) A single variable to map stroke width to.
var_stroke_opacity (character) A single variable to map stroke opacity to.
var_fill (character) A single variable to map fill to.
var_fill_opacity (character) A single variable to map fill opacity to.

color (character) Valid RGB hex color. Assigned to the variable marker-color
symbol (character) An icon ID from the Maki project https://labs.mapbox.com/maki-icons/ or a single alphanumeric character (a-z or 0-9). Assigned to the variable marker-symbol
size (character) One of 'small', 'medium', or 'large'. Assigned to the variable marker-size
stroke (character) Color of a polygon edge or line (RGB). Assigned to the variable stroke
stroke_width (numeric) Width of a polygon edge or line (number > 0). Assigned to the variable stroke-width
stroke_opacity (numeric) Opacity of a polygon edge or line (0.0 - 1.0). Assigned to the variable stroke-opacity
fill (character) The color of the interior of a polygon (GRB). Assigned to the variable fill
fill_opacity (character) The opacity of the interior of a polygon (0.0-1.0). Assigned to the variable fill-opacity

Details

The parameters color, symbol, size, stroke, stroke_width, stroke_opacity, fill, and fill_opacity expect a vector of size 1 (recycled), or exact length of vector being applied to in your input data.

This function helps add styling data to a list or data.frame following the Simplestyle Spec (https://github.com/mapbox/simplestyle-spec/tree/master/1.1.0), used by MapBox and GitHub Gists (that renders geoJSON/topoJSON as interactive maps).

There are a few other style variables, but deal with polygons

GitHub has a nice help article on geoJSON files https://help.github.com/articles/mapping-geojson-files-on-github/

Please do get in touch if you think anything should change in this function.
geojson_style

Examples

## Not run:
## from data.frames - point data
library("RColorBrewer")
smalluscities <-
  subset(us_cities, country.etc == "OR" | country.etc == "NY" | country.etc == "CA")
### Just color
geojson_style(smalluscities,
  var = "country.etc",
  color = brewer.pal(length(unique(smalluscities$country.etc)), "Blues")
)
### Just size
geojson_style(smalluscities, var = "country.etc", size = c("small", "medium", "large"))
### Color and size
geojson_style(smalluscities,
  var = "country.etc",
  color = brewer.pal(length(unique(smalluscities$country.etc)), "Blues"),
  size = c("small", "medium", "large")
)
## from lists - point data
mylist <- list(
  list(latitude = 30, longitude = 120, state = "US"),
  list(latitude = 32, longitude = 130, state = "OR"),
  list(latitude = 38, longitude = 125, state = "NY"),
  list(latitude = 40, longitude = 128, state = "VT")
)
# just color
geojson_style(mylist,
  var = "state",
  color = brewer.pal(length(unique(sapply(mylist, "[[", "state")))), "Blues")
)
# color and size
geojson_style(mylist,
  var = "state",
  color = brewer.pal(length(unique(sapply(mylist, "[[", "state")))), "Blues"),
  size = c("small", "medium", "large", "large")
)
# color, size, and symbol
geojson_style(mylist,
  var = "state",
  color = brewer.pal(length(unique(sapply(mylist, "[[", "state")))), "Blues"),
  size = c("small", "medium", "large", "large"),
  symbol = "zoo"
)
# stroke, fill
geojson_style(mylist,
  var = "state",
  stroke = brewer.pal(length(unique(sapply(mylist, "[[", "state")))), "Blues"),
  fill = brewer.pal(length(unique(sapply(mylist, "[[", "state")))), "Greens"))
# from data.frame - polygon data
smallstates <- states[states$group %in% 1:3, ]
head(smallstates)
geojson_style(smallstates,
  var = "group",
  stroke = brewer.pal(length(unique(smallstates$group)), "Blues"),
  stroke_width = c(1, 2, 3),
  fill = brewer.pal(length(unique(smallstates$group)), "Greens")
)

## End(Not run)

---

**geojson_write**

Convert many input types with spatial data to a geojson file

## Description

Convert many input types with spatial data to a geojson file

## Usage

```r
geojson_write(
  input,
  lat = NULL,
  lon = NULL,
  geometry = "point",
  group = NULL,
  file = "myfile.geojson",
  overwrite = TRUE,
  precision = NULL,
  convert_wgs84 = FALSE,
  crs = NULL,
  ...
)
```

## Arguments

- **input**: Input list, data.frame, spatial class, or sf class. Inputs can also be dplyr `tbl_df` class since it inherits from `data.frame`
- **lat** (character): Latitude name. The default is `NULL`, and we attempt to guess.
- **lon** (character): Longitude name. The default is `NULL`, and we attempt to guess.
- **geometry** (character): One of point (Default) or polygon.
- **group** (character): A grouping variable to perform grouping for polygons - doesn't apply for points
- **file** (character): A path and file name (e.g., myfile), with the .geojson file extension. Default writes to current working directory.
overwrite  (logical) Overwrite the file given in file with input. Default: TRUE. If this param is FALSE and the file already exists, we stop with error message.

precision  desired number of decimal places for the coordinates in the geojson file. Using fewer decimal places can decrease file sizes (at the cost of precision).

convert_wgs84  Should the input be converted to the standard CRS for GeoJSON (https://tools.ietf.org/html/rfc7946) (geographic coordinate reference system, using the WGS84 datum, with longitude and latitude units of decimal degrees; EPSG: 4326). Default is FALSE though this may change in a future package version. This will only work for sf or Spatial objects with a CRS already defined. If one is not defined but you know what it is, you may define it in the crs argument below.

crs  The CRS of the input if it is not already defined. This can be an epsg code as a four or five digit integer or a valid proj4 string. This argument will be ignored if convert_wgs84 is FALSE or the object already has a CRS.

...  Further args passed on to internal functions. For Spatial* classes, data.frames, regular lists, and numerics, it is passed through to sf::st_write(). For sf classes, geo_lists and json classes, it is passed through to jsonlite::toJSON().

Value

A geojson_write class, with two elements:

- path: path to the file with the GeoJSON
- type: type of object the GeoJSON came from, e.g., SpatialPoints

See Also

geojson_list(), geojson_json(), topojson_write()

Examples

## Not run:
# From a data.frame
# to points
geojson_write(us_cities[1:2, ], lat = "lat", lon = "long")

# to polygons
head(states)
geojson_write(
  input = states, lat = "lat", lon = "long",
  geometry = "polygon", group = "group"
)

## partial states dataset to points (defaults to points)
geojson_write(input = states, lat = "lat", lon = "long")

## Lists
### list of numeric pairs
poly <- list(
  c(-114.345703125, 39.436192999314095),

sf_fc <- st_read(file, quiet = TRUE)
  geojson_write(sf_fc)
}

## End(Not run)

geojson_write.SpatialRings

### Deprecated functions from geojsonio

**Description**

[Deprecated]

**Usage**

## S3 method for class 'SpatialRings'
geojson_write(
  input,
  lat = NULL,
  lon = NULL,
  geometry = "point",
  group = NULL,
  file = "myfile.geojson",
  overwrite = TRUE,
  precision = NULL,
  convert_wgs84 = FALSE,
  crs = NULL,
  ...
)

## S3 method for class 'SpatialRingsDataFrame'
geojson_write(
  input,
  lat = NULL,
  lon = NULL,
  geometry = "point",
  group = NULL,
  file = "myfile.geojson",
  overwrite = TRUE,
  precision = NULL,
  convert_wgs84 = FALSE,
  crs = NULL,
  ...
)

## S3 method for class 'SpatialCollections'
geojson_write(
  input,
  lat = NULL,
  lon = NULL,
  geometry = "point",
  group = NULL,
  file = "myfile.geojson",
  overwrite = TRUE,
  precision = NULL,
  convert_wgs84 = FALSE,
  crs = NULL,
  ...
)

Arguments

input Input list, data.frame, spatial class, or sf class. Inputs can also be dplyr tbl_df class since it inherits from data.frame
lat (character) Latitude name. The default is NULL, and we attempt to guess.
lon (character) Longitude name. The default is NULL, and we attempt to guess.
geometry (character) One of point (Default) or polygon.
group (character) A grouping variable to perform grouping for polygons - doesn't apply for points
file (character) A path and file name (e.g., myfile), with the .geojson file extension. Default writes to current working directory.
overwrite (logical) Overwrite the file given in file with input. Default: TRUE. If this param is FALSE and the file already exists, we stop with error message.
precision desired number of decimal places for the coordinates in the geojson file. Using fewer decimal places can decrease file sizes (at the cost of precision).
convert_wgs84 Should the input be converted to the standard CRS for GeoJSON (https://tools.ietf.org/html/rfc7946) (geographic coordinate reference system, using the WGS84 datum, with longitude and latitude units of decimal degrees; EPSG: 4326). Default is FALSE though this may change in a future package version. This will only work for sf or Spatial objects with a CRS already defined. If one is not defined but you know what it is, you may define it in the crs argument below.
crs The CRS of the input if it is not already defined. This can be an epsg code as a four or five digit integer or a valid proj4 string. This argument will be ignored if convert_wgs84 is FALSE or the object already has a CRS.
... Further args passed on to internal functions. For Spatial* classes, data.frames, regular lists, and numerics, it is passed through to sf::st_write(). For sf classes, geo_lists and json classes, it is passed through to jsonlite::toJSON().

Details

Due to the retirement of rgeos and maptools in 2023, the following functions are now deprecated and provide warnings on use. They will error beginning in early 2023 and then be removed entirely in the future.

At the moment, there is no replacement for these functions that uses the newer geos package (or any alternative for maptools). If you’d be interested in contributing replacements, please feel free to contribute a pull request!

Examples

# Not run:
# From SpatialRings
library(rgeos)
r1 <- Ring(cbind(x = c(1, 1, 2, 2, 1), y = c(1, 2, 2, 1, 1)), ID = "1")
r2 <- Ring(cbind(x = c(1, 1, 2, 2, 1), y = c(1, 2, 2, 1, 1)), ID = "2")
r1r2 <- SpatialRings(list(r1, r2))
geojson_write(r1r2)

# From SpatialRingsDataFrame
dat <- data.frame(id = c(1, 2), value = 3:4)
r1r2df <- SpatialRingsDataFrame(r1r2, data = dat)
geojson_write(r1r2df)
# From SpatialCollections
library("sp")

poly1 <- Polygons(list(Polygon(cbind(c(-100, -90, -85, -100), c(40, 50, 45, 40)))), "1")
poly2 <- Polygons(list(Polygon(cbind(c(-90, -80, -75, -90), c(30, 40, 35, 30)))), "2")
poly <- SpatialPolygons(list(poly1, poly2), 1:2)
coordinates(us_cities) <- ~ long + lat
dat <- SpatialCollections(points = us_cities, polygons = poly)
geojson_write(dat)

## End(Not run)

---

**map_gist**

_Publish an interactive map as a GitHub gist_

**Description**

There are two ways to authorize to work with your GitHub account:

- **PAT** - Generate a personal access token (PAT) at https://help.github.com/articles/creating-an-access-token-for-command-line-use and record it in the `GITHUB_PAT` envar in your `.Renviron` file.
- **Interactive** - Interactively login into your GitHub account and authorise with OAuth.

Using the PAT method is recommended.

Using the `gist_auth()` function you can authenticate separately first, or if you’re not authenticated, this function will run internally with each function call. If you have a PAT, that will be used, if not, OAuth will be used.

**Usage**

```r
map_gist(
  input,
  lat = "lat",
  lon = "long",
  geometry = "point",
  group = NULL,
  type = "FeatureCollection",
  file = "myfile.geojson",
  description = "",
  public = TRUE,
  browse = TRUE,
  ...
)
```
Arguments

input  Input object
lat    Name of latitude variable
lon    Name of longitude variable
geometry  (character) Are polygons in the object
group  (character) A grouping variable to perform grouping for polygons - doesn’t apply for points
type  (character) One of FeatureCollection or GeometryCollection
file  File name to use to put up as the gist file
description  Description for the GitHub gist, or leave to default (=no description)
public  (logical) Want gist to be public or not? Default: TRUE
browse  If TRUE (default) the map opens in your default browser.

...  Further arguments passed on to http::POST

Examples

```r
## Not run:

map_leaf(poly)
```

## NOTE: Polygons from lists aren't supported yet

## From a json object

```r
map_leaf(geojson_json(c(-99.74, 32.45)))
map_leaf(geojson_json(c(-119, 45)))
map_leaf(geojson_json(c(-99.74, 32.45)))
```

## another example

```r
map_leaf(geojson_json(us_cities[1:10, ], lat = "lat", lon = "long"))
```

## From a geo_list object

```r
(res <- geojson_list(us_cities[1:2, ], lat = "lat", lon = "long"))
map_leaf(res)
```

## From SpatialPixels

```r
pixels <- suppressWarnings(SpatialPixels(SpatialPoints(us_cities[c("long", "lat")])))
summary(pixels)
map_leaf(pixels)
```

## From SpatialPixelsDataFrame

```r
pixelsdf <- suppressWarnings(
  SpatialPixelsDataFrame(points = canada_cities[c("long", "lat")], data = canada_cities)
)
map_leaf(pixelsdf)
```

## From SpatialRings

```r
library("rgeos")
r1 <- Ring(cbind(x = c(1, 1, 2, 2, 1), y = c(1, 2, 2, 1, 1)), ID = "1")
r2 <- Ring(cbind(x = c(1, 1, 2, 2, 1), y = c(1, 2, 2, 1, 1)), ID = "2")
r1r2 <- SpatialRings(list(r1, r2))
map_leaf(r1r2)
```

## From SpatialRingsDataFrame

```r
dat <- data.frame(id = c(1, 2), value = 3:4)
r1r2df <- SpatialRingsDataFrame(r1r2, data = dat)
map_leaf(r1r2df)
```

# basemap toggling ------------------------
map_leaf(us_cities, basemap = "Acetate.terrain")
map_leaf(us_cities, basemap = "CartoDB.Positron")
map_leaf(us_cities, basemap = "OpenTopoMap")

# leaflet options ------------------------
map_leaf(us_cities) %>%
  addPopups(-122.327298, 47.597131, "foo bar", options = popupOptions(closeButton = FALSE))

####### not working yet
# From a numeric vector
## of length 2 to a point
## vec <- c(-99.74,32.45)

## End(Not run)

---

**pretty**

Convert json input to pretty printed output

**Description**

Convert json input to pretty printed output

**Usage**

```
pretty(x, indent = 4)
```
Arguments

x Input, character string
indent (integer) Number of spaces to indent

Details

Only works with json class input. This is a simple wrapper around `jsonlite::prettify()`, so you can easily use that yourself.

```
projections topojson projections and extensions

Description

topojson projections and extensions

Usage

projections(
  proj,
  rotate = NULL,
  center = NULL,
  translate = NULL,
  scale = NULL,
  clipAngle = NULL,
  precision = NULL,
  parallels = NULL,
  clipExtent = NULL,
  invert = NULL
)
```

Arguments

proj Map projection name. One of albers, albersUsa, azimuthalEqualArea, azimuthalEquidistant, conicEqualArea, conicConformal, conicEquidistant, equirectangular, gnomonic, mercator, orthographic, stereographic, or transverseMercator.
rotate If rotation is specified, sets the projection’s three-axis rotation to the specified angles yaw, pitch and roll (or equivalently longitude, latitude and roll) in degrees and returns the projection. If rotation is not specified, returns the current rotation which defaults \([0, 0, 0]\). If the specified rotation has only two values, rather than three, the roll is assumed to be 0.
center If center is specified, sets the projection’s center to the specified location, a two-element array of longitude and latitude in degrees and returns the projection. If center is not specified, returns the current center which defaults to \((0,0)\)
translate
If point is specified, sets the projection’s translation offset to the specified two-
element array \([x, y]\) and returns the projection. If point is not specified, returns
the current translation offset which defaults to \([480, 250]\). The translation
offset determines the pixel coordinates of the projection’s center. The default
translation offset places \((0,0)\) at the center of a 960x500 area.

scale
If scale is specified, sets the projection’s scale factor to the specified value and
returns the projection. If scale is not specified, returns the current scale fac-
tor which defaults to 150. The scale factor corresponds linearly to the distance
between projected points. However, scale factors are not consistent across pro-
jections.

clipAngle
If angle is specified, sets the projection’s clipping circle radius to the specified
angle in degrees and returns the projection. If angle is null, switches to an-
timeridian cutting rather than small-circle clipping. If angle is not specified,
returns the current clip angle which defaults to null. Small-circle clipping is
independent of viewport clipping via clipExtent.

precision
If precision is specified, sets the threshold for the projection’s adaptive resam-
pling to the specified value in pixels and returns the projection. This value corre-
sponds to the Douglas-Peucker distance. If precision is not specified, returns the
projection’s current resampling precision which defaults to Math.SQRT(1/2).

parallels
Depends on the projection used! See https://github.com/mbostock/d3/wiki/Geo-
Projections#standard-projections for help

clipExtent
If extent is specified, sets the projection’s viewport clip extent to the specified
bounds in pixels and returns the projection. The extent bounds are specified as
an array \([[[x0, y0], [x1, y1]]\), where \(x0\) is the left-side of the viewport, \(y0\)
the top, \(x1\) is the right and \(y1\) is the bottom. If extent is null, no viewport
clipping is performed. If extent is not specified, returns the current viewport clip
extent which defaults to null. Viewport clipping is independent of small-circle
clipping via clipAngle.

invert
Projects backward from Cartesian coordinates (in pixels) to spherical coordi-
nates (in degrees). Returns an array \([longitude, latitude]\) given the input
array \([x, y]\).

Examples

projections(proj = "albers")
projections(proj = "albers", rotate = "[98 + 00 / 60, -35 - 00 / 60]", scale = 5700)
projections(proj = "albers", scale = 5700)
projections(proj = "albers", translate = "[55 * width / 100, 52 * height / 100]"
projections(proj = "albers", clipAngle = 90)
projections(proj = "albers", precision = 0.1)
projections(proj = "albers", parallels = "[30, 62]")
projections(proj = "albers", clipExtent = "[[105 - 87, 40], [105 + 87 + 1e-6, 82 + 1e-6]]"
projections(proj = "albers", invert = 60)
projections("orthographic")

states

This is the same data set from the ggplot2 library

Description

This is a data.frame with "long", "lat", "group", "order", "region", and "subregion" columns specifying polygons for each US state.

topojson_json

Convert many input types with spatial data to TopoJSON as a JSON string

Description

Convert many input types with spatial data to TopoJSON as a JSON string

Usage

topojson_json(
  input,
  lat = NULL,
  lon = NULL,
  group = NULL,
  geometry = "point",
  type = "FeatureCollection",
  convert_wgs84 = FALSE,
  crs = NULL,
  object_name = "foo",
  quantization = 0,
  ...
)

Arguments

input Input list, data.frame, spatial class, or sf class. Inputs can also be dplyr tbl_df class since it inherits from data.frame.
lat (character) Latitude name. The default is NULL, and we attempt to guess.
lon (character) Longitude name. The default is NULL, and we attempt to guess.
group (character) A grouping variable to perform grouping for polygons - doesn't apply for points
geometry (character) One of point (Default) or polygon.
type (character) The type of collection. One of 'auto' (default for 'sf' objects), 'FeatureCollection' (default for everything else), or 'GeometryCollection'. "skip" skips the coercion with package `geojson` functions; skipping can save significant run time on larger geojson objects. Spatial objects can only accept "FeatureCollection" or "skip". "skip" is not available as an option for numeric, list, and data.frame classes

convert_wgs84 Should the input be converted to the standard CRS system for GeoJSON (https://tools.ietf.org/html/rfc7946) (geographic coordinate reference system, using the WGS84 datum, with longitude and latitude units of decimal degrees; EPSG: 4326). Default is FALSE though this may change in a future package version. This will only work for sf or Spatial objects with a CRS already defined. If one is not defined but you know what it is, you may define it in the crs argument below.

crs The CRS of the input if it is not already defined. This can be an epsg code as a four or five digit integer or a valid proj4 string. This argument will be ignored if convert_wgs84 is FALSE or the object already has a CRS.

object_name (character) name to give to the TopoJSON object created. Default: "foo"

quantization (numeric) quantization parameter, use this to quantize geometry prior to computing topology. Typical values are powers of ten (1e4, 1e5, ...), default is 0 to not perform quantization. For more information about quantization, see this by Mike Bostock https://stackoverflow.com/questions/18900022/topojson-quantization-vs-simplification/18921214#18921214

... args passed down to `geojson_json()`; see `geojson_json()` for help on what’s supported here

Details

The type parameter is automatically converted to type="auto" if a sf, sfc, or sfg class is passed to input

Value

An object of class geo_json (and json)

Examples

## Not run:
# From a numeric vector of length 2, making a point type
topojson_json(c(-99.74, 32.45), pretty = TRUE)
topojson_json(c(-99.74, 32.45), type = "GeometryCollection")

## polygon type
### this requires numeric class input, so inputting a list will dispatch on the list method
poly <- c(

topojson_list

Convert many input types with spatial data to TopoJSON as a list

Description
Convert many input types with spatial data to TopoJSON as a list

Usage
topojson_list(
  input,
  lat = NULL,
  lon = NULL,
  group = NULL,
  geometry = "point",
  type = "FeatureCollection",
  convert_wgs84 = FALSE,
  crs = NULL,
  object_name = "foo",
  quantization = 0,
  ...
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Input list, data.frame, spatial class, or sf class. Inputs can also be dplyr tbl_df class since it inherits from data.frame</td>
</tr>
<tr>
<td>lat</td>
<td>(character) Latitude name. The default is NULL, and we attempt to guess.</td>
</tr>
<tr>
<td>lon</td>
<td>(character) Longitude name. The default is NULL, and we attempt to guess.</td>
</tr>
<tr>
<td>group</td>
<td>(character) A grouping variable to perform grouping for polygons - doesn't apply for points</td>
</tr>
<tr>
<td>geometry</td>
<td>(character) One of point (Default) or polygon.</td>
</tr>
<tr>
<td>type</td>
<td>(character) The type of collection. One of FeatureCollection (default) or GeometryCollection.</td>
</tr>
</tbody>
</table>
convert_wgs84 Should the input be converted to the standard CRS for GeoJSON (https://tools.ietf.org/html/rfc7946) (geographic coordinate reference system, using the WGS84 datum, with longitude and latitude units of decimal degrees; EPSG: 4326). Default is FALSE though this may change in a future package version. This will only work for sf or Spatial objects with a CRS already defined. If one is not defined but you know what it is, you may define it in the crs argument below.

crs The CRS of the input if it is not already defined. This can be an epsg code as a four or five digit integer or a valid proj4 string. This argument will be ignored if convert_wgs84 is FALSE or the object already has a CRS.

object_name (character) name to give to the TopoJSON object created. Default: "foo"

quantization (numeric) quantization parameter, use this to quantize geometry prior to computing topology. Typical values are powers of ten (1e4, 1e5, ...), default is 0 to not perform quantization. For more information about quantization, see this by Mike Bostock https://stackoverflow.com/questions/18900022/topojson-quantization-vs-simplification/18921214 for help on what's supported here

Details

Internally, we call topojson_json(), then use an internal function to convert that JSON output to a list

The type parameter is automatically converted to type="auto" if a sf, sfc, or sfg class is passed to input

Value

a list with TopoJSON

Examples

## Not run:
# From a numeric vector of length 2 to a point
vec <- c(-99.74, 32.45)
topojson_list(vec)

# Lists
## From a list

---
topojson_read  Read topojson from a local file or a URL

Description

Read topojson from a local file or a URL

Usage

topojson_read(x, ...)

Arguments

- x            Path to a local file or a URL.
- ... Further args passed on to sf::st_read(). Can use any args from sf::st_read() except quiet, which we have set as quiet = TRUE internally already
topojson_write

Details

Returns a sf class, but you can easily and quickly get this to geojson, see examples.

Note that this does not give you Topojson, but gives you a sf class - which you can use then to turn it into geojson as a list or json

Value

an object of class sf/data.frame

See Also

geojson_read(), topojson_write()

Examples

## Not run:
# From a file
file <- system.file("examples", "us_states.topojson", package = "geojsonio")
topojson_read(file)

# From a URL
url <- "https://raw.githubusercontent.com/shawnbot/d3-cartogram/master/data/us-states.topojson"
topojson_read(url)

# Use as.location first if you want
topojson_read(as.location(file))

# quickly convert to geojson as a list
file <- system.file("examples", "us_states.topojson", package = "geojsonio")
tmp <- topojson_read(file)
geojson_list(tmp)
geojson_json(tmp)

# pass on args
topojson_read(file, quiet = TRUE)
topojson_read(file, stringsAsFactors = FALSE)

## End(Not run)
Usage

topojson_write(
  input,
  lat = NULL,
  lon = NULL,
  geometry = "point",
  group = NULL,
  file = "myfile.topojson",
  overwrite = TRUE,
  precision = NULL,
  convert_wgs84 = FALSE,
  crs = NULL,
  object_name = "foo",
  quantization = 0,
  ...
)

Arguments

input  Input list, data.frame, spatial class, or sf class. Inputs can also be dplyr tbl_df
        class since it inherits from data.frame
lat    (character) Latitude name. The default is NULL, and we attempt to guess.
lon    (character) Longitude name. The default is NULL, and we attempt to guess.
geometry (character) One of point (Default) or polygon.
group  (character) A grouping variable to perform grouping for polygons - doesn’t apply
        for points
file   (character) A path and file name (e.g., myfile), with the .geojson file extension. Default writes to current working directory.
overwrite (logical) Overwrite the file given in file with input. Default: TRUE. If this
precision  desired number of decimal places for the coordinates in the geojson file. Using
convert_wgs84 Should the input be converted to the standard CRS for GeoJSON (https://tools.ietf.org/html/rfc7946)
        (geographic coordinate reference system, using the WGS84 datum, with longitude and latitude units of decimal degrees; EPSG: 4326). Default is FALSE though this may change in a future package version. This will only work for sf or Spatial objects with a CRS already defined. If one is not defined but you know what it is, you may define it in the crs argument below.
        (numeric) quantization parameter, use this to quantize geometry prior to computing topology. Typical values are powers of ten (1e4, 1e5, ...), default is 0 to not perform quantization. For more information about quantization, see
Details

Under the hood we simply wrap `geojson_write()`, then take the GeoJSON output of that operation, then convert to TopoJSON with `geo2topo()`, then write to disk.

Unfortunately, this process requires a number of round trips to disk, so speed ups will hopefully come soon.

Any intermediate geojson files are cleaned up (deleted).

Value

A `topojson_write` class, with two elements:

- `path`: path to the file with the TopoJSON
- `type`: type of object the TopoJSON came from, e.g., SpatialPoints

See Also

`geojson_write()`, `topojson_read()`

---

us_cities

**This is the same data set from the maps library, named differently**

Description

This database is of US cities of population greater than about 40,000. Also included are state capitals of any population size.

Format

A list with 6 components, namely "name", "country.etc", "pop", "lat", "long", and "capital", containing the city name, the state abbreviation, approximate population (as at January 2006), latitude, longitude and capital status indication (0 for non-capital, 1 for capital, 2 for state capital).

---

us_cities

... this by Mike Bostock https://stackoverflow.com/questions/18900022/topojson-quantization-vs-simplification/18921214

Further args passed on to internal functions. For Spatial* classes, data.frames, regular lists, and numerics, it is passed through to `sf::st_write()`. For sf classes, geo_lists and json classes, it is passed through to `jsonlite::toJSON()`.
