Package ‘ggTimeSeries’
January 23, 2022

Type Package
Title Time Series Visualisations Using the Grammar of Graphics
Version 1.0.2
Date 2022-01-17
Maintainer Aditya Kothari <mail.thecomeonman@gmail.com>
Description Provides additional display mediums for time series visualisations.
URL https://github.com/thecomeonman/ggTimeSeries
BugReports https://github.com/thecomeonman/ggTimeSeries/issues
License MIT + file LICENSE
Encoding UTF-8
LazyData true
Depends R (>= 3.4.0), ggplot2
Imports data.table, stats, utils
RoxygenNote 6.1.0
Suggests knitr, rmarkdown, ggthemes, prettydoc
VignetteBuilder knitr, rmarkdown
NeedsCompilation no
Author Aditya Kothari [cre, aut],

ggplot_waterfall .................................................. 6
Climate data.

The climate data used in the blogpost.

data (dtClimate)

An object of class data.table (inherits from data.frame) with 23628 rows and 5 columns.

http://doi.org/10.7289/V5D21VHZ Downloaded from ftp://ftp.ncdc.noaa.gov/pub/data/ghcn/daily/by_year/

Description
A calendar heatmap provides context for weeks, and day of week which makes it a better way to visualise daily data than line charts. Largely uses Codoremifa's code from stackoverflow.com/questions/22815688/calendar-time-series-with-r.

Usage
```
ggplot_calendar_heatmap(dtDateValue, cDateColumnName = "", cValueColumnName = ", vcGroupingColumnNames = "Year", dayBorderSize = 0.25, dayBorderColour = "black", monthBorderSize = 2, monthBorderColour = "black", monthBorderLineEnd = "round")
```

Arguments
- `dtDateValue`: Data set which may include other columns apart from date and values.
- `cDateColumnName`: Column name of the dates.
- `cValueColumnName`: Column name of the data.
- `vcGroupingColumnNames`: The set of columns which together define the group for the chart to operate within. If you plan to facet your plot, you should specify the same column names to this argument. The function will automatically add the variable for the year to the facet.
- `dayBorderSize`: Size of the border around each day
- `dayBorderColour`: Colour of the border around each day
- `monthBorderSize`: Size of the border around each month
- `monthBorderColour`: Colour of the border around each month
- `monthBorderLineEnd`: Line end for the border around each month

Value
Returns a ggplot friendly object which means the user can use ggplot scales to modify the look, add more geoms, etc.
Cosmetic Tips

The minimalist look can be achieved by appending the following chunk of code to the output object:

```r
+ xlab(NULL) + ylab(NULL) + scale_fill_continuous(low = "green", high = "red") +
theme(axis.text = element_blank(), axis.ticks = element_blank(), legend.position = "none", strip.background = element_blank(), strip.text = element_blank(),
plot.background = element_blank(),
panel.border = element_blank(), panel.background = element_blank(),
panel.grid = element_blank(), panel.border = element_blank())
```

Also See

`stat_calendar_heatmap`, a flexible but less polished alternative.

Examples

```r
{
library(data.table)
library(ggplot2)
set.seed(1)
dtData = data.table(
  DateCol = seq(
    as.Date("1/01/2014", "%d/%m/%Y"),
    as.Date("31/12/2015", "%d/%m/%Y"),
    "days"),
  ValueCol = runif(730))
# you could also try categorical data with
# ValueCol = sample(c("a","b","c"), 730, replace = T)
p1 = ggplot_calendar_heatmap(
  dtData,
  'DateCol',
  'ValueCol')
p1
# add new geoms
p1 +
  geom_text(label = "!!!") +
  scale_colour_continuous(low = "red", high = "green")
}
```

---

**ggplot_horizon**

Plot a time series as a horizon plot

---

**Description**

A horizon plot breaks the Y dimension down using colours. This is useful when visualising y values spanning a vast range and / or trying to highlight outliers without losing context of the rest of the data. Horizon plots are best viewed in an aspect ratio of very low vertical length.
Usage

```r
ggplot_horizon(dtData, cXColumnName, cYColumnName, bandwidth = NULL, 
vcGroupingColumnNames = NULL)
```

Arguments

- **dtData**: Data set which may include other columns apart from date and values.
- **cXColumnName**: Column name of dates.
- **cYColumnName**: Column name of values.
- **bandwidth**: the width of one band of Y values. easier to differentiate between the bands.
- **vcGroupingColumnNames**: The set of columns which together define the group for the chart to operate within. If you plan to facet your plot, you should specify the same column names to this argument.

Value

Returns a ggplot friendly object which means the user can use ggplot scales, etc. to modify the look.

Cosmetic Tips

The minimalist look can be achieved by appending the following chunk of code to the example output object:

```r
+ xlab(NULL) + ylab(NULL) + scale_fill_continuous(low = 'green', high = 'red') + theme( 
axis.text = element_blank(),axis.ticks = element_blank(),legend.position = 'none',strip.background = element_blank(),strip.text = element_blank(),# useful if only one year of data plot.background = element_blank(),panel.border = element_blank(),panel.background = element_blank(),panel.grid = element_blank(),panel.border = element_blank() ) + coord_fixed(0.5 * diff(range(dfData$x)) / diff(range(dfData$y)))
```

Also See

- `stat_horizon`, a less polished but more flexible alternative.

Examples

```r
{
library(ggplot2)
set.seed(1)
dfData = data.frame(x = 1:1000, y = cumsum(rnorm(1000)))
p1 = ggplot_horizon(dfData, 'x', 'y')
p1
  # add new geoms or colours
p1 + geom_text(label = '!!!') +
scale_colour_continuous(low = 'red', high = 'green')
}
```
ggplot_waterfall  

Plots a waterfall plot

Description

A waterfall plot highlights the change in the time series rather than the value of the time series itself.

Usage

```r
ggplot_waterfall(dtData, cXColumnName, cYColumnName, nArrowSize = 0.25, vcGroupingColumnNames = NULL)
```

Arguments

dtData Data set which may include other columns apart from the columns mapped to x and y.
cXColumnName Column name of the x mapping.
cYColumnName Column name of the y mapping.
nArrowSize the size of the arrow head on the plot in cm
vcGroupingColumnNames The set of columns which together define the group for the chart to operate between. If you plan to facet your plot, you should specify the same column names to this argument.

Value

Returns a ggpplot friendly object which means the user can use ggplot scales to modify the look, add more geoms, etc.

Cosmetic Tips

The minimalist look can be achieved by appending the following chunk of code to the output object:
```r
+ xlab(NULL) + ylab(NULL) + scale_fill_continuous(low = 'green', high = 'red') + theme( axis.text = element_blank(), axis.ticks = element_blank(), legend.position = 'none', strip.background = element_blank(), strip.text = element_blank(), panel.background = element_blank(), panel.border = element_blank(), panel.grid = element_blank() )
```

Also See

stat_waterfall, a flexible but less polished alternative.
Examples

```r
library(ggplot2)
set.seed(1)
dfData = data.frame(x = 1:100, y = cumsum(rnorm(100)))
ggplot_waterfall(
  dtData = dfData,
  'x',
  'y'
)
```

Marimekkofy

Description

Marimekkofy

Usage

```r
Marimekkofy(data, xbucket = "xbucket", ybucket = "ybucket",
weight = NULL)
```

Arguments

data     dataframe
xbucket   x value
ybucket   y value
weight    weight value

Value

df

StatCalendarMonthBreaks

*Transforms data for the month breaks of the calendar heatmap*

Description

Transforms data for the month breaks of the calendar heatmap

Usage

StatCalendarMonthBreaks
**StatOccurrence**

**Format**
An object of class `StatCalendarMonthBreaks` (inherits from Stat, ggproto, gg) of length 3.

**StatHorizon**
*Transforms data for a horizon plot*

**Description**
Transforms data for a horizon plot

**Usage**
StatHorizon

**Format**
An object of class `StatHorizon` (inherits from Stat, ggproto, gg) of length 4.

**StatMarimekko**
*Transforms data for the tiles of the heatmap*

**Description**
Transforms data for the tiles of the heatmap

**Usage**
StatMarimekko

**Format**
An object of class `StatMarimekko` (inherits from Stat, ggproto, gg) of length 4.

**StatOccurrence**
*Transforms data for an occurrence plot*

**Description**
Transforms data for an occurrence plot

**Usage**
StatOccurrence

**Format**
An object of class `StatOccurrence` (inherits from Stat, ggproto, gg) of length 3.
**StatSteamgraph**

Transforms data for a steam graph

**Description**

Transforms data for a steam graph

**Usage**

StatSteamgraph

**Format**

An object of class StatSteamgraph (inherits from Stat, ggproto, gg) of length 4.

---

**StatWaterfall**

Transforms data for a horizon plot

**Description**

Transforms data for a horizon plot

**Usage**

StatWaterfall

**Format**

An object of class StatWaterfall (inherits from Stat, ggproto, gg) of length 3.

---

**stat_calendar_heatmap**

Plots a calendar heatmap

**Description**

A calendar heatmap provides context for weeks, and day of week and is a better way to visualise daily data than line charts.

**Usage**

stat_calendar_heatmap(mapping = NULL, data = NULL, show.legend = NA, inherit.aes = TRUE, na.rm = T, bandwidth = NULL, ...)

---
Arguments

- mapping: mapping
- data: df
- show.legend: logical
- inherit.aes: logical
- na.rm: logical
- bandwidth: bandwidth
- ...: more functions

Aesthetics

date, fill.

Data Tips

`strftime` can help extract the value of the year, week of year, and day of week from the date column. You might need to extract the year to facet multiple years as demonstrated in the example. This stat uses the following transformation to obtain the x and y coordinate to be used in the heatmap:

```r
data$x = 1 + as.integer(strftime(data$date, "%W"))
data$y = as.integer(strftime(data$date, "%w"))
data$y[data$y == 0L] = 7
data$y = 8 -data$y
```

Cosmetic Tips

The minimalist look can be achieved by appending the following chunk of code to the output object:

```r
+ xlab(NULL) + ylab(NULL) + scale_fill_continuous(low = 'green', high = 'red') +
  theme(axis.text = element_blank(), axis.ticks = element_blank(), legend.position = 'none', strip.background = element_blank(), panel.background = element_blank(), panel.border = element_blank())
```

Also See

`ggplot_calendar_heatmap`, a polished but less flexible alternative.

Examples

```r
{
library(ggplot2)
DailyData = data.frame(
  DateCol = seq(
    as.Date("1/01/2014", "%d/%m/%Y"),
    as.Date("31/12/2015", "%d/%m/%Y"),
    "days"),
  ValueCol = runif(730)
)
DailyData$Year = strftime(DailyData$DateCol, "%Y")
ggplot(
  DailyData,
```
stat_horizon

```r
aes(
    date = DateCol,
    fill = ValueCol
)
) +
stat_calendar_heatmap() +
facet_wrap(~Year, ncol = 1))
```

---

**stat_horizon**

Plot a time series as a horizon plot

**Description**

Plot a time series as a horizon plot

**Usage**

```r
stat_horizon(mapping = NULL, data = NULL, show.legend = NA,
             inherit.aes = TRUE, na.rm = T, bandwidth = NULL, ...)
```

**Arguments**

- `mapping`: mapping
- `data`: dataframe
- `show.legend`: logical
- `inherit.aes`: logical
- `na.rm`: logical
- `bandwidth`: bandwidth
- `...`: other functions

A horizon plot breaks the Y dimension down using colours. This is useful when visualising y values spanning a vast range and / or trying to highlight outliers without losing context of the rest of the data. Horizon plots are best viewed in an aspect ratio of very low vertical length.

**Aesthetics**

- `x`, `y`, `fill`. Fill argument is overridden internally but is required for ggplot to assign a colour / fill scale.

**Other parameters**

- `bandwidth`, to dictate the span of a band.
Cosmetic Tips

The minimalist look can be achieved by appending the following chunk of code to the output object:
```r
+ xlab(NULL) + ylab(NULL) + scale_fill_continuous(low = 'green', high = 'red') + theme(axis.text = element_blank(), axis.ticks = element_blank(), legend.position = 'none', strip.background = element_blank(), strip.text = element_blank(), legend.position = 'none', strip.background = element_blank(), panel.border = element_blank(), panel.background = element_blank(), panel.grid = element_blank(), panel.border = element_blank() )
```

Also See

`ggplot_horizon`, a more polished but less flexible alternative.

Examples

```r
{ 
  library(ggplot2)
  ggplot(data.frame(x = 1:89, y = as.numeric(unlist(austres))), aes(x = x, y = y, fill = y)) +
    stat_horizon() +
    scale_fill_continuous(low = 'white', high = 'red')
}
```

```r
set.seed(10)
  ggplot(data.frame(x = 1:1000, y = cumsum(rnorm(1000))), aes(x = x, y = y, fill = y)) +
    stat_horizon() +
    scale_fill_continuous(low = 'white', high = 'red')
```

---

### stat_marimekko

Plot two categorical variables as marimekko

#### Description

Plot two categorical variables as marimekko

#### Usage

```r
stat_marimekko(mapping = NULL, data = NULL, show.legend = NA, 
inherit.aes = TRUE, na.rm = T, xlabelyposition = NULL, ...)
```

#### Arguments

- `mapping`  
- `data`  
- `show.legend`  
- `inherit.aes`  
- `na.rm`  
- `xlabelyposition`
A marimekko plot, or a mosaic plot, visualises the co-occurrence of two categorical / ordinal variables. In a time series, it could be used to visualise the transitions from one state to another by considering each state to be a category and plotting current category vs. next category.

**Aesthetics**

-xbucket, ybucket, fill. Fill argument needs to be assigned to ybucket, or some other column which is a one to one mapping of ybucket.

**Cosmetic Tips**

The minimalist look can be achieved by appending the following chunk of code to the output object:

```r
+ xlab(NULL) + ylab(NULL) + scale_fill_continuous(low = 'green', high = 'red') +
  theme(axis.text = element_blank(), axis.ticks = element_blank(), legend.position = 'none',
  strip.background = element_blank(),
  strip.text = element_blank(),
  plot.background = element_blank(),
  panel.border = element_blank(),
  panel.background = element_blank(),
  panel.grid = element_blank())
```

**Examples**

```r
library(ggplot2)

ggplot(data.frame(
  x1 = round(3 * runif(10000), 0),
  y1 = pmax(pmin(round(3 * rnorm(10000), 0), 3), -3),
  weight = 1:10000
)) +
stat_marimekko(
  aes(xbucket = x1,
       ybucket = y1,
       fill = factor(y1),
       weight = weight),
  xlabeyposition = 1.1,
  color = 'black')
```

---

**stat_occurrence**

Plots a time series as a dot plot

**Description**

Plots a time series as a dot plot
Usage

```r
stat_occurrence(mapping = NULL, data = NULL, show.legend = NA,
    inherit.aes = TRUE, na.rm = T, bandwidth = NULL, ...)
```

Arguments

- `mapping`: mapping
- `data`: df
- `show.legend`: logical
- `inherit.aes`: logical
- `na.rm`: logical
- `bandwidth`: bandwidth
- `...`: more functions

For rare events, it’s convenient to have the count of events encoded in the chart itself. A bar chart requires the user to perceive the y axis which this does not.

Aesthetics

- `x`, `y`

Cosmetic Tips

The minimalist look can be achieved by appending the following chunk of code to the output object:

```r
+ xlab(NULL) + ylab(NULL) + scale_fill_continuous(low = 'green', high = 'red') +
  theme( axis.text.y = element_blank(), axis.ticks.y = element_blank(),
         legend.position = 'none', strip.background = element_blank(),
         panel.background = element_blank(), panel.border = element_blank(),
         panel.grid = element_blank(), panel.border = element_blank() ) +
  coord_fixed(ylim = c(0, 1 + max(dfData$y)))
```

`coord_fixed` can provide a balance to the aspect ratio of the chart.

Examples

```r
{
  library(data.table)
  library(ggplot2)
  set.seed(1)
  dfData = data.table(x = 1:100, y = floor(4 * abs(rnorm(100, 0, 0.4))))
  ggplot(dfData, aes(x = x, y = y)) +
    stat_occurrence() +
    coord_fixed()
}
Description

Plot multiple time series as a steamgraph

Usage

stat_steamgraph(mapping = NULL, data = NULL, show.legend = NA, 
    inherit.aes = TRUE, na.rm = T, ...)

Arguments

mapping mapping
data data
show.legend logical
inherit.aes logical
na.rm logical
... other functions

Plots geom_ribbon for each time series and stacks them one on top of the other. It's a more aesthetically appealing version of a stacked area chart. The groups with the most variance are placed on the outside, and the groups with the least variance are placed on the inside.

Aesthetics

geom_steamgraph needs x, y, group, fill.

Cosmetic Tips

The minimalist look can be achieved by appending the following chunk of code to the example output object:

+ xlab(NULL) + ylab(NULL) + theme( axis.text = element_blank(), axis.ticks = element_blank(), legend.position = 'none', strip.background = element_blank(), # strip.text = element_blank(), # useful if only one year of data plot.background = element_blank(), panel.background = element_blank(), panel.border = element_blank(), panel.grid = element_blank(), panel.border = element_blank() ) + coord_fixed( 0.2 * diff(range(df$Time)) / diff(range(df$Signal)) )

Examples

{library(ggplot2)
set.seed(10)
df = data.frame(
  Time=1:1000,
  Signal=as(c(cumsum(rnorm(1000, 0, 3)),

stat_steamgraph

Plot multiple time series as a steamgraph
stat_waterfall

Plot a time series as a waterfall plot

Description

Plot a time series as a waterfall plot

Usage

```r
stat_waterfall(mapping = NULL, data = NULL, show.legend = NA,
inherit.aes = TRUE, na.rm = T, bandwidth = NULL, ...)
```

Arguments

- `mapping`  
- `data`  
- `show.legend`  
- `inherit.aes`  
- `na.rm`  
- `bandwidth`  
- `...`  

Aesthetics

stat_waterfall needs x, y

Cosmetic Tips

The minimalist look can be achieved by appending the following chunk of code to the output object:

```r
+ xlab(NULL) + ylab(NULL) + theme(axis.text = element_blank(), axis.ticks = element_blank(), legend.position = 'none', strip.background = element_blank(), plot.background = element_blank(), panel.background = element_blank(), panel.border = element_blank(), panel.grid = element_blank(), panel.border = element_blank())
```
Also See

`ggplot_waterfall`, a flexible but less polished alternative.

Examples

```r
{  
  library(ggplot2)
  set.seed(1)
  dfData = data.frame(x = 1:20, y = cumsum(rnorm(20)))
  ggplot(dfData, aes(x = x, y = y)) +
    stat_waterfall()
}
