Package ‘ggmap’

November 19, 2023

Version  4.0.0
Title  Spatial Visualization with ggplot2
Description  A collection of functions to visualize spatial data and models on top of static maps from various online sources (e.g Google Maps and Stamen Maps). It includes tools common to those tasks, including functions for geolocation and routing.

URL  https://github.com/dkahle/ggmap
BugReports  https://github.com/dkahle/ggmap/issues
Depends  R (>= 3.1.0), ggplot2 (>= 2.2.0)
Imports  png, plyr, jpeg, digest, scales, dplyr, bitops, grid, glue, httr, stringr, purrr, magrittr, tibble, tidyr, rlang, cli
Suggests  MASS, hexbin, testthat
License  GPL-2
LazyData  true
RoxygenNote  7.2.3
Encoding  UTF-8
NeedsCompilation  no
Author  David Kahle [aut, cre] (https://orcid.org/0000-0002-9999-1558), Hadley Wickham [aut] (https://orcid.org/0000-0003-4757-117X), Scott Jackson [aut], Mikko Korpela [cit]
Maintainer  David Kahle <david@kahle.io>
Repository  CRAN

R topics documented:

bb2bbox .......................................................... 2
calc_zoom ......................................................... 4
crime .............................................................. 5
Convert a bb specification to a bbox specification

In ggmap, all maps (class ggmap) have the bb attribute, a data frame bounding box specification in terms of the bottom left and top right points of the spatial extent. This function converts this specification to a named double vector (with names left, bottom, right, top) specification that is used in some querying functions (e.g. get_stadiumap).
Usage

bb2bbox(bb)

Arguments

bb a bounding box in bb format (see examples)

Value

a bounding box in bbox format (see examples)

Author(s)

David Kahle <david@kahle.io>

Examples

## Not run: # cut down on R CMD check time

# grab a center/zoom map and compute its bounding box
gc <- geocode("white house, washington dc")
map <- get_map(gc)
(bb <- attr(map, "bb"))
(bbox <- bb2bbox(bb))

# use the bounding box to get a Stadia map
stadMap <- get_stadiamap(bbox)

ggmap(map) +
  geom_point(
    aes(x = lon, y = lat),
    data = gc, colour = "red", size = 3
  )

ggmap(stadMap) +
  geom_point(
    aes(x = lon, y = lat),
    data = gc, colour = "red", size = 3
  )

## End(Not run)
Description

calc_zoom can calculate a zoom based on either (1) a data frame with longitude and latitude variables, (2) a longitude range and latitude range, or (3) a bounding box (bbox specification). The specification for (1) is identical to that of most R functions, for (2) simply put in a longitude range into lon and a latitude range into lat, and for (3) put the bounding box in for the lon argument.

Usage

calc_zoom(lon, lat, data, adjust = 0, f = 0.05)

Arguments

lon    longitude, see details
lat    latitude, see details
data   (optional) a data frame containing lon and lat as variables
adjust number to add to the calculated zoom
f      argument to pass to make_bbox

See Also

make_bbox(), bb2bbox()

Examples

# From data
calc_zoom(lon, lat, wind)

# From range
lon_range <- extendrange( wind$lon )
lat_range <- extendrange( wind$lat )
calc_zoom(lon_range, lat_range)

# From bounding box
box <- make_bbox(lon, lat, data = crime)
calc_zoom(box)
crime

Crime data

Description
Lightly cleaned Houston crime from January 2010 to August 2010 geocoded with Google Maps

Author(s)
Houston Police Department, City of Houston

References
https://www.houstontx.gov/police/cs/index-2.htm

gcode
Geocode

Description
Geocodes (finds latitude and longitude of) a location using the Google Geocoding API. Note: To use Google’s Geocoding API, you must first enable the API in the Google Cloud Platform Console. See register_google().

Usage
gcode(
  location,
  output = c("latlon", "latlona", "more", "all"),
  source = c("google", "dsk"),
  force = ifelse(source == "dsk", FALSE, TRUE),
  urlonly = FALSE,
  override_limit = FALSE,
  nameType = c("long", "short"),
  ext = "com",
  inject = "",
  ...
)

muate_geocode(data, location, ...)

gcodeQueryCheck()

gcode_cache()
write_geocode_cache(path, ...)

load_geocode_cache(path, overwrite = FALSE)

clear_geocode_cache(path)

Arguments

location  a character vector of street addresses or place names (e.g. "1600 pennsylvania avenue, washington dc" or "Baylor University")
output       amount of output, "latlon", "latlona", "more", or "all"
source       "google" for Google (note: "dsk" is defunct)
force        force online query even if cached.
urlonly       return only the url?
override_limit  override the current query rate
nameType      in some cases, Google returns both a long name and a short name. this parameter allows the user to specify which to grab.
ext           top level domain (e.g. "com", "co.nz"); helpful for non-US users
inject       character string to add to the url or named character vector of key-value pairs to be injected (e.g. c("a" = "b") get converted to "a=b" and appended to the query)
...           In `mutate_geocode()`, arguments to pass to `geocode()`. In `write_geocode_cache()`, arguments to pass to `saveRDS()`.
data         a data frame or equivalent
path         path to file
overwrite    in `load_geocode_cache()`, should the current cache be wholly replaced with the one on file?

Details

Note: `geocode()` uses Google’s Geocoding API to geocode addresses. Please take care not to disclose sensitive information. [https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8972108/](https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8972108/) suggest various alternative options for such data.

Value

If output is "latlon", "latlona", or "more", a tibble (classed data frame). If "all", a list.

Author(s)

David Kahle <david@kahle.io>

See Also

Examples

## Not run: requires Google API key, see \?register_google

## basic usage

# geocoding is most commonly used for addresses
geocode("1600 Amphitheatre Parkway, Mountain View, CA")
geocode("1600 Amphitheatre Parkway, Mountain View, CA", urlonly = TRUE)

# google can also geocode colloquial names of places
geocode("the white house")

# geocode can also accept character vectors of places
geocode(c("the white house", "washington dc"))

## types of output

geocode("waco texas")
geocode("waco texas", output = "latlona")
geocode("waco texas", output = "more")
str(geocode("waco texas", output = "all"))
geocode(c("waco, texas", "houston, texas"))
geocode(c("waco, texas", "houston, texas"), output = "latlona")
geocode(c("waco, texas", "houston, texas"), output = "all") %>% str(4)

## mutate_geocode

# mutate_geocode is used to add location columns to an existing dataset
# that has location information

df <- data.frame(
  address = c("1600 Pennsylvania Avenue, Washington DC", "", "houston texas"),
  stringsAsFactors = FALSE
)

mutate_geocode(df, address)
df %>% mutate_geocode(address)

## known issues

# in some cases geocode finds several locations
## geom_leg

**Single line segments with rounded ends**

### Description

This is `ggplot2`'s segment with rounded ends. It's mainly included in `ggmap` for historical reasons.

### Usage

```r
geom_leg(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  arrow = NULL,
  lineend = "round",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...
)
```

### Arguments

#### mapping

Set of aesthetic mappings created by `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

#### data

The data to be displayed in this layer. There are three options:

- If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
- A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
- A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

#### stat

The statistical transformation to use on the data for this layer, either as a `ggproto` Geom subclass or as a string naming the stat stripped of the `stat_` prefix (e.g. "count" rather than "stat_count")
geom_leg

position  Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use position_jitter), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.

arrow  specification for arrow heads, as created by grid::arrow().

lineend  Line end style (round, butt, square).

na.rm  If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes  If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

...  Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Details

only intended for use in ggmap package. only designed for mercator projection.

geom_segment(), route(), inspired by http://spatialanalysis.co.uk/2012/02/great-maps-ggplot2/, no longer active

Examples

## Not run: # removed for R CMD check speed

map <- get_map(
  location = c(-77.0425, 38.8925), # painfully picked by hand
  source = "google", zoom = 14, maptype = "satellite"
)
ggmap(map)

(legs_df <- route("the white house, dc", "lincoln memorial washington dc", alternatives = TRUE))
ggplot(data = legs_df) +
  geom_leg(aes(
    x = start_lon, xend = end_lon,
    y = start_lat, yend = end_lat
  )) +

...
get_cloudmademap

```
coord_map()

ggplot(data = legs_df) +
  geom_leg(aes(
    x = start_lon, xend = end_lon,
    y = start_lat, yend = end_lat,
    color = route
  )) +
  coord_map()

ggmap(map) +
  geom_leg(
    aes(
      x = start_lon, xend = end_lon,
      y = start_lat, yend = end_lat
    ),
    data = legs_df, color = "red"
  )

# adding a color aesthetic errors because of a base-layer problem
# ggmap(map) +
#  geom_leg(
#    aes(
#      x = start_lon, xend = end_lon,
#      y = start_lat, yend = end_lat,
#      color = route
#    )
#  )

# this is probably the easiest hack to fix it
ggplot(data = legs_df) +
  inset_ggmap(map) +
  geom_leg(
    aes(
      x = start_lon, xend = end_lon,
      y = start_lat, yend = end_lat,
      color = route
    ),
    data = legs_df
  ) +
  coord_map()

## End(Not run)
```

get_cloudmademap  
Get a CloudMade map.
get_cloudmademap

Description

get_cloudmademap() accesses a tile server for Stamen Maps and downloads/stitches map tiles/formats
a map image. This function requires an api key which can be obtained for free from http://cloudmade.com/user/show,
now defunct. Thousands of maptypes ("styles"), including create-your-own options, are available

Usage

get_cloudmademap(
  bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313, top = 30.14344),
  zoom = 10,
  api_key,
  maptype = 1,
  highres = TRUE,
  crop = TRUE,
  messaging = FALSE,
  urlonly = FALSE,
  filename = NULL,
  color = c("color", "bw"),
  ...
)

Arguments

bbox a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat).
zoom a zoom level
api_key character string containing cloud made api key, see details
maptype an integer of what cloud made calls style, see details
highres double resolution
crop crop raw map tiles to specified bounding box
messaging turn messaging on/off
urlonly return url only
filename destination file for download (file extension added according to format). Default
NULL means a random tempfile().
color color or black-and-white
...
...

Value

a ggmmap object (a classed raster object with a bounding box attribute)

Author(s)

David Kahle <david@kahle.io>
See Also

http://maps.cloudmade.com/ (defunct), ggmap()

get_googlemap

Get a Google Map.

Description

get_googlemap() queries the Google Maps Static API version 2 to download a static map. Note that in most cases by using this function you are agreeing to the Google Maps API Terms of Service at https://cloud.google.com/maps-platform/terms/. Note that as of mid-2018, registering with Google Cloud to obtain an API key is required to use any of Google’s services, including get_googlemap(). Usage and billing may apply, see the links under See Also further down in this documentation for more details.

Usage

googlemap(
  center = c(lon = -95.3632715, lat = 29.7632836),
  zoom = 10,
  size = c(640, 640),
  scale = 2,
  format = c("png8", "gif", "jpg", "jpg-baseline", "png32"),
  maptype = GOOGLE_VALID_MAP_TYPES,
  language = "en-EN",
  messaging = FALSE,
  urlonly = FALSE,
  filename = NULL,
  color = c("color", "bw"),
  force = FALSE,
  where = tempdir(),
  archiving = FALSE,
  ext = "com",
  inject = "",
  region,
  markers,
  path,
  visible,
  style,
  ...
)

Arguments

center the center of the map; either a longitude/latitude numeric vector or a string containing a location, in which case geocode() is called with source = "google".

(default: c(lon = -95.3632715, lat = 29.7632836), a reference to Houston, Texas)
get_googlemap

**zoom**

map zoom; an integer from 3 (continent) to 21 (building), default value 10 (city)

**size**

rectangular dimensions of map in pixels - horizontal x vertical - with a max of c(640, 640). this parameter is affected in a multiplicative way by scale.

**scale**

multiplicative factor for the number of pixels returned possible values are 1, 2, or 4 (e.g. size = c(640,640) and scale = 2 returns an image with 1280x1280 pixels). 4 is reserved for google business users only. scale also affects the size of labels as well.

**format**

character string providing image format - png, jpeg, and gif formats available in various flavors

**maptype**

character string providing google map theme. options available are "terrain", "satellite", "roadmap", and "hybrid"

**language**

character string providing language of map labels (for themes with them) in the format "en-EN". not all languages are supported; for those which aren’t the default language is used

**messaging**

turn messaging on/off

**urlonly**

return url only

**filename**

destination file for download (file extension added according to format). Default NULL means a random tempfile().

**color**

color or black-and-white

**force**

if the map is on file, should a new map be looked up?

**where**

where should the file drawer be located (without terminating "/")

**archiving**

use archived maps. note: by changing to TRUE you agree to the one of the approved uses listed in the Google Maps API Terms of Service: https://cloud.google.com/maps-platform/terms/.

**ext**

domain extension (e.g. "com", "co.nz")

**inject**

character string to add to the url

**region**

borders to display as a region code specified as a two-character ccTLD ("top-level domain") value, see https://en.wikipedia.org/wiki/List_of_Internet_top-level_domains#Country_code_top-level_domains

**markers**

data.frame with first column longitude, second column latitude, for which google markers should be embedded in the map image, or character string to be passed directly to api

**path**

data.frame (or list of data.frames) with first column longitude, second column latitude, for which a single path should be embedded in the map image, or character string to be passed directly to api

**visible**

a location as a longitude/latitude numeric vector (or data frame with first column longitude, second latitude) or vector of character string addresses which should be visible in map extent

**style**

character string to be supplied directly to the api for the style argument or a named vector (see examples). this is a powerful complex specification, see https://developers.google.com/maps/documentation/maps-static/
Value

a ggmap object (a classed raster object with a bounding box attribute)

Author(s)

David Kahle <david@kahle.io>

Examples

## Not run: requires Google API key, see ?register_google

## basic usage

```r
(map <- get_googlemap(c(-97.14667, 31.5493)))
ggmap(map)
```

# plotting based on a colloquial name
# this requires a geocode() call, and needs that API

```r
get_googlemap("waco, texas") %>% ggmap()
```

# different maptypes are available

```r
get_googlemap("waco, texas", maptype = "satellite") %>% ggmap()
get_googlemap("waco, texas", maptype = "hybrid") %>% ggmap()
```

# you can get the url as follows
# see ?register_google if you want the key printed

```r
get_googlemap(urlonly = TRUE)
```

## other usage

```r
# markers and paths are easy to access
d <- function(x=-95.36, y=29.76, n,r,a){
  round(data.frame(
    lon = jitter(rep(x,n), amount = a),
    lat = jitter(rep(y,n), amount = a)
  ), digits = r)
}
(df <- d(n = 50, r = 3, a = .3))
map <- get_googlemap(markers = df, path = df, scale = 2)
ggmap(map)
ggmap(map, extent = "device") +
```
get_map

Grab a map.

Description

get_map() is a smart wrapper that queries the Google Maps, OpenStreetMap, and Studia Maps servers for a map.

Usage

get_map(
  location = c(lon = -95.3632715, lat = 29.7632836),
  zoom = "auto",
  scale = "auto",
  maptype = c(GOOGLE_VALID_MAP_TYPES, STADIA_VALID_MAP_TYPES),
  source = c("google", "osm", "stadia"),
)
force = ifelse(source == "google", TRUE, FALSE),
messaging = FALSE,
urlonly = FALSE,
filename = NULL,
crop = TRUE,
color = c("color", "bw"),
language = "en-EN",
...
)

Arguments

location an address, longitude/latitude pair (in that order), or left/bottom/right/top bounding box

zoom map zoom, an integer from 3 (continent) to 21 (building), default value 10 (city). openstreetmaps limits a zoom of 18, and the limit on Stadia Maps depends on the maptype, "auto" automatically determines the zoom for bounding box specifications, and is defaulted to 10 with center/zoom specifications. maps of the whole world currently not supported.

scale scale argument of get_googlemap() or get_openstreetmap()

maptype character string providing map theme. options available are "terrain", "terrain-background", "satellite", "roadmap", and "hybrid" (Google Maps), "stamen_terrain", "stamen_toner", "stamen_toner_lite", "stamen_watercolor", "stamen_terrain_background", "stamen_toner_background", "stamen_terrain_lines", "stamen_terrain_labels", "stamen_toner_lines", "stamen_toner_labels" (Stadia Maps)

source Google Maps ("google"), OpenStreetMap ("osm"), Stadia Maps ("stadia")

force force new map (don’t use archived version)
messaging turn messaging on/off
urlonly return url only
filename destination file for download (file extension added according to format). Default NULL means a random tempfile().
crop (Stadia and cloudmade maps) crop tiles to bounding box
color color ("color") or black-and-white ("bw")
language language for google maps
...

Value

a gmap object (a classed raster object with a bounding box attribute)

Author(s)

David Kahle <david@kahle.io>

gmap()
**get_navermap**

Get a Naver Map

**Description**

This is (at least) temporarily unavailable as the Naver API changed.

**Usage**

```r
get_navermap(
  center = c(lon = 126.9849208, lat = 37.5664519),
  zoom = 4,
  size = c(640, 640),
  format = c("png", "jpeg", "jpg"),
```
get_navermap

"EPSG:2097", "EPSG:2098", "EPSG:900913"),
baselayer = c("default", "satellite"),
color = c("color", "bw"),
overlayers = c("anno_satellite", "bicycle", "roadview", "traffic"),
markers,
key,
uri,
filename = NULL,
messaging = FALSE,
urlonly = FALSE,
force = FALSE,
where = tempdir(),
archiving = TRUE,
...)

Arguments

center the center of the map. this can be longitude/latitude numeric vector.
zoom map zoom, an integer from 1 to 14 (building), default value 10
size rectangular dimensions of map in pixels - horizontal x vertical - with a max of c(640, 640).
format character string providing image format - png, jpeg formats available in various flavors
 CRS Coordinate system, this currently supports EPSG:4326
baselayer base layer, this can be either "default", "satellite".
color color or black-and-white
overlayers overlay layers, this can be "anno_satellite","bicycle", "roadview", "traffic".
markers data.frame with first column longitude, second column latitude, for which naver markers should be embedded in the map image, or character string to be passed directly to api
key key code from naver api center
uri registered host url
filename destination file for download (file extension added according to format). Default NULL means a random tempfile().
messaging turn messaging on/off
urlonly return url only
force if the map is on file, should a new map be looked up?
where where should the file drawer be located (without terminating "/")
archiving use archived maps. note: by changing to TRUE you agree to abide by any of the rules governing caching naver maps
...
**get_openstreetmap**

**Details**

`get_navermap()` accesses the Naver Static Maps API version 1.1 to download a static map. Note that in most cases by using this function you are agreeing to the Naver Maps API Terms of Service.

**Author(s)**

Heewon Jeon <madjakarta@gmail.com>

**See Also**

`ggmap()`

---

**Description**

`get_openstreetmap()` accesses a tile server for OpenStreetMap and downloads/formats a map image. This is simply a wrapper for the web-based version at https://www.openstreetmap.org/. If you don’t know how to get the map you want, go there, navigate to the map extent that you want, click the export tab at the top of the page, and copy the information into this function.

**Usage**

```r
get_openstreetmap(
  bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313, top = 30.14344),
  scale = 606250,
  format = c("png", "jpeg", "svg", "pdf", "ps"),
  messaging = FALSE,
  urlonly = FALSE,
  filename = NULL,
  color = c("color", "bw"),
  ...
)
```

**Arguments**

- `bbox` a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat)
- `scale` scale parameter, see https://wiki.openstreetmap.org/wiki/MinScaleDenominator. smaller scales provide a finer degree of detail, where larger scales produce more coarse detail. The scale argument is a tricky number to correctly specify. In most cases, if you get an error when downloading an openstreetmap the error is attributable to an improper scale specification. `OSM_scale_lookup()` can help; but the best way to get in the correct range is to go to https://www.openstreetmap.org/, navigate to the map of interest, click export at the top of the page, click ‘map image’ and then copy down the scale listed.
get_stadiamap

Description

get_stadiamap() accesses a tile server for Stadia Maps and downloads/stitches map tiles/formats a map image.

Usage

get_stadiamap(
  bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313, top = 30.14344),
  zoom = 10,
  maptype = STADIA_VALID_MAP_TYPES,
  crop = TRUE,
  messaging = FALSE,
  urlonly = FALSE,
  color = c("color", "bw"),
)

format character string providing image format - png, jpeg, svg, pdf, and ps formats
messaging turn messaging on/off
urlonly return url only
filename destination file for download (file extension added according to format). Default NULL means a random tempfile().
color color or black-and-white

Details

In some cases the OSM server is unavailable, in these cases you will receive an error message from utils::download.file() with the message HTTP status '503 Service Unavailable'. You can confirm this by setting urlonly = TRUE, and then entering the URL in a web browser. The solution is either (1) change sources or (2) wait for the OSM servers to come back up.

See https://www.openstreetmap.org/copyright/ for license and copyright information.

Value

a ggmap object (a classed raster object with a bounding box attribute)

Author(s)

David Kahle <david@kahle.io>

See Also

https://www.openstreetmap.org/, ggmap()
get_stadiamap

```r
force = FALSE,
where = tempdir(),
...
)
```

Arguments

- **bbox**: a bounding box in the format `c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat).
- **zoom**: a zoom level
- **maptype**: stamen_terrain, stamen_toner, stamen_toner_lite, stamen_watercolor, stamenTerrain_background, stamen_toner_background, stamen_terrain_lines, stamen_terrain_labels, stamen_toner_lines, stamen_toner_labels.
- **crop**: crop raw map tiles to specified bounding box. if FALSE, the resulting map will more than cover the bounding box specified.
- **messaging**: turn messaging on/off
- **urlonly**: return url only
- **color**: color or black-and-white (use force = TRUE if you’ve already downloaded the images)
- **force**: if the map is on file, should a new map be looked up?
- **where**: where should the file drawer be located (without terminating "/")
  ...
  ...

Value

a ggmap object (a classed raster object with a bounding box attribute)

  geom_point(aes(x = lon, y = lat), data = gc, colour = "red", size = 3)
qmap("the white house", zoom = 16, source = "stada", maptype = "stamen_terrain") +
  geom_point(aes(x = lon, y = lat), data = gc, colour = "red", size = 3)

## known issues
# Stamen's original tilesets were raster renders built up over time, but have not been
# actively rendered for several years. As a consequence, some tiles simply do not exist,
# particularly at high zoom levels.
#
# The newer styles have been redesigned and are now generated live by Stadia Maps, so
# these are complete, but at the time of this writing, the Watercolor style is still incomplete.

get_stamedmap

---

**get_stamenmap**

---

**Get a Stamen Map**

**Description**

`get_stamenmap()` accesses a tile server for Stamen Maps and downloads/stitches map tiles/formats
a map image. Note that Stamen maps don’t cover the entire world.

**Usage**

```r
get_stamenmap(
  bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313, top = 30.14344),
  zoom = 10,
  maptype = c("terrain", "terrain-background", "terrain-labels", "terrain-lines",",
```
get_stamenmap

"toner", "toner-2010", "toner-2011", "toner-background", "toner-hybrid",
"toner-labels", "toner-lines", "toner-lite", "watercolor"),
crop = TRUE,
messaging = FALSE,
urlonly = FALSE,
color = c("color", "bw"),
force = FALSE,
where = tempdir(),
https = FALSE,
...
)

get_stamen_tile_download_fail_log()

retry_stamen_map_download()

Arguments

bbox a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat).

zoom a zoom level

maptype terrain, terrain-background, terrain-labels, terrain-lines, toner, toner-2010, toner-2011, toner-background, toner-hybrid, toner-labels, toner-lines, toner-lite, or watercolor.

crop crop raw map tiles to specified bounding box. if FALSE, the resulting map will more than cover the bounding box specified.

messaging turn messaging on/off

urlonly return url only

color color or black-and-white (use force = TRUE if you’ve already downloaded the images)

force if the map is on file, should a new map be looked up?

where where should the file drawer be located (without terminating "/")

https if TRUE, queries an https endpoint so that web traffic between you and the tile server is encrypted using SSL.

Value

a ggmap object (a classed raster object with a bounding box attribute)

See Also

ggmap()
ggimage

Plot an image using ggplot2

Description

ggimage is the near ggplot2 equivalent of image.

Usage

ggimage(mat, fullpage = TRUE, coord_equal = TRUE, scale_axes = FALSE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mat</td>
<td>a matrix, imagematrix, array, or raster (something that can be coerced by as.raster)</td>
</tr>
<tr>
<td>fullpage</td>
<td>should the image take up the entire viewport?</td>
</tr>
<tr>
<td>coord_equal</td>
<td>should the axes units be equal?</td>
</tr>
<tr>
<td>scale_axes</td>
<td>should the axes be (0, ncol(mat)-1)x(0,nrow(mat)-1) (F) or (0.1)x(0.1) (T)</td>
</tr>
</tbody>
</table>

Value

a ggplot object

Author(s)

David Kahle <david@kahle.io>

Examples

```r
img <- matrix(1:16, 4, 4)
image(img)
ggimage(t(img[,4:1]), fullpage = FALSE, scale_axes = TRUE)
ggimage(t(img[,4:1]), fullpage = FALSE)

## Not run:
# not run due to slow performance

data(hadley)
ggimage(hadley)
ggimage(hadley, coord_equal = FALSE)

x <- seq(1, 438, 15); n <- length(x)
df <- data.frame(x = x, y = -(120*(scale((x - 219)^3 - 25000*x) + rnorm(n)/2 - 3)))
ggplot(x, y, data = df, geom = c('smooth','point'))
ggimage(hadley, fullpage = FALSE) +
  geom_smooth(
    aes(x = x, y = y),
```
gglocator

Locator for ggplot objects

Description

Locator for ggplot objects (Note: only accurate when extent = "normal" when using ggmap.)

Usage

```r
gglocator(n = 1, message = FALSE, mercator = TRUE, ...)
```

Arguments

- **n**: number of points to locate.
- **message**: unused
- **mercator**: logical flag; should the plot be treated as using the projection common to most web map services? Set to FALSE if the axes on the plot use a linear scale.
- **...**: additional arguments (including deprecated, e.g. xexpand)

Value

a data frame with columns according to the x and y aesthetics

Author(s)

Tyler Rinker, Baptiste Auguie, DWin, David Kahle, \@Nikolai-Hlubek and \@mvkorpel.

Examples

```r
if (interactive()) {
  # only run for interactive sessions
  df <- expand.grid(x = 0:-5, y = 0:-5)

  ggplot(df, aes(x, y)) + geom_point() +
  annotate(geom = "point", x = -2, y = -2, colour = "red")
```

(pt <- gglocator(mercator = FALSE)) # click red point

last_plot() +
  annotate("point", pt$x, pt$y, color = "blue", size = 3, alpha = .5)

hdf <- get_map("houston, texas")
ggmap(hdf, extent = "normal")
(pt <- gglocator(mercator = TRUE))
last_plot() +
  annotate("point", pt$lon, pt$lat, color = "blue", size = 3, alpha = .5)

}
padding distance from legend to corner of the plot (used with legend, formerly b)
darken vector of the form c(number, color), where number is in (0,1) and color is a character string indicating the color of the darken. 0 indicates no darkening, 1 indicates a black-out.
b Deprecated, renamed to padding. Overrides any padding argument.
fullpage Deprecated, equivalent to extent = "device" when TRUE. Overrides any extent argument.
expand Deprecated, equivalent to extent = "panel" when TRUE and fullpage is FALSE. When fullpage is FALSE and expand is FALSE, equivalent to extent="normal". Overrides any extent argument.

Value
a ggplot object

Author(s)
David Kahle <david@kahle.io>

## darken argument

```r
# ggmap(get_map())
ggmap(get_map(), darken = .5)
```
Description

As provider services change over time, ggmap has to make corresponding changes. Since its inception, a few services have stopped offering their previous functionality, and in some cases this has required us to remove those functions from the package entirely.

Details

The following are defunct ggmap functions:

- get_cloudemademap
- get_navermap
- get_openstreetmap
- get_stamenmap

---

ggmapplot

Don’t use this function, use ggmap.

Description

ggmap plots the raster object produced by get_map().

Usage

```r
ggmapplot(
  ggrepplot,
  fullpage = FALSE,
  base_layer,
  maprange = FALSE,
  expand = FALSE,
  ...
)
```
ggmap_options

Arguments

- `ggmap`: an object of class ggmap (from function `get_map()`)
- `fullpage`: logical; should the map take up the entire viewport?
- `base_layer`: a `ggplot(aes(...), ...)` call; see examples
- `maprange`: logical for use with `base_layer`; should the map define the x and y limits?
- `expand`: should the map extend to the edge of the panel? used with `base_layer` and `maprange=TRUE.
  ...
  ...

Value

a `ggplot` object

Author(s)

David Kahle <david@kahle.io>

See Also

`get_map()`, `qmap()`

Examples

```r
## Not run:
this is a deprecated function, use ggmap.

## End(Not run)
```

Description

ggmap stores options as a named list in R’s global options, i.e. `getOption("ggmap")`. It currently stores two such options, one for Google credentialing and one to suppress private API information in the URLs printed to the screen when web queries are placed. For both of those, see `register_google()`.

Usage

- `set_ggmap_option(...)`
- `has_ggmap_options()`
- `has_ggmap_option(option)`
- `ggmap_credentials()`
Arguments

... a named listing of options to set
option a specific option to query, e.g. "display_api_key"

Author(s)

David Kahle <david@kahle.io>

Highly unofficial ggplot2 image

---

Description

Highly unofficial ggplot2 image

Author(s)

Garrett Grolemund <grolemund@gmail.com>

---

inset  

Add ggplot2 insets to a map

---

Description

This is identical to ggplot2::annotation_custom for use with ggmap

Usage

inset(grob, xmin = -Inf, xmax = Inf, ymin = -Inf, ymax = Inf)
Arguments

grob  grob to display
xmin, xmax  x location (in data coordinates) giving horizontal location of raster
ymin, ymax  y location (in data coordinates) giving vertical location of raster

Details

Most useful for adding tables, inset plots, and other grid-based decorations

Note

annotation_custom() expects the grob to fill the entire viewport defined by xmin, xmax, ymin, ymax. Grobs with a different (absolute) size will be center-justified in that region. Inf values can be used to fill the full plot panel

Description

This is a special version of ggplot2::annotation_raster for use with ggmap. (It simply removes the requirement for cartesian coordinates.) The only difference between inset_raster() and inset_ggmap() is their arguments. inset_ggmap() is simply a wrapper of inset_raster() with xmin, ..., ymax arguments equal to the map’s bounding box.

Usage

inset_raster(raster, xmin, xmax, ymin, ymax, interpolate = TRUE)
inset_ggmap(ggmap)

Arguments

raster  raster object to display
xmin, xmax  x location (in data coordinates) giving horizontal location of raster
ymin, ymax  y location (in data coordinates) giving vertical location of raster
interpolate  interpolate the raster? (i.e. antialiasing)
ggmap  a ggmap object, see get_map()

```

#### legs2route

Convert a leg-structured route to a route-structured route

**Description**

Convert a leg-structured route to a route-structured route

**Usage**

```r
legs2route(legsdf)
```

**Arguments**

- `legsdf` a legs-structured route, see `route()`

**See Also**

- `geom_path()`

**Examples**

```r
## Not run: requires Google API key, see ?register_google

(legs_df <- route("houston","galveston"))
legs2route(legs_df)

(legs_df <- route(
```
"marrs mclean science, baylor university",
"220 south 3rd street, waco, tx 76701", # ninfas
alternatives = TRUE))

legs2route(legs_df)

from <- "houston, texas"
to <- "waco, texas"
legs_df <- route(from, to)

qmap("college station, texas", zoom = 8) +
  geom_segment(
    aes(x = start_lon, y = start_lat, xend = end_lon, yend = end_lat),
    colour = "red", size = 1.5, data = legs_df
  )
  # notice boxy ends
qmap("college station, texas", zoom = 8) +
  geom_leg(
    aes(x = start_lon, y = start_lat, xend = end_lon, yend = end_lat),
    colour = "red", size = 1.5, data = legs_df
  )
  # notice overshooting ends
route_df <- legs2route(legs_df)
qmap("college station, texas", zoom = 8) +
  geom_path(
    aes(x = lon, y = lat),
    colour = "red", size = 1.5, data = route_df, lineend = "round"
  )

## End(Not run)

---

**LonLat2XY**

*Convert a lon/lat coordinate to a tile coordinate*

**Description**

Convert a lon/lat coordinate to a tile coordinate for a given zoom. Decimal tile coordinates (x, y) are reported.

**Usage**

`LonLat2XY(lon_deg, lat_deg, zoom, xpix = 256, ypix = 256)`
Arguments

lon_deg  longitude in degrees
lat_deg  latitude in degrees
zoom    zoom
xpix     width of tile in pixels
ypix     length of tile in pixels

Value

a data frame with columns X, Y, x, y

Author(s)

David Kahle <david@kahle.io>, based on RgoogleMaps::LatLon2XY() by Markus Loecher of Sense Networks <markus@sensenetworks.com>

See Also

https://wiki.openstreetmap.org/wiki/Slippy_map_tilenames

Examples

```r
## Not run:
gc <- geocode('baylor university')
LonLat2XY(gc$lon, gc$lat, 10)

## End(Not run)
```

Description

Compute a bounding box for a given longitude / latitude collection.

Usage

```r
make_bbox(lon, lat, data, f = 0.05)
```
Arguments

- `lon`  longitude
- `lat`  latitude
- `data`  (optional) a data frame containing lon and lat as variables
- `f`  number specifying the fraction by which the range should be extended. If length 2 vector, applies to longitude and then latitude.

Examples

```r
make_bbox(lon, lat, data = crime)
make_bbox(lon, lat, data = crime, f = .20)
make_bbox(lon, lat, data = crime, f = c(.20, .05))

(lon <- sample(crime$lon, 10))
(lat <- sample(crime$lat, 10))
make_bbox(lon, lat)
make_bbox(lon, lat, f = .10) # bigger box
```

mapdist  

*Compute map distances using Google*

Description

Compute map distances using Google’s Distance Matrix API. Note: To use Google’s Distance Matrix API, you must first enable the API in the Google Cloud Platform Console. See `register_google()`.

Usage

```r
mapdist(
  from,
  to,
  mode = c("driving", "walking", "bicycling", "transit"),
  output = c("simple", "all"),
  urlonly = FALSE,
  override_limit = FALSE,
  ext = "com",
  inject = "",
  ...
)

distQueryCheck()
```
Arguments

- **from**: name of origin addresses in a data frame (vector accepted), or a data frame with from and to columns
- **to**: name of destination addresses in a data frame (vector accepted)
- **mode**: driving, bicycling, walking, or transit
- **output**: amount of output
- **urlonly**: return only the url?
- **override_limit**: override the current query count (.google_distance_query_times)
- **ext**: top level domain domain extension (e.g. "com", "co.nz")
- **inject**: character string to add to the url

Details

If parameters from and to are specified as geographic coordinates, they are reverse geocoded with `revgeocode`. Note that the Google Maps API limits to 2500 element queries a day.

Value

A data frame (output="simple") or all of the geocoded information (output="all")

Author(s)

David Kahle <david@kahle.io>

Examples

```r
## Not run: requires Google API key, see ?register_google

## basic usage
#-----------------------------------------------
mapdist("waco, texas", "houston, texas")

# many from, single to
from <- c("houston, texas", "dallas")
to <- "waco, texas"
mapdist(from, to)
mapdist(from, to, mode = "bicycling")
mapdist(from, to, mode = "walking")
```

# tibble of from's, vector of to's
# (with a data frame, remember stringsAsFactors = FALSE)
tibble(
  "from" = c("houston", "houston", "dallas"),
  "to" = c("waco", "san antonio", "houston")
) %>% mapdist()

# distance matrix
library("tidyverse")
c("Hamburg, Germany", "Stockholm, Sweden", "Copenhagen, Denmark") %>%
  list(., .) %>%
  set_names(c("from", "to")) %>%
  cross_df() %>%
  mapdist() -> distances
distances

  distances %>%
  select(from, to, km) %>%
  spread(from, km)

## other examples

### other examples

# many from, single to with addresses
from <- c(
  "1600 Amphitheatre Parkway, Mountain View, CA",
  "3111 World Drive Walt Disney World, Orlando, FL"
)
to <- "1600 Pennsylvania Avenue, Washington DC"
mapdist(from, to)

# mode = "transit
from <- "st lukes hospital houston texas"
to <- "houston zoo, houston texas"
mapdist(from, to, mode = "transit")

## geographic coordinates are accepted as well

(wh <- as.numeric(geocode("the white house, dc")))
(lm <- as.numeric(geocode("lincoln memorial washington dc")))
mapdist(wh, lm, mode = "walking")
OSM_scale_lookup

## Description

Look up OpenStreetMap scale for a given zoom level.

## Usage

OSM_scale_lookup(zoom = 10)

## Arguments

zoom

google zoom

## Details

The calculation of an appropriate OSM scale value for a given zoom level is a complicated task. For details, see https://wiki.openstreetmap.org/wiki/FAQ

## Value

scale

## Author(s)

David Kahle <david@kahle.io>

## Examples

OSM_scale_lookup(zoom = 3)
OSM_scale_lookup(zoom = 10)

```r
## Not run:
# these can take a long time or are prone to crashing
# if the osm server load is too high

# these maps are were the ones used to tailor fit the scale
# the zooms were fixed
ggmap(get_map(zoom = 3, source = 'osm', scale = 47500000), extent = "device")
ggmap(get_map(zoom = 4, source = 'osm', scale = 32500000), extent = "device")
ggmap(get_map(zoom = 5, source = 'osm', scale = 15000000), extent = "device")
ggmap(get_map(zoom = 6, source = 'osm', scale = 10000000), extent = "device")
ggmap(get_map(zoom = 7, source = 'osm', scale = 5000000), extent = "device")
```
print.ggmap

Print a map

Description

Print a console description of a map

Usage

## S3 method for class 'ggmap'
print(x, ...)

Arguments

x an object of class elicit

... additional parameters

Value

Invisibly returns x.
qmap

Quick map plot

Description

qmap is a wrapper for `ggmap()` and `get_map()`.

Usage

```r
qmap(location = "houston", ...)
```

Arguments

- `location` character; location of interest
- `...` stuff to pass to `ggmap()` and `get_map()`

Value

a ggplot object

Author(s)

David Kahle <david@kahle.io>

See Also

`ggmap()` and `get_map()`

Examples

```r
## Not run: some requires Google API key; heavy network/time load

location <- "marrs mclean science, waco, texas"
qmap(location)
qmap(location, zoom = 14)
qmap(location, zoom = 14, source = "osm")
qmap(location, zoom = 14, source = "osm", scale = 20000)
qmap(location, zoom = 14, maptype = "satellite")
```
```r
qmap(location, zoom = 14, maptype = "hybrid")
qmap(location, zoom = 14, maptype = "stamen_toner", source = "stadia")
qmap(location, zoom = 14, maptype = "stamen_watercolor", source = "stadia")
qmap(location, zoom = 14, maptype = "stamenTerrain_background", source = "stadia")
qmap(location, zoom = 14, maptype = "stamen_toner_lite", source = "stadia")

where <- "the white house, washington dc"
wh <- geocode(where)
qmap(where, maprange = TRUE, zoom = 15,
    base_layer = ggplot(aes(x=lon, y=lat), data = wh) + geom_point()
)

## End(Not run)
```

---

**qmplot**

**Quick map plot**

**Description**

$qmplot()$ is the ggmap equivalent to the ggplot2 function qplot and allows for the quick plotting of maps with data/models/etc.

**Usage**

```
qmplot(
    x,
    y,
    ...
    data,
    zoom,
    source = "stadia",
    maptype = "stamen_toner_lite",
    extent = "device",
    legend = "right",
    padding = 0.02,
    force = FALSE,
    darken = c(0, "black"),
    mapcolor = "color",
    facets = NULL,
    margins = FALSE,
    geom = "auto",
    stat = list(NULL),
    position = list(NULL),
    xlim = c(NA, NA),
```

ylim = c(NA, NA),
main = NULL,
f = 0.05,
xlab = "Longitude",
ylab = "Latitude"
)

Arguments

x longitude values
y latitude values
... other aesthetics passed for each layer
data data frame to use (optional). If not specified, will create one, extracting vectors from the current environment.
zoom map zoom, see get_map()
source map source, see get_map()
maptype map type, see get_map()
extent how much of the plot should the map take up? "normal", "panel", or "device" (default)
legend "left", "right" (default), "bottom", "top", "bottomleft", "bottomright", "topleft", "topright", "none" (used with extent = "device")
padding distance from legend to corner of the plot (used with extent = "device")
force force new map (don’t use archived version)
darken vector of the form c(number, color), where number is in (0,1) and color is a character string indicating the color of the darken. 0 indicates no darkening, 1 indicates a black-out.
mapcolor color ("color") or black-and-white ("bw")
facets faceting formula to use. Picks facet_wrap() or facet_grid() depending on whether the formula is one sided or two-sided
margins whether or not margins will be displayed
geom character vector specifying geom to use. defaults to "point"
stat character vector specifying statistics to use
position character vector giving position adjustment to use
xlim limits for x axis
ylim limits for y axis
main character vector or expression for plot title
f number specifying the fraction by which the range should be extended
xlab character vector or expression for x axis label
ylab character vector or expression for y axis label
Examples

```r
## Not run: # these are skipped to conserve R check time
qmplot(lon, lat, data = crime)

# only violent crimes
violent_crimes <- subset(crime,
    offense != "auto theft" &
    offense != "theft" &
    offense != "burglary"
)

# rank violent crimes
violent_crimes$offense <- factor(
    violent_crimes$offense,
    levels = c("robbery", "aggravated assault", "rape", "murder")
)

# restrict to downtown
violent_crimes <- subset(violent_crimes,
    -95.39681 <= lon & lon <= -95.34188 &
    29.73631 <= lat & lat <= 29.78400
)
theme_set(theme_bw())
qmplot(lon, lat, data = violent_crimes, colour = offense,
    size = I(3.5), alpha = I(.6), legend = "topleft")
qmplot(lon, lat, data = violent_crimes, geom = c("point","density2d"))
qmplot(lon, lat, data = violent_crimes) + facet_wrap(~ offense)
qmplot(lon, lat, data = violent_crimes, extent = "panel") + facet_wrap(~ offense)
qmplot(lon, lat, data = violent_crimes, extent = "panel", colour = offense, darken = .4) +
    facet_wrap(~ month)
qmplot(long, lat, xend = long + delta_long,
    color = I("red"), yend = lat + delta_lat, data = seals,
    geom = "segment", zoom = 5)
qmplot(long, lat, xend = long + delta_long, maptype = "stamen_watercolor",
    yend = lat + delta_lat, data = seals,
    geom = "segment", zoom = 6)
qmplot(long, lat, xend = long + delta_long, maptype = "stamen_terrain",
    yend = lat + delta_lat, data = seals,
    geom = "segment", zoom = 6)
```
qmplot(lon, lat, data = wind, size = I(.5), alpha = I(.5)) +
  ggtitle("NOAA Wind Report Sites")

# thin down data set...
s <- seq(1, 227, 8)
thinwind <- subset(wind,
  lon %in% unique(wind$lon)[s] &
  lat %in% unique(wind$lat)[s]
)

# for some reason adding arrows to the following plot bugs
theme_set(theme_bw(18))
qmplot(lon, lat, data = thinwind, geom = "tile", fill = spd, alpha = spd,
legend = "bottomleft") +
  geom_leg(aes(xend = lon + delta_lon, yend = lat + delta_lat)) +
  scale_fill_gradient2("Wind Speed\nand\nDirection",
  low = "green", mid = scales::muted("green"), high = "red") +
  scale_alpha("Wind Speed\nand\nDirection", range = c(.1, .75)) +
  guides(fill = guide_legend(), alpha = guide_legend())

## kriging

### the below examples show kriging based on undeclared packages
# to better comply with CRAN's standards, we remove it from
# executing, but leave the code as a kind of case-study
# they also require the rgdal library

library(lattice)
library(sp)
library(rgdal)

# load in and format the meuse dataset (see bivand, pebesma, and gomez-rubio)
data(meuse)

   scale +
   scale_size("Observed Log Zinc")
```
Register a Google API

Description
This page contains documentation for tools related to enabling Google services in R. See the Details section of this file for background information.

Usage
showing_key()

ggmap_show_api_key()

ggmap_hide_api_key()

scrub_key(string, with = "xxx")

register_google(
  key,
  account_type,
  client,
  signature,
  second_limit,
  day_limit,
  write = FALSE
)

## S3 method for class 'google_credentials'
print(x, ...)

google_key()

has_google_key()

has_google_account()

google_account()
google_client()
has_google_client()
google_signature()
has_google_signature()
google_second_limit()
google_day_limit()

Arguments

string  a url string to be scrubbed. currently key, signature, and client keywords are
        scrubbed from the url and replace with the with argument
with    a string to replace
key     an api key
account_type  "standard" or "premium"
client   client code
signature signature code
second_limit  query limit per second (default 50)
day_limit query limit per day (default 2500 for standard accounts, 100000 for premium
accounts)
write    if TRUE, stores the secrets provided in the .Renviron file
x       a google credentials class object
...     a dumped formal argument to the generic print method

Details

As of mid-2018, the Google Maps Platform requires a registered API key. While this alleviates
previous burdens (e.g. query limits), it creates some challenges as well. The most immediate
challenge for most R users is that ggmap functions that use Google’s services no longer function
out of the box, since the user has to setup an account with Google, enable the relevant APIs, and
then tell R about the user’s setup.

To obtain an API key and enable services, go to https://mapsplatform.google.com/. This
documentation shows you how to input the requisite information (e.g. your API key) into R, and it
also shows you a few tools that can help you work with the credentialing.

To tell ggmap about your API key, use register_google(), e.g. register_google(key = "mQkzTpiaLYjPqXQBotesgif3EfGL2dbrNVOrogg")
(that’s a fake key). This will set your API key for the current session, but if you restart R, you’ll need
to do it again. You can set it permanently by setting write = TRUE, see the examples. If you set it
permanently it will be stored in your .Renviron file, and that will be accessed by ggmap persistently
across sessions.

Users should be aware that the API key, a string of jarbled characters/numbers/symbols, is a PRI-
VATE key - it uniquely identifies and authenticates you to Google’s services. If anyone gets your
API key, they can use it to masquerade as you to Google and potentially use services that you have enabled. Since Google requires a valid credit card to use its online cloud services, this also means that anyone who obtains your key can potentially make charges to your card in the form of Google services. So be sure to not share your API key. To mitigate against users inadvertently sharing their keys, by default ggmap never displays a user’s key in messages displayed to the console.

Users should also be aware that ggmap has no mechanism with which to safeguard the private key once registered with R. That is to say, once you register your API key, any function R will have access to it. As a consequence, ggmap will not know if another function, potentially from a compromised package, accesses the key and uploads it to a third party. For this reason, when using ggmap we recommend a heightened sense of security and self-awareness: only use trusted packages, do not save API keys in script files, routinely cycle keys (regenerate new keys and retire old ones), etc. Google offers features to help in securing your API key, including things like limiting queries using that key to a particular IP address, as well as guidance on security best practices. See [https://cloud.google.com/docs/authentication/api-keys#securing_an_api_key](https://cloud.google.com/docs/authentication/api-keys#securing_an_api_key) for details.

register_stadiamaps  Register a Stadia Maps API Key

Description

This page contains documentation for tools related to enabling Stadia Maps services in R. See the Details section of this file for background information.

Usage

```r
register_stadiamaps(key, write = FALSE)

stadiamaps_key()

has_stadiamaps_key()
```

Arguments

- `key` an api key
- `write` if TRUE, stores the secrets provided in the .Renviron file

Details

To obtain an API key and enable services, go to https://client.stadiamaps.com/signup/. It is completely free for non-commercial and evaluation use (a license is for commercial use; see https://stadiamaps.com/pricing for pricing), and no credit card is required to sign up.

To tell ggmap about your API key, use `register_stadiamaps()`, e.g. `register_stadiamaps(key = "YOUR-API-KEY")` (that’s a fake key). This will set your API key for the current session, but if you restart R, you’ll need to do it again. You can set it permanently by setting `write = TRUE`, see the examples. If you set it permanently it will be stored in your .Renviron file, and that will be accessed by ggmap persistently across sessions.

Users should be aware that the API key, is a PRIVATE key - it uniquely identifies and authenticates you to Stadia Maps’ services. If anyone gets your API key, they can use it to masquerade as you to Stadia Maps and potentially use services that you have enabled. While Stadia Maps requires you to opt in to additional usage-based billing, this also means that anyone who obtains your key can potentially incur charges on your behalf or steal the quota that you have already purchased. So be sure to not share your API key. To mitigate against users inadvertently sharing their keys, by default ggmap never displays a user’s key in messages displayed to the console.

Users should also be aware that ggmap has no mechanism with which to safeguard the private key once registered with R. That is to say, once you register your API key, any function R will have access to it. As a consequence, ggmap will not know if another function, potentially from a compromised package, accesses the key and uploads it to a third party. For this reason, when using ggmap we recommend a heightened sense of security and self-awareness: only use trusted packages, do not save API keys in script files, routinely cycle keys (regenerate new keys and retire old ones), etc.

revgeocode  Reverse geocode

Description

Reverse geocodes (looks up the address of) a longitude/latitude location using the Google Geocoding API. Note: To use Google’s Geocoding API, you must first enable the API in the Google Cloud Platform Console. See register_google().

Usage

revgeocode(
  location,
  output = c("address", "all"),
  force = FALSE,
  urlonly = FALSE,
  override_limit = FALSE,
  ext = "com",
  inject = "",
  ...
)

Arguments

location a location in longitude/latitude format
output "address" or "all"
force force online query, even if cached (previously downloaded)
urlonly return only the url?
override_limit override the current query rate
ext top level domain extension (e.g. "com", "co.nz")
inject character string to add to the url
... ...
Value

  a character(1) address or a list (the parsed json output from Google)

Author(s)

  David Kahle <david@kahle.io>

See Also

  https://developers.google.com/maps/documentation/geocoding/

Examples

  ## Not run: requires Google API key, see ?register_google

  ## basic usage
  ##############################################################################
  ( gc <- as.numeric(geocode("the white house")) )
  revgeocode(gc)
  str(revgeocode(gc, output = "all"), 3)

  ## End(Not run)

---

route  

*Grab a route from Google*

Description

  Route two locations: determine a sequence of steps (legs) between two locations using the Google Directions API. Note: To use Google’s Directions API, you must first enable the API in the Google Cloud Platform Console. See `register_google()`.

Usage

  route(
    from,
    to,
    mode = c("driving", "walking", "bicycling", "transit"),
    structure = c("legs", "route"),
    output = c("simple", "all"),
    alternatives = FALSE,
    units = "metric",
    urlonly = FALSE,
    override_limit = FALSE,
  )
Arguments

from  vector of origin addresses

to    vector of destination addresses

mode  driving, bicycling, walking, or transit

structure structure of output, "legs" or "route", see examples

output amount of output ("simple" or "all")

alternatives should more than one route be provided?

units  "metric"

urlonly return only the url?

override_limit override the current query count

ext    domain extension (e.g. "com", "co.nz")

inject character string to add to the url

... ...

Value

a data frame (output="simple") or all of the geocoded information (output="all")

Author(s)

David Kahle <david@kahle.io>

https://developers.google.com/maps/documentation/directions/, trek(), legs2route(), geom_leg(), register_google()

Examples

## Not run: requires Google API key, see ?register_google

## basic usage

from <- "houston, texas"
to <- "waco, texas"

route(from, to, structure = "legs")
## Make a ggplot2 inset theme.

### Description

theme_inset is a ggplot2 theme geared towards making inset plots.

### Usage

```r
theme_inset(base_size = 12)
```

### Arguments

- `base_size`: base size, not used.
**Value**

a ggplot2 theme (i.e., a list of class options).

**Author(s)**

David Kahle <david@kahle.io>

**Examples**

```r
library(ggplot2)
## Not run:
n <- 50
df <- expand.grid(x = 1:n, y = 1:n)[sample(n^2,.5*n^2),]
quplot(x, y, data = df, geom = 'tile')
quplot(x, y, data = df, geom = 'tile') + theme_nothing()
quplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10)),
    8, Inf, -Inf, 2
  )
quplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10) + theme_nothing()),
    8, Inf, -Inf, 2
  )
quplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10) + theme_inset()),
    8, Inf, -Inf, 2
  )

## End(Not run)
```

---

**theme_nothing**  
*Make a blank ggplot2 theme.*

**Description**

theme_nothing simply strips all thematic element in ggplot2.

**Usage**

```r
theme_nothing(base_size = 12, legend = FALSE)
```
theme_nothing

Arguments

base_size  base size, not used.
legend  should the legend be included?

Value

a ggplot2 theme (i.e., a list of class options).

Author(s)

David Kahle <david@kahle.io>

Examples

# no legend example
n <- 50
df <- expand.grid(x = 1:n,y = 1:n)[sample(n^2,.5*n^2),]
p <- ggplot(df, aes(x, y)) + geom_raster()
p
p + theme_nothing()
p + theme_nothing(legend = TRUE)  # no difference
p +
  scale_x_continuous(expand = c(0,0)) +
  scale_y_continuous(expand = c(0,0)) +
  theme_nothing()

# legend example
df$class <- factor(sample(0:1, .5*n^2, replace = TRUE))
p <- ggplot(df, aes(x, y)) + geom_raster(aes(fill = class))
p
p + theme_nothing()
p + theme_nothing(legend = TRUE)
p <- p +
  scale_x_continuous(expand = c(0,0)) +
  scale_y_continuous(expand = c(0,0))
p
p + theme_nothing()
p + theme_nothing(legend = TRUE)
Description

Sequence treks (latitude-longitude sequences following ordinary paths, e.g. roads) between two locations using the Google Directions API. Note: To use Google’s Directions API, you must first enable the API in the Google Cloud Platform Console. See `register_google()`.

Usage

trek(
    from,
    to,
    mode = c("driving", "walking", "bicycling", "transit"),
    output = c("simple", "all"),
    alternatives = FALSE,
    units = "metric",
    urlonly = FALSE,
    override_limit = FALSE,
    ext = "com",
    inject = "",
    ...
)

Arguments

from               name of origin addresses in a data frame
to                 name of destination addresses in a data frame
mode               driving, bicycling, walking, or transit
output             amount of output ("simple" or "all")
alternatives       should more than one route be provided?
units              "metric"
urlonly             return only the url?
override_limit     override the current query count
ext                 domain extension (e.g. "com", "co.nz")
inject             character string to add to the url
...                 ...

Value

a tibble
Author(s)

**XY2LonLat**

**Convert a tile coordinate to a lon/lat coordinate**

**Description**

Convert a tile coordinate to a lon/lat coordinate for a given zoom. Decimal tile coordinates are accepted.

**Usage**

```r
XY2LonLat(X, Y, zoom, x = 0, y = 0, xpix = 255, ypix = 255)
```

**Arguments**

- `X`: horizontal map-tile coordinate (0 is map-left)
- `Y`: vertical map-tile coordinate (0 is map-top)
- `zoom`: zoom
- `x`: within tile x (0 is tile-left)
- `y`: within tile y (0 it tile-top)
- `xpix`: width of tile in pixels
- `ypix`: length of tile in pixels

**Value**

a data frame with columns lon and lat (in degrees)

**Author(s)**

David Kahle <david@kahle.io>, based on RgoogleMaps::XY2LatLon() by Markus Loecher of Sense Networks <markus@sensenetworks.com>

**See Also**

https://wiki.openstreetmap.org/wiki/Slippy_map_tilenames

**Examples**

```r
## Not run:
XY2LonLat(480, 845, zoom = 11)
XY2LonLat(0, 0, zoom = 1)
XY2LonLat(0, 0, 255, 255, zoom = 1)
XY2LonLat(0, 0, 255, 255, zoom = 1)

## End(Not run)
